

Recap: Fragmentation External Fragmentation: - The space wasted external to the allocated memory regions. - Memory space exists to satisfy a request, but it is unusable as it is not contiguous. Internal Fragmentation: - The space wasted internal to the allocated memory regions. - allocated memory may be slightly larger than requested memory; this size difference is wasted memory internal to a partition.

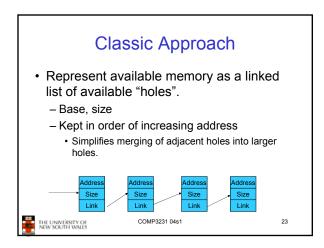

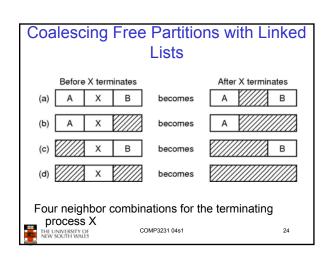

THE UNIVERSITY OF NEW SOUTH WALES

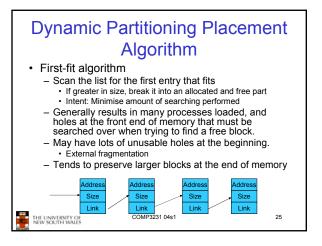

COMP3231 04s1

21

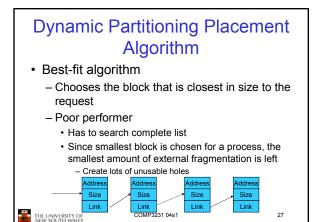

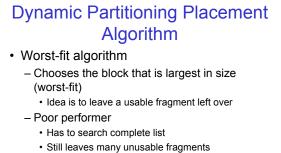

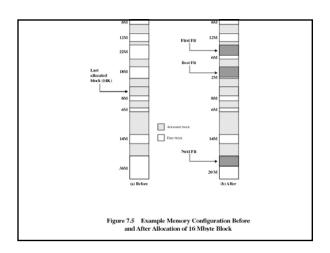

- Spread allocation more uniformly over entire memory
 More often allocates a block of memory at the end of memory
 where the largest block is found
- The largest block of memory is broken up into smaller blocks

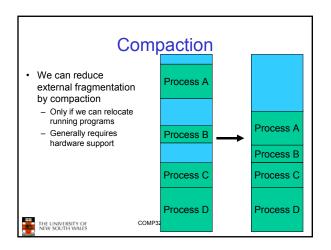

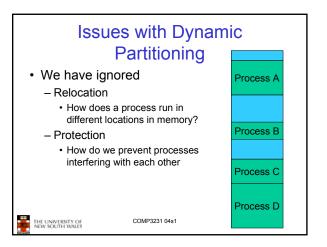

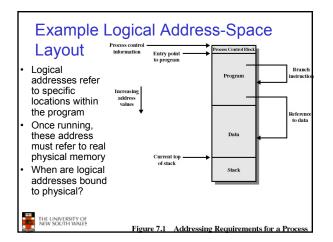

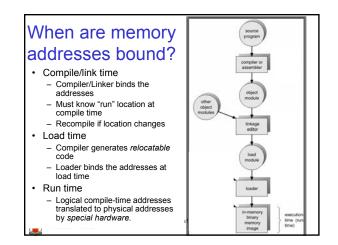

Dynamic Partition Allocation Algorithm

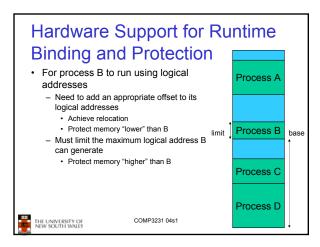

- Summary
 - First-fit and next-fit are generally better than the others and easiest to implement
- · Note: Used rarely these days
 - Typical in-kernel allocators used are *lazy* buddy, and slab allocators
 - Might go through these later in session

| Consideration | Paging | Segmentation | | |
|--|---|--|------------------|----|
| Need the programmer be aware that this technique is being used? | No | Yes | | |
| How many linear address spaces are there? | 1 | Many | | |
| Can the total address space exceed the size of physical memory? | Yes | Yes | | |
| Can procedures and data be distinguished and separately protected? | No | Yes | | |
| Can tables whose size fluctuates be accommodated easily? | No | Yes | | |
| Is sharing of procedures between users facilitated? | No | Yes | | |
| Why was this technique invented? | To get a large linear address space without having to buy more physical memory | To allow programs and data to be broken up into logically independent address spaces and to aid sharing and protection | | |
| Comparison of pa | memory | sharing and protection | ion ₆ | 61 |
