Scheduler Activations

With some slides modified from Raymond Namyst, U. Bordeaux

User-level Threads

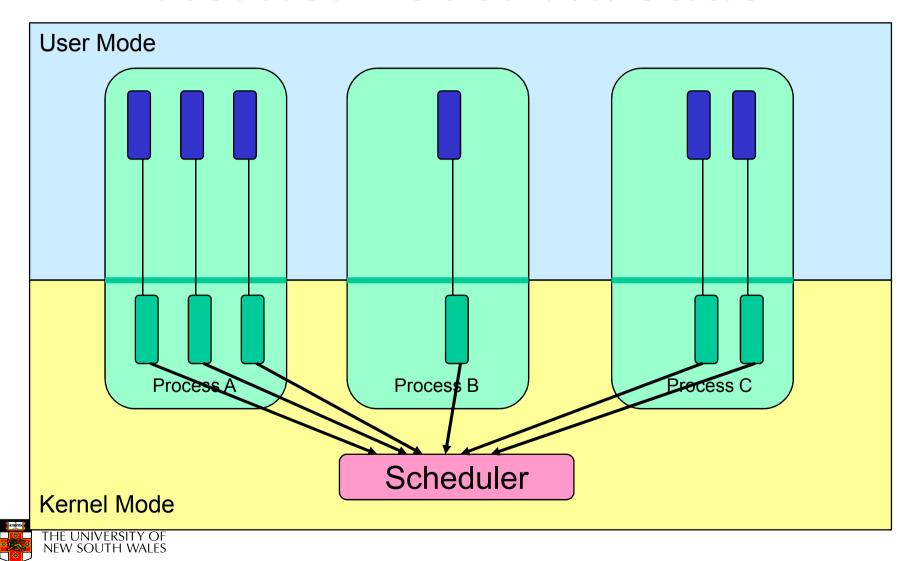

User-level Threads

- ✓ Fast thread management (creation, deletion, switching, synchronisation...)
- Blocking blocks all threads in a process
 - Syscalls
 - Page faults
- No thread-level parallelism on multiprocessor

Kernel-Level Threads

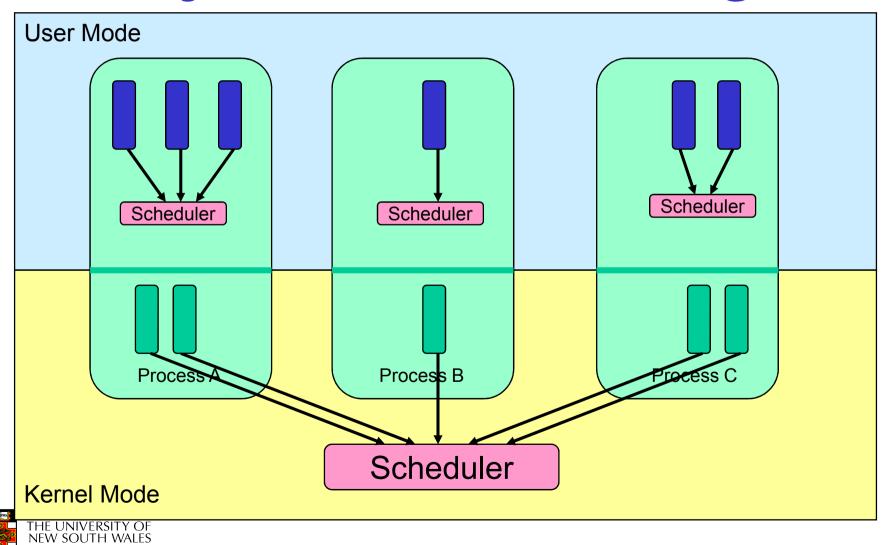

Kernel-level Threads

- Slow thread management (creation, deletion, switching, synchronisation...)
 - System calls
- Blocking blocks only the appropriate thread in a process
- Thread-level parallelism on multiprocessor

Hybrid Multithreading

Hybrid Multithreading

- Can get real thread parallelism on multiprocessor
- Blocking still a problem!!!

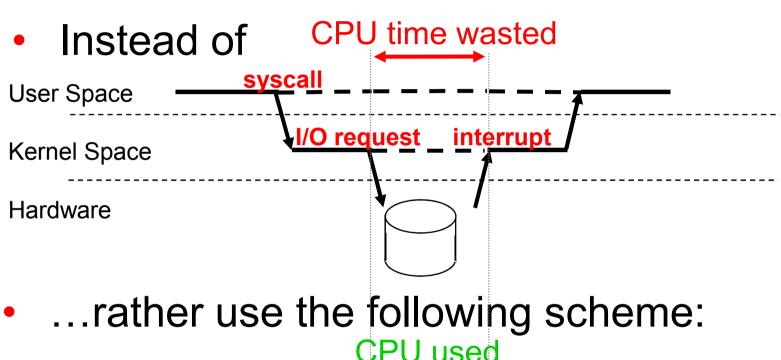

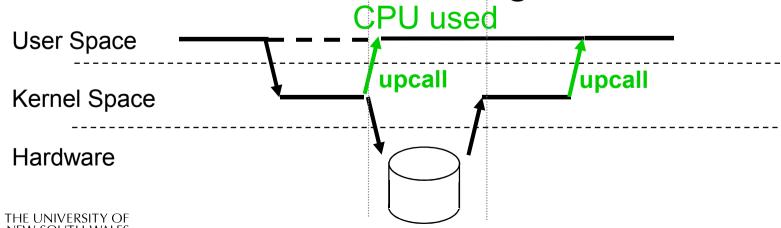

Scheduler Activations

- First proposed by [Anderson et al. 91]
- Idea: Both schedulers co-operate
 - User scheduler uses system calls
 - Kernel scheduler uses upcalls!
- Two important concepts
 - Upcalls
 - Notify the user-level of kernel scheduling events
 - Activations
 - A new structure to support upcalls and execution
 - approximately a kernel thread
 - As many running activations as (allocated) processors
 - Kernel controls activation creation and destruction

Scheduler Activations

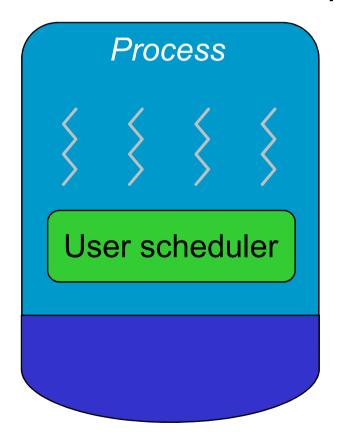

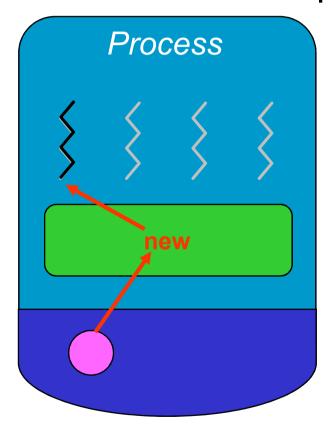

Upcalls to User-level scheduler

- New
 - Allocated a new virtual CPU
 - Can schedule a user-level thread
- Preempted
 - Deallocated a virtual CPU
 - Can schedule one less thread
- Blocked
 - Notifies thread has blocked
 - Can schedule another user-level thread
- Unblocked
 - Notifies a thread has become runnable
 - Must decided to continue current or unblocked thread

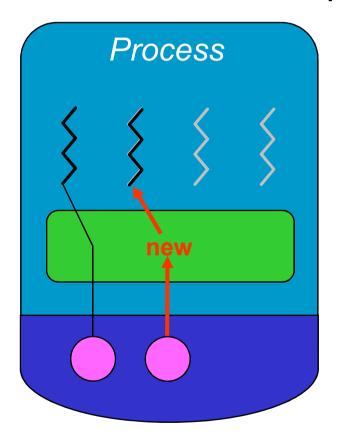

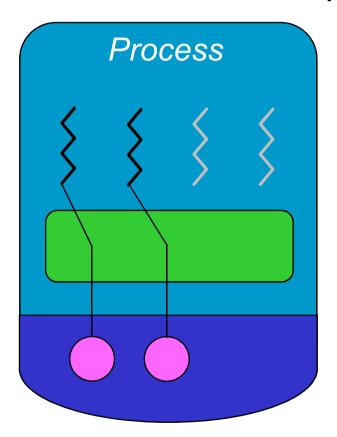

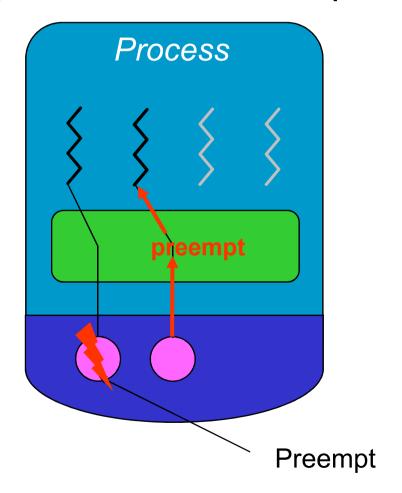

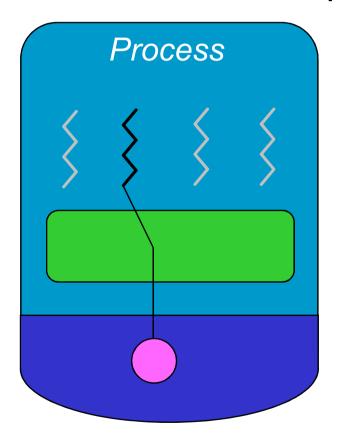

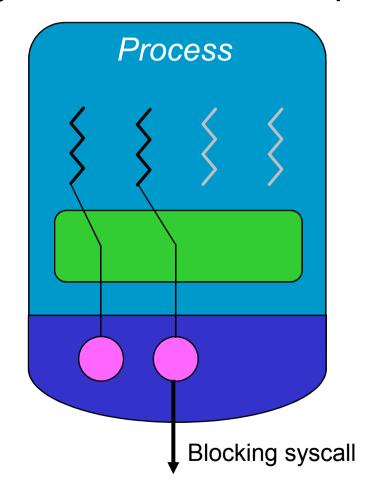

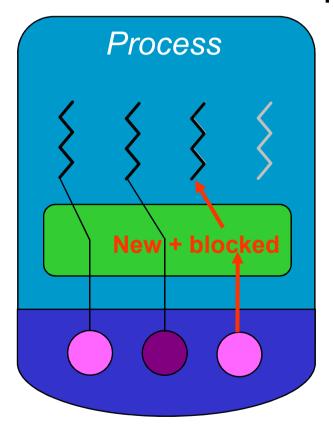

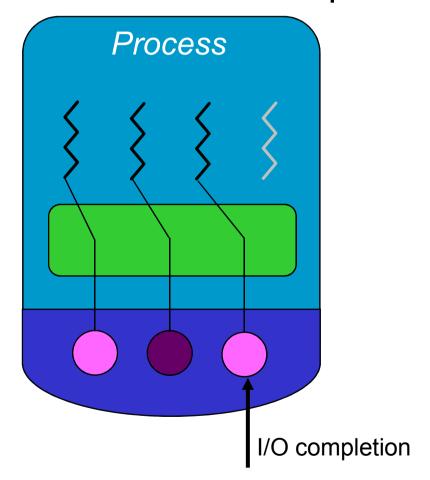

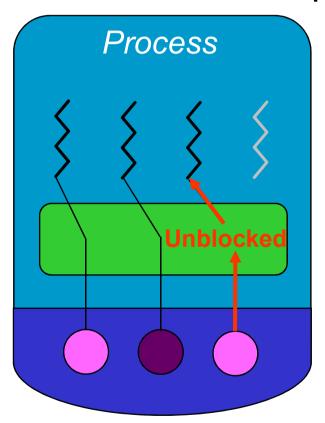

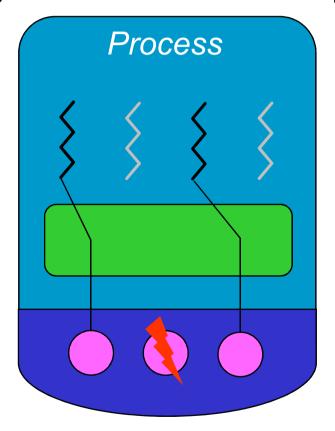

Scheduler Activations

- Thread management at user-level
 - Fast
- Real thread parallelism via activations
 - Number of activations (virtual CPU) can equal CPUs
- Blocking (syscall or page fault) creates new activation
 - User-level scheduler can pick new runnable thread.
- Fewer stacks in kernel
 - Blocked activations + number of virtual CPUs

Adoption

- Adopters
 - BSD "Kernel Scheduled Entities"
 - K42
 - Digital UNIX
 - Solaris
 - Mach
- Linux -> kernel threads
