IVERSITY OF		39

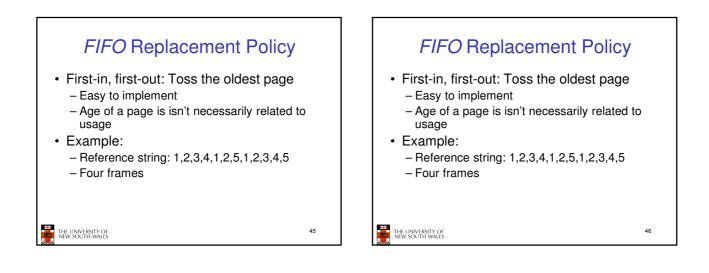

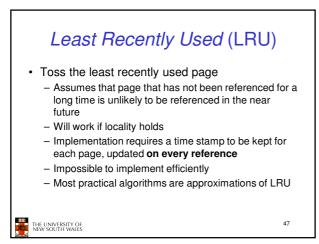

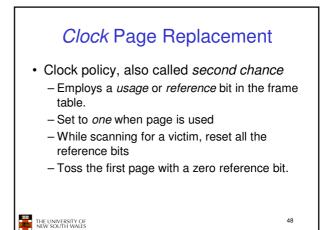

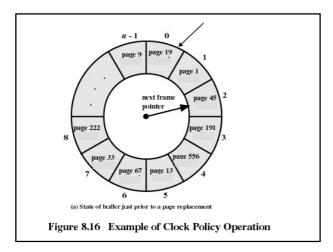

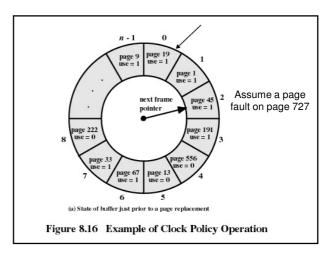

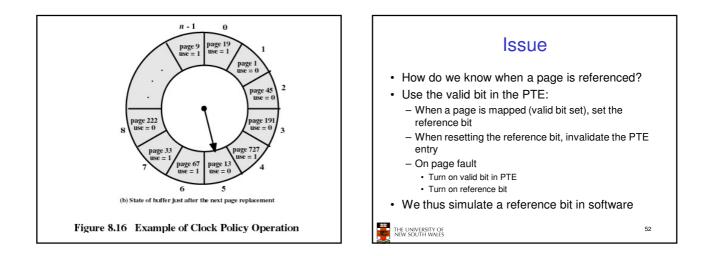

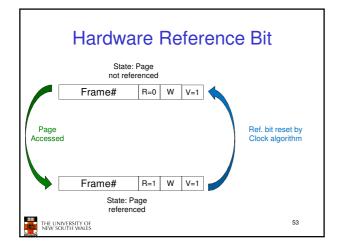

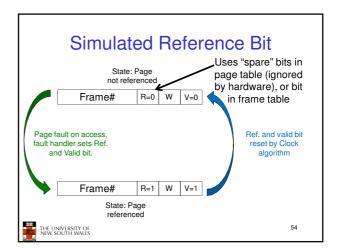

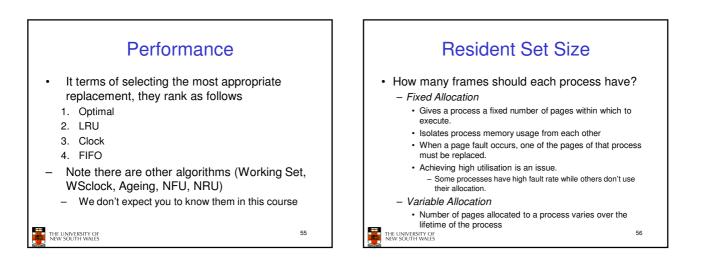

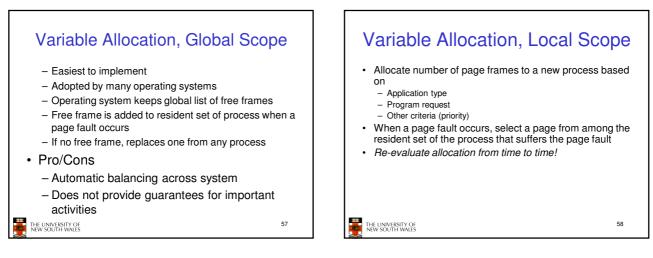

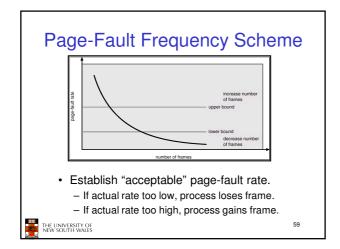

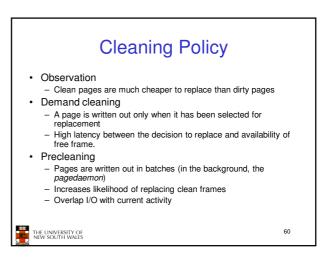

- Determines the number of runnable processes
- Controlled by:
- Admission control
  - Only let new process's threads enter *ready* state if enough memory is available
- Suspension:
  - Move all threads of some process into a special *suspended* state
    Swap complete process image of suspended process to disk

61

- Trade-off
  - Too many processes will lead to thrashing
  - Too few will lead to idle CPU
