Processes and Threads

COMP3231 04s1

1

Major Requirements of an Operating System

- Interleave the execution of several processes to maximize processor utilization while providing reasonable response time
- Allocate resources to processes
- Support interprocess communication and user creation of processes

Processes and Threads

- Processes:
 - Also called a task or job
 - Execution of an individual program
 - "Owner" of resources allocated for program execution
 - Encompasses one or more threads
- Threads:
 - Unit of execution
 - Can be traced
 - list the sequence of instructions that execute
 - Belongs to a process

Figure 3.1 Snapshot of Example Execution (Figure 3 at Instruction Cycle 13

Logical Execution Trace

5000	8000	12000
5001	8001	12001
5002	8002	12002
5003	8003	12003

100 = Starting address of dispatcher program

shaded areas indicate execution of dispatcher process; first and third columns count instruction cycles; second and fourth columns show address of instruction being executed

Summary: The Process Model

- Multiprogramming of four programs
- Conceptual model of 4 independent, sequential processes (with a single thread each)
- Only one program active at any instant

Figure 4.1 Threads and Processes [ANDE97]

Process and thread models of selected OSes

- Single process, single thread
 - MSDOS
- Single process, multiple threads
 - OS/161 as distributed
- Multiple processes, single thread
 - Traditional unix
- Multiple processes, multiple threads

- Modern Unix (Linux, Solaris), Windows 2000

Note: Literature (incl. Textbooks) often do not cleanly distinguish between processes and threads (for historical reasons)

the University of New South Wales

Process Creation

Principal events that cause process creation

- 1. System initialization
 - Foreground processes (interactive programs)
 - Background processes
 - Email server, web server, print server, etc.
 - Called a *daemon* (unix) or *service* (Windows)
- 2. Execution of a process creation system call by a running process
 - New login shell for an incoming telnet connection
- 3. User request to create a new process
- 4. Initiation of a batch job
- Note: Technically, all these cases use the same system mechanism to create new processes.

Process Termination

Conditions which terminate processes

- 1. Normal exit (voluntary)
- 2. Error exit (voluntary)
- 3. Fatal error (involuntary)
- 4. Killed by another process (involuntary)

Process/Thread States

- 1. Process blocks for input
- 2. Scheduler picks another process
- 3. Scheduler picks this process
- 4. Input becomes available

- Possible process/thread states
 - running
 - blocked
 - ready

Transitions between states shown

Some Transition Causing Events

Running ⊳Ready

- Voluntary Yield()
- End of timeslice
- Running
 Blocked
 - Waiting for input
 - File, network,
 - Waiting for a timer (alarm signal)
 - Waiting for a resource to become available

Dispatcher

- Sometimes also called the scheduler
 - The literature is also a little inconsistent on this point
- Has to choose a Ready process to run
 - How?
 - It is inefficient to search through all processes

The Ready Queue

(b) Queuing diagram

What about blocked processes?

 When an *unblocking* event occurs, we also wish to avoid scanning all processes to select one to make *Ready*

Using Two Queues
