Why are there so many?

- Different physical nature of storage devices
 - Ext3 is optimised for magnetic disks
 - JFFS2 is optimised for flash memory devices
 - ISO9660 is optimised for CDROM
- Different storage capacities
 - FAT16 does not support drives >2GB
 - FAT32 becomes inefficient on drives >32GB
 - ZFS, Btrfs is designed to scale to multi-TB disk arrays
- · Different CPU and memory requirements
 - FAT16 is not suitable for modern PCs but is a good fit for many embedded devices
- Proprietary standards
 - NTFS may be a nice FS, but its specification is closed

13

17

In this lecture we focus on file systems for magnetic disks Seek time 15 ** 15ms worst case** Rotational delay 8ms worst case for 7200rpm drive** For comparison, disk-to-buffer transfer speed of a modern drive is ~10µs per 4K block. Conclusion: keep blocks that are likely to be accessed together close to each other

14

16

18

Assumptions

The FS must map symbolic file names into a collection of block addresses The FS must keep track of which blocks belong to which files. in what order the blocks form the file which blocks are free for allocation Given a logical region of a file, the FS must track the corresponding block(s) on disk. Stored in file system metadata

File Allocation Methods

• A file is divided into "blocks"

– the unit of transfer to storage

• Given the logical blocks of a file, what method is used to choose were to put the blocks on disk?

File 12345678

15

Contiguous Allocation Easy bookkeeping (need to keep track of the starting block and length of the file) Increases performance for sequential operations Need the maximum size for the file at the time of creation As files are deleted, free space becomes divided into many small chunks (external fragmentation) Example: ISO 9660 (CDROM FS)

Dynamic Allocation Strategies

- Disk space allocated in portions as needed
- Allocation occurs in fixed-size blocks

✓ No external fragmentation

✓ Does not require pre-allocating disk space

✓ Partially filled blocks (internal fragmentation)

✓ File blocks are scattered across the disk

✓ Complex metadata management (maintain the list of blocks for each file)

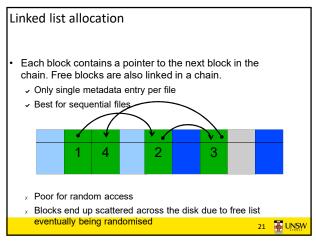

External and internal fragmentation External fragmentation - The space wasted external to the allocated memory regions - Memory space exists to satisfy a request but it is unusable as it is not contiguous Internal fragmentation - The space wasted internal to the allocated memory - Allocated memory may be slightly larger than requested memory; this size difference is wasted memory internal to a partition

Dynamic allocation: Linked list allocation Each block contains a pointer to the next block in the chain. Free blocks are also linked in a chain. → Only single metadata entry per file → Best for sequential files Question: What are the downsides? 20 JUNSW

20

22

19 FUNSW

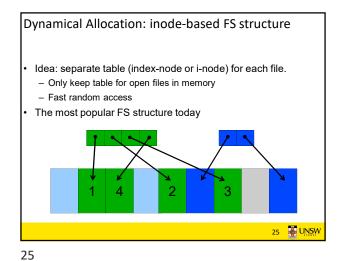

Dynamic Allocation: File allocation table · Keep a map of the entire FS in a separate table - A table entry contains the number of the next block of the file - The last block in a file and empty blocks are marked using reserved values · The table is stored on the disk and is replicated in memory Random access is fast (following the in-memory list) Question: any issues with this design?

21

19

File allocation table Issues - Requires a lot of memory for large disks • 200GB = 200*10^6 * 1K-blocks ==> 200*10^6 FAT entries = 800MB Free block lookup is slow 23

File allocation table disk layout Examples - FAT12, FAT16, FAT32 data blocks reserved FAT1 24

i-node implementation issues

• i-nodes occupy one or several disk areas

• i-nodes are allocated dynamically, hence free-space management is required for i-nodes

- Use fixed-size i-nodes to simplify dynamic allocation

- Reserve the last i-node entry for a pointer to an extension i-node

i-node implementation issues

• Free-space management

- Approach 1: linked list of free blocks

- Approach 2: keep bitmaps of free blocks and free i-nodes

- Approach 2: keep bitmaps of free blocks and free i-nodes

- Approach 2: keep bitmaps of free blocks and free i-nodes

- Approach 2: keep bitmaps of free blocks and free i-nodes

- Approach 2: keep bitmaps of free blocks and free i-nodes

- Approach 2: keep bitmaps of free blocks and free i-nodes

- Approach 2: keep bitmaps of free blocks and free i-nodes

- Approach 2: keep bitmaps of free blocks and free i-nodes

- Approach 2: keep bitmaps of free blocks and free i-nodes

- Approach 2: keep bitmaps of free blocks and free i-nodes

- Approach 3: keep bitmaps of free blocks and free i-nodes

- Approach 2: keep bitmaps of free blocks and free i-nodes

- Approach 3: keep bitmaps of free blocks and free i-nodes

- Approach 2: keep bitmaps of free blocks and free i-nodes

- Approach 3: keep bitmaps of free blocks and free i-nodes

- Approach 3: keep bitmaps of free blocks and free i-nodes

- Approach 3: keep bitmaps of free blocks and free i-nodes

- Approach 3: keep bitmaps of free blocks and free i-nodes

- Approach 3: keep bitmaps of free blocks and free i-nodes

Individual bits in a bit vector flags used/free blocks

Concentrating (de)allocations in a portion of the bitmap

16GB disk with 512-byte blocks --> 4MB table

- Optimisations possible, e.g. a two level table

has desirable effect of concentrating access Simple to find contiguous free space

May be too large to hold in main memory

27 28

Free block list

- · List of all unallocated blocks
- · Background jobs can re-order list for better contiguity
- · Store in free blocks themselves
 - Does not reduce disk capacity
- Only one block of pointers need be kept in the main memory

Bit tables

Expensive to search

26

29 🎩 UNSV

29

Implementing directories

- · Directories are stored like normal files
 - directory entries are contained inside data blocks
- The FS assigns special meaning to the content of these files
 - a directory file is a list of directory entries
 - a directory entry contains file name, attributes, and the file i-node number
 - maps human-oriented file name to a system-oriented name.

31 JUNSW

31

33

Fixed-size vs variable-size directory entries

- · Fixed-size directory entries
 - Either too small
 - Example: DOS 8+3 characters
 - Or waste too much space
 - Example: 255 characters per file name
 - Variable-size directory entries
 - Freeing variable length entries can create external fragmentation in directory blocks
 - · Can compact when block is in RAM

32 JUNSW

32

Searching Directory Listings

- Locating a file in a directory
 - Linear scan
 - Implement a directory cache in software to speed-up search
 - Hash lookup
 - B-tree (100's of thousands entries)

34

Trade-off in FS block size

- File systems deal with 2 types of blocks
 - Disk blocks or sectors (usually 512 bytes)
 - File system blocks 512 * 2^N bytes
 - What is the optimal N?
- Larger blocks require less FS metadata
- Smaller blocks waste less disk space (less internal fragmentation)
- Sequential Access
- The larger the block size, the fewer I/O operations required
- Random Access
- The larger the block size, the more unrelated data loaded.
- Spatial locality of access improves the situation
- Choosing an appropriate block size is a compromise
