THE UNIVERSITY OF NEW SOUTH WALES

Each CPU has its own OS

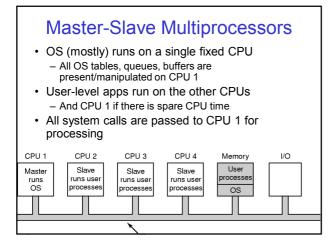

- · Statically allocate physical memory to
- Each CPU runs its own independent OS
- Share peripherals
- · Each CPU (OS) handles its processes

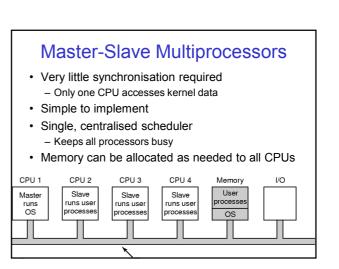

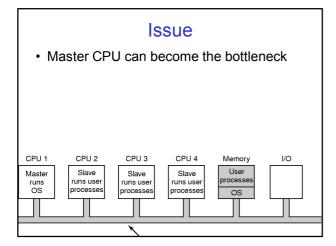

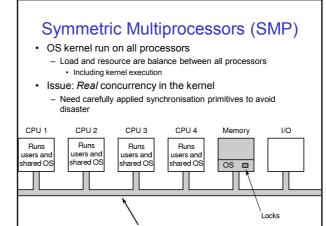

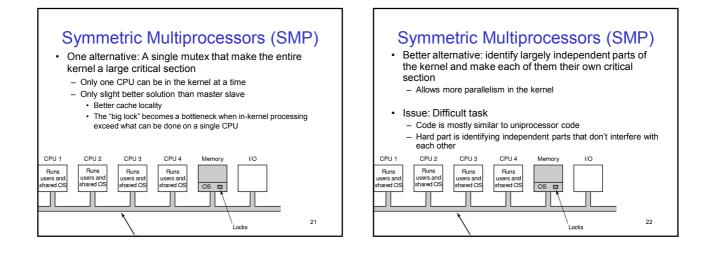

Issues

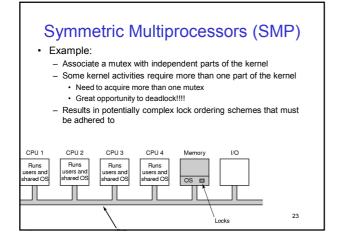

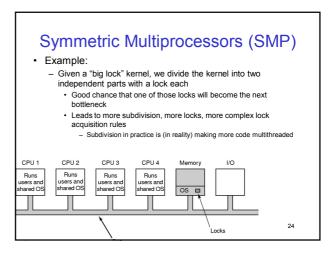

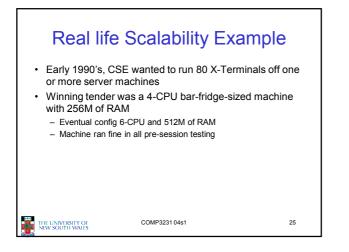

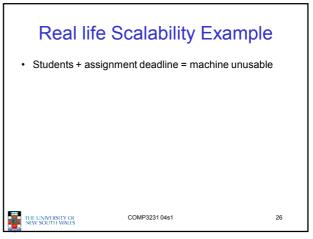

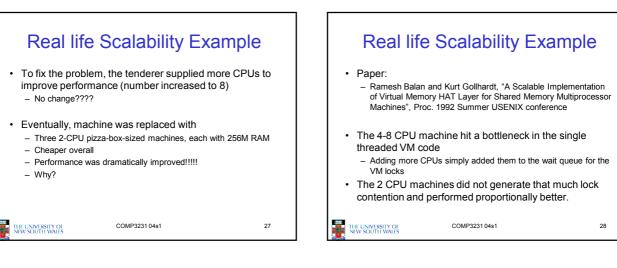

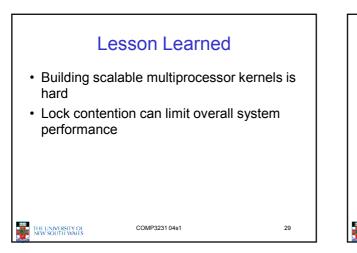

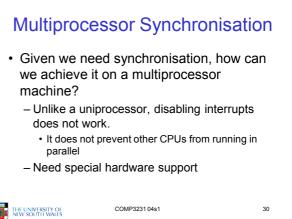

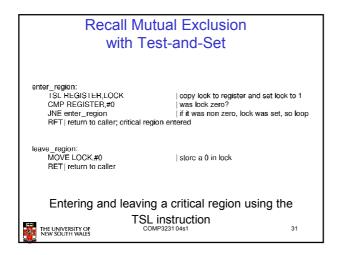

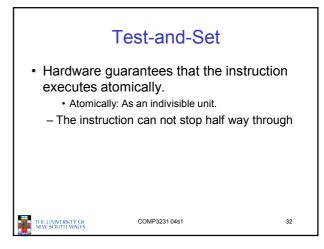

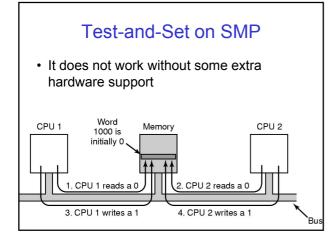

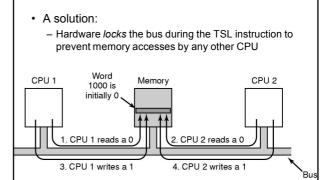

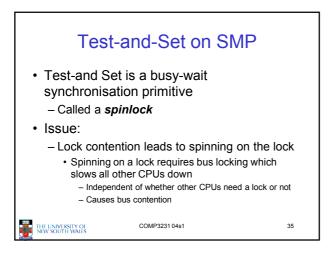

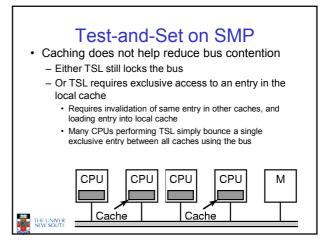

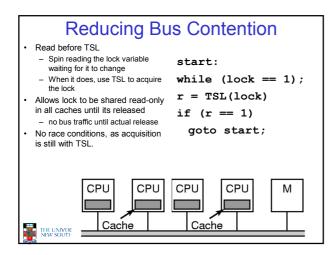

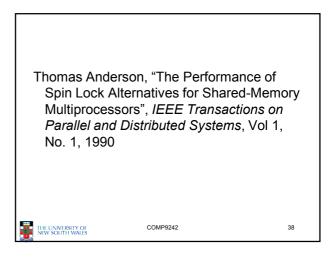

Test-and-Set on SMP

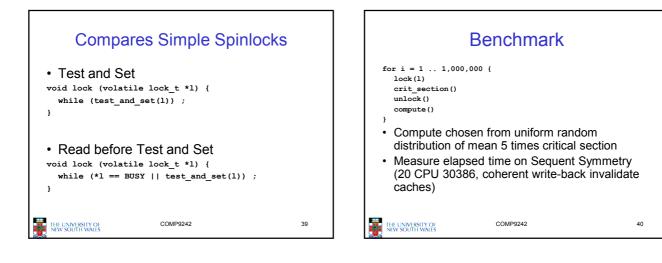

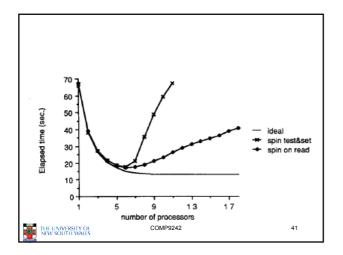

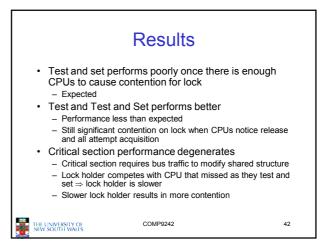

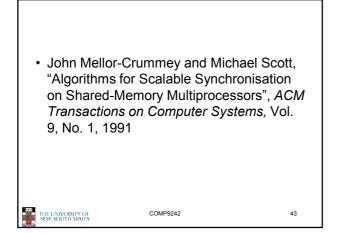

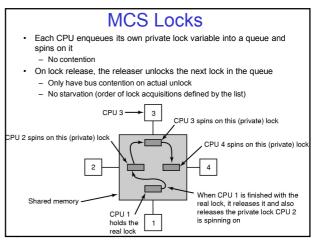

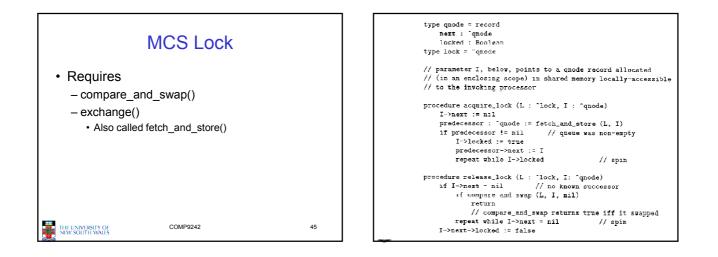

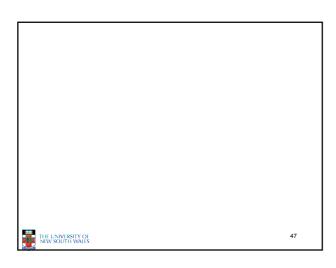

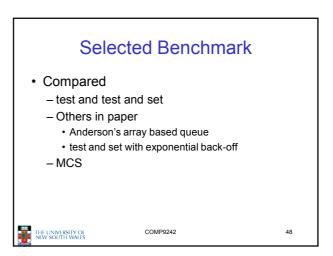

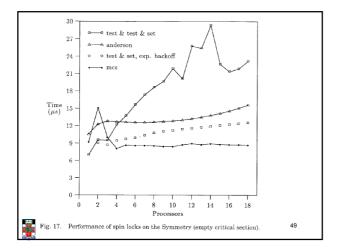

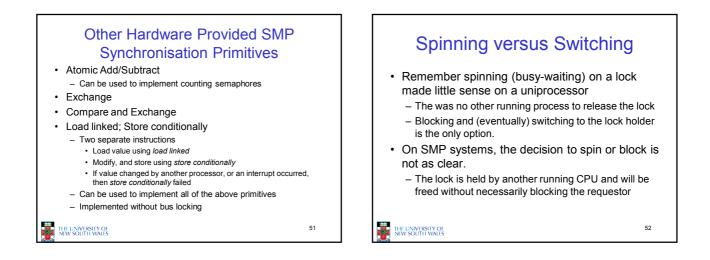

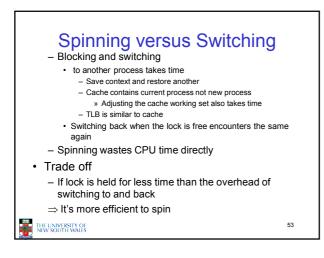

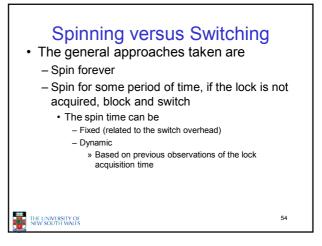

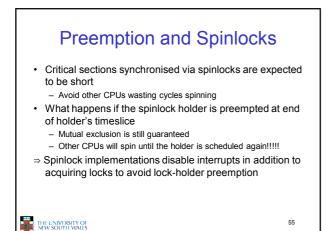

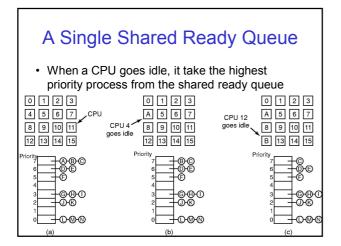

Multiprocessor Scheduling

- Given X processes (or threads) and Y CPUs,
 - how do we allocate them to the CPUs

Single Shared Ready Queue

56

58

- Pros
 _ Simple
 - Automotio

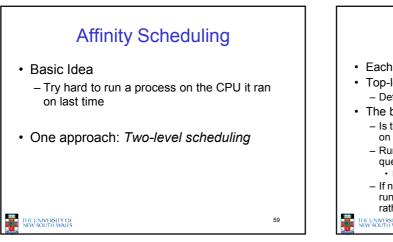

THE UNIVERSITY OF NEW SOUTH WALES

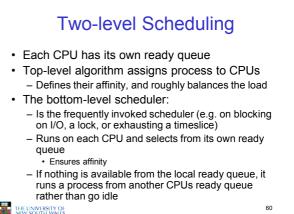

- Automatic load balancing

Cons

- Lock contention on the ready queue can be a major bottleneck
- Due to frequent scheduling or many CPUs or both Not all CPUs are equal
- The last CPU a process ran on is likely to have more related entries in the cache.

THE UNIVERSITY OF NEW SOUTH WALES

Two-level Scheduling

• Pros

 No lock contention on per-CPU ready queues in the (hopefully) common case

- Load balancing to avoid idle queues
- Automatic affinity to a single CPU for more cache friendly behaviour
