

cse

# Introduction

COMP3231/9201/3891/9283  
(Extended) Operating Systems  
Kevin Elphinstone

cse

# Course Outline

- Prerequisites
  - COMP2011 Data Organisation
    - Stacks, queues, hash tables, lists, trees, heaps,....
  - COMP2121 Microprocessor and Interfacing
    - Assembly programming
    - Mapping of high-level procedural language to assembly language
  - or the postgraduate equivalent
  - **You are expected to be competent programmers!!!!**
    - We will be using the C programming language
      - The dominant language for OS implementation.
      - Need to understand pointers, pointer arithmetic, explicit memory allocation.

2

cse

# Why does this fail?

```

void func(int *x, int *y)
{
    *x = 1; *y = 2;
}

void main()
{
    int *a, *b;
    func(a,b);
    printf("%d %d\n", *a,*b);
}
  
```

3

cse

# Lectures

- Common for all courses (3231/3891/9201/9283)
- Tuesday, 2-4pm
- Wednesday, 1-2pm
  - All lectures are here (Central Lecture Block 2 (K-E19-G03))
  - The lecture notes will be available on the course web site
    - Available prior to lectures, when possible.
    - Slide numbers for note taking
  - The lecture notes and textbook are NOT a substitute for attending lectures.

4

cse

# Tutorials

- Start in week 2
- A tutorial participation mark will contribute to your final assessment.
  - Participation means participation, NOT attendance.
  - Comp3891/9283 students excluded
  - Comp9201 optional
- **You will only get participation marks in your enrolled tutorial.**

5

cse

# Assignments

- Assignments form a substantial component of your assessment.
- They are challenging!!!!
  - Because operating systems are challenging
- We will be using OS/161,
  - an educational operating system
  - developed by the [Systems Group At Harvard](#)
  - It contains roughly 20,000 lines of code and comments

6

cse

## Assignments

- Don't under estimate the time needed to do the assignments.
- If you start a couple days before they are due, you will be late.
- To encourage you to start early,
  - Bonus 10% of max mark of the assignment for finishing a week early
  - To iron out any potential problems with the spec, 5% bonus for finishing within 48 hours of assignment release.
  - See course handout for exact details
    - Read the fine print!!!!

7

cse

## Assignments

- Assignments are in pairs
  - Info on how to pair up available soon
- We usually offer advanced versions of the assignments
  - Available bonus marks are small compared to amount of effort required.
  - Student should do it for the challenge, not the marks.
  - Attempting the advanced component is not a valid excuse for failure to complete the normal component of the assignment
- Extended OS students (COMP3891/9283) are expected to attempt the advanced assignments

8

cse

## Assignments

- Four assignments
  - due roughly week 4,5, 9,13
- The first one is trivial
  - It's a warm up to have you familiarize yourself with the environment and easy marks.
  - Do not use it as a gauge for judging the difficulty of the following assignments.

9

cse

## Assignments

- Late penalty
  - 4% of total assignment value per day
    - Assignment is worth 20%
    - You get 18, and are 2 days late
    - Final mark =  $18 - (20 \cdot 0.04 \cdot 2) = 16$  (16.4)
- Assignments are only accepted up to one week late. 8+ days = 0

10

cse

## Assignments

- To help you with the assignments
  - We dedicate a tutorial per-assignment to discuss issues related to the assignment
  - Prepare for them!!!!

11

cse

## Plagiarism

- We take cheating seriously!!!
- We systematically check for plagiarised code
  - Penalties are generally sufficient to make it difficult to pass

12

### Cheating Statistics

Session	1998/S1	1999/S1	2000/S1	2001/S1	2001/S2	2002/S1	2002/S2	2003/S1	2003/S2
enrolment	178	410	320	300	107	298	156	333	133
suspected cheaters	10(6%)	28(6%)	22(7%)	26(9%)	20(19%)	15(5%)	???(?)	13 (4%)	???(?)
full penalties	2	6	9	14	10	9	5	2	1
reduced penalties cheaters	7	15	7	7	5	4	2	2	9
failed cheaters	4	10	16	16	10	12	5	4	?
suspended cheaters	0	0	1	0	0	1	0	0	0

\*Note: Full penalty 0 FL not applied prior to 2001/S1

- ### Exams
- There is NO mid-session
  - The final written exam is 2 hours
  - Supplementary exams are oral.
    - Supplementaries are available according to school policy, not as a second chance.

- ### Assessment
- |  |  |
|--|--|
| <ul style="list-style-type: none"> <li>• Exam Mark Component           <ul style="list-style-type: none"> <li>– Max mark of 100</li> </ul> </li> <li>• Based solely on the final exam</li> </ul> | <ul style="list-style-type: none"> <li>• Class Mark Component           <ul style="list-style-type: none"> <li>– Max mark of 100</li> </ul> </li> <li>• 10% tutorial participation</li> <li>• 90% Assignments</li> </ul> |
|--|--|

- ### 3891/9283
- No tutorial participation component
  - Assignment marks scaled to 100

- ### 9201
- Optional tutorial participation, we'll award the better mark of
    - Tutorial participation included as for comp3231
    - Class marked based solely on the assignments

### Undergrad Assessment

- The final assessment is the harmonic mean of the exam and class component.
- If  $E \geq 40$ ,

$$M = \frac{2EC}{E + C}$$

cse

THE UNIVERSITY OF NEW SOUTH WALES

cse

## Course Outline

- “the course aims to educate students in the basic concepts and components of operating systems, the relevant characteristics of hardware, and the tradeoffs between conflicting objectives faced by operating systems in efficiently supporting a wide range of applications.”

30

THE UNIVERSITY OF NEW SOUTH WALES

cse

## Course Outline

- Processes and threads
- Concurrency control
- Memory Management
- File Systems
- I/O and Devices
- Security
- Scheduling

31

THE UNIVERSITY OF NEW SOUTH WALES

cse

## Introduction to Operating Systems

Chapter 1 – 1.3

32

THE UNIVERSITY OF NEW SOUTH WALES

cse

## Learning Outcomes

- High-level understand what is an operating system and the role it plays
- Appreciate the evolution of operating systems tracks the evolution of hardware, and that evolution is repeated in each new hardware era.

33

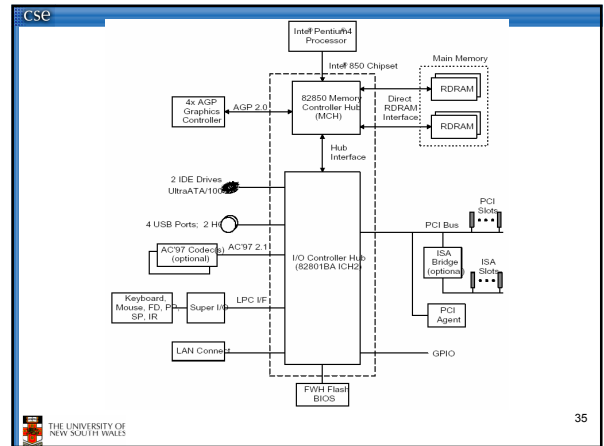

THE UNIVERSITY OF NEW SOUTH WALES

CSE

## What is an Operating System?

THE UNIVERSITY OF NEW SOUTH WALES

34

CSE

## Viewing the Operating System as an Abstract Machine

- Extends the basic hardware with added functionality
- Provides high-level abstractions
  - More programmer friendly
  - Common core for all applications
- It hides the details of the hardware
  - Makes application code portable

THE UNIVERSITY OF NEW SOUTH WALES

36

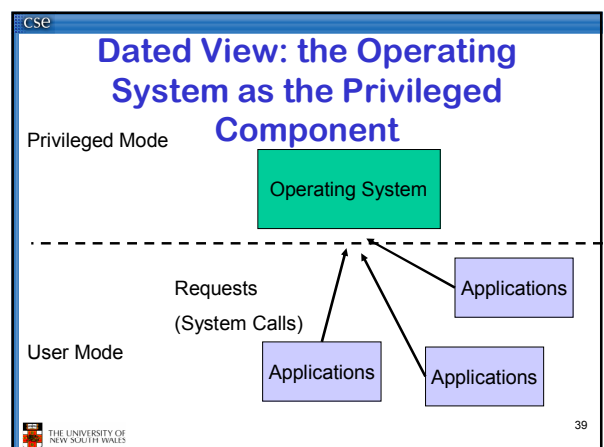

CSE

## Viewing the Operating System as a Resource Manager

- Responsible for allocating resources to users and processes
- Must ensure
  - No Starvation
  - Progress
  - Allocation is according to some desired policy
    - First-come, first-served; Fair share; Weighted fair share; limits (quotas), etc...
  - Overall, that the system is efficiently used

THE UNIVERSITY OF NEW SOUTH WALES

38

cse

## The Operating System is Privileged

- Applications should not be able to interfere or bypass the operating system
  - OS can enforce the “extended machine”
  - OS can enforce its resource allocation policies
  - Prevent applications from interfering with each other
- Note: Some Embedded OSs have no privileged component, e.g. PalmOS
  - Can implement OS functionality, but cannot enforce it.
- Note: Some operating systems implement significant OS functionality in user-mode, e.g. User-mode Linux

THE UNIVERSITY OF NEW SOUTH WALES 40

cse

## Why Study Operating Systems?

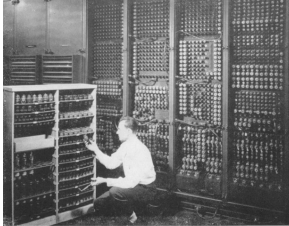

- There are many interesting problems in operating systems.
- For a complete, top-to-bottom view of a system.
- Understand performance implications of application behaviour.
- Understanding and programming large, complex, software systems is a good skill to acquire.

THE UNIVERSITY OF NEW SOUTH WALES 41

cse

## (A brief) Operating System History

- Largely parallels hardware development
- First Generation machines
  - Vacuum tubes
  - Plug boards
    - Programming via wiring
    - Users were simultaneously designers, engineers, and programmers
    - “single user”
    - difficult to debug (hardware)
  - No Operating System

Replacing a bad tube mount checking among ENIAC's 18,000 possibilities.

THE UNIVERSITY OF NEW SOUTH WALES 42

cse

## Second Generation Machines Batch Systems

- IBM 7094
  - 0.35 MIPS, 32K x 36-bit memory
  - 3.5 million dollars
- Batching used to more efficiently use the hardware
  - Share machine amongst many users
  - One at a time
  - Debugging a pain
    - Drink coffee until jobs finished

THE UNIVERSITY OF NEW SOUTH WALES 43

cse

## Batch System Operating Systems

- Sometimes called “resident job monitor”
- Managed the Hardware
- Simple Job Control Language (JCL)
  - Load compiler
  - Compile job
  - Run job
  - End job
- No resource allocation issues
  - “one user”

THE UNIVERSITY OF NEW SOUTH WALES 44

cse

## Issue: Keeping Batch Systems Busy

- Reading tapes or punch cards was time consuming
- Expensive CPU was idle waiting for input

THE UNIVERSITY OF NEW SOUTH WALES 45

cse

## Third Generation Systems - Multiprogramming

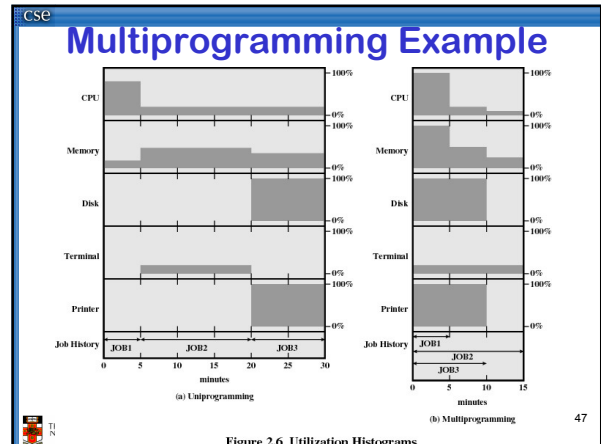

- Divided memory among several loaded jobs
- While one job is loading, CPU works on another
- With enough jobs, CPU 100% busy
- Needs special hardware to isolate memory partitions from each other
  - This hardware was notably absent on early batch systems

Memory

Job 1
Job 2
Job 3
OS

46

THE UNIVERSITY OF NEW SOUTH WALES

cse

## Job turn-around time was still an issue.

- Batch systems were well suited to
  - Scientific calculations
  - Data processing
- For programmers, debugging was much easier on older first gen. machines as the programmer had the machine to himself.
- Word processing on a batch system?

48

THE UNIVERSITY OF NEW SOUTH WALES

cse

## Time sharing

- Each user had his/her own terminal connected to the machine
- All user's jobs were multiprogrammed
  - Regularly switch between each job
  - Do it fast
- Gives the illusion that the programmer has the machine to himself
- Early examples: Compatible Time Sharing System (CTSS), MULTICS

49

THE UNIVERSITY OF NEW SOUTH WALES

cse

## An then...

- Further developments (hardware and software) resulted in improved techniques, concepts, and operating systems.....
  - CAP, Hydra, Mach, UNIX V6, BSD UNIX, THE, Thoth, Sprite, Accent, UNIX SysV, Linux, EROS, KeyKOS, OS/360, VMS, HPUX, Apollo Domain, Nemesis, L3, L4, CP/M, DOS, Exo-kernel, Angel, Mungi, BE OS, Cache Kernel, Choices, V, Inferno, Grasshopper, MOSIX, Opal, SPIN, VINO, OS9, Plan/9, QNX, Synthetix, Tornado, x-kernel, VxWorks, Solaris.....

50

THE UNIVERSITY OF NEW SOUTH WALES

cse

## A little history tour...

51

THE UNIVERSITY OF NEW SOUTH WALES

CSE

## The Advent of the PC

- Large Scale Integration (LSI) made small, fast(-ish), cheap computers possible
- OSs followed a similar path as with the mainframes
  - Simple "single-user" systems (DOS)
  - Multiprogramming without protection, (80286 era, Window 3.1, 95, 98, ME, etc..., MacOS <= 9)
  - "Real" operating systems (UNIX, WinNT, MacOS X etc..)

52

THE UNIVERSITY OF NEW SOUTH WALES

CSE

## Operating System Time Line

53

THE UNIVERSITY OF NEW SOUTH WALES

CSE

## Computer Hardware Review

Chapter 1.4

54

THE UNIVERSITY OF NEW SOUTH WALES

CSE

## Learning Outcomes

- Understand the basic components of computer hardware
  - CPU, buses, memory, devices controllers, DMA, Interrupts, hard disks
- Understand the concepts of memory hierarchy and caching, and how they affect performance.

55

THE UNIVERSITY OF NEW SOUTH WALES

CSE

## Operating Systems

- Exploit the hardware available
- Provide a set of high-level services that represent or are implemented by the hardware.
- Manages the hardware reliably and efficiently
- *Understanding operating systems requires a basic understanding of the underlying hardware*

56

THE UNIVERSITY OF NEW SOUTH WALES

CSE

## Basic Computer Elements

57

THE UNIVERSITY OF NEW SOUTH WALES

CSE

## Basic Computer Elements

- CPU
  - Performs computations
  - Load data to/from memory via system bus
- Device controllers
  - Control operation of their particular device
  - Operate in parallel with CPU
  - Can also load/store to memory (Direct Memory Access, DMA)
  - Control register appear as memory locations to CPU
    - Or I/O ports
  - Signal the CPU with “interrupts”
- Memory Controller
  - Responsible for refreshing dynamic RAM
  - Arbitrating access between different devices and CPU

THE UNIVERSITY OF NEW SOUTH WALES 58

CSE

## The real world is logically similar, but a little more complex

THE UNIVERSITY OF NEW SOUTH WALES 59

CSE

## A Simple Model of CPU Computation

- The fetch-execute cycle

Figure 1.2 Basic Instruction Cycle

THE UNIVERSITY OF NEW SOUTH WALES 60

CSE

## A Simple Model of CPU Computation

- Stack Pointer
- Status Register
  - Condition codes
    - Positive result
    - Zero result
    - Negative result
- General Purpose Registers
  - Holds operands of most instructions
  - Enables programmers to minimise memory references.

CPU Registers

THE UNIVERSITY OF NEW SOUTH WALES 62

CSE

## Privileged-mode Operation

- To protect operating system execution, two or more CPU modes of operation exist
  - Privileged mode (system-, kernel-mode)
    - All instructions and registers are available
  - User-mode
    - Uses ‘safe’ subset of the instruction set
      - E.g. no disable interrupts instruction
    - Only ‘safe’ registers are accessible

CPU Registers

Interrupt Mask
Exception Type
MMU regs
Others
PC: 0x0300
SP: 0xcbf3
Status
R1
↑
Rn

THE UNIVERSITY OF NEW SOUTH WALES 63

cse

## 'Safe' registers and instructions

- Registers and instructions are safe if
  - Only affect the state of the application itself
  - They cannot be used to uncontrollably interfere with
    - The operating system
    - Other applications
  - They cannot be used to violate a correctly implemented operating system policy.

THE UNIVERSITY OF NEW SOUTH WALES 64

cse

## Privileged-mode Operation

Address Space

- The accessibility of addresses within an address space changes depending on operating mode
  - To protect kernel code and data

0xFFFFFFFF	Accessible only to Kernel-mode
0x80000000	Accessible to User- and Kernel-mode
0x00000000	

THE UNIVERSITY OF NEW SOUTH WALES 65

cse

## I/O and Interrupts

- I/O events (keyboard, mouse, incoming network packets) happen at unpredictable times
- How does the CPU know when to service an I/O event?

THE UNIVERSITY OF NEW SOUTH WALES 66

cse

## Interrupts

- An interruption of the normal sequence of execution
- A suspension of processing caused by an event external to that processing, and performed in such a way that the processing can be resumed.
- Improves processing efficiency
  - Allows the processor to execute other instructions while an I/O operation is in progress
  - Avoids unnecessary completion checking (polling)

THE UNIVERSITY OF NEW SOUTH WALES 67

cse

## Interrupt Cycle

- Processor checks for interrupts
- If no interrupts, fetch the next instruction
- If an interrupt is pending, divert to the interrupt handler

Figure 1.7. Instruction Cycle with Interrupts

THE UNIVERSITY OF NEW SOUTH WALES 68

cse

## Classes of Interrupts

- Program exceptions (also called *synchronous interrupts*)
  - Arithmetic overflow
  - Division by zero
  - Executing an illegal/privileged instruction
  - Reference outside user's memory space.
- Asynchronous (external) events
  - Timer
  - I/O
  - Hardware or power failure

THE UNIVERSITY OF NEW SOUTH WALES 69

CSE

## Interrupt Handler

- A software routine that determines the nature of the interrupt and performs whatever actions are needed.
- Control is transferred to the handler by *hardware*.
- The handler is generally part of the operating system.

70

CSE

## Simple Interrupt

71

CSE

## Simple Interrupt Processing

72

CSE

## Programmed I/O

- Also called *polling*, or *busy waiting*
- I/O module (controller) performs the action, not the processor
- Sets appropriate bits in the I/O status register
- No interrupts occur
- Processor checks status until operation is complete  
– **Wastes CPU cycles**

(a) Programmed I/O

CSE

## Interrupt-Driven I/O

- Processor is interrupted when I/O module (controller) ready to exchange data
- Processor is free to do other work
- No needless waiting
- Consumes a lot of processor time because every word read or written passes through the processor

(b) Interrupt-driven I/O

CSE

## Direct memory access (DMA)

- I/O exchanges occur directly with memory
- Processor directs I/O controller to read/write to memory
- Relieves the processor of the responsibility for data transfer
- Processor free to do other things
- An interrupt is sent when the task is complete

(c) Direct memory access

77

CSE

## Multiprogramming (Multitasking)

- Processor has more than one program to execute.
  - Some tasks waiting for I/O to complete
  - Some tasks ready to run, but not running
- Interrupt handler can switch to other tasks when they become runnable
- Regular timer interrupts can be used for timesharing

THE UNIVERSITY OF NEW SOUTH WALES 78

CSE

## Memory Hierarchy

- Going down the hierarchy
  - Decreasing cost per bit
  - Increasing capacity
  - Increasing access time
  - Decreasing frequency of access to the memory by the processor
    - Hopefully
    - Principle of locality!!!!

THE UNIVERSITY OF NEW SOUTH WALES

Figure 1.14 The Memory Hierarchy

CSE

## Memory Hierarchy

- Rough approximation of memory hierarchy

Typical access time		Typical capacity
1 nsec	Registers	<1 KB
2 nsec	Cache	1 MB
10 nsec	Main memory	64-512 MB
10 msec	Magnetic disk	5-50 GB
100 sec	Magnetic tape	20-100 GB

THE UNIVERSITY OF NEW SOUTH WALES 80

CSE

## Cache

- Cache is fast memory placed between the CPU and main memory
  - 1 to a few cycles access time compared to RAM access time of tens – hundreds of cycles
- Holds recently used data or instructions to save memory accesses.
- Matches slow RAM access time to CPU speed if high hit rate
- Is hardware maintained and (mostly) transparent to software
- Sizes range from few kB to several MB.
- Usually a hierarchy of caches (2–5 levels), on- and off-chip.
- Block transfers can achieve higher transfer bandwidth than single words.
  - Also assumes probability of using newly fetched data is higher than the probability of reuse of ejected data.

83

- cse
- ## Example Disk Access Times
- Disk can read/write data relatively fast
    - 15,000 rpm drive - 80 MB/sec
    - 1 KB block is read in 12 microseconds
  - Access time dominated by time to locate the head over data
    - Rotational latency
      - Half one rotation is 2 milliseconds
    - Seek time
      - Full inside to outside is 8 milliseconds
      - Track to track .5 milliseconds
  - 2 milliseconds is 164KB in “lost bandwidth”
- THE UNIVERSITY OF NEW SOUTH WALES 85

- cse
- ## A Strategy: Avoid Waiting for Disk Access
- Keep a subset of the disk's data in memory
- ⇒ Main memory acts as a *cache* of disk contents
- THE UNIVERSITY OF NEW SOUTH WALES 86

- cse
- ## Two-level Memories and Hit Rates
- Given a two-level memory,
    - cache memory and main memory (RAM)
    - main memory and disk
- what is the effective access time?
- Answer: It depends on the hit rate in the first level.
- THE UNIVERSITY OF NEW SOUTH WALES 87

cse

## Effective Access Time

$$T_{eff} = H \times T_1 + (1 - H) \times (T_1 + T_2)$$

$T_1$  = access time of memory 1  
 $T_2$  = access time of memory 2  
 $H$  = hit rate in memory 1  
 $T_{eff}$  = effective access time of system

THE UNIVERSITY OF NEW SOUTH WALES 88

cse

## Example

- Cache memory access time 1ns
- Main memory access time 10ns
- Hit rate of 95%

$$T_{eff} = 0.95 \times 1 \times 10^{-9} + 0.05 \times (1 \times 10^{-9} + 10 \times 10^{-9}) = 1.5 \times 10^{-9}$$

THE UNIVERSITY OF NEW SOUTH WALES 89
