System Modelling and Design
COMP2111

Johannes Åman Pohjola
We’ll learn to
model systems in a way that’s unambiguous and mathematically precise.

We’ll be able to
say what it means for a system to satisfy its specification,
and prove that it does so.

We’ll need
a substantial toolbox of discrete math and formal logic.

Don’t worry; we’ll teach it, not assume it.

3.9. Event Processing

The processing depicted in this section is an example of one possible implementation. Other implementations may have slightly different processing sequences, but they should differ from those in this section only in detail, not in substance.

The activity of the TCP can be characterized as responding to events. The events that occur can be cast into three categories: user calls, arriving segments, and timeouts. This section describes the processing the TCP does in response to each of the events. In many cases the processing required depends on the state of the connection.

Events that occur:

User Calls

OPEN
SEND
RECEIVE
CLOSE
ABORT
STATUS

Arriving Segments

SEGMENT ARRIVES

Timeouts

USER TIMEOUT
RETRANSMISSION TIMEOUT
TIME-WAIT TIMEOUT

The model of the TCP/User interface is that user commands receive an immediate return and possibly a delayed response via an event or pseudo interrupt. In the following descriptions, the term "signal" means cause a delayed response.

Error responses are given as character strings. For example, user commands referencing connections that do not exist receive "error: connection not open".

Please note in the following that all arithmetic on sequence numbers, acknowledgment numbers, windows, etcetera, is modulo $2^{32}$ the size of the sequence number space. Also note that "<" means less than or equal to (modulo $2^{32}$).
Non-examples

This RFC is a specification in English.

Natural language specs tend to have:

- Ambiguities
- Room for interpretation
- Important details in the writer’s head absent from actual text.

- Room for interpretation
- Important details in the writer’s head absent from actual text.

You’ve experienced this yourself now, in Assignment 2.
Non-examples

DrawPolygons
- polygonsArray(Polygon)
+ paint(g:Graphics):void
+ main(args:String[]):void

Polygon
#center:Point
- Polygon(p:Point)
+ Polygon(x:int, y: int)
+ paint(g:Graphics):void

Point

Rectangle
+ Rectangle(x:int, y: int)

Square
+ Square(x:int, y: int)

Circle
+ Circle(x:int, y: int)
Non-examples

This UML diagram describes the structure of the system, not its behaviour.

Could we give it meaning using the tools from this course?
Non-examples

This UML diagram describes the structure of the system, not its behaviour.

..oh btw, OO developers regularly use other modelling tools from this course (though they may not know they do)
public static <T extends Object & Comparable<? super T>> T max(Collection<? extends T> coll)

Returns the maximum element of the given collection, according to the natural ordering of its elements. All elements in the collection must implement the Comparable interface. Furthermore, all elements in the collection must be mutually comparable (that is, e1.compareTo(e2) must not throw a ClassCastException for any elements e1 and e2 in the collection).

This method iterates over the entire collection, hence it requires time proportional to the size of the collection.

**Type Parameters:**
T - the class of the objects in the collection

**Parameters:**
coll - the collection whose maximum element is to be determined.

**Returns:**
the maximum element of the given collection, according to the natural ordering of its elements.

**Throws:**
ClassCastException - if the collection contains elements that are not mutually comparable (for example, strings and integers).

NoSuchElementException - if the collection is empty.

**See Also:**
Comparable
public static <T extends Object & Comparable<? super T>> T max(Collection<? extends T> coll)

Returns the maximum element of the given collection, according to the natural ordering of its elements. All elements in the collection must implement the Comparable interface. Furthermore, all elements in the collection must be mutually comparable (that is, e1.compareTo(e2) must not throw a ClassCastException for any elements e1 and e2 in the collection).

This method iterates over the entire collection, hence it requires time proportional to the size of the collection.

Type Parameters:
T - the class of the objects in the collection.

Parameters:
coll - the collection whose maximum element is to be determined.

Returns:
the maximum element of the given collection, according to the natural ordering of its elements.

Throws:
ClassCastException - if the collection contains elements that are not mutually comparable (for example, strings and integers).

NoSuchElementException - if the collection is empty.

Comparable
From Java’s library documentation

```java
public static <T extends Object & Comparable<? super T>> T max(Collection<? extends T> coll)
```

Returns the maximum element of the given collection, according to the natural ordering of its elements. All elements in the collection must implement the Comparable interface. Furthermore, all elements in the collection must be mutually comparable (that is, e1.compareTo(e2) must not throw a ClassCastException for any elements e1 and e2 in the collection).

This method iterates over the entire collection, hence it requires time proportional to the size of the collection.

**Type Parameters:**
- T - the class of the objects in the collection

**Parameters:**
- coll - the collection

**Returns:**
the maximum element in the collection, according to the natural ordering of its elements.

**Throws:**
ClassCastException - if the collection contains elements that are not mutually comparable (for example, strings and integers).

NoSuchElementException - if the collection is empty.

**See Also:**
Comparable
In OO design this is called *design by contract*, not Hoare triples, but it’s the same thing.

You know how to *prove* this function is correct: Hoare logic.

Formal methods have found bugs in Java’s standard library before.

Maybe you’ll find the next bug? :)

coll - the collection whose maximum element is to be determined.

**Returns:**
the maximum element of the given collection, according to the *natural ordering* of its elements.

**Throws:**
ClassCastException - if the collection contains elements that are not *mutually comparable* (for example, strings and integers).

NoSuchElementException - if the collection is empty.

Comparable
Practice exam

Exam coming up soon: May 3rd 8AM - May 4th 8AM

The 2021 exam is available for practice on the course website.

It’s mostly representative of what you should expect. Any topic covered in the lectures and tutes may come up.
