

Assignment 2

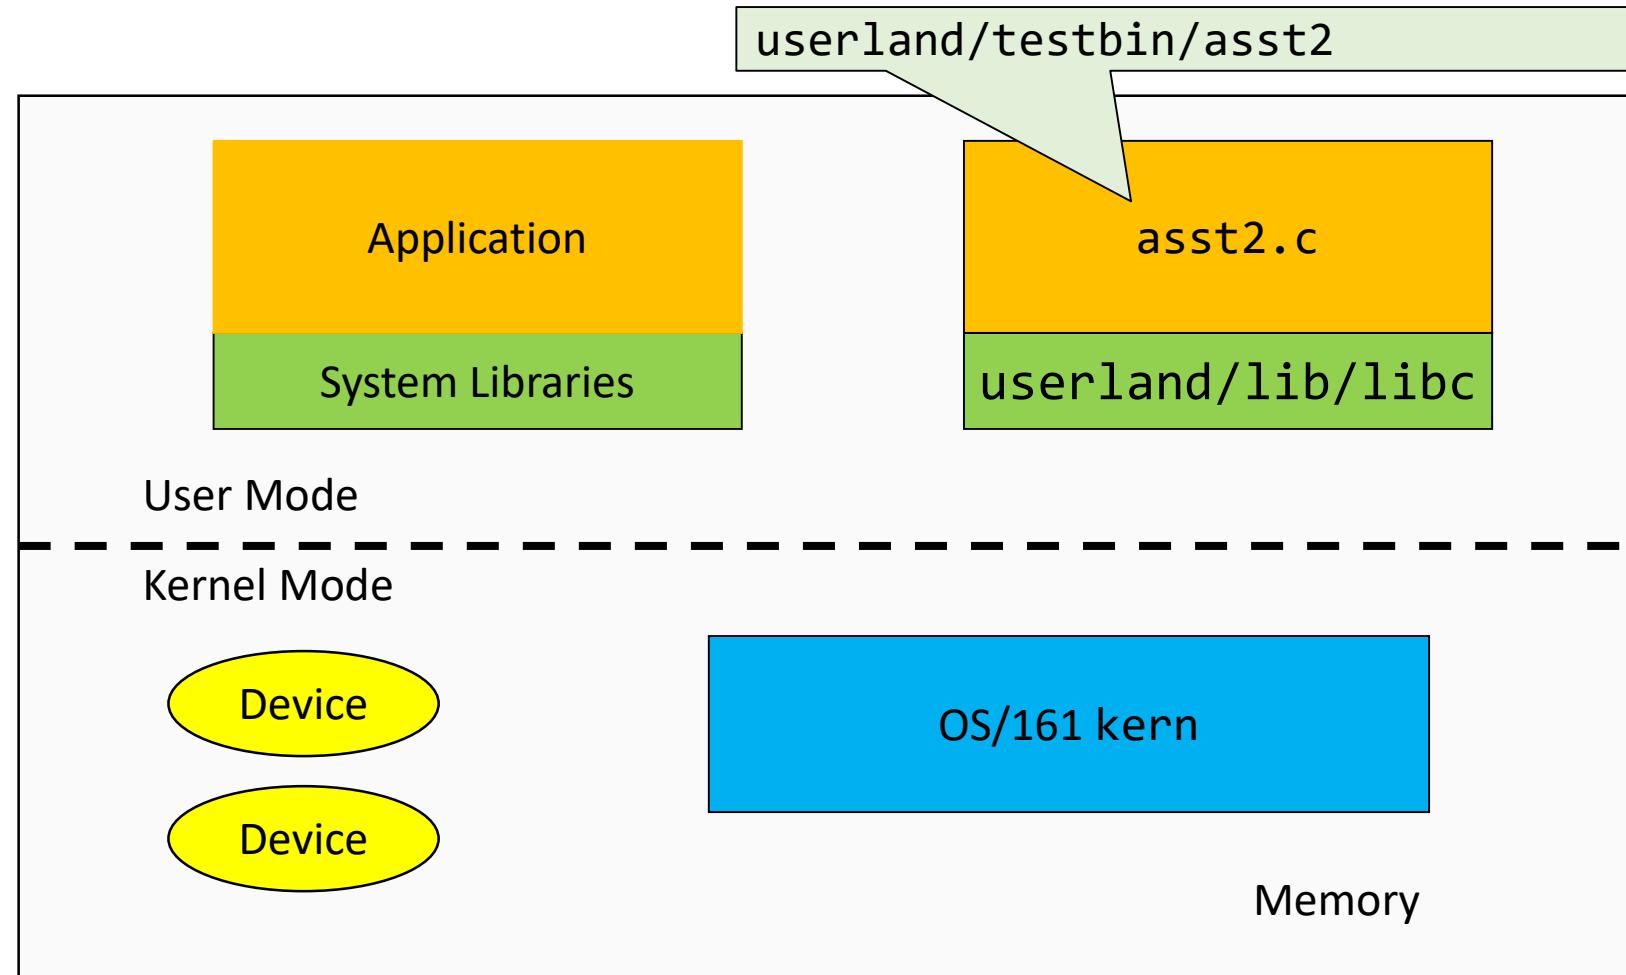

The Basic ASST2 Spec

- Implement open(), read(), write(), lseek(), close(), and dup2()
 - Assume you need to support fork()
 - Document the concurrency issues introduced by fork()
 - However, you should not synchronise the actual code
 - Can assume we will only test with a single process at a time.
 - Your data structures should not need significant changes to support fork()
 - Except for synchronisation
 - User-level exists
 - asst2
 - C libraries
 - An existing framework and code for:
 - system call dispatching,
 - VFS
 - Emufs
 - drivers

Overview

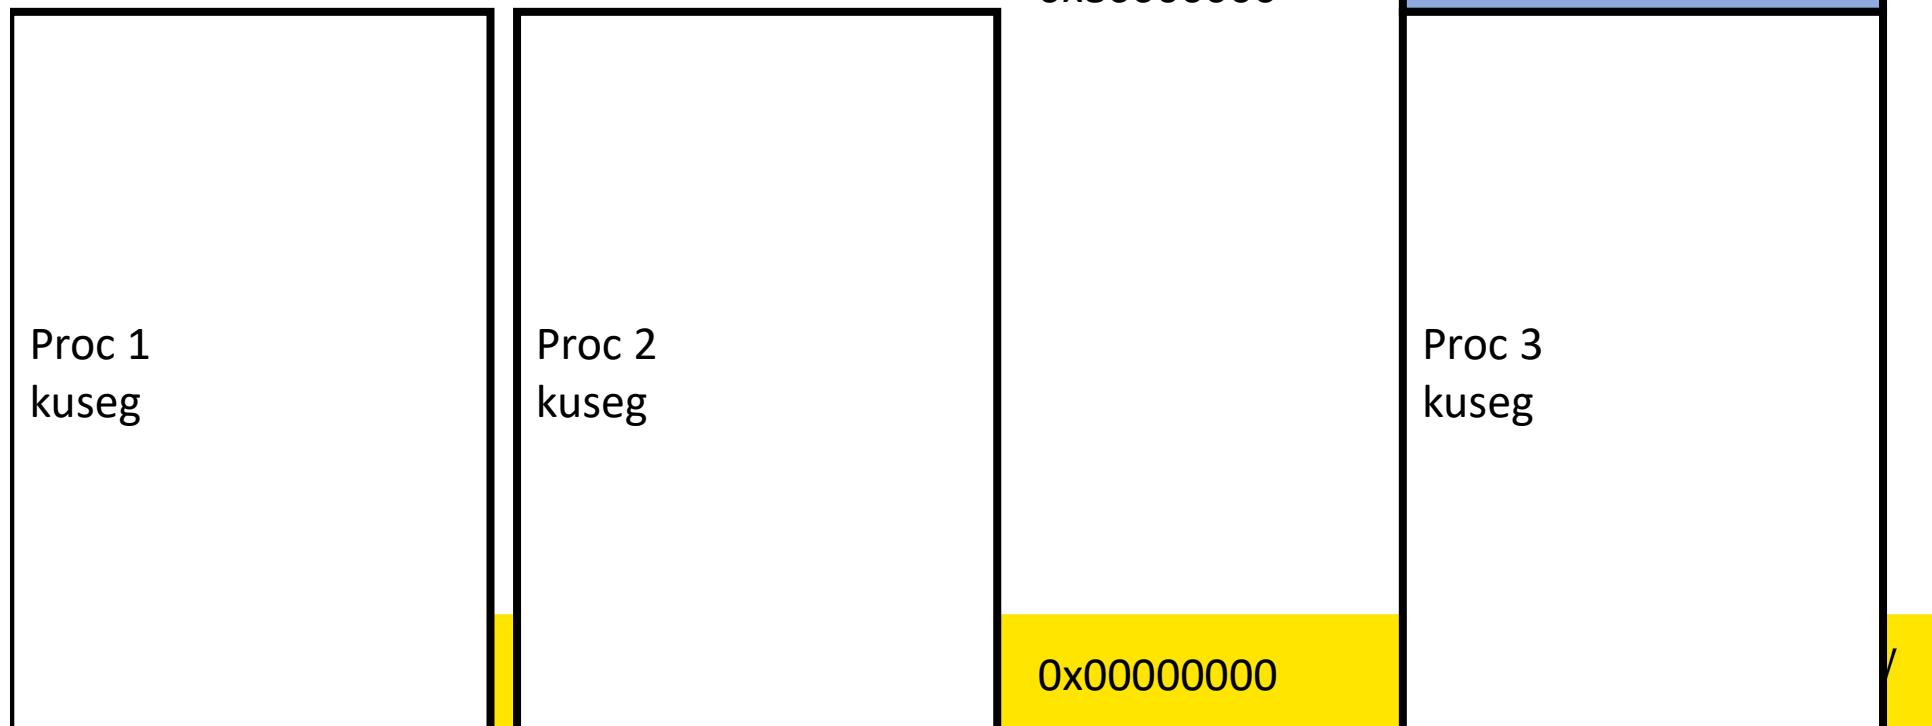

- Overall structure
 - User-level
 - Process structure
 - In-kernel
 - The storage stack
 - Overview of VFS and emufs functionality
- Details
 - Understanding the system interface
 - Argument passing
 - System call dispatching
 - Moving data across the user-kernel boundary
 - Connecting the interface to the VFS

Structure of a Computer System

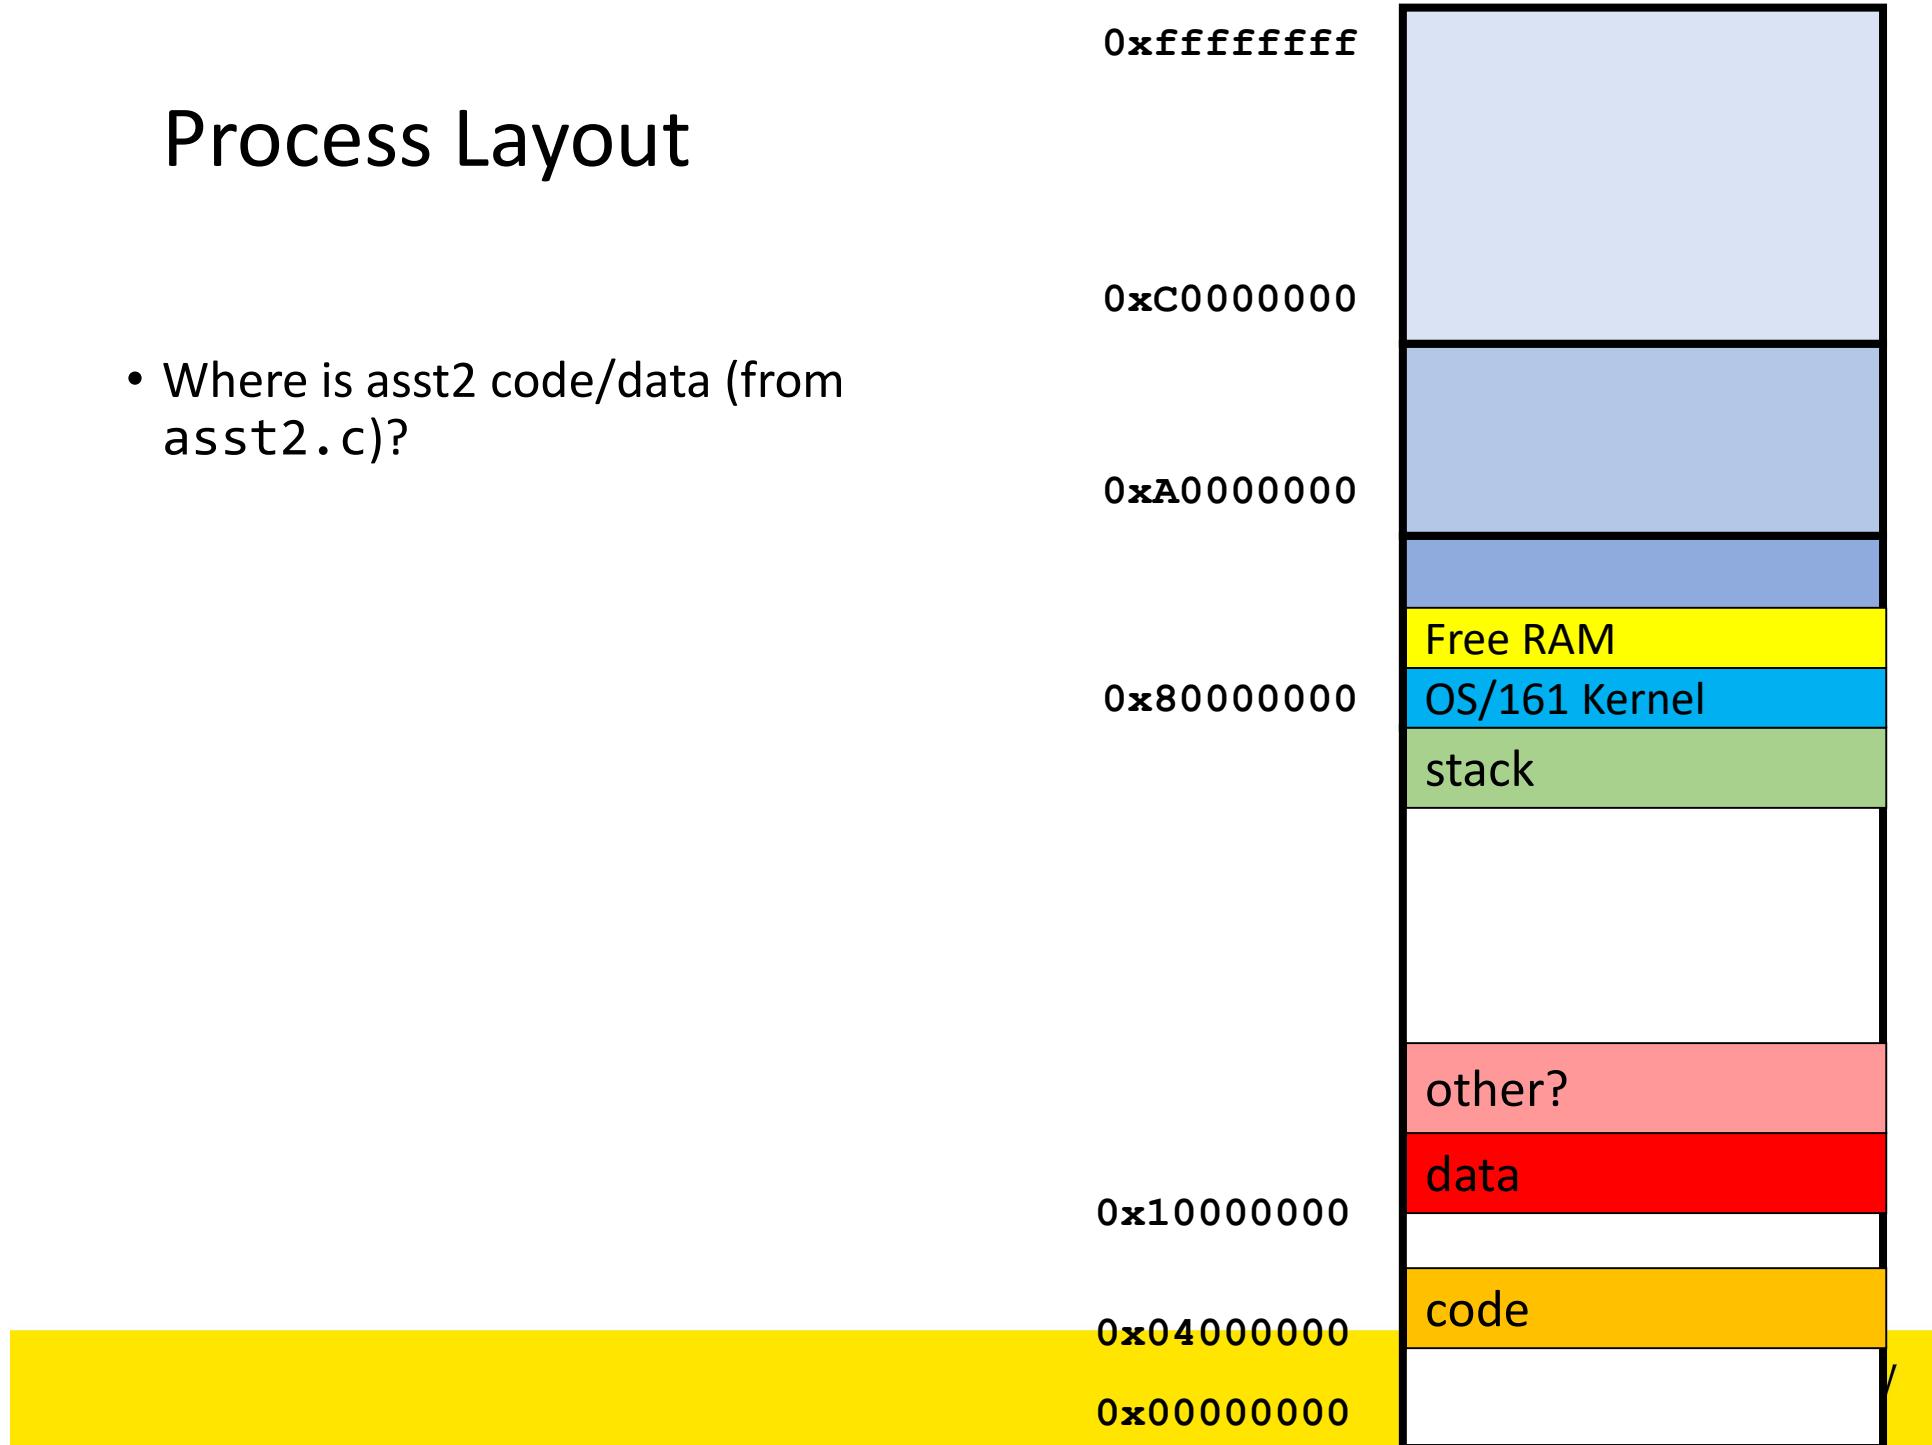

R3000 Address Space Layout

- ksegX not accessible in usermode
- Switching processes switches the application view of memory (translation stored in a page table) for kuseg

Process Layout

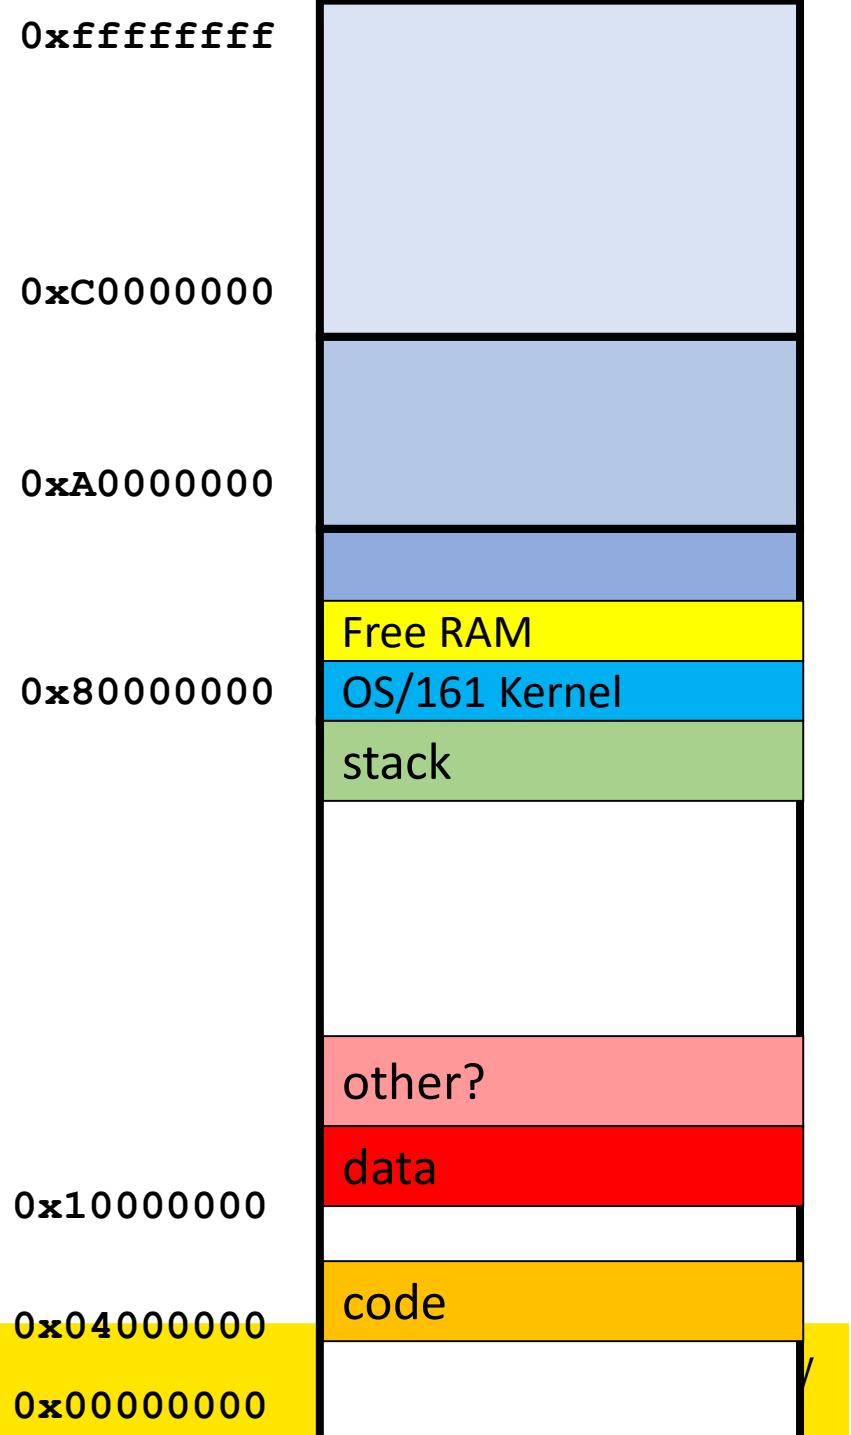

- Where is asst2 code/data (from `asst2.c`)?

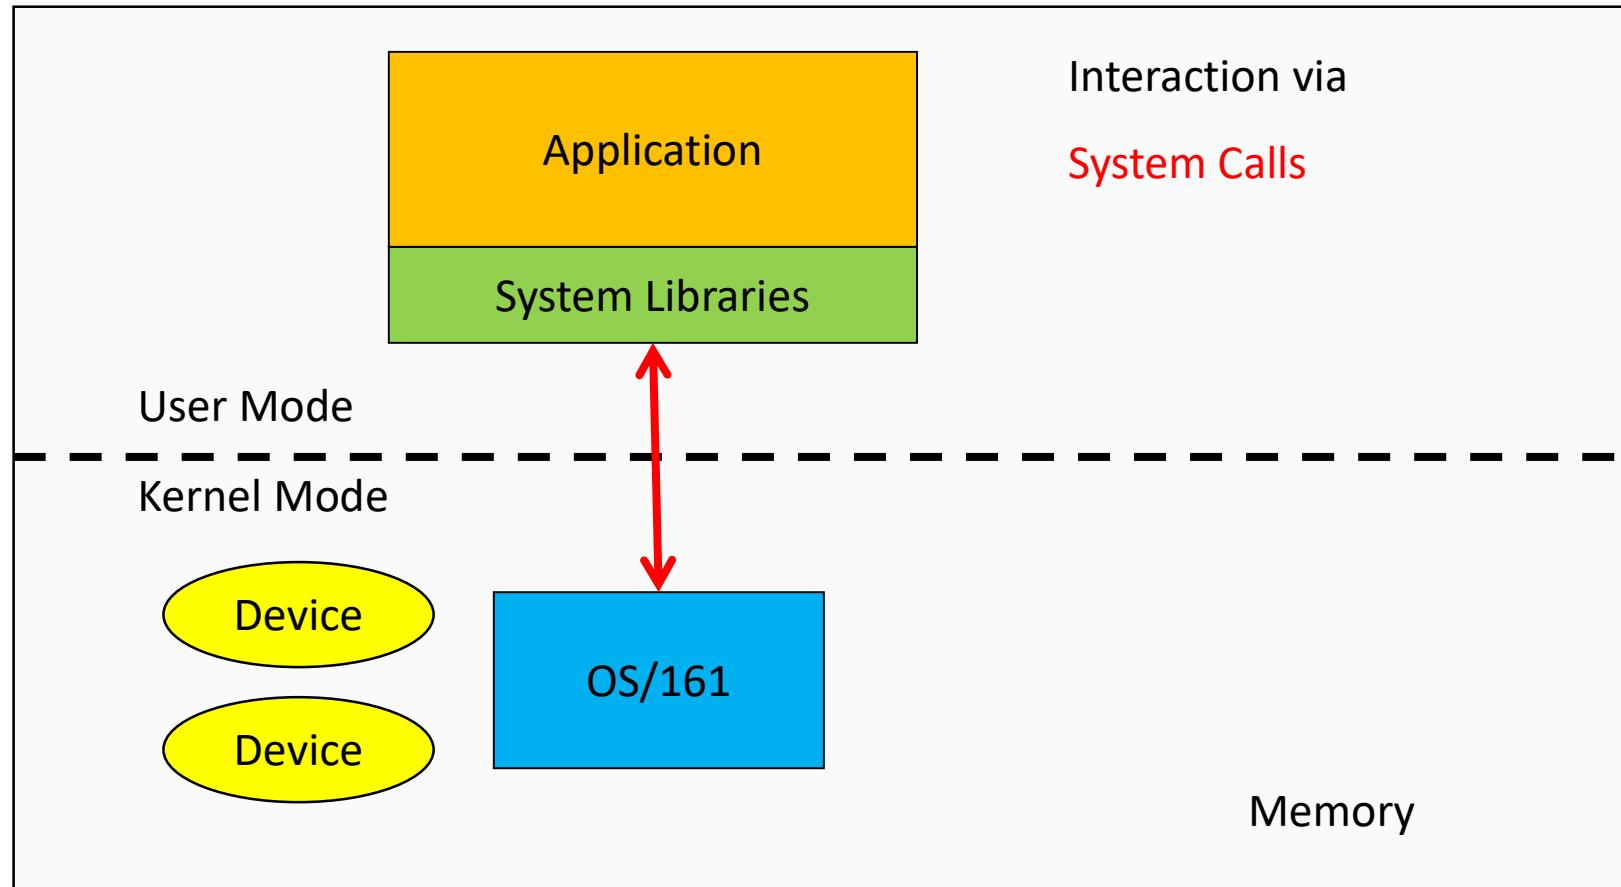

Calling open()

```
int open(const char *filename,  
        int flags, ...);
```

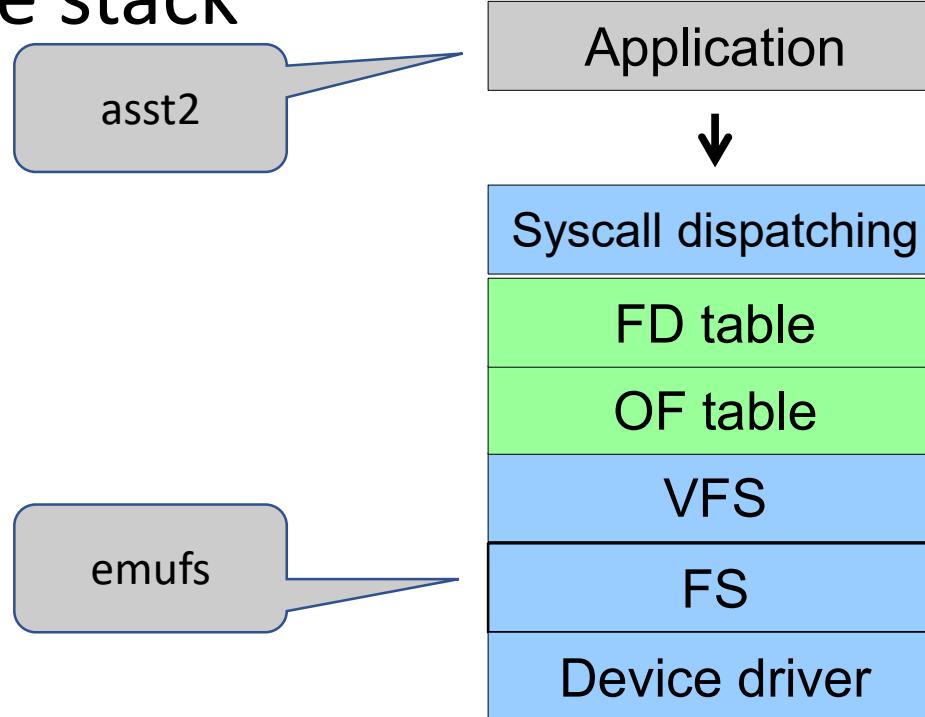

- Where is the function “open()”?

Structure of a Computer System

OS/161 storage stack

sys161

~/cs3231/root

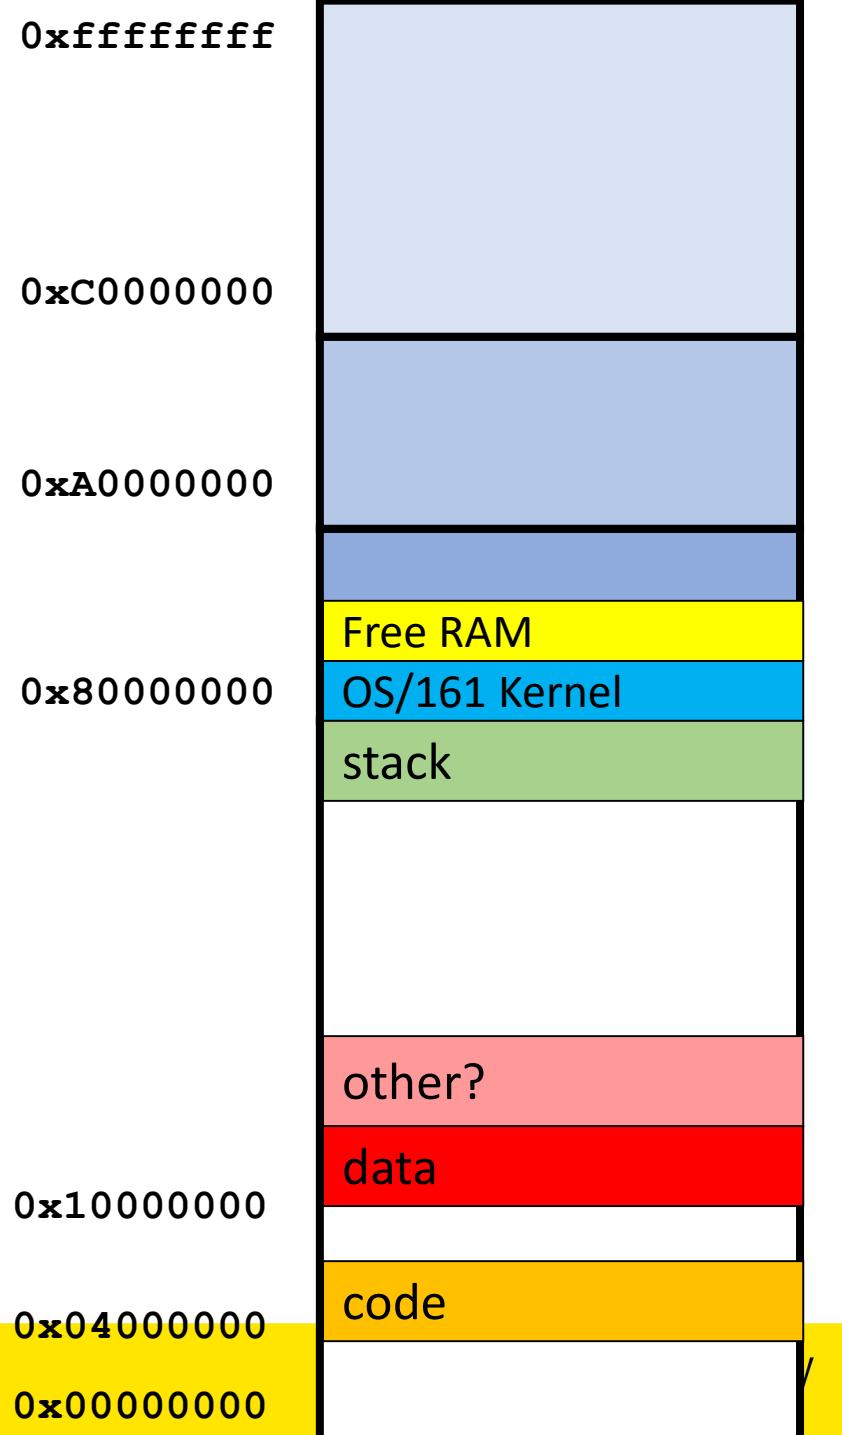

open()?

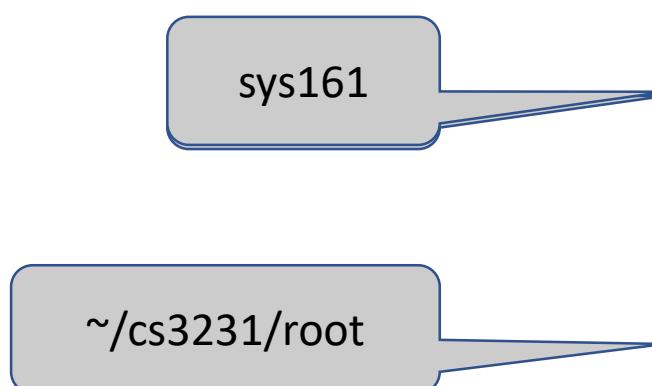

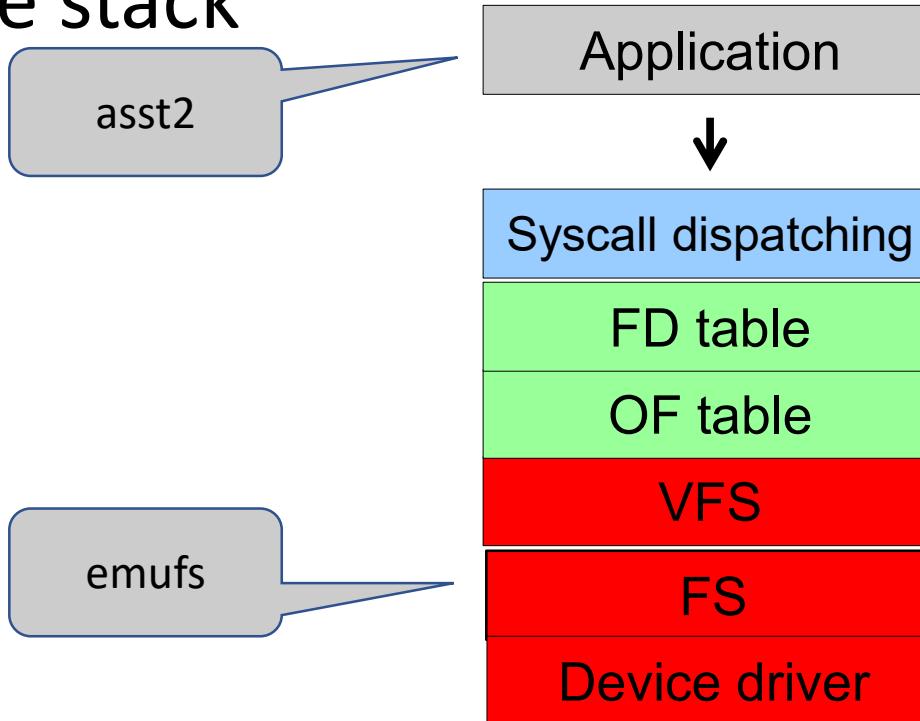

```
int open(const char *filename,  
        int flags, ...);
```

- Where is “open()’s” implementation?
- By convention, it’s called `sys_open()` in the kernel.

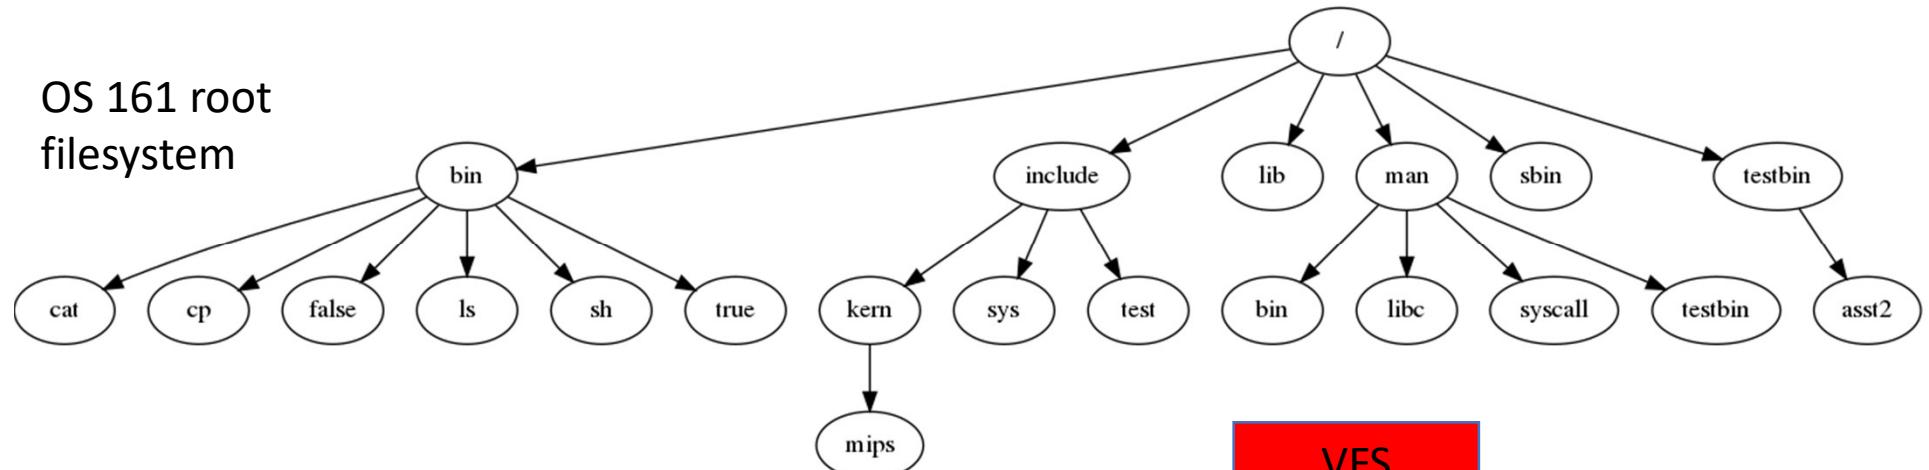

This is what you are
implementing in ASST2

Existing storage stack

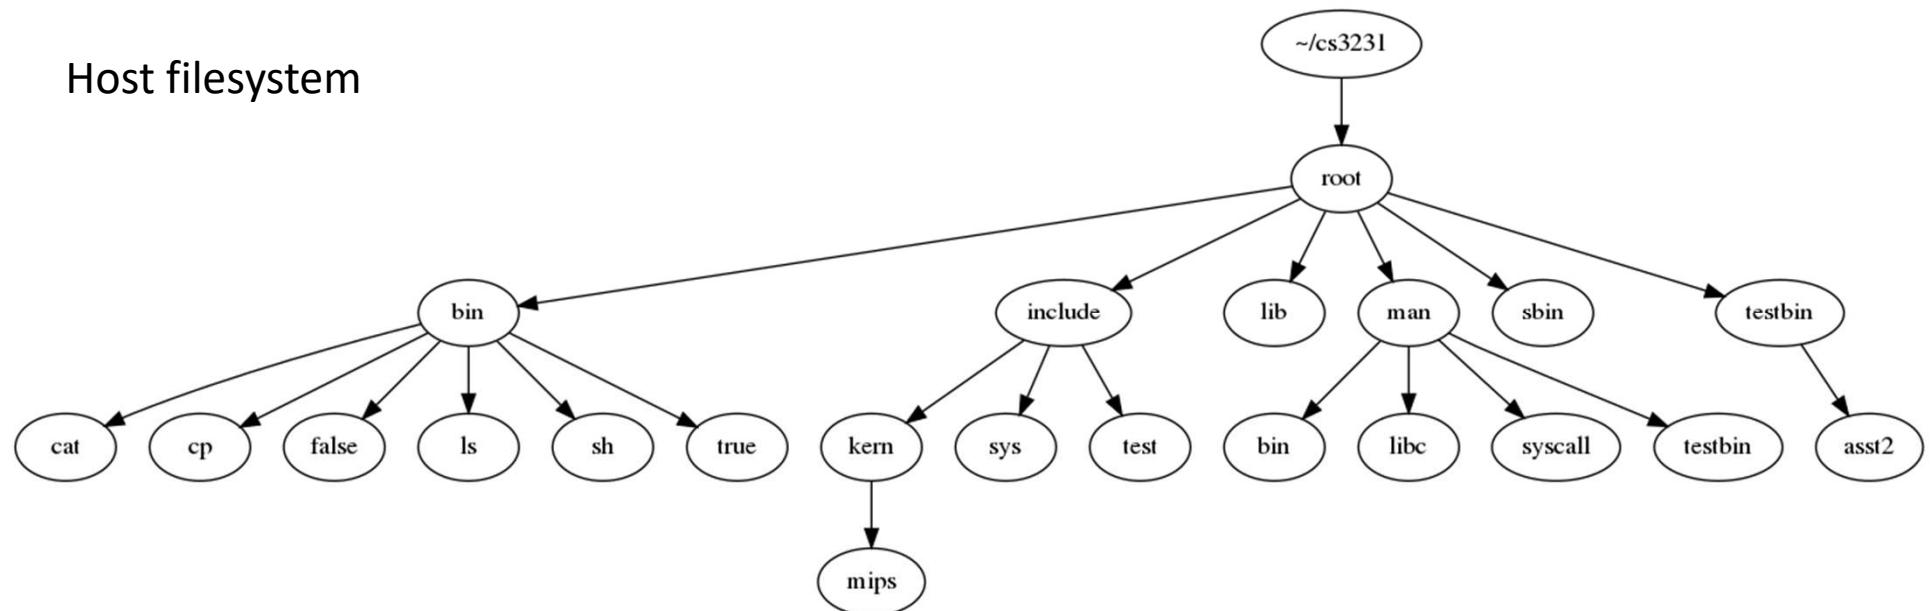

OS 161 root
filesystem

VFS
emuufs
driver
sys161

Provided Storage Stack

Host filesystem

Details

System Call Interface

```
int open(const char *filename, int flags);
int open(const char *filename, int flags, mode_t mode);
int close(int fd);
ssize_t read(int fd, void *buf, size_t buflen);
ssize_t write(int fd, const void *buf, size_t nbytes);
int dup2(int oldfd, int newfd);
off_t lseek(int fd, off_t pos, int whence);
```

Solution should work with fork() if implemented

```
pid_t fork(void);
```

open/close

```
int open(const char *filename, int flags);  
int open(const char *filename, int flags, mode_t mode);  
int close(int fd);
```

Read/write

```
ssize_t read(int fd, void *buf, size_t buflen);  
ssize_t write(int fd, const void *buf, size_t nbytes);
```

dup2

```
int dup2(int oldfd, int newfd);
```

lseek

```
off_t lseek(int fd, off_t pos, int whence);
```

fork

```
pid_t fork(void);
```

Argument passing

```
#include <unistd.h>

int reboot(int code);
```

Description

reboot reboots or shuts down the system. The specific action depends on the code passed:

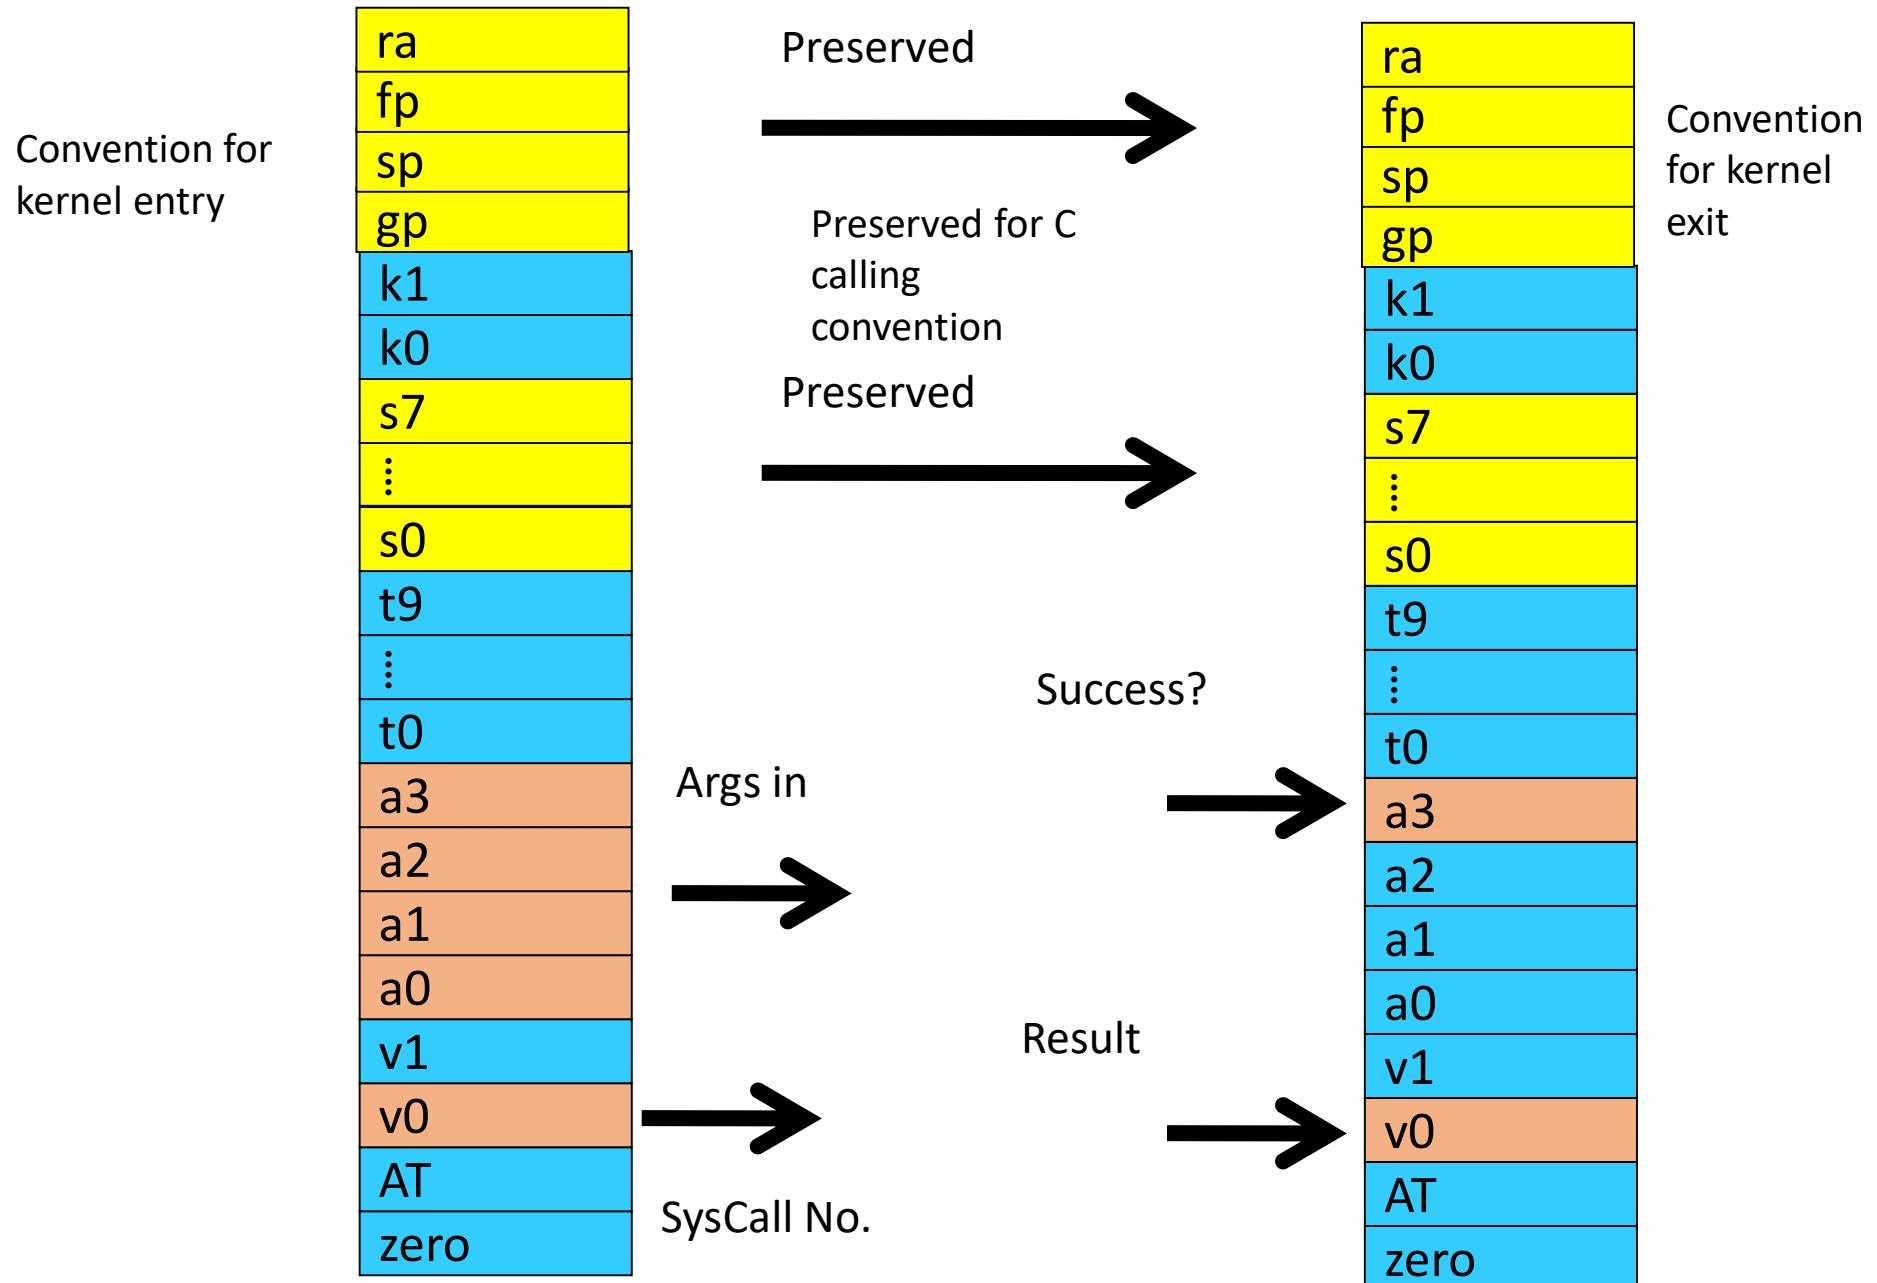

RB_REBOOT The system is rebooted.

RB_HALT The system is halted.

RB_POWEROFF The system is powered off.

Return Values

On success, reboot does not return. On error, -1 is returned, and errno is set according to the error encountered.

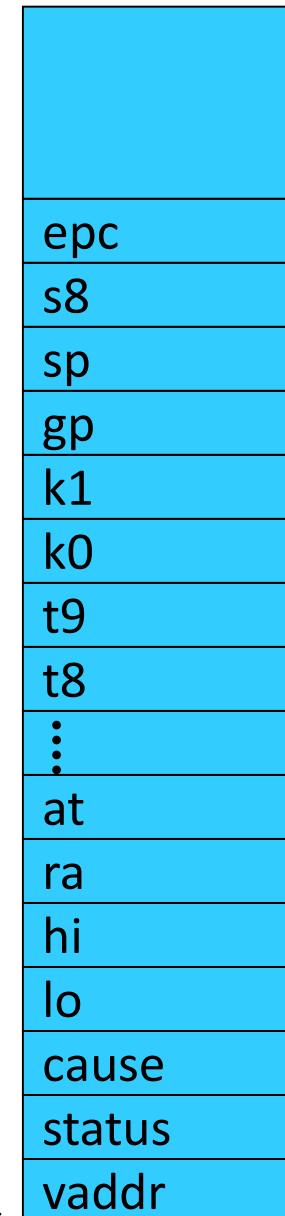

```

struct trapframe {
    u_int32_t tf_vaddr; /* vaddr register */
    u_int32_t tf_status; /* status register */
    u_int32_t tf_cause; /* cause register */
    u_int32_t tf_lo;
    u_int32_t tf_hi;
    u_int32_t tf_ra; /* Saved register 31 */
    u_int32_t tf_at; /* Saved register 1 (AT) */
    u_int32_t tf_v0; /* Saved register 2 (v0) */
    u_int32_t tf_v1; /* etc. */
    u_int32_t tf_a0;
    u_int32_t tf_a1;
    u_int32_t tf_a2;
    u_int32_t tf_a3;
    u_int32_t tf_t0;
    ...
    u_int32_t tf_t7;
    u_int32_t tf_s0;
    ...
    u_int32_t tf_s7;
    u_int32_t tf_t8;
    u_int32_t tf_t9;
    u_int32_t tf_k0;
    */
    u_int32_t tf_k1;
    u_int32_t tf_gp;
    u_int32_t tf_sp;
    u_int32_t tf_s8;
    u_int32_t tf_epc;
};

/* coprocessor 0 epc regis

```

Kernel Stack

By creating a pointer to here of type struct trapframe *, we can access the user's saved registers as normal variables within 'C'

```
syscall(struct trapframe *tf)
{
    callno = tf->tf_v0;
    retval = 0;

    switch (callno) {
        case SYS_reboot:
            err = sys_reboot(tf->tf_a0);
            break;

        /* Add stuff here */

        default:
            kprintf("Unknown syscall %d\n", callno);
            err = ENOSYS;
            break;
    }
}
```

```
if (err) {
    tf->tf_v0 = err;
    tf->tf_a3 = 1;      /* signal an error */
}

else {
    /* Success. */
    tf->tf_v0 = retval;
    tf->tf_a3 = 0;      /* signal no error */
}

tf->tf_epc += 4;

}
```

System Call Interface

```
int open(const char *filename, int flags);
int open(const char *filename, int flags, mode_t mode);
int close(int fd);
ssize_t read(int fd, void *buf, size_t buflen);
ssize_t write(int fd, const void *buf, size_t nbytes);
int dup2(int oldfd, int newfd);
off_t lseek(int fd, off_t pos, int whence);
```

Iseek() Offset

```
uint64_t offset;
int whence;
off_t retval64;

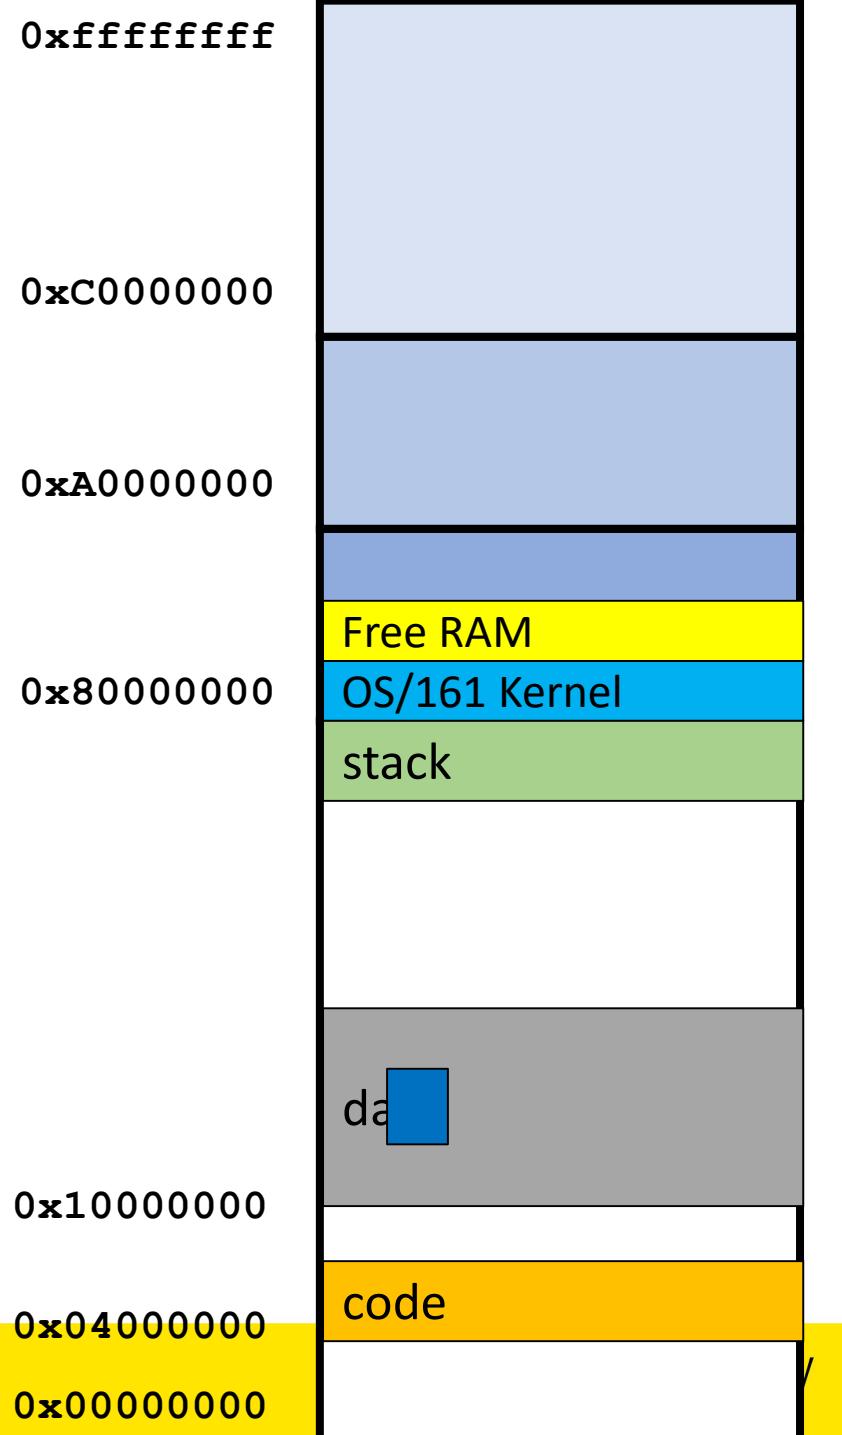

join32to64(tf->tf_a2, tf->tf_a3, &offset);

copyin((userptr_t)tf->tf_sp + 16, &whence, sizeof(int));

split64to32(retval64, &tf->tf_v0, &tf->tf_v1);
```

Pointers

- What about the first argument to `open()`
 - It's a string?
- What are the problems with accessing a string (i.e. user-specified region of memory)?

Copy in/out(str)

```
int copyin(const_userptr_t usersrc, void *dest,  
          size_t len);  
  
int copyout(const void *src, userptr_t userdest,  
            size_t len);  
  
int copyinstr(const_userptr_t usersrc, char  
              *dest, size_t len, size_t *got);  
  
int copyoutstr(const char *src, userptr_t  
               userdest, size_t len, size_t *got);
```

0xffffffff

0xC0000000

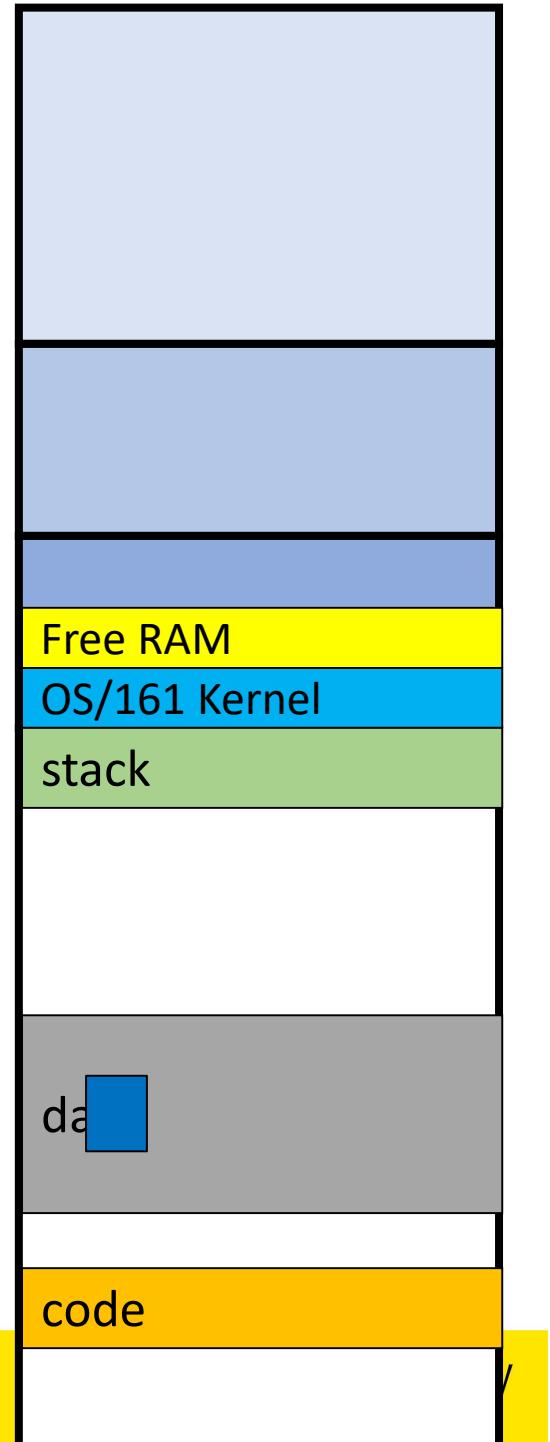

0xA0000000

0x80000000

0x10000000

0x04000000

0x00000000

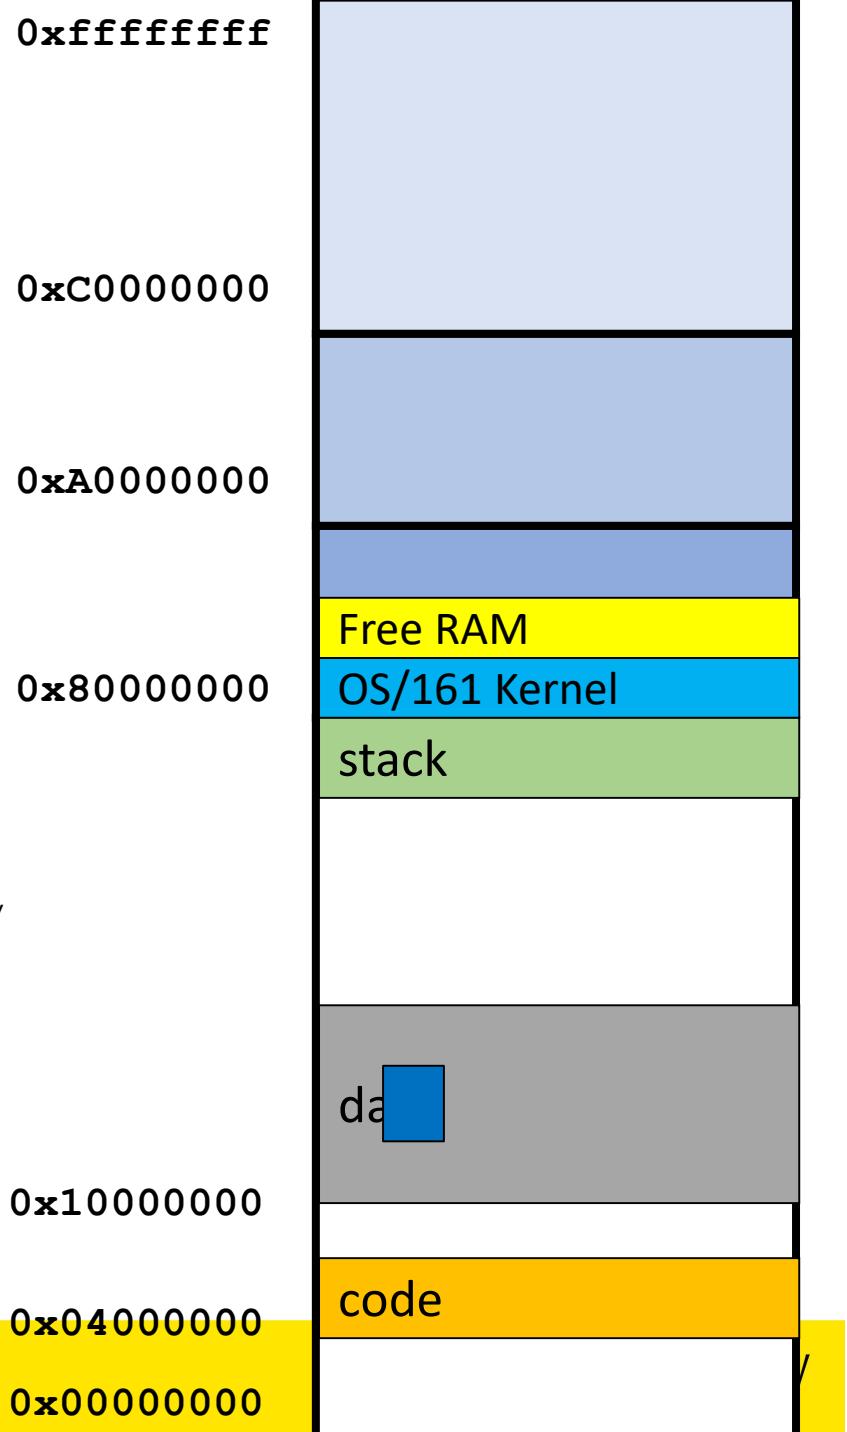

Buffers – e.g. read()

- Kernel framework for safely handling buffers
 - Does error/range/validity checking for you

```
ssize_t read(int fd, void *buf, size_t buflen);

struct iovec {
    union {
        userptr_t iov_ubase;      /* user-supplied pointer */
        void     *iov_kbase;      /* kernel-supplied pointer */
    };
    size_t iov_len;    /* Length of data */
};
```

VFS READ

A macro with sanity checking

`VOP_READ(vn, uio)`

Invokes a function point of following prototype:

```
int (*vop_read)(struct vnode *file, struct uio *uio);
```

What are the arguments?

UIO

```
/* Source/destination. */
enum uio_seg {
    UIO_USERISPACE,                      /* User process code. */
    UIO_USERSPACE,                        /* User process data. */
    UIO_SYSSPACE,                         /* Kernel. */
};

struct uio {
    struct iovec      *uio_iov;          /* Data blocks */
    unsigned           uio_iovcnt;        /* Number of iovecs */
    off_t              uio_offset;        /* Desired offset into object */
    size_t              uio_resid;         /* Remaining amt of data to xfer */
    enum uio_seg       uio_segflg;        /* What kind of pointer we have */
    enum uio_rw        uio_rw;            /* Whether op is a read or write */
    struct addrspace   *uio_space;        /* Address space for user pointer */
};
```

Sample Helper function

```
uio_uinit(struct iovec *iov, struct uio *u, userptr_t buf,  
size_t len, off_t offset, enum uio_rw rw)  
{  
    iov->iov_ubase = buf;  
    iov->iov_len = len;  
    u->uio iov = iov;  
    u->uio iovcnt = 1;  
    u->uio_offset = offset;  
    u->uio_resid = len;  
    u->uio_segflg = UIO_USERSPACE;  
    u->uio_rw = rw;  
    u->uio_space = proc_getas();  
}
```
