COMP3221 lec03-C-language-II .1

Saeid Nooshabadi

#### Review: What is Subject about?

- ° Coordination of many *levels of abstraction*

COMP3221 lec03-C-language-II .3

Saeid Nooshabadi

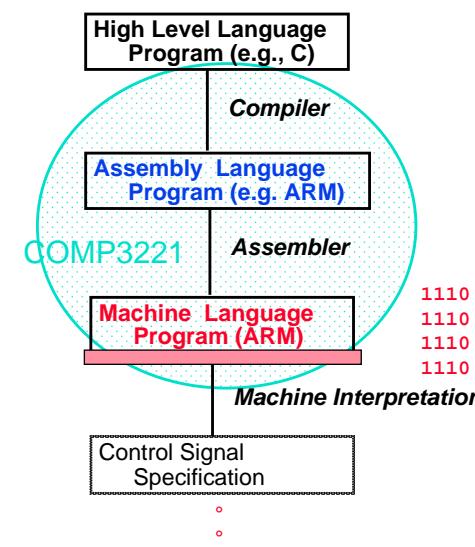

## Overview

- ° Common Pointer Mistakes
- ° Operators
- ° World's Last C Bug
- ° Examples

COMP3221 lec03-C-language-II .2

Saeid Nooshabadi

#### Review: Programming Levels of Representation

temp = v[k];  
v[k] = v[k+1];  
v[k+1] = temp;

COMP3221 lec03-C-language-II .4

Saeid Nooshabadi

## Review: Address v. Value (#1/2)

---

- Consider memory to be a single huge array:
  - Each cell of the array has an address associated with it.
  - Each cell also stores some value.
- Don't confuse the address referring to a memory location with the value stored in that location.

COMP3221 lec03-C-language-II .5

Saeid Nooshabadi

## Review: Pointers in C (#1/6)

---

- An address refers to a particular memory location. In other words, it *points* to a memory location.
- **Pointer:** High Level Language (in this case C) way of representing a memory address.
- More specifically, a C variable can contain a pointer to something else. It actually stores the memory address that something else is stored at.

COMP3221 lec03-C-language-II .6

Saeid Nooshabadi

## Review: Pointer Arithmetic (4/4)

---

- So what's valid pointer arithmetic?
  - Add an integer to a pointer.
  - Subtract 2 pointers (in the same array).
  - Compare pointers (<, >, etc.).
  - Compare pointer to NULL (indicates that the pointer points to nothing).
- Everything else is illegal since it makes no sense:
  - adding two pointers, multiplying pointers, etc.

COMP3221 lec03-C-language-II .7

Saeid Nooshabadi

## Review: Arrays

---

- Declaration:

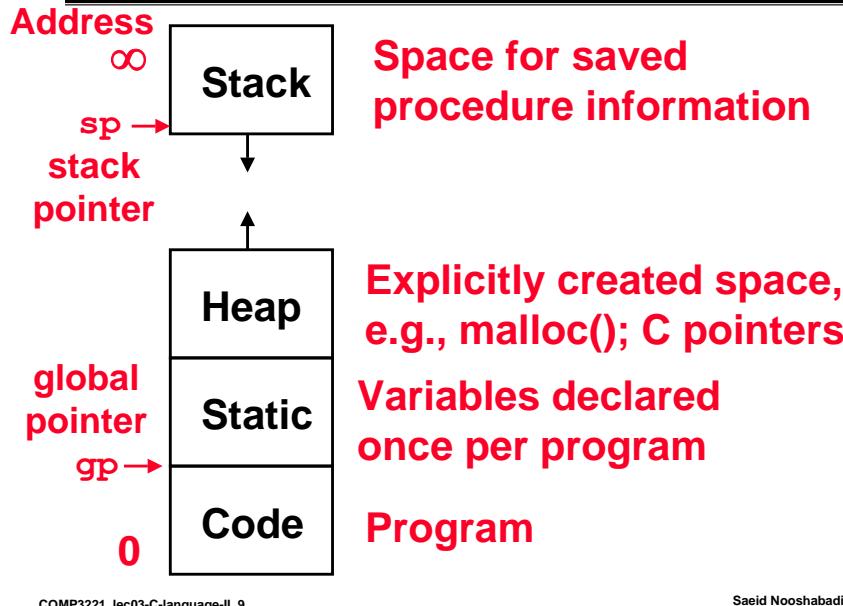

```
int ar[12];
```

declares a 12-element integer array.
- Accessing elements:
  - `ar[num]` ; returns the numth element.
  - `ar` is a pointer
  - `ar[0]` is the same as `*ar`
  - `ar[2]` is the same as `* (ar+2)`

COMP3221 lec03-C-language-II .8

Saeid Nooshabadi

## Review: C memory allocation

COMP3221 lec03-C-language-II .9

Saeid Nooshabadi

## Review: Arguments to Functions

### ° Arguments can be:

- **passed by value:** Make a copy of the original argument (doesn't really affect types such as integers).
- **passed by reference:** Pass a pointer, so the called function makes modifications to the original struct.

### ° Passing by reference can be dangerous, so be careful.

COMP3221 lec03-C-language-II .10

Saeid Nooshabadi

## Review: Common Pointer Mistakes (#1/2)

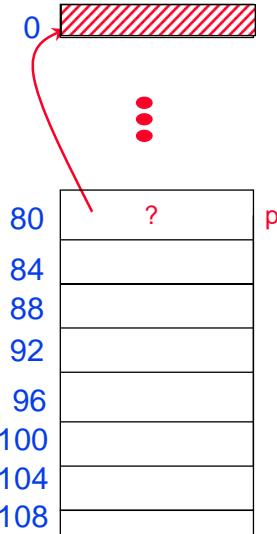

### ° Declare and write:

```
int *p;  
*p = 10; /* WRONG */
```

### ° What address is in p?

- Answer: NULL; C defines that memory address 0 (same as NULL) is not valid to write to.

### ° Remember to `malloc` first.

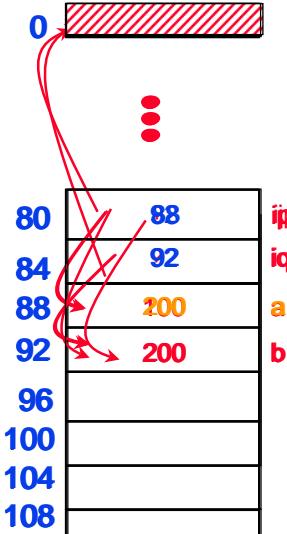

COMP3221 lec03-C-language-II .11

Saeid Nooshabadi

## Review: Common Pointer Mistakes (#2/2)

### ° Copy pointers v. values:

```
int *ip, *iq, a = 100, b = 200;  
ip = &a; iq = &b;  
*ip = *iq; /* what changed? */  
ip = iq; /* what changed? */
```

COMP3221 lec03-C-language-II .12

Saeid Nooshabadi

## World's Last C Bug

- ° If you remember nothing else, remember this:

```
while (1) {  
    status = GetRadarInfo();  
    if (status = 1) {  
        LaunchMissiles();  
    }  
}
```

= is used instead of ==

COMP3221 lec03-C-language-II .13

Saeid Nooshabadi

## World's Last C Bug Improved!

```
launches = 0;  
while (1) {  
    status = GetRadarInfo();  
    if (status == 1){  
        LaunchMissiles();  
        launches++;  
    }  
    if (launches > 1){  
        apologize();  
    }  
}
```

Steve Litt: [www.troubleshooters.com](http://www.troubleshooters.com)

Saeid Nooshabadi

## Example #1:

- ° How many bugs in this code?

```
#include <stdio.h>  
int main () {  
    int numAs; /* counts A's in the input */  
    char c;  
    while (c = getchar ( ) != EOF) {  
    /* getchar returns EOF if no more chars to read. */  
        if (c == 'A') {  
            numAs++;  
        }  
    }  
    printf ("%d A's in the input\n", numAs);  
    return 0;  
}
```

Choices:  
1 or none,  
2,  
3,  
4,  
5 or more

COMP3221 lec03-C-language-II .15

Saeid Nooshabadi

## Example #1 (Solution):

- ° How many bugs in this code?

```
#include <stdio.h>  
int main () {  
    int numAs; /* counts A's in the input */  
    char c;  
    numAs = 0;  
    while ((c = getchar ( )) != EOF) {  
    /* getchar returns EOF if no more chars to read. */  
        if (c == 'A') {  
            numAs++;  
        }  
    }  
    printf ("%d A's in the input\n", numAs);  
    return 0;  
}
```

3 Bugs

Saeid Nooshabadi

## Bug Symptoms

- ° A value that's wildly out of range suggests an uninitialized variable or function return value.
- ° A loop that's executed 0 times or the maximum number of times when it shouldn't be suggests misuse of = in a test, or misparenthesization.

COMP3221 lec03-C-language-II .17

Saeid Nooshabadi

## Example #2 (Solution)

- ° What output is produced by this code?

```
void addOne (int x) {  
    x = x + 1;  
}  
  
int main ( ) {  
    int y = 3;  
    addOne (y);  
    printf ("%d, y);  
    return 0;  
}
```

3 is Produced  
passed by value:  
Make a copy of the  
original argument.  
The original won't  
change

COMP3221 lec03-C-language-II .19

Saeid Nooshabadi

## Example #2

- ° What output is produced by this code?

```
void addOne (int x) {  
    x = x + 1;  
}  
  
int main ( ) {  
    int y = 3;  
    addOne (y);  
    printf ("%d, y);  
    return 0;  
}
```

COMP3221 lec03-C-language-II .18

Choices:  
3,  
4,  
unknown,

Saeid Nooshabadi

## Example #3

- ° What choice for the blank ensures that  $7 = 7$  is printed?

```
#include <stdio.h>  
int *f (int varNotToSet, int varToSet) {  
    int n = 7;  
    varToSet = 7;  
    return _____;  
    /* &n, &varNotToSet, or &varToSet could go here */  
}  
  
int main ( ) {  
    int *ptr;  
    int k1 = 7, k2 = 0;  
    ptr = f(k1, k2);  
    printf ("7 = ");  
    printf ("%d\n", *ptr);  
    return 0;  
}
```

Choices:  
&n, &varNotToSet, &varToSet  
1  
2,  
3,  
none

Saeid Nooshabadi

## Example #3 (Solution)

Answer: none

- Variables and function parameters are allocated on the system stack
- When a function exits, its allocated space disappears.

COMP3221 lec03-C-language-II .21

Saeid Nooshabadi

## Example #4

- What choice for the blank ensures that `values[0]=x`

```
int main ( ) {
    int values[20];
    int x;
    ...
    assign ( _____ , x);
    ...
}
```

Answer:

```
void assign ( int *y , int x) {
    *y = x;
}
```

1. `values`

2. `&values[0]`

COMP3221 lec03-C-language-II .22

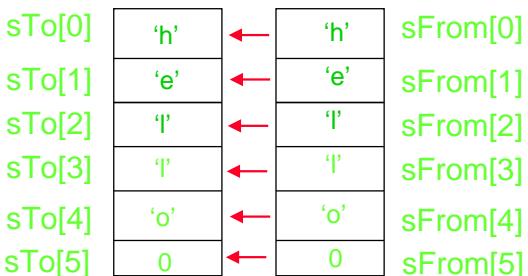

Saeid Nooshabadi

## Example #5

- How to copy one array to another array

```
int main ( ) {
    char sFrom[6] , sTo[6];
    copy (sTo[6] , sFrom[6]);
}

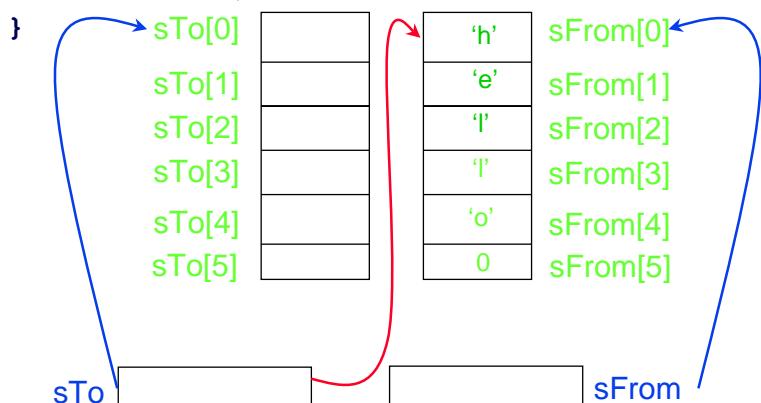

void copy (char sTo[], char sFrom[]) {
    ----
    ----
}
```

Saeid Nooshabadi

## Example #5 (Soultion #1/4)

```
void copy (char sTo[], char sFrom[]) {
    sTo = sFrom;
```

Similarly you don't compare two string using ==

COMP3221 lec03-C-language-II .23

COMP3221 lec03-C-language-II .24

Saeid Nooshabadi

## Example #5 (Soultion #2/4)

°Straight Forward Array Version

```
void copy (char sTo[], char sFrom[]) {  
    int k = 0;  
    while (sFrom[k] != '\0') {  
        sTo[k] = sFrom[k];  
        k++;  
    }  
    sTo[k] = sFrom[k]; /* copy terminating 0 */  
}
```

sTo[0]	'h'	←	sFrom[0]	'h'
sTo[1]	'e'	←	sFrom[1]	'e'
sTo[2]	'l'	←	sFrom[2]	'l'
sTo[3]	'l'	←	sFrom[3]	'l'
sTo[4]	'o'	←	sFrom[4]	'o'
sTo[5]	0	←	sFrom[5]	0

Saeid Nooshabadi

COMP3221 lec03-C-language-II .25

## Example #5 (Soultion #3/4)

°Array Version (Taking advantage of value returned by assignment operator)

```
void copy (char sTo[], char sFrom[]) {  
    int k = 0;  
    while ((sTo[k] = sFrom[k]) != '\0') {  
        k++;  
    }  
}
```

sTo[0]	'h'	←	sFrom[0]	'h'
sTo[1]	'e'	←	sFrom[1]	'e'
sTo[2]	'l'	←	sFrom[2]	'l'
sTo[3]	'l'	←	sFrom[3]	'l'
sTo[4]	'o'	←	sFrom[4]	'o'
sTo[5]	0	←	sFrom[5]	0

Saeid Nooshabadi

COMP3221 lec03-C-language-II .26

## Example #5 (Soultion #3/4)

°Pointer Version

```
void copy (char sTo[], char sFrom[]) {  
    while ((*sTo = *sFrom) != '\0') {  
        /* pointer arithmetic (K&R 5.4) */  
        sFrom++;  
        sTo++;  
    }  
}
```

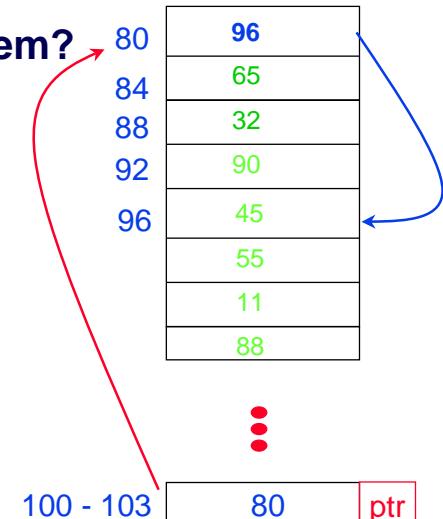

sTo			sFrom	
sTo[0]	'h'	←	sFrom[0]	'h'
sTo[1]	'e'	←	sFrom[1]	'e'
sTo[2]	'l'	←	sFrom[2]	'l'
sTo[3]	'l'	←	sFrom[3]	'l'
sTo[4]	'o'	←	sFrom[4]	'o'
sTo[5]	0	←	sFrom[5]	0

Saeid Nooshabadi

COMP3221 lec03-C-language-II .27

## Pointers to pointers (\*\*ptr)

°Where do we use them?

COMP3221 lec03-C-language-II .28

Saeid Nooshabadi

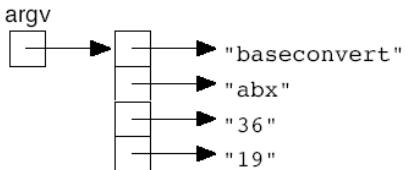

## Recall: C Syntax; Arguments to main

- To get the main function to accept arguments, use this:

```
int main (int argc, char *argv[])
```

- What does this mean?

- `argc` will contain the number of strings on the command line (the executable counts as one, plus one for each argument).
- `argv` is a pointer to an array containing the rest of the arguments as strings

COMP3221 lec03-C-language-II .29

Saeid Nooshabadi

## Things to Remember

- Common Pointer problems

- Declare and write
- Copy pointers v. values

- Bug Symptom

- A value that's wildly out of range suggests an uninitialized variable or function return value.
- A loop that's executed 0 times or the maximum number of times when it shouldn't be suggests misuse of = in a test, or misparenthesization.

COMP3221 lec03-C-language-II .30
