

COMP1927 (16s1)

Ass2 (part-1) : How to Implement?

Notes:

- The document offers some **suggestions only**, with incomplete pseudo code
- The pseudo code is easy to read, but may not be efficient. You need to improve it!
- You can use code from labs/lecture material, however, must acknowledge it and provide a reference. For example you can use graph ADT implementation from one of the labs, and adapt it for this assignment.
- You can build a graph structure using Adjacency Matrix or List Representation.

readData.c

List_of_Urls \leftarrow GetCollection()

Create a set (list) of urls to process by reading data from file
“collection.txt”

Graph g \leftarrow GetGraph(List_of_Urls)

Create empty graph (use graph ADT in say graph.h and graph.c)

For each url in the above list

- read <url>.txt file, and update graph by adding a node and outgoing links

InvertedList \leftarrow GetInvertedList(List_of_Urls)

Create empty inverted list (use say List of lists, BST where values are lists, etc)

For each url in List_of_Urls

- read <url>.txt file, and update inverted index

pagerank.h

pagerank.c

pagerank.c

Get args : d, diffPR, maxIterations

List_of_Urls \leftarrow GetCollection()

Graph g \leftarrow GetGraph(List_of_Urls)

List_Urls_PageRanks = calculatePageRank(g, d, diffPR, maxIterations);

Ordered_List_Urls_PageRanks = order (List_Urls_PageRanks)

Output Ordered_List_Urls_PageRanks to “pagerankList.txt”

invertedIndex.h

invertedIndex.c

invertedIndex.c

List_of_Urls \leftarrow GetCollection()

InvertedIndex invertedIdx \leftarrow GetInvertedList (List_of_Urls)

Output invertedIdx to “invertedIndex.txt”

searchPagerank.h

searchPagerank.c

searchPagerank.c

Get query words from arguments

```
matched_Url_list ← findMatchedUrls("invertedIndex.txt", queryWords)  
matched_Urls_with_PR ← findPagerank("pagerankList.txt", matched_Url_list)
```

Output ordered urls on stdout
