D6.1.3 Enabling sampling and filtering sample records

Profiling can be disabled at individual Exception levels, and is always disabled at EL3.

When profiling is disabled, no sample records are collected and the sample interval counters retain their values and do not decrement.

Collected sample records can also be filtered by type, by event, and by latency:

- By type, a combination of any or all of:
  - Branches.
  - Loads.
  - Load Atomic.
  - Stores.
- By event, a combination of any or all of:
  - Mispredicted branches.
  - TLB missing accesses.
  - Level 1 cache refilling accesses.
  - Architecturally retired instructions.
- By latency:
  - Whether the total latency of the operation exceeds a programmable threshold.

When filtering is enabled, sample records that do not meet the filtering criteria are discarded and are not written to the Profiling Buffer. The pseudocode functions `OpType()`, `OpType_Branch()`, `OpType_Load()`, `OpType_Store()`, `OpType_Other()`, `OpType_Atomic()`, describe the operation types.

D6.1.4 Capturing records of sampled operations

Sample records are written by hardware in a packetized format to a buffer in memory:

- The start and end pointers for this buffer are specified in System registers.
- The pointers are virtual address pointers.
- The PE generates a Profiling Buffer management interrupt when the Profiling Buffer is full.

For more information see *The Profiling Buffer* on page D6-2285 and *Profiling Buffer management interrupt* on page D6-2289.

D6.1.5 PMU Extensions

Two sets of additional events are defined for the PMU. If the Statistical Profiling and Performance Monitoring Extensions are implemented, then the following events must be implemented:

- SAMPLE_POP.
- SAMPLE_FEED.
- SAMPLE_FILTRATE.
- SAMPLE_COLLISION.

Note

These events are discoverable through a read of PMCEID0_EL0[35:32].

The Statistical Profiling Extension also introduces the events the following events:

- REMOTE_ACCESS.
- LL_CACHE.
- LL_CACHE_MISS.
- DTLB_WALK.
- ITLB_WALK.
• LL_CACHE_RD.
• LL_CACHE_MISS_RD.
• REMOTE_ACCESS_RD.

These events can be included in any implementation of the PMU Extension, even if the Statistical Profiling Extension is not implemented.

Note

These events are discoverable through a read of PMCEID1_EL0[24:17] and PMCEID1[24:17].

D6.1.6 Misspeculation and non-architectural operations

It is IMPLEMENTATION DEFINED whether the sample record for a misspeculated operation or an operation generating a non-architectural exception, if sampled, is written to the Profiling Buffer:

• If a sample record of a misspeculated operation or an operation generating a non-architectural exception is written to the Profiling Buffer, then neither event 0 (generated exception) nor event 1 (architecturally retired) are set in the record Events packet.

• If a sample record of a misspeculated operation or an operation generating a non-architectural exception is not captured into the Profiling Buffer, then no event packets are output and the sample is not counted by the SAMPLE_FILTRATE event.

Note

It is IMPLEMENTATION DEFINED whether such operations can be sampled. See Operations that might be excluded from the sample population on page D6-2274.

It is IMPLEMENTATION DEFINED whether each of the following operations are part of the sample population:

• Operations on misspeculated paths.
• Operations (specifically micro-ops) that do not relate to any architecture instruction.

If such an operation is not part of the sample population

The operation does not cause the sample counter to decrement, is no counted by the SAMPLE_POP event, and hence is never sampled.

If such an operation is part of the sample population

The operation causes the sample counter to decrement, is counted by the SAMPLE_POP event, and might be sampled and counted by the SAMPLE_FEED event.

It is IMPLEMENTATION DEFINED whether the sample record for such an operation, if sampled, is captured in the Profiling Buffer:

• If such a sample record is captured in the Profiling Buffer then some information for the operation might not be present. However, the Events packet and either the End packet or the Timestamp packet is always output. Neither event 0 (generated exception) nor event 1 (architecturally retired) will be set in the Events packet.

• If such a sample record is not captured into the Profiling Buffer then no event packets are output and the sample is not counted by the SAMPLE_FILTRATE event.

If the sample record for an operation on a misspeculated path is captured into the Profiling Buffer, then the record must not contain information that cannot be accessed by privileged software of the owning Exception level.

Note

If the Owning Exception level passes this data to less privileged software for processing, it can set PMSFCR_EL1.FE to 1 and PMSEVFR_EL1[1] to 1 to prevent speculative instructions from being recorded in the Profiling Buffer.
All sample records written to the Profiling Buffer contain the Events packet and either the End packet or the Timestamp packet.

If the sampled operation generates an exception, it is UNPREDICTABLE whether the sample record contains any other information.

Where a sampled operation generates an exception and the type of exception means that a particular item is not computed by the sampled operation, that information is not collected by the profiling operation. For more information see Synchronization and Statistical Profiling on page D6-2292.

Example D6-3 Translation Faults

If a sampled operation generates a Translation Fault, the physical address for the sampled operation was not generated by the MMU and cannot be recorded.

D6.1.7 Non-architectural exceptions

An implementation might include exceptions that are not architectural exceptions. That is, in executing an operation, the PE performs some exceptional behavior that does not take an exception as defined by the architecture. These non-architectural exceptions are usually not visible to software.

The use on non-architectural exceptions are IMPLEMENTATION DEFINED.

If a sampled operations generates a non-architectural exception, the sample might include handling of the non-architectural exception. If the sample does not include handling of the non-architectural exception, then the sampled operation does not complete because of the non-architectural exception and it is recorded using $E[1] = 0$ (operation did not retire) in the Events packet. Bit $E[0]$ (operation generated an exception) might be used to indicate the operation did not complete because of the non-architectural exception.

D6.1.8 Interaction with the Embedded Cross Trigger

When a sample completes and is written out, CTI input trigger 2 is asserted. This trigger might also be directly connected to other IMPLEMENTATION DEFINED debug features.

D6.1.9 Multithreaded implementations

In a multithreaded implementation, Statistical Profiling is implemented per-thread.

The sample interval counter counts only operations for the thread that is being profiled.

Latency and other cycle counters count each cycle for the PE for which the thread was active and could issue an operation.

The architecture does not define features for inter-thread profiling and does not support sharing the Profiling Buffer between threads.

--- Note ---

An implementation is described as multithreaded when the lowest level of affinity consists of logical processors that are implemented using a multi-threading type approach. That is, the performance of processors at the lowest affinity level is very interdependent. On such an implementation, the value of $\text{MPIDR\_EL1\_MT}$, when read at the highest implemented Exception level, is 1.

---
D6.2 Programmers’ Model

Profiling is controlled by System registers. There is no direct EL0 access to the control registers and by default profiling is disabled. The programmers’ model is divided into the following parts:

- **Sampling controls:**
  - Controlling when an operation is sampled.
  - Enable and Filtering controls.
  - Controlling the data that is collected.
- **Profiling Buffer controls:**
  - The Profiling Buffer on page D6-2285.
  - Profiling Buffer management interrupt on page D6-2289.
- **Synchronization and Statistical Profiling** on page D6-2292.

D6.2.1 Controlling when an operation is sampled

The sample interval counter, PMSICR_EL1.COUNT controls when an operation is selected for sampling. In some implementations, a secondary sample interval counter, PMSICR_EL1.ECOUNT, is also used.

The following sections describe the operation of the sample interval counters.

Details of the random or pseudorandom number generator used when PMSIRR_EL1.RND is set to 1 are IMPLEMENTATION DEFINED. See Random number generation on page D6-2273.

Initializing one or more sample interval counters

When the PE moves from a state where profiling is disabled to a state where profiling is enabled:

- If PMSICR_EL1 is nonzero, then sampling restarts from the current values in PMSICR_EL1.
- If PMSICR_EL1 is zero, then it is loaded with an initial value. The behavior depends on PMSIRR_EL1.RND and an IMPLEMENTATION DEFINED choice discoverable by a read of PMSIDR_EL1.ERnd.
- If PMSIRR_EL1.RND is cleared to 0:
  - PMSICR_EL1.COUNT[31:8] is set to PMSIRR_EL1.INTERVAL.
  - PMSICR_EL1.COUNT[7:0] is set to 0x00.
- If PMSIRR_EL1.RND is set to 1 and PMSIDR_EL1.ERnd is 0:
  - PMSICR_EL1.COUNT[31:8] is set to PMSIRR_EL1.INTERVAL.
  - PMSICR_EL1.COUNT[7:0] is set to a random or pseudorandom value in the range 0x00 to 0xFF.
- If PMSIRR_EL1.RND is set to 1 and PMSIDR_EL1.ERnd is 1:
  - PMSICR_EL1.COUNT[31:8] is set to PMSIRR_EL1.INTERVAL.
  - PMSICR_EL1.COUNT[7:0] is set to 0x00.

D6.2.2 Behavior of the sample interval counter while profiling is enabled

While profiling is enabled, the counters control when an operation is selected for sampling. The behavior depends on PMSIRR_EL1.RND and an IMPLEMENTATION DEFINED choice discoverable in PMSIDR_EL1.ERnd.

If PMSIRR_EL1.RND is cleared to 0:

While nonzero, the sample interval counter decrements by 1 for each member of the sample population. When the counter reaches zero:

- A member of the sampling population is selected for sampling.
- The counter is set as follows:
  - PMSICR_EL1.COUNT[31:8] is set to PMSIRR_EL1.INTERVAL.
  - PMSICR_EL1.COUNT[7:0] is set to 0x00.
Note

Because the counter counts down to zero, when PMSIRR_EL1.RND is cleared to 0 the interval between operations being selected for sampling is (INTERVAL×256+1).

If PMSIRR_EL1.RND is set to 1 and PMSIDR_EL1.ERnd is 0:

While nonzero, the sample interval counter decrements by 1 for each member of the sample population. When the counter reaches zero:

- A member of the sampling population is selected for sampling.
- The counter is set as follows:
  - PMSICR_EL1.COUNT[31:8] is set to PMSIRR_EL1.INTERVAL.
  - PMSICR_EL1.COUNT[7:0] is set to a random or pseudorandom value in the range $0x00$ to $0xFF$.

Note

When PMSIRR_EL1.RND is set to 0 and PMSIDR_EL1.ERnd is 1, the mean interval between operations being selected for sampling is (INTERVAL×256+128), if the random number generator is uniform.

If PMSIRR_EL1.RND is set to 1 and PMSIDR_EL1.ERnd is 1:

While nonzero, the primary sample interval counter decrements by 1 for each member of the sample population. When the primary counter reaches zero:

- The primary sample interval counter is reloaded.
- A secondary sample interval counter, PMSICR_EL1.ECOUNT, is set to a random or pseudorandom value in the range $0x00$ to $0xFF$.

While the secondary sample interval counter is nonzero, the secondary sample interval counter decrements by 1 for each member of the sample population. The primary sample interval counter also continues to decrement because it is also nonzero.

When the secondary sample interval counter reaches zero, an operation is selected for sampling.

Note

When PMSIRR_EL1.RND is set to 1 and PMSIDR_EL1.ERnd is 1, the mean interval between operations being selected for sampling is (INTERVAL×256+1), if the random number generator is uniform.

D6.2.3 Behavior of the sample interval counter while profiling is disabled

When profiling is disabled:

- No operations are selected for sampling.
- No sample records are collected.
- The sample interval counters retain their values and do not decrement.

D6.2.4 Sample collision behavior

On a sample collision:

- The PMU event SAMPLE_COLLISION is generated.
- PMBSR_EL1.COLL is set to 1.

Following a context synchronization event an indirect write to PMBSR_EL1.COLL is guaranteed to be visible to instructions in program order after the sampled operation that collided. There is no guarantee of visibility without a context synchronization event. For more information see Synchronization and Statistical Profiling on page D6-2292.
Note

This means that following a context synchronization event PMBSR_EL1.COLL will not change on entry to a state where profiling is disabled.
D6.3 Enable and Filtering controls

D6.3.1 Enabling Profiling

Profiling is disabled if the Profiling Buffer is disabled, including when:

- PMBLIMITR_EL1.E is cleared to 0 or PMBSR_EL1.S is set to 1.
- Executing at a higher Exception level than the Profiling Buffer owning Exception level.
- Executing in the Security state that is not the Security state of the owning Exception level.
- The PE is in Debug state.

Note

The owning Exception level is controlled by MDCR_EL3.NSPB and MDCR_EL2.E2PB.

PMSCR_EL1.{E1SPE, E0SPE} and PMSCR_EL2.{E2SPE, E0HSPE} enable sampling by Exception level:

- In a guest operating system or Secure state, PMSCR_EL1.E1SPE enables profiling at EL1 and PMSCR_EL1.E0SPE at EL0.
- In a hypervisor or host operating system, PMSCR_EL2.E2SPE enables profiling at EL2 and PMSCR_EL2.E0HSPE at EL0.

Table D6-1 shows the valid combinations of the values of PMBSR_EL1.S, PMBLIMITR_EL1.E, SCR_EL3.NS, MDCR_EL3.NSPB, MDCR_EL2.E2PB and HCR_EL2.TGE that define when sampling is enabled.

In Table D6-1:

- D: Disabled.
- E2SPE: Enabled if PMSCR_EL2.E2SPE == 1, disabled otherwise.
- E1SPE: Enabled if PMSCR_EL1.E1SPE == 1, disabled otherwise.
- E0HSPE: Enabled if PMSCR_EL2.E0HSPE == 1, disabled otherwise.
- E0SPE: Enabled if PMSCR_EL1.E0SPE == 1, disabled otherwise.

Table D6-1 Enabling by Exception level and Security state (for all Exception levels using AArch64)

This is described in the pseudocode functions ProfilingBufferEnabled() and CheckStatisticalProfilingAccess().
D6.3.2 Filtering sample records

PMSFCR_EL1.FT enables filtering by operation type. When enabled PMSFCR_EL1.{ST, LD, B} define the collected types:

- ST enables collection of store sampled operations, including all atomic operations.
- LD enables collection of load sampled operations, including atomic operations that return a value to a register.
- B enables collection of branch sampled operations, including direct and indirect branches and exception returns.

**Note**
When micro-op sampling is implemented, filtering is based on the micro-op type.

Table D6-2 summarizes the controls for filtering by operation type. In this table:

- Load Atomic: Refers to atomic operations which return a value to a general-purpose register. Other atomic operations are classed as Store.
- D: Indicates that the operation is discarded.
- C: Indicates that the operation is collected.

PMSFCR_EL1.FE enables filtering by a set of events that are defined by PMSEVFR_EL1. When enabled, only sampled operations with all the events in the filter set are recorded and written to the Profiling Buffer.

PMSFCR_EL1.FL enables filtering by total latency. PMSLATFR_EL1.MINLAT defines the minimum latency. When enabled, only sampled operations with a total latency greater than or equal to the minimum latency are recorded and written to the Profiling Buffer.

These controls combine together as a logical AND.

**Example D6-4 Collection of sampled operations**

If PMSFCR_EL1.FE is set to 1, PMSFCR_EL1.FT is set to 1, and PMSFCR_EL1.FL is set to 1, then only sampled operations that meet all of the following criteria are recorded and written to the Profiling Buffer:

- The sampled operation is one of the selected operation types.
- The operation has all of the events in the filter set.
The total latency is equal to or greater than the minimum latency.

This is described in the pseudocode function `CollectRecord()`.

### D6.3.3 Controlling the data that is collected

Certain data in sample records is only collected if permitted by one or both of EL1 and EL2. This is to restrict exposure of data to a lower Exception level or to Non-secure state.

**CONTEXTIDR_EL1** is collected only if **PMSCR_EL1.CX** is set to 1 and one of the following is true:
- The PE is executing at EL1 or EL0.
- The PE is executing in Secure state or the Effective value of **HCR_EL2.TGE** is 0.

**CONTEXTIDR_EL2** is collected only if the Effective value of **PMSCR_EL2.CX** is 1 and all of the following are true:
- EL2 is implemented.
- The PE is executing in Non-secure state.

This is described in the pseudocode functions `CollectContextIDR1()` and `CollectContextIDR2()`.

Timestamps are collected only if one of the following is true:
- **PMSCR_EL1.TS** is set to 1 and the Profiling Buffer is owned by EL1.
- **PMSCR_EL2.TS** is set to 1 and the Profiling Buffer is owned by EL2.

The timestamp is a choice between:
- Physical time, which is defined by the value of **CNTPCT_EL0**.
- Virtual time, as defined by the value of **CNTVCT_EL0**. That is, the physical time minus the virtual offset, **CNTVOFF_EL2**. However, the virtual offset is treated as zero if a read of **CNTVCT_EL0** at the current Exception level would treat the virtual offset as zero.

Physical time is collected if any of the following is true:
- **PMSCR_EL1.PCT** is set to 1 and the Profiling Buffer is owned by Secure EL1.
- **PMSCR_EL2.PCT** is set to 1 and the Profiling Buffer is owned by EL2.
- **PMSCR_EL1.PCT** is set to 1 and **PMSCR_EL2.PCT** is set to 1 and the Profiling Buffer is owned by Non-secure EL1.

Virtual time is collected otherwise. If EL2 is not implemented, **PMSCR_EL1.PCT** is `RES1`. This is described by the pseudocode function `CollectTimeStamp()`.

Physical data addresses are collected only if one of the following is true:
- **PMSCR_EL1.PA** is set to 1 and the Profiling Buffer is owned by Secure EL1.
- **PMSCR_EL2.PA** is set to 1 and the Profiling Buffer is owned by EL2.
- **PMSCR_EL1.PA** is set to 1 and **PMSCR_EL2.PA** is set to 1 and the Profiling Buffer is owned by Non-secure EL1.

If EL2 is not implemented, the PE behaves as if **PMSCR_EL2.PA** is set to 1, other than for a direct read of the register.

Enabling collection of the physical data addresses has an IMPLEMENTATION DEFINED impact on the sampled operation. This is described by the pseudocode function `CollectPhysicalAddress()`.

### D6.3.4 The Profiling Buffer

The profile data is collected in a memory *Profiling Buffer*. The Profiling Buffer is defined by:
- **PMBPTR_EL1**, the current write pointer.
- **PMBLIMITR_EL1**, the write limit pointer.
The Profiling Buffer starts at the current write pointer and extends to the current limit pointer minus one. The write limit pointer must be aligned to the smallest implemented translation granule size. The alignment of the current write pointer is IMPLEMENTATION DEFINED.

PMBLIMITR_EL1 and PMBPTR_EL1 are virtual addresses in the stage 1 translation regime of the owning Exception level. This is called the *owning translation regime*.

--- Note ---

The translation of virtual addresses to physical addresses is identical to that for any other virtual address in the owning Exception level. For example, PMBPTR_EL1[63:56] are ignored by address translation if the respective TBI bit is set to 1.

---

### D6.3.5 Restrictions on the current write pointer

This section describes the software rules on setting the current write pointer, PMBPTR_EL1. If these rules are not followed, the value returned for a direct read of PMBPTR_EL1 is UNKNOWN, the behavior is UNPREDICTABLE, and the PE might do any of the following at any point after profiling is enabled:

- Write sample records to any writeable address in memory that is writable at the owning Exception level.
- Generate a Profiling Buffer management interrupt, with or without indicating data loss, for one of the following reasons:
  - The Profiling Buffer is full.
  - Any MMU Fault.

When profiling becomes enabled, all the following must be true:

- The current write pointer must be at least one sample record below the write limit pointer. That is:
  \[
  \text{UInt}(\text{PMBPTR\_EL1.PTR}) \leq \text{UInt}(\text{PMBLIMITR\_EL1.LIMIT} : \text{Zeros}(12)) - 2^\text{PMSIDR\_EL1.MaxSize}.
  \]
- PMBPTR\_EL1.PTR[63:56] must equal PMBLIMITR\_EL1.LIMIT[63:56].

When the Profiling Buffer is first configured, PMBPTR\_EL1.PTR must be aligned to PMBIDR\_EL1.Align. That is, if PMBIDR\_EL1.Align is nonzero, PMBPTR\_EL1.PTR [\text{UInt}(\text{PMBIDR\_EL1.Align})-1:0] must be all zeros.

However, the current write pointer can usually be restored to the saved write pointer value it had when profiling was disabled, providing a PSB CSYNC and a context synchronization event were executed before reading PMBPTR\_EL1:

- If no Profiling Buffer management interrupt was signaled then profiling can be restarted from the saved write pointer. In this case, the saved write pointer points within one sample record of the write limit pointer.
- If a Profiling Buffer management interrupt was signaled then:
  - If PMBSR\_EL1.S is restored to 1, then profiling is not being enabled, and there are no constraints on the value written to PMBPTR\_EL1.
  - If PMBSR\_EL1.S is restored to 0, and the Profiling Buffer management interrupt was caused by an MMU fault, profiling can be restarted from the saved write pointer; if PMBSR\_EL1.{EA, DL} did not also indicate an external abort or data loss, and the saved write pointer is at least one sample record below the write limit pointer.

--- Note ---

If a signaled MMU fault has not been corrected, the Statistical Profiling Extension generates a new MMU fault Profiling Buffer management interrupt when it next tries to write a sample record.

---

- If PMBSR\_EL1.S is restored to 0, and the Profiling Buffer management interrupt was caused by a buffer full event, the Profiling Buffer can be extended and profiling restarted from the saved write pointer; if PMBSR\_EL1.{EA, DL} did not also indicate an external abort or data loss and the saved write pointer is at least one sample record below the extended write limit pointer.

The current write pointer must not be restored from the saved write pointer following a Profiling Buffer management interrupt if PMBSR\_EL1.DL was set to 1.

The saved write pointer might not be aligned to $2^{\text{PMBIDR\_EL1.Align}}$ and might point to within one sample record of the write limit pointer.

For more information see *Synchronization and Statistical Profiling* on page 2292.
D6.3.6 The owning Exception level

The owning Exception level is:

- Non-secure EL1, if all of the following are true:
  - Either EL3 is not implemented and the PE executes in Non-secure state, or MDCR_EL3.NSPB is set to either 0b10 or 0b11.
  - Either EL2 is not implemented or MDCR_EL2.E2PB is set to either 0b10 or 0b11.

- EL2, if all of the following are true:
  - EL2 is implemented.
  - Either EL3 is not implemented or MDCR_EL3.NSPB is set to either 0b10 or 0b11.
  - MDCR_EL2.E2PB is set to 0b00.

- Secure EL1, if any of the following are true:
  - EL3 is not implemented and the PE executes in Secure state.
  - MDCR_EL3.NSPB is set to either 0b00 or 0b01.

When the owning Exception level is Non-secure EL1

The Profiling Buffer addresses are in the Non-secure EL1&0 translation regime using the current ASID from TTBRx_EL1. This is a two-stage translation using the current VMID if EL2 is implemented and HCR_EL2.VM is set to 1.

If EL3 is implemented, then the Profiling Buffer is disabled in Secure state.

If EL2 is implemented, then profiling is disabled at EL2 and at Non-secure EL0 when HCR_EL2.TGE is set to 1.

When the owning Exception level is EL2

The Profiling Buffer addresses are in the EL2 translation regime. If both HCR_EL2.E2H is set to 1 and HCR_EL2.TGE is set to 1, this is an EL2&0 translation regime using the current EL2&0 translation regime ASID from TTBRx_EL2.

If EL3 is implemented, then the Profiling Buffer is disabled in Secure state.

--- Note ---

If either HCR_EL2.E2H is cleared to 0 or HCR_EL2.TGE is cleared to 0, and the PE is executing at EL1 or EL0, the EL2 translation regime is not the current stage 1 translation regime because the current stage 1 translation regime is EL1&0.

---

When the owning Exception level is Secure EL1

The Profiling Buffer addresses are in the Secure EL1&0 translation regime using the current ASID from TTBRx_EL1.

If EL3 is implemented, then the buffer is disabled in Non-secure state.

The Profiling Buffer is disabled if any of the following are true:

- SCR_EL3.NS indicates the other Security state to the owning Exception level.
- The owning Exception level is using AArch32 state.
- PMBLIMITR_EL1.E is cleared to 0.
Table D6-3 summarizes the owning translation regime.

D6.3.7 Memory access types and coherency

The Statistical Profiling Extension acts as a separate observer in the system and is subject to the rules regarding coherency.

The memory type that is used for a write by the Statistical Profiling Extension to the Profiling Buffer is taken from the translation table entries for the virtual address being written to. That is:

- The writes are treated as coming from an observer that is coherent with all observers in the Shareability domain that is defined by the translation tables.
- There is no requirement to manage coherency for observers in the same Shareability domain but coherency for other observers in the system might require explicit management.

For more information see *Synchronization and Statistical Profiling* on page D6-2292.

D6.3.8 TLB operations

Translations might be cached in a TLB. TLB maintenance operations (including TLB maintenance operations that are broadcast from other PEs) operate on these cached translations.

Any TLB maintenance operation followed by a **DSB** (including an operation broadcast from another PE and a following **DSB** on that other PE):

- Does not complete until all sample records previously translated using an invalidated translation have been written to the Profiling Buffer.
- Any remaining sample records are guaranteed not to use an invalidated translation.

For such operations, the **DSB** must apply to both loads and stores. Although the Statistical Profiling Extension acts as another observer in the system, for determining the Shareability domain of this **DSB** or TLB maintenance operation, the writes of sample records are treated as coming from the PE that is being profiled.

---

**Note**

Completion of the **DSB** does not guarantee that all buffered profiling data has written out. See *Synchronization and Statistical Profiling* on page D6-2292.

D6.3.9 Effect on the exclusive monitors

If an operation between Load-Exclusive and Store-Exclusive instructions is sampled, then the Store-Exclusive must be guaranteed not to fail, even though the sample record is written to an unrelated address.
D6.4 Profiling Buffer management interrupt

A Profiling Buffer management interrupt occurs:

- On a fault, see Faults and watchpoints on page D6-2290.
- On an external abort, see External aborts on page D6-2291.
- When the Profiling Buffer fills, see Buffer full event on page D6-2290.

On a Profiling Buffer management interrupt:

- The service bit, PMBSR_EL1.S, is set to 1.
- The data loss bit, PMBSR_EL1.DL, is set as described in the event description.
- The Profiling Buffer management interrupt signal, PMBIRQ, is asserted:
  - PMBIRQ is a level interrupt driven by PMBSR_EL1.S. This means that:
    - A direct write that sets PMBSR_EL1.S to 1 causes the interrupt to be asserted.
    - PMBIRQ remains asserted until software clears PMBSR_EL1.S to 0.
  - If a Generic Interrupt Controller (GIC) is implemented, PMBIRQ must be configured as a Private Peripheral Interrupt (PPI) in a multiprocessor system. PMBIRQ is signaled by the PE that implements the Statistical Profiling Extension.

--- Note ---
A standard PPI number is allocated by the ARM® Server Base System Architecture (SBSA).

- Additional syndrome for the event is written to PMBSR_EL1.MSS. Unless otherwise stated in the event description, other PMBSR_EL1 fields are unchanged.

While PMBSR_EL1.S is set to 1:

- The buffer is disabled and profiling is disabled.
- All remaining buffered sample records are discarded.
- The values in PMBPTR_EL1 are retained and PMSICR_EL1 does not decrement.

Buffer full events and MMU faults leading to Profiling Buffer management interrupts are synchronous.

It is implementation defined whether external aborts are reported to the Statistical Profiling Extension synchronously or asynchronously. If external aborts are reported as asynchronous:

- The external abort might not be received until after a first Profiling Buffer management interrupt has set PMBSR_EL1.S to 1.
- Writes to the buffer might generate a second Profiling Buffer management interrupt after the external abort has set PMBSR_EL1.S to 1.

The architecture does not require that a sample record is written sequentially by the Statistical Profiling Extension, only that:

- The Statistical Profiling Extension never writes past the PMBLIMITR_EL1 limit pointer.
- On a Profiling Buffer management interrupt, PMBSR_EL1.DL indicates whether PMBPTR_EL1 points to the first byte after the last complete sample record.
- On an MMU fault or synchronous external abort, PMBPTR_EL1 serves as a Fault Address Register.

--- Note ---
- This means that it must not be assumed that:
  - There is ever any valid data beyond the current PMBPTR_EL1 write pointer.
  - The PE has not written a valid sample record between the current PMBPTR_EL1 write pointer and the PMBLIMITR_EL1 limit pointer.
  - If PMBSR_EL1.DL is set to 1 on a Profiling Buffer management interrupt, that there is any valid data between the end of the last complete sample record and the current PMBPTR_EL1 write pointer.
  - Any valid data has been written to the Profiling Buffer if an external abort is reported asynchronously to the Statistical Profiling Extension.

- The last complete sample record must end at most 2^(PMSIDR_EL1.MaxSize) bytes below PMBPTR_EL1.
D6.4.1 Prioritization of Profiling Buffer management interrupts

Where multiple synchronous Profiling Buffer management interrupts occur on writing a sample record, the PE prioritizes them as follows (from highest to lowest priority):

1. Synchronous fault.
2. Synchronous external abort.
3. Buffer full event.

Asynchronous external aborts are not prioritized with respect to other events.

D6.4.2 Buffer full event

If, after writing a sample record, there is not sufficient space in the Profiling Buffer for a sample record of the size indicated by PMSIDR_EL1.MaxSize, and PMBSR_EL1.S is 0, a Profiling Buffer management interrupt is generated:

- PMBSR_EL1.EC is set to \(0b000000\), other buffer management event.
- The BSC field of PMBSR_EL1.MSS is set as follows:
  - PMBSR_EL1.BSC is set to \(0b000001\), buffer filled.
- PMBPTR_EL1 is set to the first byte after the last complete sample record. PMBSR_EL1.DL is unchanged.
- The other PMBSR_EL1 fields are unchanged.

That is, the Profiling Buffer management interrupt is generated when the PE writes past the write limit pointer minus \(2^{\text{PMSIDR_EL1.MaxSize}}\). The Statistical Profiling Extension never writes beyond the write limit pointer.

For more information see Restrictions on the current write pointer on page D6-2286.

D6.4.3 Faults and watchpoints

Table D6-4 lists the faults that might be generated by a write to the Profiling Buffer by the Statistical Profiling Extension.

Writes to the Profiling Buffer never generate watchpoints.

### Table D6-4 Faults

<table>
<thead>
<tr>
<th>Fault</th>
<th>Conditions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Translation</td>
<td>The translation of a virtual address to a physical address might generate a Translation fault.</td>
</tr>
<tr>
<td>Address Size</td>
<td>The translation of a virtual address to a physical address might generate an Address Size fault.</td>
</tr>
<tr>
<td>Alignment</td>
<td>If PMBPTR_EL1 is not aligned to an IMPLEMENTATION DEFINED minimum alignment, the behavior is UNPREDICTABLE and a write to the Profiling Buffer by the Statistical Profiling Extension might generate an Alignment fault. For more information see Restrictions on the current write pointer on page D6-2286.</td>
</tr>
<tr>
<td>Permission</td>
<td>Writes to the Profiling Buffer are made as privileged writes. If the write does not have write permission, a Permission fault is generated. The value of PSTATE.PAN is ignored and treated as zero.</td>
</tr>
<tr>
<td>Unsupported Access</td>
<td>If hardware management of the Dirty Bit is enabled and the Dirty Bit is not set, it is IMPLEMENTATION DEFINED whether an Unsupported Access fault is generated or the write sets the Dirty Bit in the translation table. For more information see Hardware management of dirty state on page D4-2167.</td>
</tr>
<tr>
<td>Access Flag</td>
<td>If hardware management of the Access Flag is enabled and the Access Flag is not set, it is IMPLEMENTATION DEFINED whether an Access Flag fault is generated or the write sets the Access Flag in the translation table. For more information see Hardware management of the Access flag on page D4-2166.</td>
</tr>
<tr>
<td>TLB Conflict fault</td>
<td>IMPLEMENTATION DEFINED.</td>
</tr>
</tbody>
</table>
If a write to the Profiling Buffer generates a fault and PMBSR_EL1.S is 0, then a Profiling Buffer management interrupt is generated:

- PMBSR_EL1.S is set to 1.
- PMBSR_EL1.EC is set to one of:
  - 0b100100, stage 1 Data Abort on write to the Profiling Buffer.
  - 0b100101, stage 2 Data Abort on write to the Profiling Buffer.
- The FSC field of PMBSR_EL1.MSS is set as follows:
  - PMBSR_EL1.FSC is set to indicate the type of the fault.
- PMBPTR_EL1 is set to the address that generated the fault.
- If PMBPTR_EL1 is not the address of the first byte after the last complete sample record written by the Statistical Profiling Extension, then PMBSR_EL1.DL is set to 1. Otherwise, PMBSR_EL1.DL is unchanged.
- The other PMBSR_EL1 fields are unchanged.

**Note**

Each of these faults gives rise to a Profiling Buffer management interrupt, not an actual MMU fault exception. The ESR and FAR registers are unchanged.

For more information see *The MMU fault-checking sequence on page D4-2194.*

### D6.4.4 External aborts

A write to the Profiling Buffer might generate an external abort, including an external abort on a translation table walk or translation table update. It is an IMPLEMENTATION DEFINED choice whether such an external abort:

- Is reported to the Statistical Profiling Extension and treated as a Profiling Buffer management interrupt.
- Generates an SError interrupt exception.

If a write to the Profiling Buffer generates an external abort that is reported to the Statistical Profiling Extension:

- The external abort bit, PMBSR_EL1.EA, is set to 1.
- The Statistical Profiling Extension stops writing sample records to the Profiling Buffer. It is IMPLEMENTATION DEFINED whether an external abort on a write to the Profiling Buffer is reported as synchronous or asynchronous:
  - The external abort is reported as *synchronous* if PMBPTR_EL1 is set to the address that was externally aborted.
  - The external abort is reported as *asynchronous* if PMBPTR_EL1 is not guaranteed to be set to the address that was externally aborted.
- If the external abort is reported as asynchronous or PMBPTR_EL1 is not the address of the first byte of the sample record being written by the Statistical Profiling Extension, then PMBSR_EL1.DL is set to 1. Otherwise, PMBSR_EL1.DL is unchanged.

**Note**

Following an external abort reported asynchronously to the Statistical Profiling Extension, software must not assume that any valid data has been written to the Profiling Buffer.

- The other PMBSR_EL1 fields are unchanged.

If a write to the Profiling Buffer generates an external abort that is taken as an SError interrupt exception, the PE takes the SError interrupt exception as normal, and PMBSR_EL1 fields are unchanged.
Note

Treating the external abort as a Profiling Buffer management interrupt:
• Sets PMBSR_EL1.S to 1 and so disables the Statistical Profiling Extension.
• Allows error recovery software to isolate the event to the actions of the Statistical Profiling Extension.

Taking an SError interrupt:
• Means that the Statistical Profiling Extension will only be disabled if the SError interrupt is taken to an Exception level where the Statistical Profiling Extension is disabled.
• Might not allow error recovery software to isolate the event and error containment.

D6.4.5 Synchronization and Statistical Profiling

The profiling operation of the Statistical Profiling Extension:
• Makes indirect reads and indirect writes of System registers.
• Writes to memory.
• Makes further indirect writes to PMBPTR_EL1 as a result of an external abort on a write to memory.

The indirect reads of the PMSCR_EL1.{E1SPE, E0SPE} and PMSCR_EL2.{E2SPE, E0HSPE} controls when determining whether to select an operation for profiling are treated as indirect reads made by the instruction being executed, and subject to the standard requirements for synchronization.

Otherwise, although the profiling operation is generated by a sampled operation, the profiling operation executes independently of the instructions that are executed on the PE, and acts as a separate memory observer from the PE in the system.

A DSB instruction guarantees that all memory transactions that are made by the PE are observable by writes made by a profiling operation relating to a sampled operation in program order after the DSB instruction.

A Context synchronization event guarantees that a direct write to a System register made by the PE in program order before the context synchronization event are observable by indirect reads and indirect writes of the same System register made by a profiling operation relating to a sampled operation in program order after the context synchronization event.

To synchronize previous profiling operations, software must execute a PSB CSYNC Buffer Synchronization instruction.

Note

The PSB CSYNC instruction is not defined in the AArch32 instruction set architecture.

Following a context synchronization event, a PSB CSYNC instruction is guaranteed to synchronize the profiling operations for all instructions that are executed in program order before the context synchronization event.

Synchronized by the PSB CSYNC instruction means:
• A direct read of a System register in program order following a PSB CSYNC instruction requires explicit synchronization to observe an indirect write to the same System register made by a profiling operation synchronized by the PSB CSYNC instruction.
• An indirect write to a System register made by a profiling operation synchronized by a PSB CSYNC instruction does not affect a direct write to the same System register made in program order following the PSB CSYNC instruction.
• A direct write to a System register in program order following a PSB CSYNC instruction is not allowed to affect an indirect read of the same System register made by a profiling operation synchronized by the PSB CSYNC instruction.
• A DSB instruction in program order following a PSB CSYNC instruction does not complete before the writes to the Profiling Buffer of sample records for profiling operations synchronized by the PSB CSYNC instruction have completed. The DSB instruction must apply to both loads and stores.

For the indirect write to PMBSR_EL1 that is made as a result of an external abort on a write of a sample record to memory, the synchronization rules apply only after the write has completed.
Although the Statistical Profiling Extension acts as another observer in the system, for determining the Shareability domain of the DS B instructions, the writes of sample records are treated as coming from the PE that is being profiled.

Note

If the Statistical Profiling Extension is not disabled when the context synchronization event occurs, further profiling operations might be generated that are not guaranteed to be synchronized by the PSB CSYNC instruction.

If the PE takes an exception to an Exception level where the Statistical Profiling Extension is disabled, no new operations are selected for sampling. The Statistical Profiling Extension is always disabled if the owning Exception level is a lower Exception level than the current Exception level.

In the absence of a context synchronization event, a PSB CSYNC instruction is not required to execute in program order with respect to sampled operations.

D6.4.6 UNPREDICTABLE behavior

In the absence of correct context synchronization events, it is UNPREDICTABLE whether an indirect read of a System register made by a profiling operation will return the old or the new values.

If the indirect reads mean that ProfilingBufferEnabled() returns FALSE when a sample record or records are about to be written to the physical address, then it is further UNPREDICTABLE whether the sample record or records:

• Are written to memory.
• Are silently discarded and not written to memory.
• Are discarded and not written to memory, and a Profiling Buffer management interrupt is generated:
  — PMBSR_EL1.DL is set to 1.
  — PMBSR_EL1.EC is set to 0x00.
  — PMBSR_EL1.BSC is set to 0x00 to indicate that the buffer is not full.

This means that software must execute a PSB CSYNC instruction to force any sample records to be written to the Profiling Buffer before changing context.
D6.4 Profiling Buffer management interrupt
Chapter D7
Statistical Profiling Extension Sample Record Specification

This chapter describes the sample records generated by the Statistical Profiling Extension. It contains the following sections:

- _About the Statistical Profiling Extension Sample Records_ on page D7-2296.
- _Alphabetical list of Statistical Profiling Extension packets_ on page D7-2299.
D7.1 About the Statistical Profiling Extension Sample Records

The sample record format is self-describing and extensible. This format allows software to parse profile data even when that profile data contains extended information.

The Statistical Profiling Extension writes a series of sample records to memory, each record consisting of a sequence of packets, and each packet consisting of:

- One or two header bytes.
- Zero, 1, 2, 4 or 8 payload bytes.

D7.1.1 Headers

The first header byte encodes the number of payload bytes:

- **0x00-0x1F**: Single byte header, no payload.
- **0x20-0x3F**: First byte of extended header. Second byte encodes the payload length.
- **0x40-0x4F, 0x80-0x8F, 0xC0-0xCF**: 8-bit payload.
- **0x50-0x5F, 0x90-0x9F, 0xD0-0xDF**: 16-bit payload.
- **0x60-0x6F, 0xA0-0xAF, 0xE0-0xEF**: 32-bit payload.
- **0x70-0x7F, 0xB0-0xBF, 0xF0-0xFF**: 64-bit payload.

D7.1.2 Records

A record consists of multiple packets. A record comprises, in ascending address order:

- A sequence of headers, each followed by their payload byte or bytes.
- Either:
  - An end packet header.
  - A timestamp packet.

Figures in this chapter show each packet as a sequence of bytes, with the LSB of each byte to the right and the most significant bit (MSB) to the left. Figure D7-1 shows this convention, and how it relates to data transmission for a packet with a header byte and two payload bytes.

**Figure D7-1 Convention for packet descriptions**

In some sections, the figures are split into separate figures for the header byte and payload bytes. For instance, where the number of payload bytes varies according to a field in the header.
D7.1.3 Byte order

Header bytes and payload bytes are written in ascending address order. Within a payload value, values are written in little-endian byte order.

D7.1.4 Protocol framing packets and forwards compatibility

The padding header, alignment command, timestamp packet, and end packet are protocol framing packets that frame the records created by the Statistical Profiling Extension. Only padding headers and alignment commands are permitted between records.

Note

PMBIDR_EL1.Align [TBDXREF] defines a minimum alignment for records. However, implementations must nevertheless create a valid protocol stream that can be parsed without knowledge of the minimum alignment.

The packet types are described in the following sections. Software must ignore unknown packets, using the size field encoded in the header. This includes packets containing reserved values in fields.

The following sections give an overview of the Statistical Profiling Extension packets and how the TPIU transmits them:

• Statistical Profiling Extension protocol packet headers

Note

This chapter describes packet transmission by a trace sink such as a TPIU. The Statistical Profiling Extension can send packets to any suitable trace sink. Regardless of the actual trace sink used, the Statistical Profiling Extension formats the packets as described in this chapter.

D7.1.5 Statistical Profiling Extension protocol packet headers

8-bit headers

For Address packets and Counter packets, the 8-bit header format is described as the short format.

Table D7-1 8-bit header encodings

<td><strong>Counter packet</strong> on page D7-2305</td>
</tr>
</tbody>
</table>
D7.2  Alphabetical list of Statistical Profiling Extension packets

D7.2.1  Address packet

The Address packet characteristics are:

**Purpose**  Provides an address value for the record. Addresses are always 64 bits.

**Attributes**  Multi-part packet comprising:
- 8 or 16-bit header.
- 64-bit payload.

**Address packet header**

When Extended format is used, the Address packet header bit assignments are:

<table>
<thead>
<tr>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td>1</td>
<td>0</td>
<td>SZ</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>INDEX[2:0]</td>
<td></td>
</tr>
</tbody>
</table>

When Short format is used, the Address packet header bit assignments are:

<table>
<thead>
<tr>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>

**Byte 1 bits [7:6], when Extended format, Byte 0 bits [7:6], when Short format**

This field reads as \(0b10\).

**SZ, byte 1 bits [5:4], when Extended format, SZ, byte 0 bits [5:4], when Short format**

Payload size. The defined values of this field are:
- \(0b11\)  Doubleword.

This field reads as \(0b11\).

**Byte 1 bit [3], when Extended format, Byte 0 bit [3], when Short format**

This bit reads as \(0b0\).

**Byte 0 bits [7:5], when Extended format**

This field reads as \(0b00\).

**Byte 0 bits [4:2], when Extended format**

This field reads-as-zero.

**INDEX, byte 0 bits [1:0], byte 1 bits [2:0], when Extended format, INDEX, byte 0 bits [2:0], when Short format**

The defined values of this field are:
- \(0b0000\)  Issued instruction virtual address (PC). Included for all operations.
- \(0b0001\)  Branch target address:
  - It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether this address is included for an Exception Return to an Exception level where profiling is disabled.
  - Included for all other branch and exception return instructions.
0b00010  Data access virtual address. Included for all load, store and atomic operations.
0b00011  Data access physical address:
  • It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether this address included for accesses that generate Permission or Access Flag faults.
  • Not included for all other accesses that generate an abort, or if disabled by CollectPhysicalAddress.
  • Included for all other load, store and atomic operations.
0b0011x  IMPLEMENTATION DEFINED address.
0b1xxxx  IMPLEMENTATION DEFINED address.
All other values are reserved.
In the Short format header, bits [4:3] are zero.

**Address packet payload**

When Data access physical address, the Address packet payload bit assignments are:

```
   7 6 5 4 3 2 1 0
```

<table>

**TAG byte <7>, when Data access virtual address**

Top-byte tag.

If the value of the applicable TBI bit is 1, a data access virtual address includes the top-byte tag. Otherwise this field reads-as-zero.
NS, byte 7 bit [7], when Instruction virtual address

Non-secure state. The Security state associated with the address. For an issued instruction virtual address (PC) this is the Security state the instruction was executed in. For a branch target address, this is the Security state at the target of the branch. The defined values of this bit are:

0 Secure state.
1 Non-secure state.

--- Note ---
For an Exception Return, the Security state at the target of the branch might be different to the Security state the instruction was executed in.

NS, byte 7 bit [7], when Data access physical address

Physical address space identifier. The Security attribute for the physical address. The defined values of this bit are:

0 Secure physical address space.
1 Non-secure physical address space.

EL, byte 7 bits [6:5], when Instruction virtual address

Exception level. The Exception level associated with the address. For an issued instruction virtual address (PC) this is the Exception level the instruction was executed in. For a branch target address, this is the Exception level at the target of the branch. The defined values of this field are:

0b00 EL0.
0b01 EL1.
0b10 EL2.
0b11 EL3.

--- Note ---
For an Exception Return, the Exception level at the target of the branch might be different to the Exception level the instruction was executed in.

Byte 7 bits [6:0], when Data access physical address

This field reads as 0b000000.

Byte 7 bits [4:0], when Instruction virtual address

This field reads as 0b00000.

ADDR, bytes <6:0>

D7.2.2 Alignment command

The Alignment command characteristics are:

**Purpose**  Allows the PE to create alignment to a naturally aligned address boundary in the buffer for the next protocol byte. Alignment bytes must be ignored.

**Attributes**  16-bit packet.

**Field descriptions**

The Alignment command bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th>Field description</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>64 Kbyte alignment.</td>
</tr>
</tbody>
</table>

**Note**

The address of the next protocol byte is aligned to a multiple of the specified size. There will always be fewer than this number of bytes between the Alignment command and the next protocol byte.
D7.2.3 Context packet

The Context packet characteristics are:

**Purpose**
Provides context information for the record.

**Attributes**
Multi-part packet comprising:
- 8-bit header.
- 32-bit payload.

**Context packet header**

The Context packet header bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
<th>Bit Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>7 and 6</td>
<td>SZ</td>
<td>0b01</td>
</tr>
<tr>
<td>5 and 4</td>
<td>Payload size</td>
<td>0b10</td>
</tr>
<tr>
<td>3 and 2</td>
<td>INDEX</td>
<td>0b01</td>
</tr>
<tr>
<td>1 and 0</td>
<td>INDEX</td>
<td>0b00 or 0b01</td>
</tr>
</tbody>
</table>

**Byte 0 bits [7:6]**

This field reads as 0b01.

**SZ, byte 0 bits [5:4]**

Payload size. The defined values of this field are:
- 0b10: Word.

This field reads as 0b10.

**Byte 0 bits [3:2]**

This field reads as 0b01.

**INDEX, byte 0 bits [1:0]**

Identifies the context value. The defined values of this field are:
- 0b00: CONTEXTIDR_EL1. Included for all operations if enabled by CollectContextIDR1.
- 0b01: CONTEXTIDR_EL2. Included for all operations in Non-secure state if enabled by CollectContextIDR2.

All other values are reserved.

**Context packet payload**

The Context packet payload bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
<th>Bit value</th>
</tr>
</thead>
<tbody>
<tr>
<td>7 and 6</td>
<td>CONTEXT[7:0]</td>
<td></td>
</tr>
<tr>
<td>5 and 4</td>
<td>CONTEXT[15:8]</td>
<td></td>
</tr>
<tr>
<td>3 and 2</td>
<td>CONTEXT[23:16]</td>
<td></td>
</tr>
<tr>
<td>1 and 0</td>
<td>CONTEXT[31:24]</td>
<td></td>
</tr>
</tbody>
</table>

**CONTEXT, bytes <3:0>**

The context value.
D7.2.4 Counter packet

The Counter packet characteristics are:

**Purpose**
Count of cycles the operation spent performing all or part of its behavior. The counter value occupies the least significant bits of the payload. The remaining bits are set to zero.

**Attributes**
Multi-part packet comprising:
- 8 or 16-bit header.
- 16-bit payload.

### Counter packet header

When Extended format, the Counter packet header bit assignments are:

```
<table>
<thead>
<tr>
<th>Byte 1</th>
<th>Byte 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>
```

When Short format, the Counter packet header bit assignments are:

```
<table>
<thead>
<tr>
<th>Byte 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
</tr>
</tbody>
</table>
```

**Byte 1 bits [7:6], when Extended format, Byte 0 bits [7:6], when Short format**
This field reads as **0b10**.

**SZ, byte 1 bits [5:4], when Extended format, SZ, byte 0 bits [5:4], when Short format**
Payload size. The defined values of this field are:
- **0b01** Halfword.
  This field reads as **0b01**.

**Byte 1 bit [3], when Extended format, Byte 0 bit [3], when Short format**
This bit reads as **0b1**.

**Byte 0 bits [7:5], when Extended format**
This field reads as **0b001**.

**Byte 0 bits [4:2], when Extended format**
This field reads-as-zero.

**INDEX, byte 0 bits [1:0], byte 1 bits [2:0], when Extended format, INDEX, byte 0 bits [2:0], when Short format**
The defined values of this field are:
- **0b00000** Total latency. Cycle count from the operation being dispatched for issue to the operation being complete. Included for all operations.
- **0b00001** Issue latency. Cycle count from the operation being dispatched for issue to the operation being issued for execution. This counts any delay in waiting the operation being ready to issue. Included for all operations.
- **0b00010** Translation latency. Cycle count from a virtual address being passed to the MMU for translation to the result of the translation being available. Included for all load, store and atomic operations.
- **0b0011x** IMPLEMENTATION DEFINED counter value.
0b1xxxx IMPLEMENTATION DEFINED counter value.
All other values are reserved.
In the Short format header, bits [4:3] are zero.
Dispatched for issue means:
• The operation has been decoded.
• The operation might not be ready to start execution because it is waiting for input values. The operation might be put into a queue.
Issued for execution means the operation is ready to start executing:
• For example, for a memory operation, this should be indicative of the cycle count from memory operation being dispatched for issue to access being initiated (virtual address).
Complete means:
• The operation has completed execution and is no longer capable of stalling any instruction that consumes its output.
• It is IMPLEMENTATION DEFINED whether the operation has committed its results to the architectural state of the PE.
• For example:
  — For an arithmetic, floating-point, or SIMD operation with variable timing, such as divide, the results of the operation are available.
  — For load and atomic operations that return data, all data have been returned from memory.
  — For store and atomic operations that do not return data, it is not required that the store has reached its end point for it to be complete.
  — For branch operations, the branch has been resolved as taken or not taken.
  — For barrier operations, the barrier has completed.
For WFE and WFI operations, it is IMPLEMENTATION DEFINED whether:
• The instruction is complete before the PE enters a low-power state or when the PE wakes from the low-power state.
• Counters count in the low power state.
• Sampling an operation is itself a wake-up event.

Counter packet payload
The Counter packet payload bit assignments are:

Byte 0 bits [7:4]
COUNT[7:0]

Byte 0

Byte 1 bits [7:4]
This field reads-as-zero.

COUNT, byte 1 bits [3:0], byte <0>, when a 12-bit counter is implemented
The counter value occupies the least significant bits of the payload. The remaining bits are set to zero. The counters are:
• Unsigned numbers.
• 12 bits.
• Saturating.
The value 0xFFF indicates the count has saturated.
D7.2.5 Data Source packet

The Data Source packet characteristics are:

**Purpose**
If the implementation includes support for indicating the loaded data source, the Data Source packet indicates where the data returned for a load operation was sourced. It might also include other information, such as the state of the data at the source. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether this is included for load and atomic operations that generate an external abort. It is IMPLEMENTATION DEFINED whether this is included for atomic operations that do not return data to a PE register. Included for all other load and atomic operations.

**Attributes**
Multi-part packet comprising:
- 8-bit header.
- 8 or 16-bit payload.

**Data Source packet header**
The Data Source packet header bit assignments are:

<table>
<thead>
<tr>
<th>Bit 7</th>
<th>Bit 6</th>
<th>Bit 5</th>
<th>Bit 4</th>
<th>Bit 3</th>
<th>Bit 2</th>
<th>Bit 1</th>
<th>Bit 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>0</td>
<td>0</td>
<td>1</td>
<td>1</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Byte 0 bits [7:6]**
This field reads as 0b01.

**SZ, byte 0 bits [5:4]**
Payload size. The defined values of this field are:
- 0b00: Byte.
- 0b01: Halfword.

**Byte 0 bits [3:0]**
This field reads as 0b0011.

**Data Source packet payload**
When SZ == 0b00, the Data Source packet payload bit assignments are:

<table>
<thead>
<tr>
<th>Bit 7</th>
<th>Bit 6</th>
<th>Bit 5</th>
<th>Bit 4</th>
<th>Bit 3</th>
<th>Bit 2</th>
<th>Bit 1</th>
<th>Bit 0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>SOURCE</td>
<td></td>
</tr>
</tbody>
</table>

When SZ == 0b01, the Data Source packet payload bit assignments are:

<table>
<thead>
<tr>
<th>Bit 7</th>
<th>Bit 6</th>
<th>Bit 5</th>
<th>Bit 4</th>
<th>Bit 3</th>
<th>Bit 2</th>
<th>Bit 1</th>
<th>Bit 0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>SOURCE[7:0]</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>SOURCE[15:8]</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**SOURCE, byte <0>, when SZ == 0b00, SOURCE, bytes <1:0>, when SZ == 0b01**

Because the list of data sources varies from system to system, the definition of this field is IMPLEMENTATION DEFINED. If a sampled operation generated multiple data accesses, it is IMPLEMENTATION DEFINED how the data source information is combined.
D7.2.6 End packet

The End packet characteristics are:

Purpose: Defines the end of a record if a Timestamp packet is not present.

Attributes: 8-bit packet.

Field descriptions

The End packet bit assignments are:

<table>
<thead>
<tr>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>1</td>
</tr>
</tbody>
</table>

Byte <0>

This field reads as 0b00000001.
Events packet

The Events packet characteristics are:

Purpose  Indicates up to 64 events generated by the sampled operation.

Attributes  Multi-part packet comprising:
  •  8-bit header.
  •  8, 16, 32, or 64-bit payload.

Events packet header

The Events packet header bit assignments are:

<table>
<thead>
<tr>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>SZ</td>
<td>0</td>
<td>0</td>
<td>1</td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

Byte 0 bits [7:6]

This field reads as 0\text{b}01.

SZ, byte 0 bits [5:4]

Payload size. The defined values of this field are:

- 0\text{b}00  Byte.
- 0\text{b}01  Halfword.
- 0\text{b}10  Word.
- 0\text{b}11  Doubleword.

Software must treat bits that are not output as zero.

Byte 0 bits [3:0]

This field reads as 0\text{b}0010.

Events packet payload

When SZ == 0\text{b}00, the Events packet payload bit assignments are:

<table>
<thead>
<tr>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
</table>

When SZ == 0\text{b}01, the Events packet payload bit assignments are:

<table>
<thead>
<tr>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
</table>
When $SZ == 0b10$, the Events packet payload bit assignments are:

<table>
<thead>
<tr>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

When $SZ == 0b11$, the Events packet payload bit assignments are:

<table>
<thead>
<tr>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

**E[63:48], bytes <7:6>, when $SZ == 0b11**

Events 63 to 48. IMPLEMENTATION DEFINED.

**Bytes <5:4,2>, byte 1 bit [3], when $SZ == 0b11**

This field reads-as-zero.

**E[31:24], byte <3>, when $SZ == 0b10$, or when $SZ == 0b11**

Events 31 to 24. IMPLEMENTATION DEFINED.

**Byte <2>, byte 1 bit [3], when $SZ == 0b10**

This field reads-as-zero.

**E[15:12], byte 1 bits [7:4], when $SZ == 0b01$, when $SZ == 0b10$, or when $SZ == 0b11**

Events 15 to 12. IMPLEMENTATION DEFINED.

**Byte 1 bit [3], when $SZ == 0b01**

This bit reads-as-zero.
E[10], byte 1 bit [2], when SZ == 0b01, when SZ == 0b10, or when SZ == 0b11

Remote access. The defined values of this bit are:
0  Did not cause access to another socket.
1  Load/store operation caused an access to another socket in a multi-socket system. This includes each data memory access that accesses another socket in a multi-socket system, including those that do not return data.

Note
See also REMOTE_ACCESS.

E[9], byte 1 bit [1], when SZ == 0b01, when SZ == 0b10, or when SZ == 0b11

Last Level cache miss. The defined values of this bit are:
0  Did not miss Last Level cache.
1  Load/store operation caused an access to at least the Last Level cache but is not completed by the Last Level cache. That is, each:
   • Load operation that does not return data from the Last Level cache.
   • Store operation that does not update the Last Level cache.

The event is not set for operations that are completed by a cache above the Last Level cache.

Note
See also LL_CACHE_MISS.

E[8], byte 1 bit [0], when SZ == 0b01, when SZ == 0b10, or when SZ == 0b11

Last Level cache access. The defined values of this bit are:
0  Did not access Last Level data or unified cache.
1  Load/store operation caused a cache access to at least the Last Level data or unified cache.

Note
The architecture does not define the Last Level cache. The Last Level cache is typically the largest cache on this device shared by all PEs in the inner or outer Shareable domain of this PE. In a multi-socket system, it is IMPLEMENTATION DEFINED whether this includes caches on other sockets.

Note
See also LL_CACHE.

E[7], byte 0 bit [7]

Mispredicted. The defined values of this bit are:
0  Did not cause correction to the predicted program flow.
1  A branch that caused a correction to the predicted program flow.

E[6], byte 0 bit [6]

Not taken. The defined values of this bit are:
0  Did not fail condition code check.
1  A conditional instruction that failed its condition code check. This includes conditional branches, compare-and-branch, conditional select, and conditional compares:
   • For a conditional branch or compare-and-branch instruction, this means the branch was not taken.
   • For a conditional select, this means the second operand was written to the result.
For a condition compare, this means the condition flags were set to the immediate value and not the result of the compare.

E[5], byte 0 bit [5]

TLB walk. The defined values of this bit are:

0  Did not generate TLB walk.
1  Load/store operation that causes a refill of a data or unified TLB, involving at least one translation table walk access. This includes each complete or partial translation table walk that causes an access to memory, including to data or translation table walk caches.

Note
See also DTLB_WALK.

E[4], byte 0 bit [4]

TLB access. The defined values of this bit are:

0  Did not access TLB.
1  Load/store operation caused an access to at least the first level of data or unified TLB.

Note
See also L1D_TLB.

E[3], byte 0 bit [3]

Level 1 Data cache refill. The defined values of this bit are:

0  Did not cause level 1 data cache refill.
1  Load/store operation caused a refill of at least the first level of data or unified cache. This includes each data memory access that causes a refill from outside the cache. It excludes accesses that do not cause a new cache refill but are satisfied from refilling data of a previous miss.

Note
See also L1D_CACHE_REFILL.

E[2], byte 0 bit [2]

Level 1 Data cache access. The defined values of this bit are:

0  Did not access level 1 data cache.
1  Load/store operation caused a cache access to at least the first level of data or unified cache.

Note
See also L1D_CACHE.

E[1], byte 0 bit [1]

Architecturally retired. The defined values of this bit are:

0  Did not retire.
1  Committed its results to the architectural state of the PE, or completed with a synchronous architectural exception.

Note
A conditional instruction can retire even if it fails its condition code check.
E[0], byte 0 bit [0]

Generated exception. The defined values of this bit are:

0  Did not generate an exception.
1  Completed with a synchronous exception.

If E[1] in the same Events packet is set to 0, then the meaning of this bit is IMPLEMENTATION DEFINED.
D7.2.8 Operation Type packet

The Operation Type packet characteristics are:

**Purpose**
Defines the type of operation sampled. Included for all operations.

**Attributes**
Multi-part packet comprising:
- 8-bit header.
- 8-bit payload.

**Operation Type packet header**

The Operation Type packet header bit assignments are:

```
<table>
<thead>
<tr>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td></td>
<td></td>
<td>1</td>
<td>0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

**Byte 0 bits [7:6]**
This field reads as 0b01.

**SZ, byte 0 bits [5:4]**
Payload size. The defined values of this field are:
- 0b00 Byte.
  This field reads as 0b00.

**Byte 0 bits [3:2]**
This field reads as 0b10.

**CLASS, byte 0 bits [1:0]**
Top-level instruction class. The defined values of this field are:
- 0b00 Other.
- 0b01 Load, store, or atomic.
- 0b10 Branch or exception return.
  All other values are reserved.

**Operation Type packet payload (Other)**

The Operation Type packet payload (Other) bit assignments are:

```
<table>
<thead>
<tr>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>SUBCLASS</td>
<td></td>
</tr>
</tbody>
</table>
```

**SUBCLASS, byte <0>**
Second-level instruction class. Defines the type of instruction. The defined values of this field are:
- 0x00 Other (unconditional) instruction.
- 0x01 Conditional instruction or select.
  All other values are reserved.
Operation Type packet payload (Branch)

The Operation Type packet payload (Branch) bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUBCLASS, byte &lt;0&gt;</td>
<td>Second-level instruction class. Describes the branch type. The defined values of this field are:</td>
</tr>
<tr>
<td>0b0000000x</td>
<td>Direct branch.</td>
</tr>
<tr>
<td>0b0000001x</td>
<td>Indirect branch.</td>
</tr>
<tr>
<td>All other values</td>
<td>reserved.</td>
</tr>
<tr>
<td>COND, byte 0 bit [0]</td>
<td>Conditional. The defined values of this bit are:</td>
</tr>
<tr>
<td>0</td>
<td>Unconditional branch.</td>
</tr>
<tr>
<td>1</td>
<td>Conditional branch.</td>
</tr>
</tbody>
</table>

Operation Type packet payload (Load/store)

When Extended load/store, the Operation Type packet payload (Load/store) bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUBCLASS, byte &lt;0&gt;</td>
<td>Second-level instruction class. Indicates the load/store type. The defined values of this field are:</td>
</tr>
<tr>
<td>0b0000000x</td>
<td>A load/store targeting the general-purpose registers, other than an atomic operation, load-acquire, store-release or exclusive.</td>
</tr>
<tr>
<td>0b0000001x</td>
<td>An atomic operation, load-acquire, store-release or exclusive. Bits [4:2] are further subdivided as described by the AR, EXCL and AT fields.</td>
</tr>
<tr>
<td>0b0000010x</td>
<td>A load/store targeting the SIMD&amp;FP registers.</td>
</tr>
<tr>
<td>All other values</td>
<td>reserved.</td>
</tr>
</tbody>
</table>
AR, byte 0 bit [4], when Extended load/store
Acquire/Release. The defined values of this bit are:
0   Load/store/atomic without Acquire or Release semantics.
1   Load/store/atomic with Acquire or Release semantics.

EXCL, byte 0 bit [3], when Extended load/store
Exclusive. The defined values of this bit are:
0   Load/store/atomic without Exclusive.
1   Load/store with Exclusive.
This bit is RES0 if AT == 1.

AT, byte 0 bit [2], when Extended load/store
Atomic load/store. The defined values of this bit are:
0   Not atomic.
1   Atomic.

LDST, byte 0 bit [0]
Store not load. The defined values of this bit are:
0   Load or swap.
1   Store.
### D7.2.9 Padding

The Padding characteristics are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Purpose</strong></td>
<td>Allows the PE to create alignment in the protocol buffer.</td>
</tr>
<tr>
<td><strong>Attributes</strong></td>
<td>8-bit packet.</td>
</tr>
</tbody>
</table>

#### Field descriptions

The Padding bit assignments are:

<table>
<thead>
<tr>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

**Byte <0>**

This field reads as `0b00000000.`
D7.2.10 **Timestamp packet**

The Timestamp packet characteristics are:

**Purpose**

The 64-bit timestamp value when the operation was sampled. The Timestamp packet must come at the end of the record. If the Timestamp packet is not present, an **End packet** must come at the end of the record.

**Attributes**

Multi-part packet comprising:

- 8-bit header.
- 64-bit payload.

**Timestamp packet header**

The Timestamp packet header bit assignments are:

<table>
<thead>
<tr>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>1</td>
</tr>
</tbody>
</table>

**Byte 0 bits [7:6]**

This field reads as \(0b01\).

**SZ, byte 0 bits [5:4]**

Payload size. The defined values of this field are:

- \(0b11\) Doubleword.

This field reads as \(0b11\).

**Byte 0 bits [3:0]**

This field reads as \(0b0001\).
Timestamp packet payload

The Timestamp packet payload bit assignments are:

<table>
<thead>
<tr>
<th>Bit Field</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>TS[7:0]</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>TS[15:8]</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>TS[23:16]</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>TS[31:24]</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>TS[39:32]</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>TS[47:40]</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>TS[55:48]</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>TS[63:56]</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**TS, bytes <7:0>**

Timestamp value when the operation was sampled. The value depends on the result of `aarch64/debug/statisticalprofiling/CollectRecord()`:

- If `TimeStamp_Virtual`, this is the virtual timestamp, `CNTVCT_EL0`.
- If `TimeStamp_Physical`, this is the physical timestamp, `CNTPCT_EL0`.
- If `TimeStamp_None`, the timestamp packet is not included and an **End packet** must come at the end of the record.

However, if the Generic Timer System counter is disabled and `aarch64/debug/statisticalprofiling/CollectTimeStamp()` returns a value other than `TimeStamp_None`, then it is **IMPLEMENTATION DEFINED** whether:

- The Statistical Profiling Extension behaves as if `aarch64/debug/statisticalprofiling/CollectTimeStamp()` returns the value `TimeStamp_None`.
- The value of this field in the record is **UNKNOWN**.

**Note**

This relaxation refers to when the actual System counter is disabled, that is, `CNTEN.EN == 0`. It does not apply when the System counter is enabled but not accessible at the current Exception level.
Chapter D8
The Generic Timer in AArch64 state

This chapter describes the implementation of the ARM Generic Timer. It includes an overview of the AArch64 System register interface to an ARM Generic Timer.

It contains the following sections:

• About the Generic Timer on page D8-2322.
• The AArch64 view of the Generic Timer on page D8-2326.

Chapter G5 The Generic Timer in AArch32 state describes the AArch32 view of the Generic Timer, and Chapter I2 System Level Implementation of the Generic Timer describes the system level implementation of the Generic Timer.
D8.1 About the Generic Timer

Figure D8-1 shows an example system-on-chip that uses the Generic Timer as a system timer. In this figure:

- This manual defines the architecture of the individual PEs in the multiprocessor blocks.
- The ARM Generic Interrupt Controller Architecture Specification defines a possible architecture for the interrupt controllers.
- Generic Timer functionality is distributed across multiple components.

The Generic Timer:

- Provides a system counter, that measures the passing of time in real-time.

  **Note**
  The Generic Timer can also provide other components at a system level, but Figure D8-1 does not show any such components.

- Supports **virtual counters** that measure the passing of virtual-time. That is, a virtual counter can measure the passing of time on a particular virtual machine.

- Timers, that can trigger events after a period of time has passed. The timers:
  — Can be used as count-up or as count-down timers.
  — Can operate in real-time or in virtual-time.

This chapter describes an instance of the Generic Timer component that Figure D8-1 shows as Timer_0 or Timer_1 within the Multiprocessor A or Multiprocessor B block. This component can be accessed from AArch64 state or AArch32 state, and this chapter describes access from AArch64 state. Chapter G5 The Generic Timer in AArch32 state describes access to this component from AArch32 state.

A Generic Timer implementation must also include a memory-mapped system component. This component:

- Must provide the System counter shown in Figure D8-1

  Optionally, can provide timer components for use at a system level.

Chapter I2 System Level Implementation of the Generic Timer describes this memory-mapped component.
D8.1.1 The full set of Generic Timer components

Within a system that might include multiple PEs, a full set of Generic Timer components is as follows:

**The system counter**

This provides a uniform view of system time, see *The system counter on page D8-2324*. Because this must be implemented at the system level, it is accessed through *The system level memory-mapped implementation of the Generic Timer*. However, during initialization, a status register in each implemented timer in the system must be programmed with the frequency of the system counter, so that software can read this frequency.

**PE implementations of the Generic Timer**

Each PE implementation of the Generic Timer provides the following components:

- A physical counter, that gives access to the count value of the system counter.
- A virtual counter, that gives access to virtual time. In AArch64 state, the CNTVOFF_EL2 register defines the offset between physical time, as defined by the value of the system counter, and virtual time.
- A number of timers. In an implementation where all Exception levels are implemented and can use AArch64 state, the timers that are accessible from AArch64 state are:
  - An EL1 physical timer.
  - An EL2 physical timer.
  - An EL3 physical timer.
  - A virtual timer.

*The AArch64 view of the Generic Timer on page D8-2326* describes these components.

**The system level memory-mapped implementation of the Generic Timer**

The memory-mapped registers that control the components of the system level implementation of the Generic Timer are grouped into *frames*. The Generic Timer architecture defines the offset of each register within its frame, but the base address of each frame is *IMPLEMENTATION DEFINED*, and defined by the system.

Each system level component has one or two register frames. The possible system level components are:

**The memory-mapped counter module, required**

This module controls the system counter. It has two frames:

- A control frame, CNTControlBase.
- A status frame, CNTReadBase.

**The memory-mapped timer control module, required**

The system level implementation of the Generic Timer can provide up to eight timers, and the memory-mapped timer control module identifies:

- Which timers are implemented.
- The features of each implemented timer.

This module has a single frame, CNTCTLBase.

**Memory-mapped timers, optional**

An implemented memory-mapped timer:

- Must provide a privileged view of the timer, in the CNTBase\textsuperscript{N} frame.
- Optionally, provides an unprivileged view of the timer in the CNTEL0Base\textsuperscript{N} frame.

\(N\) is the timer number, and the corresponding frame number, in the range 0-7.

*Chapter 12 System Level Implementation of the Generic Timer* describes these components.
D8.1.2 The system counter

The Generic Timer provides a system counter with the following specification:

- **Width**: At least 56 bits wide.
  The value returned by any 64-bit read of the counter is zero-extended to 64 bits.

- **Frequency**: Increments at a fixed frequency, typically in the range 1-50MHz.
  Can support one or more alternative operating modes in which it increments by larger amounts at a lower frequency, typically for power-saving.

- **Roll-over**: Roll-over time of not less than 40 years.

- **Accuracy**: ARM does not specify a required accuracy, but recommends that the counter does not gain or lose more than ten seconds in a 24-hour period.
  Use of lower-frequency modes must not affect the implemented accuracy.

- **Start-up**: Starts operating from zero.

The system counter, once configured and running, must provide a uniform view of system time. More precisely, it must be impossible for the following sequence of events to show system time going backwards:

1. Device A reads the time from the system counter.
2. Device A communicates with another agent in the system, Device B.
3. After recognizing the communication from Device A, Device B reads the time from the system counter.

The system counter must be implemented in an always-on power domain.

To support lower-power operating modes, the counter can increment by larger amounts at a lower frequency. For example, a 10MHz system counter might either increment:

- By 1 at 10MHz.
- By 500 at 20kHz, when the system lowers the clock frequency, to reduce power consumption.

In this case, the counter must support transitions between high-frequency, high-precision operation, and lower-frequency, lower-precision operation, without any impact on the required accuracy of the counter.

The CNTFRQ_EL0 register is intended to hold a copy of the current clock frequency to allow fast reference to this frequency by software running on the PE. For more information, see Initializing and reading the system counter frequency.

The mechanism by which the count from the system counter is distributed to system components is IMPLEMENTATION DEFINED, but each PE with a System register interface to the system counter must have a counter input that can capture each increment of the counter.

--- Note ---
So that the system counter can be clocked independently from the PE hardware, the count value might be distributed using a Gray code sequence. Gray-count scheme for timer distribution scheme on page K5-6470 gives more information about this possibility.

--- Note ---

Initializing and reading the system counter frequency

The CNTFRQ_EL0 register must be programmed to the clock frequency of the system counter. Typically, this is done only during the system boot process, by using the System register interface to write the system counter frequency to the CNTFRQ_EL0 register. Only software executing at the highest implemented Exception level can write to CNTFRQ_EL0.

--- Note ---

The CNTFRQ_EL0 register is UNKNOWN at reset, and therefore the counter frequency must be set as part of the system boot process.
Software can read the CNTFRQ_EL0 register, to determine the current system counter frequency, in the following states:

- EL2.
- Secure and Non-secure EL1.
- When CNTKCTL_EL1.EL0PCTEN is set to 1, Secure and Non-secure EL0.

**Memory-mapped controls of the system counter**

Some system counter controls are accessible only through the memory-mapped interface to the system counter. These controls are:

- Enabling and disabling the counter.
- Setting the counter value.
- Changing the operating mode, to change the update frequency and increment value.
- Enabling Halt-on-debug, that a debugger can then use to suspend counting.

For descriptions of these controls, see Chapter 12 *System Level Implementation of the Generic Timer*. 
D8.2 The AArch64 view of the Generic Timer

The following sections describe the components and features of a PE implementation of the Generic Timer, as seen from AArch64 state:

- **The physical counter.**
- **The virtual counter** on page D8-2327.
- **Event streams** on page D8-2328.
- **Timers** on page D8-2329.

D8.2.1 The physical counter

The PE includes a physical counter that contains the count value of the system counter. The CNTPCT_EL0 register holds the current physical counter value.

### Accessing the physical counter

Software with sufficient privilege can read CNTPCT_EL0 using a 64-bit System register read.

**CNTPCT_EL0:**

- Is always accessible from EL3, Non-secure EL2 and Secure EL1 states.
- Is accessible from Non-secure EL1 only when CNTHCTL_EL2.EL1PCTEN is set to 1. When the value of CNTHCTL_EL2.EL1PCTEN is 0, any attempt to access CNTPCT_EL0 from Non-secure EL1 is trapped to EL2.
- Is accessible from Secure EL0 state when the value of CNTKCTL_EL1.EL0PCTEN is 1. When the value of CNTKCTL_EL1.EL0PCTEN is 0, any attempt to access CNTPCT_EL0 is UNDEFINED.
- Is accessible from Non-secure EL0 when the value of CNTHCTL_EL2.EL1PCTEN is 1 and the value of CNTKCTL_EL1.EL0PCTEN is 1. Otherwise:
  - When the value of CNTKCTL_EL1.EL0PCTEN is 0, any attempt to access CNTPCT_EL0 from Non-secure EL0 generates an UNDEFINED exception.
  - When the value of CNTKCTL_EL1.EL0PCTEN is 1 and the value of CNTHCTL_EL2.EL1PCTEN is 0, any attempt to access CNTPCT_EL0 from Non-secure EL0 is trapped to EL2.

Reads of CNTPCT_EL0 can occur speculatively and out of order relative to other instructions executed on the same PE.

For example, if a read from memory is used to obtain a signal from another agent that indicates that CNTPCT_EL0 must be read, an ISB is used to ensure that the read of CNTPCT_EL0 occurs after the signal has been read from memory, as shown in the following code sequence:

```
loop                ; polling for some communication to indicate a requirement to read the timer
    LDR R1, [R2]  
    CMP R1, #1     
    BNE loop      
    ISB           ; without this, the CNTPCT could be read before the memory location in [R2]
                      ; has had the value 1 written to it
    MRS R1, CNTPCT
```
D8.2.2 The virtual counter

An implementation of the Generic Timer always includes a virtual counter, that indicates virtual time.

The virtual counter contains the value of the physical counter minus a 64-bit virtual offset. When executing at Non-secure EL1 or EL0, the virtual offset value relates to the current virtual machine.

The CNTVOFF_EL2 register contains the virtual offset. CNTVOFF_EL2 is only accessible from EL2 and EL3.

For more information, see Status of the CNTVOFF register.

The CNTVCT_EL0 register holds the current virtual counter value.

Accessing the virtual counter

Software with sufficient privilege can read CNTVCT_EL0 using a 64-bit System register read.

CNTVCT_EL0 is always accessible from Secure EL3, from Secure EL1 when EL3 is using AArch64, and from Non-secure EL1 and EL2.

In addition, when CNTKCTL_EL1.EL0VCTEN is set to 1, CNTVCT_EL0 is accessible from EL0.

When CNTKCTL_EL1.EL0VCTEN is set to 0, any attempt to access CNTVCT_EL0 from EL0 is UNDEFINED.

Reads of CNTVCT_EL0 can occur speculatively and out of order relative to other instructions executed on the same PE.

For example, if a read from memory is used to obtain a signal from another agent that indicates that CNTVCT_EL0 must be read, an ISB is used to ensure that the read of CNTVCT_EL0 occurs after the signal has been read from memory, as shown in the following code sequence:

```assembly
loop                ; polling for some communication to indicate a requirement to read the timer
     LDR R1, [R2]       ; without this, the CNTVCT could be read before the memory location in [R2]
     CMP R1, #1         ; has had the value 1 written to it
     BNE loop
     ISB
     MRS R1, CNTVCT
```

Status of the CNTVOFF register

All implementations of the Generic Timer include the virtual counter. Therefore, conceptually, all implementations include the CNTVOFF_EL2 register that defines the virtual offset between the physical count and the virtual count. CNTVOFF_EL2 is only accessible at EL2 or above. If EL2 is not implemented, the virtual counter uses a fixed virtual offset of zero.
D8.2.3 Event streams

An implementation that includes the Generic Timer can use the system counter to generate one or more event streams, to generate periodic wake-up events as part of the mechanism described in Wait for Event mechanism and Send event on page D1-1954.

--- Note ---

- An event stream might be used:
  - To impose a time-out on a Wait For Event polling loop.
  - To safeguard against any programming error that means an expected event is not generated.

An event stream is configured by:

- Selecting which bit, from the bottom 16 bits of a counter, triggers the event. This determines the frequency of the events in the stream.
- Selecting whether the event is generated on each 0 to 1 transition, or each 1 to 0 transition, of the selected counter bit.

The CNTKCTL_EL1.{EVNTEN, EVNTDIR, EVNTI} fields define an event stream that is generated from the virtual counter.

In all implementations, the CNTHCTL_EL2.{EVNTEN, EVNTDIR, EVNTI} fields define an event stream that is generated from the physical counter.

The operation of an event stream is as follows:

- The pseudocode variables PreviousCNTVCT and PreviousCNTPCT are initialized as:
  ```
  // Variables used for generation of the timer event stream.
  bits(64) PreviousCNTVCT = bits(64) UNKNOWN;
  bits(64) PreviousCNTPCT = bits(64) UNKNOWN;
  ```
- The pseudocode functions TestEventCNTV() and TestEventCNTP() are called on each cycle of the PE clock.
- The TestEventCNTx() pseudocode template defines the functions TestEventCNTV() and TestEventCNTP():
Timers

In an implementation of the Generic Timer that includes EL3, if EL3 can use AArch64, the following timers are implemented:

- An EL1 physical timer, that:
  - In Secure state, can be accessed from EL1.
  - In Non-secure state, can be accessed from EL1 unless those accesses are trapped to EL2.
  - When this timer can be accessed from EL1, an EL1 control determines whether it can be accessed from EL0.
- A Non-secure EL2 physical timer.
- A Secure EL3 physical timer. An EL3 control determines whether this register is accessible from Secure EL1.
- A virtual timer.

The output of each implemented timer:

- Provides an output signal to the system.
- If the PE interfaces to a Generic Interrupt Controller (GIC), signals a Private Peripheral Interrupt (PPI) to that GIC. In a multiprocessor implementation, each PE must use the same interrupt number for each timer.

Each timer:

- Is based around a 64-bit CompareValue that provides a 64-bit unsigned upcounter.
- Provides an alternative view of the CompareValue, called the TimerValue, that appears to operate as a 32-bit downcounter.
- Has, in addition, a 32-bit Control register.

The following sections describe:

- Operation of the CompareValue views of the timers
- Operation of the TimerValue views of the timers on page D8-2330.

Operation of the CompareValue views of the timers

The CompareValue view of a timer operates as a 64-bit upcounter. The timer condition is met when the appropriate counter reaches the value programmed into its CompareValue register. When the timer condition is met, an interrupt is generated if the interrupt is not masked in the corresponding timer control register, CNTP_CTL_EL0, CNTHP_CTL_EL2, CNTPS_CTL_EL1, or CNTV_CTL_EL0. For CNTP_CTL_EL0, the asserted interrupt is the same as the interrupt asserted by the Non-secure instance of the AArch32 register CNTP_CTL.

The operation of this view of a timer is:

\[
\text{TimerConditionMet} = (((\text{Counter}[63:0] - \text{Offset}[63:0])[63:0] - \text{CompareValue}[63:0]) \geq 0)
\]

Where:

- \text{TimerConditionMet} is TRUE if the timer condition for this counter is met, and FALSE otherwise.

a. In this column, CV indicates the CompareValue register, and TV indicates the TimerValue register.
b. Only when both the implementation includes ARMv8.1-VHE and the value of HCR_EL2.E2H is 1.
Counter
The physical counter value, that can be read from the CNTPCT_EL0 register.

Note
The virtual counter value, that can be read from the CNTVCT_EL0 register, is the value:

\[(\text{Counter} - \text{Offset})\]

Offset
For a physical timer it is zero, and for the virtual timer it is the virtual offset, held in the CNTVOFF_EL2 register.

CompareValue
The value of the appropriate CompareValue register, CNTP_CVAL_EL0, CNTHP_CVAL_EL2, CNTPS_CVAL_EL1, CNTV_CVAL_EL0, or CNTHV_CVAL_EL2.

In this view of a timer, Counter, Offset, and CompareValue are all 64-bit unsigned values.

Note
This means that a timer with a CompareValue of, or close to, 0xFFFF_FFFF_FFFF_FFFF might never meet its timer condition. However, there is no practical requirement to use values close to the counter wrap value.

Operation of the TimerValue views of the timers
The TimerValue view of a timer appears to operate as a signed 32-bit downcounter. A TimerValue register is programmed with a count value. This value decrements on each increment of the appropriate counter, and the timer condition is met when the value reaches zero. When the timer condition is met, an interrupt is generated if the interrupt is not masked in the corresponding timer control register, CNTP_CTL_EL0, CNTHP_CTL_EL2, CNTPS_CTL_EL1, or CNTV_CTL_EL0.

This view of a timer depends on the following behavior of accesses to TimerValue registers:

Reads
\[\text{TimerValue} = (\text{CompareValue} - (\text{Counter} - \text{Offset}))[31:0]\]

Writes
\[\text{CompareValue} = ((\text{Counter} - \text{Offset})[63:0] + \text{SignExtend}(\text{TimerValue})[63:0]\]

Where the arguments other than TimerValue have the definitions used in Operation of the CompareValue views of the timers on page D8-2329, and in addition:

TimerValue
The value of a TimerValue register, CNTP_TVAL_EL0, CNTHP_TVAL_EL2, CNTPS_TVAL_EL1, CNTV_TVAL_EL0, or CNTHV_TVAL_EL2.

In this view of a timer, values are signed in standard two’s complement form.

A read of a TimerValue register after the timer condition has been met indicates the time since the timer condition was met.

Note
• Operation of the CompareValue views of the timers on page D8-2329 gives a strict definition of TimerConditionMet. However, provided that the TimerValue is not expected to wrap as a 32-bit signed value when decremented from 0x80000000, the TimerValue view can be used as giving an effect equivalent to:

\[\text{TimerConditionMet} = (\text{TimerValue} \leq 0)\]

• Programming TimerValue to a negative number with magnitude greater than (Counter–Offset) can lead to an arithmetic overflow that causes the CompareValue to be an extremely large positive value. This potentially delays meeting the timer condition for an extremely long period of time.
Chapter D9
AArch64 System Register Encoding

This chapter describes the AArch64 System register encoding space. It contains the following sections:

- The System register encoding space on page D9-2332.
- $op0==0b10$, Moves to and from debug and trace System registers on page D9-2333.
- $op0==0b11$, Moves to and from non-debug System registers, Special-purpose registers on page D9-2335.
## D9.1 The System register encoding space

The A64 instruction set includes instructions that access the System register encoding space. These instructions provide:

- Access to **System registers**, including the debug registers, that provide system control, and system status information.
- Access to Special-purpose registers such as $SPSR_{ELx}$, $ELR_{ELx}$, and the equivalent fields of the Process State.
- The cache and TLB maintenance instructions and address translation instructions.
- Barriers and the CLREX instruction.
- Architectural hint instructions.

This section describes the parts of the System register encoding space that provides access to the System registers described in Chapter D10 AArch64 System Register Descriptions.

---

**Note**

- See *Fixed values in AArch64 instruction and System register descriptions* on page C2-157 for information about abbreviations used in the System instruction descriptions.
- In AArch32 state much of this functionality is provided through the System register interface described in *The AArch32 System register interface* on page G1-4693. In AArch64 state, the parameters used to characterize the System register encoding space are $\{\text{op0}, \text{op1}, \text{CRn}, \text{CRm}, \text{op2}\}$. These are based on the parameters that characterize the AArch32 System register encoding space, which reflect the original implementation of these registers, as described in *Background to the System register interface* on page G1-4694. In ARMv8, there is no particular significance to the naming of these parameters, and no functional distinction between the $\text{opn}$ parameters and the $\text{CRx}$ parameters.

---

*Principles of the System instruction class encoding* on page C5-328 describes some general properties of these encodings. *System instruction class encoding overview* on page C5-329 then describes the top-level encoding of these instructions, identifying that:

- Entries in the encoding space are characterized by the parameter set $\{\text{op0}, \text{op1}, \text{CRn}, \text{CRm}, \text{op2}\}$.
- $\text{op0}$ is the most significant parameter for determining allocations in this space.

Much of this encoding space is used for System instructions, as described in Chapter C5 The A64 System Instruction Class. This chapter describes only the part of the encoding space that is used for System registers, in the following sections:

- $\text{op0}=0b10$, *Moves to and from debug and trace System registers* on page D9-2333.
- $\text{op0}=0b11$, *Moves to and from non-debug System registers, Special-purpose registers* on page D9-2335.
D9.2 op0==0b10, Moves to and from debug and trace System registers

The instructions that move data to and from the debug, Execution environment, and trace System registers are encoded with op0==0b10. This means the encoding of these instructions is:

Note

- The section describes the use of all of the op0==0b10 region of the System register encoding space.
- These encodings access the registers that are equivalent to the AArch32 System registers in the (coproc==0b1110) encoding space.

The value of op1 provides the next level of decode of these instructions, as follows:

\[
\text{op1} = \{0, 3, 4\}
\]

**Note**

The standard encoding of debug registers is op0==0b10, op1==\{0, 3, 4\}. The registers in the op0==0b11 encoding space that are classified as debug registers are DLR_EL0, DSPSR_EL0, MDCR_EL2, MDCR_EL3, and SDER32_EL3. See Instructions for accessing non-debug System registers on page D9-2335 for the encodings of these registers.

**Note**

op1 == 1    Trace. See the appropriate trace architecture specification.

D9.2.1 Instructions for accessing debug System registers

The instructions for accessing debug System registers are:

- MSR <System register>, Xt ; Write to System register
- MRS Xt, <System register> ; Read from System register

Where <System_register> is the register name, for example MDCCSR_EL0.

This section includes only the System register access encodings for which both:

- op0 is 0b10.
- The value of op1 is one of \{0, 3, 4\}.

**Note**

These encodings access the registers that are equivalent to the AArch32 System registers in the (coproc==0b1110) encoding space.
Table D9-1 shows the mapping of the System register encodings for debug System register access.

a. Unimplemented breakpoint and watchpoint register access instructions are unallocated. CRm encodes <n>, the breakpoint or watchpoint number.

For more information see *Mapping of the System registers between the Execution states* on page D1-1965.
D9.3 \texttt{op0==0b11}, Moves to and from non-debug System registers, Special-purpose registers

The instructions that move data to and from non-debug System registers are encoded with \texttt{op0==0b11}, except that some of this encoding space is reserved for \textit{IMPLEMENTATION DEFINED} functionality. The encoding of these instructions is:

\begin{verbatim}
<table>

</table>
\end{verbatim}

The value of \texttt{CRn} provides the next level of decode of these instructions, as follows:

\texttt{CRn==\{0, 1, 2, 3, 5, 6, 7, 9, 10, 12, 13, 14\}}

See \textit{Instructions for accessing non-debug System registers}.

\texttt{CRn==4}

See \textit{Instructions for accessing Special-purpose registers on page C5-336.}

\texttt{CRn==\{11, 15\}}

See \textit{Reserved encodings for IMPLEMENTATION DEFINED registers on page D9-2345.}

D9.3.1 Instructions for accessing non-debug System registers

The A64 instructions for accessing System registers are:

\begin{verbatim}
MSR <System register>, Xt ; Write to System register
MRS Xt, <System register> ; Read from System register
\end{verbatim}

Where \texttt{<System_register>} is the register name, for example MIDR_EL1.

This section includes only the System register access encodings for which both:

- \texttt{op0} is \texttt{0b11}.
- The value of \texttt{CRn} is one of \{0, 1, 2, 3, 5, 6, 7, 9, 10, 12, 13, 14\}.

<td>0</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>1</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>
\end{verbatim}

See text for permitted values of \texttt{CRn}

Table D9-2 on page D9-2336 shows the encodings of the register access instructions. In the \textit{Notes} on page D9-2336 column of the table:

- \textbf{Config-RO} Means it is configurable whether read accesses are permitted. Write accesses are UNDEFINED.
- \textbf{Config-WO} Means it is configurable whether write accesses are permitted. Read accesses are UNDEFINED.
- \textbf{Config-RW} Means it is configurable whether accesses are permitted. Either read and write accesses are permitted, or read and write accesses are UNDEFINED.

See the register descriptions for information about the control that determines whether these accesses are permitted.

- b. GIC System register, see About the GIC System registers on page D9-2345 As that subsection describes, each ICV_* register uses the same encoding as the corresponding ICC_* register.
- e. Performance Monitors Extension System register, see Performance Monitors registers on page D10-2840.
- f. Required if the highest implemented Exception level can use both AArch32 and AArch64. If the highest implemented Exception level can use only AArch64 then it is IMPLEMENTATION DEFINED whether this register is implemented.
- g. Generic Timer System register, see Generic Timer registers on page D10-2917.
- h. When ARMv8.3-CCIDX is implemented, CCSIDR_EL1 is a 64-bit register. Otherwise, it is a 32-bit register.
- i. CCSIDR2_EL1 is implemented only when ARMv8.3-CCIDX is implemented.
- j. When AArch32 is not implemented, it is IMPLEMENTATION DEFINED whether CCSIDR2_EL1 is UNDEFINED or UNKNOWN.
- k. Config-RO at EL0. RO at EL1 if EL1 is not the highest implemented Exception level.
- l. Debug register in the op0==3 encoding space, see Debug registers on page D10-2765.
- m. Defined to allow access from AArch64 state to registers that are only used in AArch32 state.
### About the GIC System registers

From version 3.0 of the GIC architecture specification, the specification defines three groups of System registers, identified by the prefix of the register name:

- **ICC_** — GIC physical CPU interface System registers.
- **ICH_** — GIC virtual interface control System registers.
- **ICV_** — GIC Virtual CPU interface System registers.

**Note**

These registers are in addition to the GIC memory-mapped register groups GICC_, GICD_, GICH_, GICR_, GICV_, and GITS_.

When implemented, the GIC System registers form part of an ARM processor implementation, and therefore these registers are included in the register summaries. However, the registers are defined only in the GIC Architecture Specification.

As Table D9-2 on page D9-2336 shows, the ICV_* registers have the same {op0, op1, CRn, CRm, op2} encodings as the corresponding ICC_* registers. For these encodings, GIC register configuration fields determine which register is accessed.

For more information see the ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

### D9.3.2 Reserved encodings for IMPLEMENTATION DEFINED registers

The System register encoding space with op0==0b11 reserves the following encodings for IMPLEMENTATION DEFINED registers:

| 31 30 29 28|27 26 25 24|23 22 21 20|19 18 16|15|12|11|8|7|5|4|0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
|1|1|0|1|0|1|0|0|0|1|1|op1|1|x|1|CRm|op2|Rt|
|op0|CRn|

The value of `L` defines the access type and the use of `Rt` as follows:

- 0: Write the value in `Rt` to the IMPLEMENTATION DEFINED register.
- 1: Read the value of the IMPLEMENTATION DEFINED register to `Rt`.

For more information about these encodings see S3_<op1>_<_Cn>_<_Cm>_<_op2>, IMPLEMENTATION DEFINED registers on page D10-2646. As that section describes, any IMPLEMENTATION DEFINED registers are accessed in a similar way to architecturally-defined System registers, using MRS and MSR instructions, see:

- MRS on page C6-802.
- MSR (immediate) on page C6-803.
- MSR (register) on page C6-805.

See also Reserved encodings for IMPLEMENTATION DEFINED registers.

The ARM architecture guarantees not to define any register name prefixed with IMP_ as part of the standard ARM architecture.

**Note**

ARM strongly recommends that any register names created in the IMPLEMENTATION DEFINED register spaces be prefixed with IMP_ and postfixed with _ELx, where appropriate.
D9 AArch64 System Register Encoding
D9.3 op0==0b11, Moves to and from non-debug System registers, Special-purpose registers
Chapter D10
AArch64 System Register Descriptions

This chapter defines the AArch64 System registers. It contains the following sections:
• "About the AArch64 System registers" on page D10-2348.
• "General system control registers" on page D10-2357.
• "Debug registers" on page D10-2765.
• "Performance Monitors registers" on page D10-2840.
• "Statistical Profiling Extension registers" on page D10-2885.
• "Generic Timer registers" on page D10-2917.
D10.1 About the AArch64 System registers

The following sections describe common features of the AArch64 registers:

- General information about the AArch64 System registers.
- Fixed values in the System register descriptions.
- General behavior of accesses to the AArch64 System registers.
- Principles of the ID scheme for fields in ID registers on page D10-2354.

D10.1.1 General information about the AArch64 System registers

The structure of the System register descriptions has changed from that used in ARM® Architecture Reference Manual, ARMv8, for ARMv8-A architecture profile, Issue A.j and earlier:

- Information about the accessibility of the register from different Exception levels is given in the Accessibility section, that is the last but one section of a register description.
- Information about the traps and enables that apply to the register is given in the Traps and Enables section, that is the last section of a register description.

The information in these sections can depend on:

- The mnemonic that is used to access the register.
- The value of one or more of the controls {E2H, TGE, NS}.

These controls are:

- HCR_EL2.{E2H, TGE} fields.
- SCR_EL3.NS field.

Note

- These changes mean that the register descriptions can address:
  - Cases where a single register is accessible using more than one mnemonic, in different contexts, and that the accessibility can depend on the mnemonic that is used and the context in which it is used.
  - Cases where a single mnemonic can address different registers, depending on the context, and that the accessibility can also depend on the context.

These changes are needed to describe System register behaviors associated with the Virtualization Host Extension described in Virtualization Host Extensions on page D4-2183. However, they also improve the representation of many ARMv8.0 register descriptions.

- This change to the structure of System register descriptions does not apply to the description of memory-mapped registers such as those described in Chapter H9 External Debug Register Descriptions.

D10.1.2 Fixed values in the System register descriptions

See Fixed values in AArch64 instruction and System register descriptions on page C2-157. This section defines how the glossary terms RAZ, RES0, RAO, and RES1 can be represented in the System register descriptions.

System register width

The register descriptions in this chapter describe each register as either a 32-bit register or a 64-bit register. For registers described as 32-bit registers, the upper bits, bits[63:32], are RES0.

D10.1.3 General behavior of accesses to the AArch64 System registers

The following subsections give general information about the behavior of accesses to the System registers:

- Reset behavior of AArch64 System registers on page D10-2349.
- Synchronization requirements for AArch64 System registers on page D10-2349.
Reset behavior of AArch64 System registers

Reset values apply only to RW registers and fields, however:

- Some RO registers or fields, including feature ID registers and some status registers or register fields, always return a known value.

- Some RW and RO registers or register fields return status information about the PE. Unless the register description indicates that the value is UNKNOWN on reset, a read of the register immediately after a reset returns valid information.

- Some RW and RO registers and fields are aliases of other registers or fields. In these cases, the reset behavior of the aliased register or field determines the value returned by a read of the register immediately after a reset.

- WO registers that only have an effect on writes do not have meaningful reset values. However, an access to a WO register might affect underlying state, and that state might have a defined reset value.

- IMPLEMENTATION DEFINED registers have IMPLEMENTATION DEFINED reset behavior.

After a reset, only a limited subset of the PE state is guaranteed to be set to defined values. Also, for debug and trace System registers, reset requirements must take account of different levels of reset. For more information about the reset behavior of System registers when the PE resets into an Exception level that is using AArch64, see:

- PE state on reset to AArch64 state on page D1-1871.
- The appropriate Trace architecture specification, for the Trace System registers.

For a PE reset into an Exception level that is using AArch64, the architecture defines which AArch64 System registers have a defined reset value, and when that defined reset value applies. The register descriptions include this information, and PE state on reset to AArch64 state on page D1-1871 summarizes these architectural requirements. Otherwise, RW registers that have a meaningful reset value reset to an architecturally UNKNOWN value.

Note

When the PE resets into an Exception level that is using AArch32, no PE state that relates to execution in AArch64 state is accessible until another reset causes the Execution state to change to AArch64. Therefore, on a reset into AArch32 state, PE state that relates only to execution in AArch64 state cannot have a meaningful reset value.

Pseudocode description of resetting System registers

The AArch64.ResetSystemRegisters() pseudocode function resets all System registers, and register fields, that have defined reset values, as described in this section and PE state on reset to AArch64 state on page D1-1871.

Note

For debug and trace System registers, this function resets registers as defined for the appropriate level of reset.

Synchronization requirements for AArch64 System registers

Reads of the System registers can occur out of order with respect to earlier instructions executed on the same PE, provided that both:

- Any data dependencies between the instructions, including read-after-read dependencies, are respected.
- The reads to the register do not occur earlier than the most recent Context synchronization event to its architectural position in the instruction stream.

Note

In particular, the values read from System registers that hold self-incrementing counts, such as the Performance Monitors counters or the Generic Timer counter or timers, could be accessed from any time after the previous Context synchronization event. For example, where a memory access is used to communicate a read of such a
counter, an ISB must be inserted between the read of the memory location that is known to have returned its data, either as a result of a condition on that data or of the read having completed, and the read of the counter, if it is necessary that the counter returns a count value after the memory communication.

Direct writes using the instructions in Table D9-2 on page D9-2336 require synchronization before software can rely on the effects of changes to the System registers to affect instructions appearing in program order after the direct write to the System register. Direct writes to these registers are not allowed to affect any instructions appearing in program order before the direct write. The only exceptions are:

- All direct writes to the same register, that use the same encoding for that register, are guaranteed to occur in program order relative to each other
- All direct writes to a register occur in program order with respect to all direct reads to the same register using the same encoding.
- Any System register access that an ARM Architecture Specification or equivalent specification defines as not requiring synchronization.

Explicit synchronization occurs as a result of a Context synchronization event, which is one of the following events:

- Execution of an ISB instruction.
- Exception entry.
- Exception return.
- Execution of a DCPS instruction in Debug state.
- Execution of a DRPS instruction in Debug state.
- Exit from Debug state.

--- Note ---
The ISB and exception entry events are applicable both in Debug state and in Non-debug state.

--- Note ---
Conceptually, explicit synchronization occurs as the first step of each of these events, so that if the event uses state that has previously been changed but was not synchronized by the time of the event, the event is guaranteed to use the state as if it had been synchronized.

--- Note ---
This explicit synchronization applies as the first step of the execution of the events, and does not apply to any effect of System registers that apply to the fetch and decode of the instructions that cause these events, such as breakpoints or changes to the translation table.

In addition, any system instructions that cause a write to a System register must be synchronized before the result is guaranteed to be visible to subsequent direct reads of that System register.

Direct reads to any one of the following registers, using the same encoding, occur in program order relative to each other:

- ISR_EL1.
- The Generic Timer registers, that is, CNTPCT_EL0 and CNTVCT_EL0, and the Counter registers CNTP_TVAL_EL0, CNTV_TVAL_EL0, CNTHP_TVAL_EL2, and CNTPS_TVAL_EL1.
- DBGCLAIMCLR_EL1.
- The PMU Counters, that is, PMCCNTR_EL0, PMEVCNTR<\n>EL0, PMXEV CNTR_EL0, PMOVSCLR_EL0, and PMOVSSET_EL0.
- The Debug Communications Channel registers, that is, DBGDTRRX_EL0, DBGDTR_EL0, and MDCCSR_EL0.

All other direct reads of System registers can occur in any order if synchronization has not been performed.
Table D10-1 describes the synchronization requirements between two successive read or write accesses to the same register, where the ordering of the read or write accesses is:

1. Program order, in the event that both the reads or writes are caused by an instruction executed on this PE, other than one caused by a memory access by this PE.
2. The order of arrival of asynchronous reads and writes at the PE relative to the execution of instructions that cause reads or writes.
3. The order of arrival of asynchronous reads and writes at the PE relative to each other.

### Notes

The terms Direct read, Direct write, Indirect read, and Indirect write, as used in Table D10-1, are defined as follows:

**Direct read**
Where software uses a System register access instruction to read the register, see both:
- Instructions for accessing debug System registers on page D9-2333.
- Instructions for accessing non-debug System registers on page D9-2335.

Where a direct read of a register has a side-effect that changes the contents of a register, the effect of a direct read on that register is defined to be an indirect write. In this case, the indirect write is only guaranteed to have occurred, and be visible to subsequent direct or indirect reads or writes, if synchronization is performed after the direct read.

**Direct write**
Where software uses a System register access instruction to write to the register, see both:
- Instructions for accessing debug System registers on page D9-2333.
- Instructions for accessing non-debug System registers on page D9-2335.
Where a direct write to a register has an effect on the register that means that the value in the register is not always the last value that is written (as is the case with set and clear registers), the effect of a direct write on that register is defined to be an indirect write. In this case, the indirect write is only guaranteed to be visible to subsequent direct or indirect reads or writes if synchronization is performed after the direct write and before the subsequent direct or indirect reads or writes.

**Indirect read** Where an instruction uses a System register to establish operating conditions for the instruction, for example, the TTBR_ELx address or whether memory accesses are forced to be Non-cacheable. This includes situations where the contents of one System register selects what value is read or written using a different register. Indirect reads also include reads of the System register by external agents such as debuggers. Where an indirect read of a register has a side-effect that changes the contents of that register, that is defined to be an indirect write.

**Indirect write** Where a System register is written as the consequence of some other instruction, exception, operation, or by the asynchronous operation of an external agent, including the passage of time as seen in counters, timers, or performance counters, the assertion of interrupts, or writes from an external debugger.

**Note** Since an exception is context synchronizing, registers such as the Exception Syndrome registers that are indirectly written as part of exception entry do not require additional synchronization.

Where a direct read or write to a register is followed by an indirect write caused by an external agent, autonomous asynchronous event, or as a result of memory mapped write, synchronization is required to guarantee the order of those two accesses.

Where an indirect write caused by a direct write is followed by an indirect write caused by an external agent, autonomous asynchronous event, or as a result of memory mapped write, synchronization is required to guarantee the order of those two indirect accesses.

Where a direct read to one register causes a bit or field in a different register (or the same register using a different encoding) to be updated, the change to the different register (or same register using a different encoding) is defined to be an indirect write. In this case, the indirect write is only guaranteed to be visible to subsequent direct or indirect reads or writes if synchronization is performed after the direct read and before the subsequent direct or indirect reads or writes.

Where a direct write to one register causes a bit or field in a different register (or the same register using a different encoding) to be updated as a side-effect of that direct write (as opposed to simply being a direct write to the different encoding), the change to the different register (or same register using a different encoding) is defined to be an indirect write. In this case, the indirect write is only guaranteed to be visible to subsequent direct or indirect reads or writes if synchronization is performed after the direct write and before the subsequent direct or indirect reads or writes.

Where indirect writes are caused by the actions of external agents such as debuggers, or by memory-mapped reads or writes by the PE, then an indirect write by that agent and mechanism to a register, followed by an indirect read by that agent and mechanism to the same register using the same address, does not require synchronization.

Where an indirect write occurs as a side-effect of an access, this happens atomically with the access, meaning no other accesses are allowed between the register access and its side-effect.

Indirect writes caused by external agents, autonomous asynchronous events, or as a result of memory-mapped writes, to the registers shown in Table D10-2 on page D10-2353, are required to be observable to:
- Direct reads in finite time without explicit synchronization.
- Subsequent indirect reads without explicit synchronization.

Without explicit synchronization to guarantee the order of the accesses, where the same register is accessed by two or more of a System register access instruction, and external agent, and autonomous asynchronous event, or as a result of a memory-mapped access, the behavior must be as if the accesses occurred atomically and in any order. This applies even if the accesses occur simultaneously.
In addition to the requirements shown in Table D10-2:

- Indirect writes to the following registers as a result of memory-mapped writes, including accesses by external agents, are required to be observable to the indirect read made in determining the response to a subsequent memory-mapped access without explicit synchronization:
  - OSLAR_EL1. OSLAR_EL1 is indirectly read to determine whether the subsequent access is permitted.
  - EDLR, if implemented. EDLR is indirectly read to determine whether a subsequent write or side-effect of an access is ignored.

  **Note**
  This requirement is stricter than the general requirement for the observability of indirect writes.

- The requirement that an indirect write to the registers in Table D10-2 is observable to direct reads in finite time does not imply that all observers will observe the indirect write at the same time.

For example, an increment of the system counter is an autonomous asynchronous event that performs an indirect write to the counter. This asynchronous event might generate a timer interrupt request, resulting in a Context synchronization event. When a GIC is used, the timer interrupt might arrive at the GIC after the PE has taken an interrupt request from another source, but before software reads the current interrupt ID from the GIC. This means that the GIC might identify the timer interrupt as the current interrupt. Software must not assume that a subsequent direct read of the counter register is guaranteed to observe the updated value of that register.

Although this example uses the counter-timer registers, it applies equally to other registers that might be linked to interrupt requests, including the PMU and Statistical Profiling status registers.

- When the PE is in Debug state, there are synchronization requirements for the Debug Communication Channel and Instruction Transfer registers. See **DCC and ITR access in Debug state** on page H4-5776.

  **Note**
  - The provision of explicit synchronization requirements to System registers is provided to allow the direct access to these registers to be implemented in a small number of cycles, and that updates to multiple registers can be performed quickly with the synchronization penalty being paid only when the updates have occurred.
  - Since toolkits might use registers such as the thread-local storage registers within compiled code, it is recommended that access to these registers is implemented to take a small number of cycles.

• While no synchronization is required between a direct write and a direct read, or between a direct read and an indirect write, this does not imply that a direct read causes synchronization of a previous direct write. That is, the sequence direct write → direct read → indirect read, with no intervening context synchronization, does not guarantee that the indirect read observes the result of the direct write.

### D10.1.4 Principles of the ID scheme for fields in ID registers

The ARM architecture specifies a number of **ID registers** that are characterized as comprising a set of 4-bit **ID fields**. Each ID field identifies the presence, and possibly the level of support for, a particular feature in an implementation of the architecture. These fields follow an architectural model that aids their use by software and provides future compatibility. This section describes that model. **ID registers to which this scheme applies on page D10-2355** identifies the set of ID registers.

A small number of ID fields do not follow the scheme described in this section. In these cases, the field description states that it does not follow this scheme.

--- **Note** ---

• The ID fields described here are distinct from register fields that enumerate the number of resources, such as the number of breakpoints, watchpoints, or performance monitors, or the amount of memory.

• ID fields that do not follow this scheme include the ID-AA64DFR0_EL1.PMUVer, ID_DFR0_EL1.PerfMon, ID_DFR0.PerfMon and EDDFR.PMUVer fields, see **Alternative ID scheme used for the Performance Monitors Extension version on page D10-2356**.

• The presence of an ID field for a feature does not imply that the feature is optional.

---

To provide forward compatibility, software can rely on the features of these fields that are described in this section. The ID fields, which are either signed or unsigned, use increasing numerical values to indicate increases in functionality. Therefore, if a value of 0x1 indicates the presence of some instructions, then the value 0x2 will indicate the presence of those instructions plus some additional instructions or functionality. This means software can be written in the form:

```c
if (value >= number) { // do something that relies on the value of the feature}
```

For ID fields where the value 0x0 defines that a feature is not present, the field holds an unsigned value. This covers the vast majority of such fields.

In a few cases, the architecture has been changed to permit implementations to exclude a feature that has previously been required and for which no ID field has been defined. In these cases, a new ID field is defined and:

• The field holds a signed value.
• The field value 0xF indicates that the feature is not implemented.
• The field value 0x0 indicates that the feature is implemented.
• Software that depends on the feature can use the test:

  ```c
  if value >= 0 { // Software features that depend on the presence of the hardware feature }
  ```

In some cases, it has been decided retrospectively that the increase in functionality between two consecutive numerical values is too great, and it is desirable to permit an intermediate degree of functionality, and the means to discover this. This is done by the introduction of a fractional field that both:

• Is referred to in the definition of the original field.
• Applies only when the original field is at the lower value of the step.

In principle, a fractional field can be used for two different fractional steps, with different meanings associated with each of these steps. For this reason, a fractional field must be interpreted in the context of the field to which it relates and the value of that field. **Example D10-1 on page D10-2355** shows the use of such a field.
Example D10-1 Example of the use of a fractional field

For a field describing some class of functionality:

- The value 0x1 was defined as indicating that item A is present.
- The value 0x2 was defined as indicating that items B and C are present, in addition to item A.

Subsequently, it might be necessary to introduce a second ID field to indicate that A and B only are present. This new field is a fractional field, and might be defined as having the value 0x1 when A and B only are present. This fractional field is valid only when the original ID field has the value 0x1.

This approach means that:

- Software that depends on the test if (value >= 0x2) can rely on features A, B, and C being present,
- Software that depends on the test if (value >= 0x1) can rely on feature A being present.
- If new software needs to check only that features A and B are present, then it can test:

  ```c
  if (value >= 0x2 || (value == 0x1 && fractional_value >= 0x1)) { // Software features
    that depend on A and B only }
  ```

A fractional field uses the same approach of increasing numerical values indicating increasing functionality, and the fractional approach can also be applied recursively to fractional fields.

Unused ID fields, and fractional fields that are not applicable, are RES0 to allow their future use when features, or fractional implementation options, are added.

ID registers to which this scheme applies

This scheme applies to the following registers:

**AArch64 System registers**

- The AArch64 views of the AArch32 feature ID registers given by:
  - The AArch32 Auxiliary Feature register ID_AFR0_EL1.
  - The AArch32 Processor Feature registers ID_PFR0_EL1 and ID_PFR1_EL1.
  - The AArch32 Debug Feature register ID_DFR0_EL1.
  - The AArch32 Memory Model Feature registers ID_MMFR0_EL1,
    ID_MMFR1_EL1, ID_MMFR2_EL1, ID_MMFR3_EL1, and ID_MMFR4_EL1.
  - The AArch32 Instruction Set Attribute registers ID_ISAR0_EL1, ID_ISAR1_EL1,
    ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.
  - The AArch32 Media and VFP Feature registers MVFR0_EL1, MVFR1_EL1, and MVFR2_EL1.
- The AArch64 Auxiliary Feature registers ID_AA64AFR0_EL1 and ID_AA64AFR1_EL1.
- The AArch64 Processor Feature registers ID_AA64PFR0_EL1 and ID_AA64PFR1_EL1.
- The AArch64 Debug Feature registers ID_AA64DFR0_EL1 and ID_AA64DFR1_EL1.
- The AArch64 Memory Model Feature registers ID_AA64MMFR0_EL1,
  ID_AA64MMFR1_EL1, and ID_AA64MMFR2_EL1.
- The AArch64 Instruction Set Attribute registers ID_AA64ISAR0_EL1 and ID_AA64ISAR1_EL1.

**AArch32 System registers**

- The AArch32 Auxiliary Feature register ID_AFR0.
- The AArch32 Processor Feature registers ID_PFR0 and ID_PFR1.
- The AArch32 Debug Feature register ID_DFR0.
- The AArch32 Memory Model Feature registers ID_MMFR0, ID_MMFR1, ID_MMFR2,
  ID_MMFR3, and ID_MMFR4.
The AArch32 Instruction Set Attribute registers ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, ID_ISAR4, and ID_ISAR5.
• The AArch32 Media and FP Feature registers MVFR0, MVFR1, and MVFR2.

Memory-mapped registers
• The External Debug Processor Feature register EDPFR.
• The External Debug Feature register EDDFR.

Alternative ID scheme used for the Performance Monitors Extension version

The ID_AA64DFR0_EL1.PMUVer, ID_DFR0_EL1.PerfMon, ID_DFR0.PerfMon and EDDFR.PMUVer fields, that identify the version of the Performance Monitors Extension, do not follow the standard ID scheme. Software must treat these fields as follows:

• The value 0xF indicates that the ARM-architected Performance Monitors Extension is not implemented.
• If the field value is not 0xF the field is treated as an unsigned value, as described for the standard ID scheme.

This means that software that depends on the implementation of a particular version of the ARM Performance Monitors Extension must be written in the form:

```
if (value != 0xF and value >= number) { // do something that relies on version 'number' of the feature }
```

For these fields, ARM deprecates use of the value 0xF in new implementations.
D10.2 General system control registers

This section lists the System registers in AArch64 that are not part of one of the other listed groups.
D10.2.1 ACTLR_EL1, Auxiliary Control Register (EL1)

The ACTLR_EL1 characteristics are:

**Purpose**

Provides IMPLEMENTATION DEFINED configuration and control options for execution at EL1 and EL0.

---**Note**---

ARM recommends the contents of this register have no effect on the PE when HCR_EL2.{E2H, TGE} is {1, 1}, and instead the configuration and control fields are provided by the ACTLR_EL2 register. This avoids the need for software to manage the contents of these register when switching between a Guest OS and a Host OS.

**Configurations**

AArch64 System register ACTLR_EL1[31:0] is architecturally mapped to AArch32 System register ACTLR.

AArch64 System register ACTLR_EL1[63:32] is architecturally mapped to AArch32 System register ACTLR2.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ACTLR_EL1 is a 64-bit register.

**Field descriptions**

The ACTLR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:0</td>
<td>IMPLEMENTATION DEFINED, bits [63:0]</td>
</tr>
</tbody>
</table>

**Accessing the ACTLR_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTLR_EL1</td>
<td>11</td>
<td>000</td>
<td>0001</td>
<td>0000</td>
<td>001</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H  TGE NS</td>
<td>EL0</td>
</tr>
<tr>
<td>x x 0</td>
<td>-</td>
</tr>
<tr>
<td>0 0 1</td>
<td>-</td>
</tr>
<tr>
<td>0 1 1</td>
<td>-</td>
</tr>
<tr>
<td>1 0 1</td>
<td>-</td>
</tr>
<tr>
<td>1 1 1</td>
<td>-</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TACR==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TACR==1, Non-secure accesses to this register from EL1 are trapped to EL2.
D10.2.2 ACTLR_EL2, Auxiliary Control Register (EL2)

The ACTLR_EL2 characteristics are:

**Purpose**

Provides IMPLEMENTATION DEFINED configuration and control options for EL2.

--- Note ---

ARM recommends the contents of this register are updated to apply to EL0 when HCR_EL2.E2H, TGE is {1, 1}, gaining configuration and control fields from the ACTLR_EL1. This avoids the need for software to manage the contents of these register when switching between a Guest OS and a Host OS.

---

**Configurations**

AArch64 System register ACTLR_EL2[31:0] is architecturally mapped to AArch32 System register HACTLR.

AArch64 System register ACTLR_EL2[63:32] is architecturally mapped to AArch32 System register HACTLR2.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ACTLR_EL2 is a 64-bit register.

**Field descriptions**

The ACTLR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-0</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
</tbody>
</table>

**Accessing the ACTLR_EL2**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTLR_EL2</td>
<td>11</td>
<td>100</td>
<td>0001</td>
<td>000</td>
<td>001</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>

</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
D10.2.3 ACTLR_EL3, Auxiliary Control Register (EL3)

The ACTLR_EL3 characteristics are:

**Purpose**

Provides IMPLEMENTATION DEFINED configuration and control options for EL3.

**Configurations**

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ACTLR_EL3 is a 64-bit register.

**Field descriptions**

The ACTLR_EL3 bit assignments are:

![ACTLR_EL3 Bit Assignments](image)

**Accessing the ACTLR_EL3**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTLR_EL3</td>
<td>11</td>
<td>110</td>
<td>0001</td>
<td>0000</td>
<td>001</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>
D10.2.4 AFSR0_EL1, Auxiliary Fault Status Register 0 (EL1)

The AFSR0_EL1 characteristics are:

Purpose

Provides additional IMPLEMENTATION DEFINED fault status information for exceptions taken to EL1.

Configurations

AArch64 System register AFSR0_EL1 is architecturally mapped to AArch32 System register ADFSR.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AFSR0_EL1 is a 32-bit register.

Field descriptions

The AFSR0_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Field description</th>
<th>Bit assignments</th>

</table>

This table applies to all instructions that can access this register.

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic AFSR0_EL1 or AFSR0_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor AFSR0_EL12 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor AFSR0_EL12 are trapped to EL2.
D10.2.5  AFSR0_EL2, Auxiliary Fault Status Register 0 (EL2)

The AFSR0_EL2 characteristics are:

**Purpose**

Provides additional IMPLEMENTATION DEFINED fault status information for exceptions taken to EL2.

**Configurations**

AArch64 System register AFSR0_EL2 is architecturally mapped to AArch32 System register HADFSR.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

AFSR0_EL2 is a 32-bit register.

**Field descriptions**

The AFSR0_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:0</td>

</tbody>
</table>

This table applies to all instructions that can access this register.

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic AFSR1_EL1 or AFSR1_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor AFSR1_EL12 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor AFSR1_EL12 are trapped to EL2.
D10.2.8  AFSR1_EL2, Auxiliary Fault Status Register 1 (EL2)

The AFSR1_EL2 characteristics are:

**Purpose**

Provides additional IMPLEMENTATION DEFINED fault status information for exceptions taken to EL2.

**Configurations**

AArch64 System register AFSR1_EL2 is architecturally mapped to AArch32 System register HAIFSR.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

AFSR1_EL2 is a 32-bit register.

**Field descriptions**

The AFSR1_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Assignment</th>
<th>Description</th>

</tr>
</tbody>
</table>
Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  — If HCR_EL2.TID1==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  — If HCR_EL2.TID1==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
D10.2.11 AMAIR_EL1, Auxiliary Memory Attribute Indirection Register (EL1)

The AMAIR_EL1 characteristics are:

**Purpose**

Provides IMPLEMENTATION DEFINED memory attributes for the memory regions specified by MAIR_EL1.

**Configurations**

AArch64 System register AMAIR_EL1[31:0] is architecturally mapped to AArch32 System register AMAIR0.

AArch64 System register AMAIR_EL1[63:32] is architecturally mapped to AArch32 System register AMAIR1.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

AMAIR_EL1 is a 64-bit register.

**Field descriptions**

The AMAIR_EL1 bit assignments are:

A MAIR_EL1 is permitted to be cached in a TLB.

**IMPLEMENTATION DEFINED, bits [63:0]**

IMPLEMENTATION DEFINED.

**Accessing the AMAIR_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMAIR_EL1</td>
<td>11</td>
<td>000</td>
<td>1010</td>
<td>0011</td>
<td>000</td>

<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

This table applies to all instructions that can access this register.

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic AMAIR_EL1 or AMAIR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor AMAIR_EL12 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) &&
  (HCR_EL2.TGE == 0):
  - If HCR_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor AMAIR_EL12 are trapped to EL2.
D10.2.12 AMAIR_EL2, Auxiliary Memory Attribute Indirection Register (EL2)

The AMAIR_EL2 characteristics are:

Purpose

Provides IMPLEMENTATION DEFINED memory attributes for the memory regions specified by MAIR_EL2.

Configurations

AArch64 System register AMAIR_EL2[31:0] is architecturally mapped to AArch32 System register HAMAIR0.
AArch64 System register AMAIR_EL2[63:32] is architecturally mapped to AArch32 System register HAMAIR1.
If EL2 is not implemented, this register is RES0 from EL3.
RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AMAIR_EL2 is a 64-bit register.

Field descriptions

The AMAIR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:0</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
<tr>
<td>31:0</td>
<td>IMPLEMENTATION DEFINED, bits [63:0]</td>
</tr>
</tbody>
</table>

AMAIR_EL2 is permitted to be cached in a TLB.

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing the AMAIR_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>

</tbody>
</table>

This table applies to all instructions that can access this register.

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic AMAIR_EL2 or AMAIR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
D10.2.13 AMAIR_EL3, Auxiliary Memory Attribute Indirection Register (EL3)

The AMAIR_EL3 characteristics are:

**Purpose**
Provides IMPLEMENTATION DEFINED memory attributes for the memory regions specified by MAIR_EL3.

**Configurations**
RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**
AMAIR_EL3 is a 64-bit register.

**Field descriptions**
The AMAIR_EL3 bit assignments are:

```
63 0
+---------------------
| IMPLEMENTATION DEFINED |
```

AMAIR_EL3 is permitted to be cached in a TLB.

**Accessing the AMAIR_EL3**
This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMAIR_EL3</td>
<td>11</td>
<td>110</td>
<td>1010</td>
<td>0011</td>
<td>000</td>
</tr>
</tbody>
</table>

**Accessibility**
The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>

</tbody>
</table>
D10.2.14 APDAKeyHi_EL1, Pointer Authentication Key A for Data (bits[127:64])

The APDAKeyHi_EL1 characteristics are:

**Purpose**

Holds bits[127:64] of key A used for authentication of data pointer values.

--- Note ---

The term APDAKey_EL1 is used to describe the concatenation of APDAKeyHi_EL1: APDAKeyLo_EL1.

---

**Configurations**

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.3.

**Attributes**

APDAKeyHi_EL1 is a 64-bit register.

**Field descriptions**

The APDAKeyHi_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
</tr>
</thead>
<tbody>
<tr>
<td>64 bit value, bits[127:64] of the 128 bit pointer authentication key value</td>
</tr>
</tbody>
</table>

**Accessing the APDAKeyHi_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If HCR_EL2.APK==0, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If SCR_EL3.APK==0, accesses to this register from EL1 and EL2 are trapped to EL3.
D10.2.15 APDAAKeyLo_EL1, Pointer Authentication Key A for Data (bits[63:0])

The APDAAKeyLo_EL1 characteristics are:

**Purpose**

Holds bits[63:0] of key A used for authentication of data pointer values.

**Note**

The term APDAAKey_EL1 is used to describe the concatenation of APDAAKeyHi_EL1: APDAAKeyLo_EL1.

**Configurations**

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.3.

**Attributes**

APDAAKeyLo_EL1 is a 64-bit register.

**Field descriptions**

The APDAAKeyLo_EL1 bit assignments are:

**Bits [63:0]**

64 bit value, bits[63:0] of the 128 bit pointer authentication key value.

**Accessing the APDAAKeyLo_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If HCR_EL2.APK==0, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If SCR_EL3.APK==0, accesses to this register from EL1 and EL2 are trapped to EL3.
D10.2.16    APDBKeyHi_EL1, Pointer Authentication Key B for Data (bits[127:64])

The APDBKeyHi_EL1 characteristics are:

**Purpose**
Holds bits[127:64] of key B used for authentication of data pointer values.

**Note**
The term APDBKey_EL1 is used to describe the concatenation of APDBKeyHi_EL1:
APDBKeyLo_EL1.

**Configurations**
RW fields in this register reset to architecturally UNKNOWN values.
This register is introduced in ARMv8.3.

**Attributes**
APDBKeyHi_EL1 is a 64-bit register.

**Field descriptions**
The APDBKeyHi_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-0</td>
<td>64-bit value, bits[127:64] of the 128-bit pointer authentication key value</td>
</tr>
</tbody>
</table>

**Accessing the APDBKeyHi_EL1**
This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>

</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If HCR_EL2.APK==0, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If SCR_EL3.APK==0, accesses to this register from EL1 and EL2 are trapped to EL3.
D10.2.17 APDBKeyLo_EL1, Pointer Authentication Key B for Data (bits[63:0])

The APDBKeyLo_EL1 characteristics are:

**Purpose**

Holds bits[63:0] of key B used for authentication of data pointer values.

---

**Note**

The term APDBKey_EL1 is used to describe the concatenation of APDBKeyHi_EL1: APDBKeyLo_EL1.

---

**Configurations**

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.3.

**Attributes**

APDBKeyLo_EL1 is a 64-bit register.

**Field descriptions**

The APDBKeyLo_EL1 bit assignments are:

```
| Bit 63 | Bit 62 | Bit 61 | Bit 60 | Bit 59 | Bit 58 | Bit 57 | Bit 56 | Bit 55 | Bit 54 | Bit 53 | Bit 52 | Bit 51 | Bit 50 | Bit 49 | Bit 48 | Bit 47 | Bit 46 | Bit 45 | Bit 44 | Bit 43 | Bit 42 | Bit 41 | Bit 40 | Bit 39 | Bit 38 | Bit 37 | Bit 36 | Bit 35 | Bit 34 | Bit 33 | Bit 32 | Bit 31 | Bit 30 | Bit 29 | Bit 28 | Bit 27 | Bit 26 | Bit 25 | Bit 24 | Bit 23 | Bit 22 | Bit 21 | Bit 20 | Bit 19 | Bit 18 | Bit 17 | Bit 16 | Bit 15 | Bit 14 | Bit 13 | Bit 12 | Bit 11 | Bit 10 | Bit 9  | Bit 8  | Bit 7  | Bit 6  | Bit 5  | Bit 4  | Bit 3  | Bit 2  | Bit 1  | Bit 0  |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
```

64 bit value, bits[63:0] of the 128 bit pointer authentication key value

**Bits [63:0]**

64 bit value, bits[63:0] of the 128 bit pointer authentication key value.

**Accessing the APDBKeyLo_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If HCR_EL2.APK==0, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If SCR_EL3.APK==0, accesses to this register from EL1 and EL2 are trapped to EL3.
### D10.2.18 APGAKeyHi_EL1, Pointer Authentication Key A for Code (bits[127:64])

The APGAKeyHi_EL1 characteristics are:

**Purpose**

Holds bits[127:64] of key used for generic pointer authentication code.

**Note**

The term APGAKey_EL1 is used to describe the concatenation of APGAKeyHi_EL1:

APGAKeyLo_EL1.

**Configurations**

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.3.

**Attributes**

APGAKeyHi_EL1 is a 64-bit register.

**Field descriptions**

The APGAKeyHi_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
</tr>
</thead>
<tbody>
<tr>
<td>64 bit value, bits[127:64] of the 128 bit pointer authentication key value</td>
</tr>
</tbody>
</table>

**Accessing the APGAKeyHi_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If HCR_EL2.APK==0, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL3 is implemented and is using AArch64:
  - If SCR_EL3.APK==0, accesses to this register from EL1 and EL2 are trapped to EL3.
D10.2.19 APGAKeyLo_EL1, Pointer Authentication Key A for Code (bits[63:0])

The APGAKeyLo_EL1 characteristics are:

**Purpose**

Holds bits[63:0] of key used for generic pointer authentication code.

---

**Note**

The term APGAKey_EL1 is used to describe the concatenation of APGAKeyHi_EL1: APGAKeyLo_EL1.

---

**Configurations**

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.3.

**Attributes**

APGAKeyLo_EL1 is a 64-bit register.

**Field descriptions**

The APGAKeyLo_EL1 bit assignments are:

| Bits [63:0] | 64 bit value, bits[63:0] of the 128 bit pointer authentication key value |

**Accessing the APGAKeyLo_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

<td>n/a</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If HCR_EL2.APK==0, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL3 is implemented and is using AArch64:
  - If SCR_EL3.APK==0, accesses to this register from EL1 and EL2 are trapped to EL3.
### D10.2.20 APIAKeyHi_EL1, Pointer Authentication Key A for Instruction (bits[127:64])

The APIAKeyHi_EL1 characteristics are:

**Purpose**

Holds bits[127:64] of key A used for authentication of instruction pointer values.

**Note**

The term APIAKey_EL1 is used to describe the concatenation of APIAKeyHi_EL1: APIAKeyLo_EL1.

**Configurations**

RW fields in this register reset to architecturally `UNKNOWN` values.  
This register is introduced in ARMv8.3.

**Attributes**

APIAKeyHi_EL1 is a 64-bit register.

**Field descriptions**

The APIAKeyHi_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-0</td>
<td>64 bit value, bits[127:64] of the 128 bit pointer authentication key value</td>
</tr>
</tbody>
</table>

**Accessing the APIAKeyHi_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>

<tr>
<td>x 1 1</td>
<td>- n/a RW RW</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If HCR_EL2.APK==0, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL3 is implemented and is using AArch64:
  - If SCR_EL3.APK==0, accesses to this register from EL1 and EL2 are trapped to EL3.
D10.2.21 APIAKeyLo_EL1, Pointer Authentication Key A for Instruction (bits[63:0])

The APIAKeyLo_EL1 characteristics are:

**Purpose**

Holds bits[63:0] of key A used for authentication of instruction pointer values.

--- **Note** ---

The term APIAKey_EL1 is used to describe the concatenation of APIAKeyHi_EL1: APIAKeyLo_EL1.

**Configurations**

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.3.

**Attributes**

APIAKeyLo_EL1 is a 64-bit register.

**Field descriptions**

The APIAKeyLo_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 64 bit value, bits[63:0] of the 128 bit pointer authentication key value |

**Accessing the APIAKeyLo_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>

<td>1</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If HCR_EL2.APK==0, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL3 is implemented and is using AArch64:
  - If SCR_EL3.APK==0, accesses to this register from EL1 and EL2 are trapped to EL3.
D10.2.22  APIBKeyHi_EL1, Pointer Authentication Key B for Instruction (bits[127:64])

The APIBKeyHi_EL1 characteristics are:

**Purpose**

Holds bits[127:64] of key B used for authentication of instruction pointer values.

--- **Note** ---

The term APIBKey_EL1 is used to describe the concatenation of APIBKeyHi_EL1: APIBKeyLo_EL1.

**Configurations**

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.3.

**Attributes**

APIBKeyHi_EL1 is a 64-bit register.

**Field descriptions**

The APIBKeyHi_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 64 bit value, bits[127:64] of the 128 bit pointer authentication key value |

**Bits [63:0]**

64 bit value, bits[127:64] of the 128 bit pointer authentication key value.

**Accessing the APIBKeyHi_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>APIBKeyHi_EL1</td>
<td>11</td>
<td>000</td>
<td>0010</td>
<td>0001</td>
<td>011</td>
</tr>
</tbody>
</table>
 Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If HCR_EL2.APK==0, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If SCR_EL3.APK==0, accesses to this register from EL1 and EL2 are trapped to EL3.
D10.2.23  **APIBKeyLo_EL1, Pointer Authentication Key B for Instruction (bits[63:0])**

The APIBKeyLo_EL1 characteristics are:

**Purpose**

Holds bits[63:0] of key B used for authentication of instruction pointer values.

---

**Note**

The term APIBKey_EL1 is used to describe the concatenation of APIBKeyHi_EL1: APIBKeyLo_EL1.

---

**Configurations**

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.3.

**Attributes**

APIBKeyLo_EL1 is a 64-bit register.

**Field descriptions**

The APIBKeyLo_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-0</td>
<td>64 bit value, bits[63:0] of the 128 bit pointer authentication key value</td>
</tr>
</tbody>
</table>

**Accessing the APIBKeyLo_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>APIBKeyLo_EL1</td>
<td>11</td>
<td>000</td>
<td>0010</td>
<td>0001</td>
<td>010</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If HCR_EL2.APK==0, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If SCR_EL3.APK==0, accesses to this register from EL1 and EL2 are trapped to EL3.
D10.2.24  CCSIDR2_EL1, Current Cache Size ID Register 2

The CCSIDR2_EL1 characteristics are:

**Purpose**

When ARMv8.3-CCIDX is implemented, provides the information from bits[63:32] of the CCSIDR_EL1.

When ARMv8.3-CCIDX is not implemented, this register is not implemented.

**Configurations**

AArch64 System register CCSIDR2_EL1 is architecturally mapped to AArch32 System register CCSIDR2.

If AArch32 is not implemented, it is IMPLEMENTATION DEFINED whether reading this register gives an UNKNOWN value or is UNDEFINED.

The implementation includes one CCSIDR2_EL1 for each cache that it can access. CSSELR_EL1 selects which Cache Size ID Register is accessible.

This register is introduced in ARMv8.3.

**Attributes**

CCSIDR2_EL1 is a 32-bit register.

**Field descriptions**

The CCSIDR2_EL1 bit assignments are:

```
  31  24  23  0
  RES0  NumSets
```

**Bits [31:24]**

Reserved, RES0.

**NumSets, bits [23:0]**

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

**Accessing the CCSIDR2_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CCSIDR2_EL1</td>
<td>11</td>
<td>001</td>
<td>0000</td>
<td>0000</td>
<td>010</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>
</tr>
<tr>
<td>TGE</td>
<td></td>
</tr>
<tr>
<td>NS</td>
<td>-</td>
</tr>
</tbody>
</table>

If CSSELr_EL1.Level is programmed to a cache level that is not implemented, then on a read of the CCSIDR2_EL1 the behavior is CONSTRAINED UNPREDICTABLE, and can be one of the following:

- The CCSIDR2_EL1 read is treated as NOP.
- The CCSIDR2_EL1 read is UNDEFINED.
- The CCSIDR2_EL1 read returns an UNKNOWN value.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  — If HCR_EL2.TID2==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  — If HCR_EL2.TID2==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
D10.2.25  CCSIDR_EL1, Current Cache Size ID Register

The CCSIDR_EL1 characteristics are:

**Purpose**

Provides information about the architecture of the currently selected cache.

**Configurations**

AArch64 System register CCSIDR_EL1[31:0] is architecturally mapped to AArch32 System register CCSIDR.

AArch64 System register CCSIDR_EL1 bits [63:32] are architecturally mapped to AArch32 System register CCSIDR2.

The implementation includes one CCSIDR_EL1 for each cache that it can access. CSSELR_EL1 selects which Cache Size ID Register is accessible.

**Attributes**

When ARMv8.3-CCIDX is implemented, CCSIDR_EL1 is a 64-bit register.

When ARMv8.3-CCIDX is not implemented, CCSIDR_EL1 is a 32-bit register.

**Field descriptions**

The CCSIDR_EL1 bit assignments are:

*When ID_AA64MMFR2_EL1.CCIDX==0000:*

<table>
<thead>
<tr>
<th>31</th>
<th>28</th>
<th>27</th>
<th>13</th>
<th>12</th>
<th>3</th>
<th>2</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNKNOWN</td>
<td>NumSets</td>
<td>Associativity</td>
<td>LineSize</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

In ARMv8.0, ARMv8.1, and ARMv8.2, ID_AA64MMFR2_EL1.CCIDX has an *Effective value* of 0000.

**UNKNOWN, bits [31:28]**

Reserved, UNKNOWN.

**NumSets, bits [27:13]**

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

**Associativity, bits [12:3]**

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

**LineSize, bits [2:0]**

(Log2(NumberOf bytes in cache line)) - 4. For example:

For a line length of 16 bytes: Log2(16) = 4, LineSize entry = 0. This is the minimum line length.

For a line length of 32 bytes: Log2(32) = 5, LineSize entry = 1.

**Note**

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.
Note

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.

When ID_AA64MMFR2_EL1.CCIDX==0001:

<table>
<thead>
<tr>
<th></th>
<th>63</th>
<th>56</th>
<th>55</th>
<th>32</th>
<th>31</th>
<th>24</th>
<th>23</th>
<th>3</th>
<th>2</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>NumSets</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Associativity</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>LineSize</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

In ARMv8.0, ARMv8.1, and ARMv8.2, ID_AA64MMFR2_EL1.CCIDX has an Effective value of 0000.

Bits [63:56]

Reserved, RES0.

NumSets, bits [55:32]

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

Bits [31:24]

Reserved, RES0.

Associativity, bits [23:3]

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

LineSize, bits [2:0]

(Log₂(Number of bytes in cache line)) - 4. For example:
For a line length of 16 bytes: Log₂(16) = 4, LineSize entry = 0. This is the minimum line length.
For a line length of 32 bytes: Log₂(32) = 5, LineSize entry = 1.

Note

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.

Accessing the CCSIDR_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CCSIDR_EL1</td>
<td>11</td>
<td>001</td>
<td>0000</td>
<td>0000</td>
<td>000</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

If CSSELR_EL1.Level is programmed to a cache level that is not implemented, then on a read of the CCSIDR_EL1 the behavior is CONSTRAINED UNPREDICTABLE, and can be one of the following:

- The CCSIDR_EL1 read is treated as NOP.
- The CCSIDR_EL1 read is UNDEFINED.
- The CCSIDR_EL1 read returns an UNKNOWN value.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TID2==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TID2==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
D10.2.26  CLIDR_EL1, Cache Level ID Register

The CLIDR_EL1 characteristics are:

**Purpose**

Identifies the type of cache, or caches, that are implemented at each level and can be managed using the architected cache maintenance instructions that operate by set/way, up to a maximum of seven levels. Also identifies the Level of Coherence (LoC) and Level of Unification (LoU) for the cache hierarchy.

**Configurations**

AArch64 System register CLIDR_EL1 is architecturally mapped to AArch32 System register CLIDR.

**Attributes**

CLIDR_EL1 is a 64-bit register.

**Field descriptions**

The CLIDR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit positions</th>
<th>Bits [63:33]</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
<tbody>
<tr>
<td>ICB</td>
<td>33 32</td>
<td>ICB</td>
</tr>
<tr>

<td>30 29</td>
<td>LoUU</td>
</tr>
<tr>
<td>LoC</td>
<td>27 26</td>
<td>LoC</td>
</tr>
<tr>
<td>LoUIS</td>
<td>24 23</td>
<td>LoUIS</td>
</tr>
<tr>
<td>Ctype7</td>
<td>21 20</td>
<td>Ctype7</td>
</tr>
<tr>
<td>Ctype6</td>
<td>18 17</td>
<td>Ctype6</td>
</tr>
<tr>
<td>Ctype5</td>
<td>15 14</td>
<td>Ctype5</td>
</tr>
<tr>
<td>Ctype4</td>
<td>12 11</td>
<td>Ctype4</td>
</tr>
<tr>
<td>Ctype3</td>
<td>9 8</td>
<td>Ctype3</td>
</tr>
<tr>
<td>Ctype2</td>
<td>6 5</td>
<td>Ctype2</td>
</tr>
<tr>
<td>Ctype1</td>
<td>3 2 0</td>
<td>Ctype1</td>
</tr>
</tbody>
</table>

**ICB, bits [32:30]**

Inner cache boundary. This field indicates the boundary for caching Inner Cacheable memory regions.

The possible values are:

000 Not disclosed by this mechanism.

001 L1 cache is the highest Inner Cacheable level.

010 L2 cache is the highest Inner Cacheable level.

011 L3 cache is the highest Inner Cacheable level.

100 L4 cache is the highest Inner Cacheable level.

101 L5 cache is the highest Inner Cacheable level.

110 L6 cache is the highest Inner Cacheable level.

111 L7 cache is the highest Inner Cacheable level.

**LoUU, bits [29:27]**

Level of Unification Uniprocessor for the cache hierarchy.

**LoC, bits [26:24]**

Level of Coherence for the cache hierarchy.

**LoUIS, bits [23:21]**

Level of Unification Inner Shareable for the cache hierarchy.
Ctype<n>, bits [3(n-1)+2:3(n-1)], for n = 1 to 7

Cache Type fields. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy. Possible values of each field are:

- 000: No cache.
- 001: Instruction cache only.
- 010: Data cache only.
- 011: Separate instruction and data caches.
- 100: Unified cache.

All other values are reserved.

If software reads the Cache Type fields from Ctype1 upwards, once it has seen a value of 000, no caches that can be managed using the architected cache maintenance instructions that operate by set/way exist at further-out levels of the hierarchy. So, for example, if Ctype3 is the first Cache Type field with a value of 000, the values of Ctype4 to Ctype7 must be ignored.

**Accessing the CLIDR_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLIDR_EL1</td>
<td>11</td>
<td>001</td>
<td>0000</td>
<td>0000</td>
<td>001</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TID2==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TID2==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
D10.2.27 CONTEXTIDR_EL1, Context ID Register (EL1)

The CONTEXTIDR_EL1 characteristics are:

**Purpose**

Identifies the current Process Identifier.

The value of the whole of this register is called the Context ID and is used by:

- The debug logic, for Linked and Unlinked Context ID matching.
- The trace logic, to identify the current process.

The significance of this register is for debug and trace use only.

This register is used:

- In ARMv8.0.
- When ARMv8.1-VHE is implemented and HCR_EL2.E2H is 0.

**Note**

When ARMv8.1-VHE is implemented and HCR_EL2.E2H is set to 1, CONTEXTIDR_EL2 is used.

**Configurations**

AArch64 System register CONTEXTIDR_EL1 is architecturally mapped to AArch32 System register CONTEXTIDR.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CONTEXTIDR_EL1 is a 32-bit register.

**Field descriptions**

The CONTEXTIDR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>PROCID</td>
</tr>
</tbody>
</table>

**PROCID, bits [31:0]**

Process Identifier. This field must be programmed with a unique value that identifies the current process.

**Note**

In AArch32 state, when TTBCR.EAE is set to 0, CONTEXTIDR.ASID holds the ASID.

In AArch64 state, CONTEXTIDR_EL1 is independent of the ASID, and for the EL1&0 translation regime either TTBR0_EL1 or TTBR1_EL1 holds the ASID.

**Accessing the CONTEXTIDR_EL1**

This register can be read using MRS with the following syntax:

```assembly
MRS <Xt>, <systemreg>
```

This register can be written using MSR (register) with the following syntax:

```assembly
MSR <systemreg>, <Xt>
```
This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTEXTIDR_EL1</td>
<td>11</td>
<td>000</td>
<td>1101</td>
<td>0000</td>
<td>001</td>
</tr>
<tr>
<td>CONTEXTIDR_EL12</td>
<td>11</td>
<td>101</td>
<td>1101</td>
<td>0000</td>
<td>001</td>
</tr>
</tbody>
</table>

### Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>CONTEXTIDR_EL1</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>CONTEXTIDR_EL1</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>CONTEXTIDR_EL1</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>CONTEXTIDR_EL1</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>CONTEXTIDR_EL1</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>CONTEXTIDR_EL12</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>CONTEXTIDR_EL12</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>CONTEXTIDR_EL12</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>CONTEXTIDR_EL12</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>CONTEXTIDR_EL12</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

This table applies to all instructions that can access this register.

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CONTEXTIDR_EL1 or CONTEXTIDR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) & (HCR_EL2.E2H == 0):
  - If HCR_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor CONTEXTIDR_EL12 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) & (HCR_EL2.E2H == 1) & (HCR_EL2.TGE == 0):
  - If HCR_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor CONTEXTIDR_EL12 are trapped to EL2.
D10.2.28 CONTEXTIDR_EL2, Context ID Register (EL2)

The CONTEXTIDR_EL2 characteristics are:

**Purpose**
When ARMv8.1-VHE is implemented and HCR_EL2.E2H is set to 1, identifies the current Process Identifier.
The value of the whole of this register is called the Context ID and is used by:
- The debug logic, for Linked and Unlinked Context ID matching.
- The trace logic, to identify the current process.
The significance of this register is for debug and trace use only.

——— Note ————
In ARMv8.0, or when ARMv8.1-VHE is implemented and HCR_EL2.E2H is 0, CONTEXTIDR_EL1 is used.

**Configurations**
If EL2 is not implemented, this register is RES0 from EL3.
RW fields in this register reset to architecturally UNKNOWN values.
This register is introduced in ARMv8.1.

**Attributes**
CONTEXTIDR_EL2 is a 32-bit register.

**Field descriptions**
The CONTEXTIDR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>PROCID</td>
</tr>
</tbody>
</table>

**PROCID, bits [31:0]**
Process Identifier. This field must be programmed with a unique value that identifies the current process.

——— Note ————
In AArch32 state, when TTBCR.EAE is set to 0, CONTEXTIDR.ASID holds the ASID.
In AArch64 state, CONTEXTIDR_EL2 is independent of the ASID, and for the EL2&0 translation regime either TTBR0_EL2 or TTBR1_EL2 holds the ASID.

**Accessing the CONTEXTIDR_EL2**
This register can be read using MRS with the following syntax:
MRS <Xt>, <systemreg>
This register can be written using MSR (register) with the following syntax:
MSR <systemreg>, <Xt>
This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTEXTIDR_EL2</td>
<td>11 100 1101 0000 001</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>CONTEXTIDR_EL1</td>
<td>11 000 1101 0000 001</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>CONTEXTIDR_EL2</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>CONTEXTIDR_EL2</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>CONTEXTIDR_EL2</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>CONTEXTIDR_EL2</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>CONTEXTIDR_EL2</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>CONTEXTIDR_EL1</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>CONTEXTIDR_EL1</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>CONTEXTIDR_EL1</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>CONTEXTIDR_EL1</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>CONTEXTIDR_EL1</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

This table applies to all instructions that can access this register.

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic CONTEXTIDR_EL2 or CONTEXTIDR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
D10.2.29 CPACR_EL1, Architectural Feature Access Control Register

The CPACR_EL1 characteristics are:

**Purpose**

Controls access to trace, SVE, Advanced SIMD and floating-point functionality.

**Configurations**

AArch64 System register CPACR_EL1 is architecturally mapped to AArch32 System register CPACR.

When HCR_EL2.{E2H, TGE} = {1, 1}, the fields in this register have no effect on execution at EL0 and EL1. In this case, the controls provided by CPTR_EL2 are used.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CPACR_EL1 is a 32-bit register.

**Field descriptions**

The CPACR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[31:29]</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>[28]</td>
<td>TTA, bit [28]</td>
</tr>
<tr>
<td>[27:22]</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>[21:20]</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>[19:18]</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>[17:16]</td>
<td>ZEN</td>
</tr>
<tr>
<td>[15:0]</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

**Bits [31:29]**

Reserved, RES0.

**TTA, bit [28]**

Traps EL0 and EL1 System register accesses to all implemented trace registers to EL1, or to EL2 when SCR_EL3.NS is 1 and HCR_EL2.TGE is 1, from both Execution states.

0  This control does not cause any instructions to be trapped.
1  This control causes EL0 and EL1 System register accesses to all implemented trace registers to be trapped.

**Note**

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the ARMv8-A architecture is implemented with an ETMv4 implementation, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPACR_EL1.TTA is 1.
- The ARMv8-A architecture does not provide traps on trace register accesses through the optional memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

If System register access to the trace functionality is not implemented, this bit is RES0.

**Bits [27:22]**

Reserved, RES0.
FPEN, bits [21:20]

Traps EL0 and EL1 accesses to the SVE, Advanced SIMD, and floating-point registers to EL1, or to EL2 when SCR_EL3.NS is 1 and HCR_EL2.TGE is 1, from both Execution states.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>This control causes any instructions at EL0 or EL1 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, unless they are trapped by CPACR_EL1.ZEN.</td>
</tr>
<tr>
<td>01</td>
<td>This control causes any instructions at EL0 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, unless they are trapped by CPACR_EL1.ZEN, but does not cause any instruction at EL1 to be trapped.</td>
</tr>
<tr>
<td>10</td>
<td>This control causes any instructions at EL0 or EL1 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, unless they are trapped by CPACR_EL1.ZEN.</td>
</tr>
<tr>
<td>11</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

Writes to MVFR0, MVFR1 and MVFR2 from EL1 or higher are CONSTRAINED UNPREDICTABLE and whether these accesses can be trapped by this control depends on implemented CONSTRAINED UNPREDICTABLE behavior.

--- Note ---

- Attempts to write to the FPSID count as use of the registers for accesses from EL1 or higher.
- Accesses from EL0 to FPSID, MVFR0, MVFR1, MVFR2, and FPEXC are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPACR_EL1.FPEN is not 11.

Bits [19:18]

Reserved, RES0.

ZEN, bits [17:16]

**In ARMv8.3 and ARMv8.2**

- Traps SVE instructions and instructions that access SVE System registers at EL0 and EL1 to EL1, or to EL2 when SCR_EL3.NS and HCR_EL2.TGE are both 1. Defined values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>This control causes these instructions executed at EL0 or EL1 to be trapped.</td>
</tr>
<tr>
<td>01</td>
<td>This control causes these instructions executed at EL0 to be trapped, but does not cause any instruction in EL1 to be trapped.</td>
</tr>
<tr>
<td>10</td>
<td>This control causes these instructions executed at EL0 or EL1 to be trapped.</td>
</tr>
<tr>
<td>11</td>
<td>This control does not cause any instruction to be trapped.</td>
</tr>
</tbody>
</table>

If SVE is not implemented, this field is RES0.

**In ARMv8.1 and ARMv8.0.**

Reserved, RES0.

Bits [15:0]

Reserved, RES0.

Accessing the CPACR_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>
This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>

<tr>
<td>CPACR_EL12</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

This table applies to all instructions that can access this register.

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CPACR_EL1 or CPACR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If CPTR_EL2.TCPAC==1, Non-secure accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor CPACR_EL12 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If CPTR_EL2.TCPAC==1, Non-secure accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor CPACR_EL12 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If CPTR_EL3.TCPAC==1, accesses to this register from EL1 and EL2 are trapped to EL3.
D10.2.30  CPTR_EL2, Architectural Feature Trap Register (EL2)

The CPTR_EL2 characteristics are:

**Purpose**

Controls:
- Trapping to EL2 of access to CPACR, CPACR_EL1, trace functionality, and to SVE, Advanced SIMD and floating-point functionality.
- EL2 access to trace functionality, and to SVE, Advanced SIMD and floating-point functionality.

**Configurations**

AArch64 System register CPTR_EL2 is architecturally mapped to AArch32 System register HCPTR.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CPTR_EL2 is a 32-bit register.

**Field descriptions**

The CPTR_EL2 bit assignments are:

*When HCR_EL2.E2H == 0:*

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>RES0</td>
<td>TZ</td>
<td>RES1</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This format applies in all ARMv8.0 implementations.

**TCPAC, bit [31]**

Traps Non-secure EL1 accesses to CPACR_EL1 or CPACR to EL2, from both Execution states.
- 0  This control does not cause any instructions to be trapped.
- 1  Non-secure EL1 accesses to CPACR_EL1 and CPACR are trapped to EL2.

**Note**

CPACR_EL1 and CPACR are not accessible at EL0.

**Bits [30:21]**

Reserved, RES0.

**TTA, bit [20]**

Traps Non-secure System register accesses to all implemented trace registers to EL2, from both Execution states.
- 0  This control does not cause any instructions to be trapped.
1 Any attempt at EL2, or Non-secure EL0 or EL1, to execute a System register access to an implemented trace register is trapped to EL2, unless it is trapped by CPACR.NSTRCDIS or CPACR_EL1.TTA.

---

**Note**

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the ARMv8-A architecture is implemented with an ETMv4 implementation, EL0 accesses to the trace registers are **UNDEFINED**, and any resulting exception is higher priority than an exception that would be generated because the value of CPTR_EL2.TTA is 1.
- EL2 does not provide traps on trace register accesses through the optional memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

If System register access to the trace functionality is not supported, this bit is RES0.

**Bits [19:14]**

Reserved, RES0.

**Bits [13:12]**

Reserved, RES1.

**Bit [11]**

Reserved, RES0.

**TFP, bit [10]**

Traps Non-secure accesses to SVE, Advanced SIMD and floating-point functionality to EL2, from both Execution states.

0 This control does not cause any instructions to be trapped.
1 Any attempt at EL2, or Non-secure EL0 or EL1, to execute an instruction that uses the registers associated with SVE, Advanced SIMD and floating-point execution is trapped to EL2, subject to the exception prioritization rules, unless it is trapped by CPTR_EL2.TZ.

**Bit [9]**

Reserved, RES1.

**TZ, bit [8]**

*In ARMv8.3 and ARMv8.2*

Present only if SVE is implemented.

Traps Non-secure execution at EL2, EL1, or EL0 of SVE instructions and instructions that access SVE System registers to EL2. Defined values are:

0 This control does not cause any instruction to be trapped.
1 This control causes these instructions to be trapped, subject to the exception prioritization rules.

If SVE is not implemented, this field is RES1.

*In ARMv8.1 and ARMv8.0.*

Reserved, RES1.

**Bits [7:0]**

Reserved, RES1.
When HCR_EL2.E2H == 1:

TCPAC, bit [31]
When HCR_EL2.TGE is 0, traps Non-secure EL1 accesses to CPACR_EL1 and CPACR to EL2, from both Execution states.
0 This control does not cause any instructions to be trapped.
1 Non-secure EL1 accesses to CPACR_EL1 and CPACR are trapped to EL2.
When HCR_EL2.TGE is 1, this control does not cause any instructions to be trapped.

Note CPACR_EL1 and CPACR are not accessible at EL0.

Bits [30:29]
Reserved, RES0.

TTA, bit [28]
Traps Non-secure System register accesses to all implemented trace registers to EL2, from both Execution states.
0 This control does not cause any instructions to be trapped.
1 Any attempt at EL2, or Non-secure EL0 or EL1, to execute a System register access to an implemented trace register is trapped to EL2, unless HCR_EL2.TGE is 0 and it is trapped by CPACR.NSTRCDIS or CPACR_EL1.TTA.
When HCR_EL2.TGE is 1, any attempt at EL2, or Non-secure EL0, to execute a System register access to an implemented trace register is trapped to EL2.

Note
• The ETMv4 architecture does not permit EL0 to access the trace registers. If the ARMv8-A architecture is implemented with an ETMv4 implementation, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPTR_EL2.TTA is 1.
• EL2 does not provide traps on trace register accesses through the optional memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

If System register access to the trace functionality is not supported, this bit is RES0.

Bits [27:22]
Reserved, RES0.
FPEN, bits [21:20]

Traps EL2, Non-secure EL0 and, when HCR_EL2.TGE is 0, Non-secure EL1 accesses to the SVE, Advanced SIMD and floating-point registers to EL2, from both Execution states.

00  This control causes any instructions at Non-secure EL0, EL1, or EL2 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, subject to the exception prioritization rules, unless they are trapped by CPTR_EL2.ZEN.

01  When HCR_EL2.TGE is 0, this control does not cause any instructions to be trapped. When HCR_EL2.TGE is 1, this control causes instructions at Non-secure EL0 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, unless they are trapped by CPTR_EL2.ZEN, but does not cause any instruction at EL2 to be trapped.

10  This control causes any instructions at Non-secure EL0, EL1, or EL2 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, subject to the exception prioritization rules, unless they are trapped by CPTR_EL2.ZEN.

11  This control does not cause any instructions to be trapped.

Writes to MVFR0, MVFR1, and MVFR2 from EL1 or higher are CONSTRAINED UNPREDICTABLE and whether these accesses can be trapped by this control depends on implemented CONSTRAINED UNPREDICTABLE behavior.

--- Note ---

- Attempts to write to the FPSID count as use of the registers for accesses from EL1 or higher.
- Accesses from EL0 to FPSID, MVFR0, MVFR1, MVFR2, and FPEXC are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPTR_EL2.FPEN is not 11.

Bits [19:18]

Reserved, RES0.

ZEN, bits [17:16]

In ARMv8.3 and ARMv8.2

Present only if SVE is implemented.

Traps Non-secure execution at EL2, EL1, and EL0 of SVE instructions or instructions that access SVE System registers to EL2.

Defined values are:

00  This control causes Non-secure execution at EL2, EL1, and EL0 of these instructions to be trapped, subject to the exception prioritization rules.

01  When HCR_EL2.TGE is 0, this control does not cause any instruction to be trapped. When HCR_EL2.TGE is 1, this control causes these instructions executed at Non-secure EL0 to be trapped, but does not cause any instruction at EL2 to be trapped.

10  This control causes Non-secure execution at EL2, EL1, and EL0 of these instructions to be trapped, subject to the exception prioritization rules.

11  This control does not cause any instruction to be trapped.

If SVE is not implemented, this field is RES0.

In ARMv8.1.

Reserved, RES0.

Bits [15:0]

Reserved, RES0.
Accessing the CPTR_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL3 is implemented and is using AArch64:
  - If CPTR_EL3.TCPAC==1, accesses to this register from EL2 are trapped to EL3.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  — If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
D10.2.31 CPTR_EL3, Architectural Feature Trap Register (EL3)

The CPTR_EL3 characteristics are:

**Purpose**

Controls trapping to EL3 of access to CPACR_EL1, CPTR_EL2, trace functionality and registers associated with SVE, Advanced SIMD and floating-point execution. Also controls EL3 access to trace functionality and registers associated with SVE, Advanced SIMD and floating-point execution.

**Configurations**

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CPTR_EL3 is a 32-bit register.

**Field descriptions**

The CPTR_EL3 bit assignments are:

<table>
<thead>
<tr>

**TCPAC, bit [31]**

Traps all of the following to EL3, from both Security states and both Execution states.
- EL2 accesses to the CPTR_EL2 or HCPTR.
- EL2 and EL1 accesses to the CPACR_EL1 or CPACR.

When CPTR_EL3.TCPAC is:

0  This control does not cause any instructions to be trapped.
1  EL2 accesses to the CPTR_EL2 or HCPTR, and EL2 and EL1 accesses to the CPACR_EL1 or CPACR, are trapped to EL3, unless they are trapped by CPTR_EL2.TCPAC.

**Bits [30:21]**

Reserved, RES0.

**TTA, bit [20]**

Traps System register accesses to the trace registers, from all Exception levels, both Security states, and both Execution states, to EL3.

0  This control does not cause any instructions to be trapped.
1  Any System register access to the trace registers is trapped to EL3, subject to the exception prioritization rules, unless it is trapped by CPACR.NSTRCDIS, CPACR_EL1.TTA or CPTR_EL2.TTA.

If System register access to trace functionality is not supported, this bit is RES0.

**Bits [19:11]**

Reserved, RES0.
TFP, bit [10]

Traps all accesses to SVE, Advanced SIMD and floating-point functionality, from all Exception levels, both Security states, and both Execution states, to EL3. Defined values are:

0  This control does not cause any instructions to be trapped.
1  Any attempt at any Exception level to execute an instruction that uses the registers associated with SVE, Advanced SIMD and floating-point is trapped to EL3, subject to the exception prioritization rules, unless it is trapped by CPTR_EL3.EZ.

Bit [9]

Reserved, RES0.

EZ, bit [8]

*In ARMv8.3 and ARMv8.2*

Present only if SVE is implemented.

Traps all accesses to SVE functionality and registers from all Exception levels, and both Security states, to EL3. Defined values are:

0  This control causes these instructions executed at any Exception level to be trapped, subject to the exception prioritization rules.
1  This control does not cause any instruction to be trapped.

If SVE is not implemented, this field is RES0.

*In ARMv8.1 and ARMv8.0.*

Reserved, RES0.

Bits [7:0]

Reserved, RES0.

Accessing the CPTR_EL3

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

\[
\begin{array}{ccccc}
<systemreg> & op0 & op1 & CRn & CRm & op2 \\
CPTR_EL3 & 11 & 110 & 0001 & 0001 & 010 \\
\end{array}
\]

Accessibility

The register is accessible in software as follows:

\[
\begin{array}{cccccc}
\text{Control} & \text{Accessibility} \\
E2H & TGE & NS & EL0 & EL1 & EL2 & EL3 \\
x & x & 0 & - & - & n/a & RW \\
x & 0 & 1 & - & - & - & RW \\
x & 1 & 1 & - & n/a & - & RW \\
\end{array}
\]
D10.2.32 CSSELR_EL1, Cache Size Selection Register

The CSSELR_EL1 characteristics are:

**Purpose**

Selects the current Cache Size ID Register, CCSIDR_EL1, by specifying the required cache level and the cache type (either instruction or data cache).

**Configurations**

AArch64 System register CSSELR_EL1 is architecturally mapped to AArch32 System register CSSELR.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CSSELR_EL1 is a 32-bit register.

**Field descriptions**

The CSSELR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:4</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>4:1</td>
<td>Level</td>
</tr>
<tr>
<td>0</td>
<td>InD</td>
</tr>
</tbody>
</table>

**Level, bits [3:1]**

Cache level of required cache. Permitted values are:

- 000: Level 1 cache
- 001: Level 2 cache
- 010: Level 3 cache
- 011: Level 4 cache
- 100: Level 5 cache
- 101: Level 6 cache
- 110: Level 7 cache

All other values are reserved.

If CSSELR_EL1.Level is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR is UNKNOWN.

**InD, bit [0]**

Instruction not Data bit. Permitted values are:

- 0: Data or unified cache.
- 1: Instruction cache.

If CSSELR_EL1.Level is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR is UNKNOWN.

**Accessing the CSSELR_EL1**

This register can be read using MRS with the following syntax:
MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSSELR_EL1</td>
<td>11</td>
<td>010</td>
<td>0000</td>
<td>0000</td>
<td>000</td>
</tr>
</tbody>
</table>

### Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0</td>
</tr>
<tr>
<td>x x 0</td>
<td>-</td>
</tr>
<tr>
<td>x 0 1</td>
<td>-</td>
</tr>
<tr>
<td>x 1 1</td>
<td>-</td>
</tr>
</tbody>
</table>

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TID2==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TID2==1, Non-secure accesses to this register from EL1 are trapped to EL2.
D10.2.33  CTR_EL0, Cache Type Register

The CTR_EL0 characteristics are:

**Purpose**
Provides information about the architecture of the caches.

**Configurations**
AArch64 System register CTR_EL0 is architecturally mapped to AArch32 System register CTR.

**Attributes**
CTR_EL0 is a 32-bit register.

**Field descriptions**
The CTR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES1.</td>
</tr>
<tr>
<td>30</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>29</td>
<td>Instruction cache invalidation requirements for instruction to data coherence. The meaning of this bit is:</td>
</tr>
<tr>
<td>28</td>
<td>0: Instruction cache invalidation to the point of unification is required for instruction to data coherence.</td>
</tr>
<tr>
<td>27</td>
<td>1: Instruction cache cleaning to the point of unification is not required for instruction to data coherence.</td>
</tr>
<tr>
<td>26</td>
<td>Data cache clean requirements for instruction to data coherence. The meaning of this bit is:</td>
</tr>
<tr>
<td>25</td>
<td>0: Data cache clean to the point of unification is required for instruction to data coherence, unless CLIDR_EL1.LoC == 0b000 or (CLIDR_EL1.LoUIS == 0b000 &amp;&amp; CLIDR_EL1.LoUU == 0b000).</td>
</tr>
<tr>
<td>24</td>
<td>1: Data cache clean to the point of unification is not required for instruction to data coherence.</td>
</tr>
<tr>
<td>23</td>
<td>Cache writeback granule. Log2 of the number of words of the maximum size of memory that can be overwritten as a result of the eviction of a cache entry that has had a memory location in it modified.</td>
</tr>
<tr>
<td>22</td>
<td>A value of 0b0000 indicates that this register does not provide Cache writeback granule information and either:</td>
</tr>
<tr>
<td>21</td>
<td>The architectural maximum of 512 words (2KB) must be assumed.</td>
</tr>
</tbody>
</table>
The Cache writeback granule can be determined from maximum cache line size encoded in the Cache Size ID Registers. Values greater than 0b1001 are reserved. ARM recommends that an implementation that does not support cache write-back implements this field as 0b0001. This applies, for example, to an implementation that supports only write-through caches.

**ERG, bits [23:20]**

Exclusives reservation granule. Log$_2$ of the number of words of the maximum size of the reservation granule that has been implemented for the Load-Exclusive and Store-Exclusive instructions. A value of 0b0000 indicates that this register does not provide Exclusives reservation granule information and the architectural maximum of 512 words (2KB) must be assumed. Values greater than 0b1001 are reserved.

**DminLine, bits [19:16]**

Log$_2$ of the number of words in the smallest cache line of all the data caches and unified caches that are controlled by the PE.

**L1Ip, bits [15:14]**

Level 1 instruction cache policy. Indicates the indexing and tagging policy for the L1 instruction cache. Possible values of this field are:

- 00 VMID aware Physical Index, Physical tag (VPIPT)
- 01 ASID-tagged Virtual Index, Virtual Tag (AIVIVT)
- 10 Virtual Index, Physical Tag (VIPT)
- 11 Physical Index, Physical Tag (PIPT)

The value 0b01 is reserved in ARMv8.

The value 0b00 is permitted only in an implementation that includes ARMv8.2-VPIPT, otherwise the value is reserved.

**Bits [13:4]**

Reserved, RES0.

**IminLine, bits [3:0]**

Log$_2$ of the number of words in the smallest cache line of all the instruction caches that are controlled by the PE.

**Accessing the CTR_EL0**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTR_EL0</td>
<td>11</td>
<td>011</td>
<td>0000</td>
<td>0000</td>
<td>001</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If SCTLR_EL1.UCT==0, read accesses to this register from EL0 are trapped to EL1.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TID2==1, Non-secure read accesses to this register from EL0 and EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TID2==1, Non-secure read accesses to this register from EL0 and EL1 are trapped to EL2.
D10.2.34 DACR32_EL2, Domain Access Control Register

The DACR32_EL2 characteristics are:

Purpose

Allows access to the AArch32 DACR register from AArch64 state only. Its value has no effect on execution in AArch64 state.

Configurations

AArch64 System register DACR32_EL2 is architecturally mapped to AArch32 System register DACR.

If EL1 does not support AArch32, this register is UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DACR32_EL2 is a 32-bit register.

Field descriptions

The DACR32_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>D15</th>
<th>D14</th>
<th>D13</th>
<th>D12</th>
<th>D11</th>
<th>D10</th>
<th>D9</th>
<th>D8</th>
<th>D7</th>
<th>D6</th>
<th>D5</th>
<th>D4</th>
<th>D3</th>
<th>D2</th>
<th>D1</th>
<th>D0</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>30</td>
<td>29</td>
<td>28</td>
<td>27</td>
<td>26</td>
<td>25</td>
<td>24</td>
<td>23</td>
<td>22</td>
<td>21</td>
<td>20</td>
<td>19</td>
<td>18</td>
<td>17</td>
<td>16</td>
</tr>
</tbody>
</table>

D<n>, bits [2n+1:2n], for n = 0 to 15

Domain n access permission, where n = 0 to 15. Permitted values are:

00 No access. Any access to the domain generates a Domain fault.

01 Client. Accesses are checked against the permission bits in the translation tables.

11 Manager. Accesses are not checked against the permission bits in the translation tables.

The value 10 is reserved.

Accessing the DACR32_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>DACR32_EL2</td>
<td>11</td>
<td>100</td>
<td>0011</td>
<td>0000</td>
<td>000</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0</td>
</tr>
<tr>
<td>x x 0</td>
<td>-</td>
</tr>
<tr>
<td>x 0 1</td>
<td>-</td>
</tr>
<tr>
<td>x 1 1</td>
<td>-</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
D10.2.35 DCZID_EL0, Data Cache Zero ID register

The DCZID_EL0 characteristics are:

**Purpose**
Indicates the block size that is written with byte values of 0 by the DC ZVA (Data Cache Zero by Address) system instruction.

**Configurations**
There are no configuration notes.

**Attributes**
DCZID_EL0 is a 32-bit register.

**Field descriptions**
The DCZID_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [31:5]</th>
<th>31 5 4 3 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>BS</td>
</tr>
</tbody>
</table>

**DZP, bit [4]**
Data Zero prohibited. Permitted values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>DC ZVA instruction is permitted.</td>
</tr>
<tr>
<td>1</td>
<td>DC ZVA instruction is prohibited.</td>
</tr>
</tbody>
</table>

The value read from this field is governed by the access state and the values of the HCR_EL2.TDZ and SCTLR_EL1.DZE bits.

**BS, bits [3:0]**
Log₂ of the block size in words. The maximum size supported is 2KB (value == 9).

**Accessing the DCZID_EL0**
This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>DCZID_EL0</td>
<td>11</td>
<td>011</td>
<td>0000</td>
<td>0000</td>
<td>111</td>
</tr>
</tbody>
</table>
## Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0</td>
</tr>
<tr>
<td>x x 0</td>
<td>RO</td>
</tr>
<tr>
<td>x 0 1</td>
<td>RO</td>
</tr>
<tr>
<td>x 1 1</td>
<td>RO</td>
</tr>
</tbody>
</table>
### D10.2.36 ESR_EL1, Exception Syndrome Register (EL1)

The ESR_EL1 characteristics are:

**Purpose**

Holds syndrome information for an exception taken to EL1.

**Configurations**

AArch64 System register ESR_EL1 is architecturally mapped to AArch32 System register DFSR. RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ESR_EL1 is a 32-bit register.

**Field descriptions**

See ESR_ELx.

**Accessing the ESR_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESR_EL1</td>
<td>11</td>
<td>000</td>
<td>0101</td>
<td>0010</td>
<td>000</td>
</tr>
<tr>
<td>ESR_EL12</td>
<td>11</td>
<td>101</td>
<td>0101</td>
<td>0010</td>
<td>000</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>E2H TGE NS</td>
<td>EL0 EL1 EL2 EL3</td>

</tr>
<tr>
<td>ESR_EL12</td>
<td>x x 0</td>
<td>- - n/a -</td>
</tr>
<tr>
<td>ESR_EL12</td>
<td>0 0 1</td>
<td>- - - -</td>
</tr>
</tbody>
</table>
This table applies to all instructions that can access this register.

When \texttt{HCR\_EL2.E2H} is 1, without explicit synchronization, access from EL3 using the mnemonic ESR\_EL1 or ESR\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (\texttt{SCR\_EL3.NS} == 1) \&\& (\texttt{HCR\_EL2.E2H} == 0):
  - If \texttt{HCR\_EL2.TRVM}==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If \texttt{HCR\_EL2.TVM}==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If \texttt{HCR\_EL2.NV}==1, Non-secure accesses to this register from EL1 using accessor ESR\_EL12 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (\texttt{SCR\_EL3.NS} == 1) \&\& (\texttt{HCR\_EL2.E2H} == 1) \&\& (\texttt{HCR\_EL2.TGE} == 0):
  - If \texttt{HCR\_EL2.TRVM}==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If \texttt{HCR\_EL2.NV}==1, Non-secure accesses to this register from EL1 using accessor ESR\_EL12 are trapped to EL2.

\end{tabular}
\end{table}
D10.2.37  ESR_EL2, Exception Syndrome Register (EL2)

The ESR_EL2 characteristics are:

Purpose

Holds syndrome information for an exception taken to EL2.

Configurations

AArch64 System register ESR_EL2 is architecturally mapped to AArch32 System register HSR.
If EL2 is not implemented, this register is RES0 from EL3.
RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ESR_EL2 is a 32-bit register.

Field descriptions

See ESR_ELx.

Accessing the ESR_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

### D10 AArch64 System Register Descriptions

#### D10.2 General system control registers

This table applies to all instructions that can access this register.

When `HCR_EL2.E2H` is 1, without explicit synchronization, access from EL2 using the mnemonic `ESR_EL2` or `ESR_EL1` are not guaranteed to be ordered with respect to accesses using the other mnemonic.

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and `(SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0)`:  
  - If `HCR_EL2.NV==1`, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and `(SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0)`:  
  - If `HCR_EL2.NV==1`, Non-secure accesses to this register from EL1 are trapped to EL2.

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>

</tr>
<tr>
<td>ESR_EL1</td>
<td>1 0 1</td>
<td></td>
</tr>
<tr>
<td>ESR_EL1</td>
<td>1 1 1</td>
<td></td>
</tr>
</tbody>
</table>

This table applies to all instructions that can access this register.

When `HCR_EL2.E2H` is 1, without explicit synchronization, access from EL2 using the mnemonic `ESR_EL2` or `ESR_EL1` are not guaranteed to be ordered with respect to accesses using the other mnemonic.
D10.2.38 ESR_EL3, Exception Syndrome Register (EL3)

The ESR_EL3 characteristics are:

**Purpose**

Holds syndrome information for an exception taken to EL3.

**Configurations**

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

ESR_EL3 is a 32-bit register.

**Field descriptions**

See ESR_ELx.

**Accessing the ESR_EL3**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESR_EL3</td>
<td>11</td>
<td>110</td>
<td>010</td>
<td>001</td>
<td>000</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>
D10.2.39  ESR_ELx, Exception Syndrome Register (ELx)

This page describes ESR_EL1, ESR_EL2, and ESR_EL3.

The ESR_ELx characteristics are:

Purpose

Holds syndrome information for an exception taken to ELx.

Configurations

If EL2 is not implemented, ESR_EL2 is res0 from EL3.

Attributes

The ESR_ELx registers are 32-bit registers.

Field descriptions

The ESR_ELx bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>26 25 24</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>EC</td>
<td>IL</td>
<td>ISS</td>
</tr>
</tbody>
</table>

ESR_ELx is made UNKNOWN as a result of an exception return from ELx.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to ELx, the value of ESR_ELx is UNKNOWN. The value written to ESR_ELx must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about.

For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.
- The encoding of the associated ISS.

Possible values of the EC field are:

EC == 000000

Unknown reason.

This value is valid for all described registers.

See ISS encoding for exceptions with an unknown reason.

EC == 000001

Trapped WFI or WFE instruction execution.

Conditional WFE and WFI instructions that fail their condition code check do not cause an exception.

This value is valid for all described registers.

See ISS encoding for an exception from a WFI or WFE instruction.

EC == 000011

Trapped MCR or MRC access with (coproc==1111) that is not reported using EC 0b000000.

This value is valid for all described registers.

See ISS encoding for an exception from an MCR or MRC access.
EC == 000100
Trapped MCRR or MRRC access with (coproc==1111) that is not reported using EC 0b000000.
This value is valid for all described registers.
See ISS encoding for an exception from an MCRR or MRRC access.

EC == 000101
Trapped MCR or MRC access with (coproc==1110).
This value is valid for all described registers.
See ISS encoding for an exception from an MCR or MRC access.

EC == 000110
Trapped LDC or STC access.
The only architectured uses of these instructions are:
• An STC to write data to memory from DBGDTRRXint.
• An LDC to read data from memory to DBGDTRTXint.
This value is valid for all described registers.
See ISS encoding for an exception from an LDC or STC instruction.

EC == 000111
Access to SVE, Advanced SIMD, or floating-point functionality trapped by CPACR_EL1.FPEN, CPTR_EL2.FPEN, CPTR_EL2.TFP, or CPTR_EL3.TFP control.
Excludes exceptions resulting from CPACR_EL1 when the value of HCR_EL2.TGE is 1, or because SVE or Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000 as described in The EC used to report an exception routed to EL2 because HCR_EL2.TGE is 1 on page D1-1881.
This value is valid for all described registers.
See ISS encoding for an exception from an access to Advanced SIMD or floating-point functionality, resulting from CPACR_EL1.FPEN or CPTR_ELx.TFP.

EC == 001000
Trapped VMRS access, from ID group trap, that is not reported using EC 0b000111.
This value is valid for ESR_EL2.
See ISS encoding for an exception from an MCR or MRC access.

EC == 001001
Trapped Pointer Authentication instruction because HCR_EL2.API ==0 or SCR_EL3.API ==0.
This value is valid for ESR_EL2 and ESR_EL3.
See ISS encoding for a Trapped Pointer Authentication instruction because HCR_EL2.API == 0 or SCR_EL3.API == 0 on page D10-2471.

EC == 001100
Trapped MRRC access with (coproc==1110).
This value is valid for all described registers.
See ISS encoding for an exception from an MCRR or MRRC access.

EC == 001110
Illegal Execution state.
This value is valid for all described registers.
See ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault.

EC == 010001
SVC instruction execution in AArch32 state.
This is reported in ESR_EL2 only when the exception is generated because the value of HCR_EL2.TGE is 1.
This value is valid for ESR_EL1 and ESR_EL2.
See ISS encoding for an exception from HVC or SVC instruction execution.

**EC == 010010**

HVC instruction execution in AArch32 state, when HVC is not disabled.
This value is valid for ESR_EL2.
See ISS encoding for an exception from HVC or SVC instruction execution.

**EC == 010011**

SMC instruction execution in AArch32 state, when SMC is not disabled.
This is reported in ESR_EL2 only when the exception is generated because the value of HCR_EL2.TSC is 1.
This value is valid for ESR_EL2 and ESR_EL3.
See ISS encoding for an exception from SMC instruction execution in AArch32 state.

**EC == 010101**

SVC instruction execution in AArch64 state.
This value is valid for all described registers.
See ISS encoding for an exception from HVC or SVC instruction execution.

**EC == 010110**

HVC instruction execution in AArch64 state, when HVC is not disabled.
This value is valid for ESR_EL2 and ESR_EL3.
See ISS encoding for an exception from HVC or SVC instruction execution.

**EC == 010111**

SMC instruction execution in AArch64 state, when SMC is not disabled.
This is reported in ESR_EL2 only when the exception is generated because the value of HCR_EL2.TSC is 1.
This value is valid for ESR_EL2 and ESR_EL3.
See ISS encoding for an exception from SMC instruction execution in AArch64 state.

**EC == 011000**

Trapped MSR, MRS or System instruction execution in AArch64 state, that is not reported using EC 0b000000, 0b000001 or 0b000111.
This includes all instructions that cause exceptions that are part of the encoding space defined in System instruction class encoding overview on page C5-329, except for those exceptions reported using EC values 0b000000, 0b000001, or 0b000111.
This value is valid for all described registers.

**EC == 011001**

Access to SVE functionality trapped as a result of CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ, that is not reported using EC 0b000000.
This EC is defined only if SVE is implemented.
This value is valid for all described registers.
See ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ.

**EC == 011010**

Trapped ERET, ERETA, or ERETAB instruction execution.
This value is valid for ESR_EL2.
See ISS encoding for an exception from ERET, ERETA, or ERETAB instruction.

**EC == 011111**

IMPLEMENTATION DEFINED exception to EL3.
This value is valid for ESR_EL3.
See ISS encoding for a IMPLEMENTATION DEFINED exception to EL3.
EC == 100000
Instruction Abort from a lower Exception level, that might be using AArch32 or AArch64.
Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.
This value is valid for all described registers.
See ISS encoding for an exception from an Instruction Abort.

EC == 100001
Instruction Abort taken without a change in Exception level.
Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.
This value is valid for all described registers.
See ISS encoding for an exception from an Instruction Abort.

EC == 100010
PC alignment fault exception.
This value is valid for all described registers.
See ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault.

EC == 100100
Data Abort from a lower Exception level, that might be using AArch32 or AArch64.
Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.
This value is valid for all described registers.
See ISS encoding for an exception from a Data Abort.

EC == 100101
Data Abort taken without a change in Exception level.
Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.
This value is valid for all described registers.
See ISS encoding for an exception from a Data Abort.

EC == 100110
SP alignment fault exception.
This value is valid for all described registers.
See ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault.

EC == 101000
Trapped floating-point exception taken from AArch32 state.
This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.
This value is valid for ESR_EL1 and ESR_EL2.
See ISS encoding for an exception from a trapped floating-point exception.

EC == 101100
Trapped floating-point exception taken from AArch64 state.
This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.
This value is valid for all described registers.
See ISS encoding for an exception from a trapped floating-point exception.

**EC == 10111**

SError interrupt.
This value is valid for all described registers.
See ISS encoding for an SError interrupt.

**EC == 110000**

Breakpoint exception from a lower Exception level, that might be using AArch32 or AArch64.
This value is valid for ESR_EL1 and ESR_EL2.
See ISS encoding for an exception from a Breakpoint or Vector Catch debug exception.

**EC == 110001**

Breakpoint exception taken without a change in Exception level.
This value is valid for ESR_EL1 and ESR_EL2.
See ISS encoding for an exception from a Breakpoint or Vector Catch debug exception.

**EC == 110010**

Software Step exception from a lower Exception level, that might be using AArch32 or AArch64.
This value is valid for ESR_EL1 and ESR_EL2.
See ISS encoding for an exception from a Software Step exception.

**EC == 110011**

Software Step exception taken without a change in Exception level.
This value is valid for ESR_EL1 and ESR_EL2.
See ISS encoding for an exception from a Software Step exception.

**EC == 110100**

Watchpoint exception from a lower Exception level, that might be using AArch32 or AArch64.
This value is valid for ESR_EL1 and ESR_EL2.
See ISS encoding for an exception from a Watchpoint exception.

**EC == 110101**

Watchpoint exception taken without a change in Exception level.
This value is valid for ESR_EL1 and ESR_EL2.
See ISS encoding for an exception from a Watchpoint exception.

**EC == 111000**

BKPT instruction execution in AArch32 state.
This value is valid for ESR_EL1 and ESR_EL2.
See ISS encoding for an exception from execution of a Breakpoint instruction.

**EC == 111010**

Vector Catch exception from AArch32 state.
The only case where a Vector Catch exception is taken to an Exception level that is using AArch64 is when the exception is routed to EL2 and EL2 is using AArch64.
This value is valid for ESR_EL2.
See ISS encoding for an exception from a Breakpoint or Vector Catch debug exception.

**EC == 111100**

BRK instruction execution in AArch64 state.
This is reported in ESR_EL3 only if a BRK instruction is executed at EL3.
This value is valid for all described registers.
See ISS encoding for an exception from execution of a Breakpoint instruction.
All other EC values are reserved by ARM, and:

- Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in Reserved values in System and memory-mapped registers and translation table entries on page K1-6411.

**IL, bit [25]**

Instruction Length for synchronous exceptions. Possible values of this bit are:

0 16-bit instruction trapped.
1 32-bit instruction trapped. This value is also used when the exception is one of the following:

- An SError interrupt.
- An Instruction Abort exception.
- A PC alignment fault exception.
- An SP alignment fault exception.
- A Data Abort exception for which the value of the ISV bit is 0.
- An Illegal Execution state exception.
- Any debug exception except for Breakpoint instruction exceptions. For Breakpoint instruction exceptions, this bit has its standard meaning:
  0 16-bit T32 BKPT instruction.
  1 32-bit A32 BKPT instruction or A64 BRK instruction.
- An exception reported using EC value 0b000000.

**ISS, bits [24:0]**

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number. For an exception taken from AArch32 state, Mapping of the general-purpose registers between the Execution states on page D1-1963 defines this view of the specified AArch32 register. If the AArch32 register descriptor is 0b1111, then:

- If the instruction that generated the exception was not UNPREDICTABLE, the field takes the value 0b11111.
- If the instruction that generated the exception was UNPREDICTABLE, the field takes an UNKNOWN value that must be either:
  - The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
  - The value 0b11111.

When the EC field is 0b000000, indicating an exception with an unknown reason, the ISS field is not valid, RES0.

The following subsections describe each ISS format.

**ISS encoding for exceptions with an unknown reason**

This encoding is used by:

- Unknown reason.
The ISS encoding for these exceptions is:

```
    24  0
     RES0
```

**Bits [24:0]**

Reserved, RES0.

When an exception is reported using this EC code the IL field is set to 1.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction at the current Exception level and Security state, including:
  - A read access using a System register pattern that is not allocated for reads at the current Exception level and Security state.
  - A write access using a System register pattern that is not allocated for writes at the current Exception level and Security state.
  - Instruction encodings for instructions not implemented in the implementation.

- In Debug state, the attempted execution of an instruction bit pattern that is unallocated in Debug state.

- In Non-debug state, the attempted execution of an instruction bit pattern that is unallocated in Non-debug state.

- In AArch32 state, attempted execution of a short vector floating-point instruction.

- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.

- An exception generated because of the value of one of the SCTLR_EL1.ITD, SED, CP15BEN control bits.

- Attempted execution of:
  - An HVC instruction when disabled by HCR_EL2.HCD or SCR_EL3.HCE.
  - An SMC instruction when disabled by SCR_EL3.SMD.
  - An HLT instruction when disabled by EDSCR.HDE.

- Attempted execution of an MSR or MRS instruction to access SP_EL0 when the value of SPSel.SP is 0.

- Attempted execution, in Debug state, of:
  - A DCPS1 instruction in Non-secure state from EL0 when the value of HCR_EL2.TGE is 1.
  - A DCPS2 instruction from EL1 or EL0 when the value of SCR_EL3.NS is 0, or when EL2 is not implemented.
  - A DCPS3 instruction when the value of EDSCR.SDD is 1, or when EL3 is not implemented.

- When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using R13_mon. See Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32 on page D1-1944.

- In Debug state when the value of EDSCR.SDD is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.

- In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to SPSR_mon, SP_mon, or LR_mon.
• An exception that is taken to EL2 because the value of HCR_EL2.TGE is 1 that, if the value of HCR_EL2.TGE was 0 would have been reported with an ESR_ELx.EC value of 0b000111.

• In an implementation that does not include SVE, execution of an SVE instruction or an instruction that accesses the ID_AA64ZFR0_EL1, ZCR_EL1, ZCR_EL2, and ZCR_EL3 registers.

**ISS encoding for an exception from a WFI or WFE instruction**

This encoding is used by:

• Trapped WFI or WFE instruction execution.

  Conditional WFE and WFI instructions that fail their condition code check do not cause an exception.

The ISS encoding for these exceptions is:

```
  24 23 20 19 1 0
  --- --- --- --- ---
  COND RES0 TI
```

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

• When an A32 instruction is trapped, CV is set to 1.

  • When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

**COND, bits [23:20]**

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

• When an A32 instruction is trapped, CV is set to 1 and:
  — If the instruction is conditional, COND is set to the condition code field value from the instruction.
  — If the instruction is unconditional, COND is set to 0b1110.

• A conditional A32 instruction that is known to pass its condition code check can be presented either:
  — With COND set to 0b1110, the value for unconditional.
  — With the COND value held in the instruction.

• When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  — CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  — CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

### Bits [19:1]

Reserved, RES0.

### TI, bit [0]

Trapped instruction. Possible values of this bit are:

- 0: WFI trapped.
- 1: WFE trapped.

The following sections describe configuration settings for generating this exception:

- *Traps to EL1 of EL0 execution of WFE and WFI instructions* on page D1-1913.
- *Traps to EL2 of Non-secure EL0 and EL1 execution of WFE and WFI instructions* on page D1-1931.
- *Traps to EL3 of EL2, EL1, and EL0 execution of WFE and WFI instructions* on page D1-1944.

### ISS encoding for an exception from an MCR or MRC access

This encoding is used by:

- Trapped MCR or MRC access with (coproc==1111) that is not reported using EC 0b000000.
- Trapped MCR or MRC access with (coproc==1110).
- Trapped VMRS access, from ID group trap, that is not reported using EC 0b000111.

The ISS encoding for these exceptions is:

### CV, bit [24]

Condition code valid. Possible values of this bit are:

- 0: The COND field is not valid.
- 1: The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

### COND, bits [23:20]

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.
For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to $0b1110$.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to $0b1110$, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to $0b1110$, or to the value of any condition that applied to the instruction.

**Opc2, bits [19:17]**

The Opc2 value from the issued instruction.
For a trapped VMRS access, holds the value $0b000$.

**Opc1, bits [16:14]**

The Opc1 value from the issued instruction.
For a trapped VMRS access, holds the value $0b111$.

**CRn, bits [13:10]**

The CRn value from the issued instruction.
For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

**Rt, bits [9:5]**

The Rt value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See *Mapping of the general-purpose registers between the Execution states on page D1-1963*.

**CRm, bits [4:1]**

The CRm value from the issued instruction.
For a trapped VMRS access, holds the value $0b0000$.

**Direction, bit [0]**

Indicates the direction of the trapped instruction. The possible values of this bit are:

- 0 Write to System register space. MCR instruction.
- 1 Read from System register space. MRC or VMRS instruction.

The following sections describe configuration settings for generating exceptions that are reported using EC value $0b000011$:

- *Traps to EL1 of EL0 accesses to the Generic Timer registers on page D1-1917.*
- *Traps to EL1 of EL0 accesses to Performance Monitors registers on page D1-1918.*
- *Traps to EL2 of Non-secure EL1 accesses to virtual memory control registers on page D1-1922.*
- *Traps to EL2 of Non-secure EL1 execution of TLB maintenance instructions on page D1-1924.*
• **Traps to EL2 of Non-secure EL0 and EL1 execution of cache maintenance instructions** on page D1-1924.
• **Traps to EL2 of Non-secure EL1 accesses to the Auxiliary Control Register** on page D1-1926.
• **Traps to EL2 of Non-secure EL0 and EL1 accesses to lockdown, DMA, and TCM operations** on page D1-1926.
• **Traps to EL2 of Non-secure EL0 and EL1 accesses to the ID registers** on page D1-1928.
• **Trapping to EL2 of Non-secure EL1 accesses to the CPACR_EL1 or CPACR** on page D1-1932.
• **General trapping to EL2 of Non-secure EL0 and EL1 accesses to System registers, from AArch32 state only** on page D1-1934.
• **Traps to EL2 of Non-secure EL0 and EL1 accesses to the Generic Timer registers** on page D1-1938.
• **Traps to EL2 of Non-secure EL0 and EL1 accesses to Performance Monitors registers** on page D1-1938.
• **Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32** on page D1-1944.
• **Trapping to EL3 of EL2 accesses to the CPTR_EL2 or HCPTR, and EL2 and EL1 accesses to the CPACR_EL1 or CPACR** on page D1-1946.
• **Traps to EL3 of EL2, EL1, and EL0 accesses to Performance Monitors registers** on page D1-1950.

The following sections describe configuration settings for generating exceptions that are reported using EC value 0b000101:

• **Traps to EL1 of EL0 and EL1 System register accesses to the trace registers** on page D1-1915.
• **Traps to EL1 of EL0 accesses to the Debug Communications Channel (DCC) registers** on page D1-1917.
• **Traps to EL2 of Non-secure EL0 and EL1 accesses to the ID registers** on page D1-1928, for trapped accesses to the JIDR.
• **Traps to EL2 of Non-secure System register accesses to the trace registers** on page D1-1933.
• **Trapping System register accesses to Debug ROM registers to EL2** on page D1-1935.
• **Trapping System register accesses to powerdown debug registers to EL2** on page D1-1936.
• **Trapping general System register accesses to debug registers to EL2** on page D1-1936.
• **Traps to EL3 of all System register accesses to the trace registers** on page D1-1947.
• **Trapping System register accesses to powerdown debug registers to EL3** on page D1-1949.
• **Trapping general System register accesses to debug registers to EL3** on page D1-1949.

**Traps to EL2 of Non-secure EL0 and EL1 accesses to the ID registers** on page D1-1928 describes configuration settings for generating exceptions that are reported using EC value 0b001000.

**ISS encoding for an exception from an MCRR or MRRC access**

This encoding is used by:

• Trapped MCRR or MRRC access with (coproc==1111) that is not reported using EC 0b000000.
• Trapped MRRC access with (coproc==1110).

The ISS encoding for these exceptions is:
CV, bit [24]

Condition code valid. Possible values of this bit are:

0     The COND field is not valid.
1     The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.
For exceptions taken from AArch32:

• When an A32 instruction is trapped, CV is set to 1.
• When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

COND, bits [23:20]

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.
For exceptions taken from AArch32:

• When an A32 instruction is trapped, CV is set to 1 and:
  — If the instruction is conditional, COND is set to the condition code field value from the instruction.
  — If the instruction is unconditional, COND is set to 0b1110.
• A conditional A32 instruction that is known to pass its condition code check can be presented either:
  — With COND set to 0b1110, the value for unconditional.
  — With the COND value held in the instruction.
• When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  — CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  — CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
• For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

Opc1, bits [19:16]

The Opc1 value from the issued instruction.

Bit [15]

Reserved, RES0.

Rt2, bits [14:10]

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See Mapping of the general-purpose registers between the Execution states on page D1-1963.
Rt, bits [9:5]
The Rt value from the issued instruction, the first general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See Mapping of the general-purpose registers between the Execution states on page D1-1963.

CRm, bits [4:1]
The CRm value from the issued instruction.

Direction, bit [0]
Indicates the direction of the trapped instruction. The possible values of this bit are:
- 0 Write to System register space. MCRR instruction.
- 1 Read from System register space. MRRC instruction.

The following sections describe configuration settings for generating exceptions that are reported using EC value 0b0000100:
- Traps to EL1 of EL0 accesses to the Generic Timer registers on page D1-1917.
- Traps to EL1 of EL0 accesses to Performance Monitors registers on page D1-1918.
- Traps to EL2 of Non-secure EL1 accesses to virtual memory control registers on page D1-1922.
- General trapping to EL2 of Non-secure EL0 and EL1 accesses to System registers, from AArch32 state only on page D1-1934.
- Traps to EL2 of Non-secure EL0 and EL1 accesses to the Generic Timer registers on page D1-1938.
- Traps to EL2 of Non-secure EL0 and EL1 accesses to Performance Monitors registers on page D1-1938.
- Traps to EL3 of EL2, EL1, and EL0 accesses to Performance Monitors registers on page D1-1950.

The following sections describe configuration settings for generating exceptions that are reported using EC value 0b0011100:
- Traps to EL1 of EL0 and EL1 System register accesses to the trace registers on page D1-1915.
- Traps to EL1 of EL0 accesses to the Debug Communications Channel (DCC) registers on page D1-1917.
- Traps to EL2 of Non-secure System register accesses to the trace registers on page D1-1933.
- Trapping System register accesses to Debug ROM registers to EL2 on page D1-1935.
- Traps to EL3 of all System register accesses to the trace registers on page D1-1947.
- Trapping System register accesses to powerdown debug registers to EL3 on page D1-1949.
- Trapping general System register accesses to debug registers to EL3 on page D1-1949.

**ISS encoding for an exception from an LDC or STC instruction**

This encoding is used by:
- Trapped LDC or STC access.

The only architected uses of these instructions are:
- An STC to write data to memory from DBGDTRRXint.
- An LDC to read data from memory to DBGDTRTXint.

The ISS encoding for these exceptions is:
### CV, bit [24]

Condition code valid. Possible values of this bit are:

- **0**: The COND field is not valid.
- **1**: The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:
- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

### COND, bits [23:20]

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:
- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

### imm8, bits [19:12]

The immediate value from the issued instruction.

### Bits [11:10]

Reserved, RES0.
Rn, bits [9:5]
The Rn value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See Mapping of the general-purpose registers between the Execution states on page D1-1963.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

Offset, bit [4]
Indicates whether the offset is added or subtracted:
- 0 Subtract offset.
- 1 Add offset.

This bit corresponds to the U bit in the instruction encoding.

AM, bits [3:1]
Addressing mode. The permitted values of this field are:
- 000 Immediate unindexed.
- 001 Immediate post-indexed.
- 010 Immediate offset.
- 011 Immediate pre-indexed.
- 100 Literal unindexed.
- 101 Literal offset.
- 110 Literal offset.

LDC instruction in A32 instruction set only.

For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in Reserved values in System and memory-mapped registers and translation table entries on page K1-6427.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

Direction, bit [0]
Indicates the direction of the trapped instruction. The possible values of this bit are:
- 0 Write to memory. STC instruction.
- 1 Read from memory. LDC instruction.

The following sections describe the configuration settings for the traps that are reported using EC value 0b000110:

- Traps to EL1 of EL0 accesses to the Debug Communications Channel (DCC) registers on page D1-1917.
- Trapping general System register accesses to debug registers to EL2 on page D1-1936.
- Trapping general System register accesses to debug registers to EL3 on page D1-1949.

**ISS encoding for an exception from an access to Advanced SIMD or floating-point functionality, resulting from CPACR_EL1.FPEN or CPTR_ELx.TFP**

This encoding is used by:

- Access to SVE, Advanced SIMD, or floating-point functionality trapped by CPACR_EL1.FPEN, CPTR_EL2.FPEN, CPTR_EL2.TFP, or CPTR_EL3.TFP control.
Excludes exceptions resulting from CPACR_EL1 when the value of HCR_EL2.TGE is 1, or because SVE or Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000 as described in The EC used to report an exception routed to EL2 because HCR_EL2.TGE is 1 on page D1-1881.

The ISS encoding for these exceptions is:

```
<table>
<thead>
<tr>
<th>24 23</th>
<th>20 19</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>COND</td>
<td>RES0</td>
<td></td>
</tr>
</tbody>
</table>
```

The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SIMD and floating-point System registers.

For an implementation that does not include SVE, floating-point or Advanced SIMD, the exception is reported using the EC value 0b000000.

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

- 0: The COND field is not valid.
- 1: The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.
For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

**COND, bits [23:20]**

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

Bits [19:0]
Reserved, RES0.

The following sections describe the configuration settings for the traps that are reported using EC value 0b000111:

- **Traps to EL1 of EL0 and EL1 accesses to SIMD and floating-point functionality** on page D1-1916.
- **General trapping to EL2 of Non-secure accesses to the SIMD and floating-point registers** on page D1-1933.
- **Traps to EL3 of all accesses to the SIMD and floating-point registers** on page D1-1948.

**ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ**

This encoding is used by:

- Access to SVE functionality trapped as a result of CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ, that is not reported using EC 0b000000.

This EC is defined only if SVE is implemented.

The ISS encoding for these exceptions is:

![ISS encoding](image)

**Bits [24:0]**
Reserved, RES0.

The accesses covered by this trap include:

- Execution of SVE instructions.
- Accesses to the SVE system registers.

**ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault**

This encoding is used by:

- Illegal Execution state.
- PC alignment fault exception.
- SP alignment fault exception.

The ISS encoding for these exceptions is:

![ISS encoding](image)

**Bits [24:0]**
Reserved, RES0.
There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about these exceptions see The Illegal Execution state exception on page D1-1886 and PC alignment checking on page D1-1868.

SP alignment checking on page D1-1868 describes the configuration settings for generating SP alignment fault exceptions.

**ISS encoding for an exception from HVC or SVC instruction execution**

This encoding is used by:

- SVC instruction execution in AArch32 state.
  This is reported in ESR_EL2 only when the exception is generated because the value of HCR_EL2.TGE is 1.
- HVC instruction execution in AArch32 state, when HVC is not disabled.
- SVC instruction execution in AArch64 state.
- HVC instruction execution in AArch64 state, when HVC is not disabled.

The ISS encoding for these exceptions is:

```
<table>
<thead>
<tr>
<th>24</th>
<th>16</th>
<th>15</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>imm16</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

**Bits [24:16]**

Reserved, RES0.

**imm16, bits [15:0]**

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see SVC and HVC.

For A64 instructions, see SVC and HVC.

**ISS encoding for an exception from SMC instruction execution in AArch32 state**

This encoding is used by:

- SMC instruction execution in AArch32 state, when SMC is not disabled.
  This is reported in ESR_EL2 only when the exception is generated because the value of HCR_EL2.TSC is 1.

The ISS encoding for these exceptions is:
For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is `RES0`.

For an SMC instruction that is trapped to EL2 from Non-secure EL1 because `HCR_EL2.TSC` is 1, the ISS encoding is as shown in the diagram.

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

0  The COND field is not valid.
1  The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is only valid if CCKNOWNPASS is 1, otherwise it is `RES0`.

**COND, bits [23:20]**

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to `0b1110`.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to `0b1110`, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

This field is only valid if CCKNOWNPASS is 1, otherwise it is `RES0`.
CCKNOWNPASS, bit [19]
Indicates whether the instruction might have failed its condition code check.

0 The instruction was unconditional, or was conditional and passed its condition code check.
1 The instruction was conditional, and might have failed its condition code check.

--- Note ---
In an implementation in which an SMC instruction that fails its code check is not trapped, this field can always return the value 0.

Bits [18:0]
Reserved, RES0.

Traps to EL2 of Non-secure EL1 execution of SMC instructions on page D1-1927 describes the configuration settings for trapping SMC instructions from Non-secure EL1 modes, and System calls on page D1-1953 describes the case where these exceptions are trapped to EL3.

**ISS encoding for an exception from SMC instruction execution in AArch64 state**

This encoding is used by:

- SMC instruction execution in AArch64 state, when SMC is not disabled.
  - This is reported in ESR_EL2 only when the exception is generated because the value of HCR_EL2.TSC is 1.

The ISS encoding for these exceptions is:

24 16 15 0

<p>| | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>imm16</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [24:16]
Reserved, RES0.

imm16, bits [15:0]
The value of the immediate field from the issued SMC instruction.

The value of ISS[24:0] described here is used both:

- When an SMC instruction is trapped from Non-secure EL1 modes.
- When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

Traps to EL2 of Non-secure EL1 execution of SMC instructions on page D1-1927 describes the configuration settings for trapping SMC instructions from Non-secure EL1 modes, and System calls on page D1-1953 describes the case where these exceptions are trapped to EL3.

**ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state**

This encoding is used by:

- Trapped MSR, MRS or System instruction execution in AArch64 state, that is not reported using EC 0b000000, 0b000001 or 0b000111.
  - This include all instructions that cause exceptions that are part of the encoding space defined in System instruction class encoding overview on page C5-329, except for those exceptions reported using EC values 0b000000, 0b000001, or 0b000111.
The ISS encoding for these exceptions is:

```
+---+---+---+---+---+---+---+---+
| 24| 22| 21| 20| 19| 17| 16| 14| 13| 10|  9|  5|  4|  1|  0|
+---+---+---+---+---+---+---+---+
| RES0| Op0| Op2| Op1| CRn| Rt| CRm|
+---+---+---+---+---+---+---+---+
   |     |     |     |     |     |     |     | Direction
```

**Bits [24:22]**

Reserved, RES0.

**Op0, bits [21:20]**

The Op0 value from the issued instruction.

**Op2, bits [19:17]**

The Op2 value from the issued instruction.

**Op1, bits [16:14]**

The Op1 value from the issued instruction.

**CRn, bits [13:10]**

The CRn value from the issued instruction.

**Rt, bits [9:5]**

The Rt value from the issued instruction, the general-purpose register used for the transfer.

**CRm, bits [4:1]**

The CRm value from the issued instruction.

**Direction, bit [0]**

Indicates the direction of the trapped instruction. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Write access, including MSR instructions.</td>
</tr>
<tr>
<td>1</td>
<td>Read access, including MRS instructions.</td>
</tr>
</tbody>
</table>

For exceptions caused by System instructions, see System on page C4-229 for the encoding values returned by an instruction.

The following sections describe configuration settings for generating the exception that is reported using EC value 0b011000:

- **In EL1 configurable controls on page D1-1911.**
  - Traps to EL1 of EL0 execution of cache maintenance instructions on page D1-1913.
  - Traps to EL1 of EL0 accesses to the CTR_EL0 on page D1-1913.
  - Traps to EL1 of EL0 execution of DC ZVA instructions on page D1-1914.
  - Traps to EL1 of EL0 accesses to the PSTATE.{D, A, I, F} interrupt masks on page D1-1914.
  - Traps to EL1 of EL0 and EL1 System register accesses to the trace registers on page D1-1915.
  - Traps to EL1 of EL0 accesses to the Debug Communications Channel (DCC) registers on page D1-1917.
  - Traps to EL1 of EL0 accesses to the Generic Timer registers on page D1-1917.
  - Traps to EL1 of EL0 accesses to Performance Monitors registers on page D1-1918.

- **In EL2 configurable controls on page D1-1920.**
  - Traps to EL2 of Non-secure EL1 accesses to virtual memory control registers on page D1-1922.
— Traps to EL2 of Non-secure EL0 and EL1 execution of DC ZVA instructions on page D1-1923.
— Traps to EL2 of Non-secure EL1 execution of TLB maintenance instructions on page D1-1924.
— Traps to EL2 of Non-secure EL0 and EL1 execution of cache maintenance instructions on page D1-1924.
— Traps to EL2 of Non-secure EL1 accesses to the Auxiliary Control Register on page D1-1926.
— Traps to EL2 of Non-secure EL0 and EL1 accesses to lockdown, DMA, and TCM operations on page D1-1926.
— Traps to EL2 of Non-secure EL0 and EL1 accesses to the ID registers on page D1-1928.
— Trapping to EL2 of Non-secure EL1 accesses to the CPACR_EL1 or CPACR on page D1-1932.
— Traps to EL2 of Non-secure System register accesses to the trace registers on page D1-1933.
— Trapping System register accesses to Debug ROM registers to EL2 on page D1-1935.
— Trapping System register accesses to powerdown debug registers to EL2 on page D1-1936.
— Traps to EL2 of Non-secure EL0 and EL1 accesses to the Generic Timer registers on page D1-1938.
— Trapping general System register accesses to debug registers to EL2 on page D1-1936.
— Traps to EL2 of Non-secure EL0 and EL1 accesses to Performance Monitors registers on page D1-1938.
— Trap to EL2 Non-secure EL1 accesses to Pointer authentication key registers on page D1-1940
— Traps to EL2 for Nested virtualization on page D1-1941
— Trap to EL2 Non-secure EL1 accesses to AT S1E* instructions on page D1-1942

* In EL3 configurable controls on page D1-1942.
— Traps to EL3 of Secure EL1 accesses to the Counter-timer Physical Secure timer registers on page D1-1945.
— Trapping to EL3 of EL2 accesses to the CPTR_EL2 or HCPTR, and EL2 and EL1 accesses to the CPACR_EL1 or CPACR on page D1-1946.
— Traps to EL3 of all System register accesses to the trace registers on page D1-1947.
— Trapping System register accesses to powerdown debug registers to EL3 on page D1-1949.
— Trapping general System register accesses to debug registers to EL3 on page D1-1949.
— Traps to EL3 of EL2, EL1, and EL0 accesses to Performance Monitors registers on page D1-1950.
— Trap to EL3 accesses to Pointer authentication key registers on page D1-1952

**ISS encoding for a IMPLEMENTATION DEFINED exception to EL3**

This encoding is used by:

• IMPLEMENTATION DEFINED exception to EL3.

The ISS encoding for these exceptions is:

```
  24  0

IMPLEMENTATION DEFINED
```

IMPLEMENTATION DEFINED, bits [24:0]

IMPLEMENTATION DEFINED.

**ISS encoding for an exception from an Instruction Abort**

This encoding is used by:

• Instruction Abort from a lower Exception level, that might be using AArch32 or AArch64.
Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.

- Instruction Abort taken without a change in Exception level.

Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.

The ISS encoding for these exceptions is:

```
Bits [24:13]
Reserved, RES0.

SET, bits [12:11]
Synchronous Error Type. When the RAS Extension is implemented and IFSC is 010000, describes the state of the PE after taking the Instruction Abort exception. The possible values of this field are:
00  Recoverable error (UER).
01  Restartable error (UEO).
10  Uncontainable error (UC).
11  Corrected error (CE).

Note
Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in an unrecoverable PE state.

This field is RES0 if either:
- The RAS Extension is not implemented.
- The value returned in the IFSC field is not 010000.

FnV, bit [10]
FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.
0  FAR is valid.
1  FAR is not valid, and holds an UNKNOWN value.

This field is only valid if the IFSC code is 010000. It is RES0 for all other aborts.

EA, bit [9]
External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.
For any abort other than an External abort this bit returns a value of 0.

Bit [8]
Reserved, RES0.
S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

0  Fault not on a stage 2 translation for a stage 1 translation table walk.
1  Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

Bit [6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code. Possible values of this field are:

000000  Address size fault, level 0 of translation or translation table base register
000001  Address size fault, level 1
000010  Address size fault, level 2
000011  Address size fault, level 3
000100  Translation fault, level 0
000101  Translation fault, level 1
000110  Translation fault, level 2
000111  Translation fault, level 3
001001  Access flag fault, level 1
001010  Access flag fault, level 2
001011  Access flag fault, level 3
001101  Permission fault, level 1
001110  Permission fault, level 2
001111  Permission fault, level 3
010000  Synchronous External abort, not on translation table walk
010001  Synchronous parity or ECC error on memory access, not on translation table walk
010100  Synchronous External abort, on translation table walk, level 0
010101  Synchronous External abort, on translation table walk, level 1
010110  Synchronous External abort, on translation table walk, level 2
010111  Synchronous External abort, on translation table walk, level 3
011000  Synchronous parity or ECC error on memory access on translation table walk, level 0
011001  Synchronous parity or ECC error on memory access on translation table walk, level 1
011110  Synchronous parity or ECC error on memory access on translation table walk, level 2
011111  Synchronous parity or ECC error on memory access on translation table walk, level 3
110000  TLB conflict abort
110001  Unsupported atomic hardware update fault, if the implementation includes ARMv8.1-TTHM. Otherwise reserved.

All other values are reserved.

When the RAS Extension is implemented, 011000, 011100, 011101, 011110, and 011111, are reserved.

Note

ARMv8.2 requires the implementation of the RAS Extension.

For more information about the lookup level associated with a fault, see The level associated with MMU faults on page D4-2197.
Note

Because Access flag faults and Permission faults can only result from a Block or Page translation table descriptor, they cannot occur at level 0.

ISS encoding for an exception from a Data Abort

This encoding is used by:

- Data Abort from a lower Exception level, that might be using AArch32 or AArch64. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.

- Data Abort taken without a change in Exception level.
  Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.

The ISS encoding for these exceptions is:

<table>
<thead>
<tr>
<th>ISS, bit [24]</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
</tr>
<tr>
<td>1</td>
</tr>
</tbody>
</table>

- AArch64 loads and stores of a single general-purpose register (including the register specified with 0b111111), including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback.

- AArch32 instructions where the instruction:
  - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLB, or STRBT instruction.
  - Is not performing register writeback.
  - Is not using R15 as a source or destination register.

For these cases, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome. ISV is 0 for all faults reported in ESR_EL1 or ESR_EL3.

When the RAS Extension is implemented, ISV is 0 for any synchronous External abort. For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.
When the RAS Extension is not implemented, the value of ISV on a synchronous External abort on a stage 2 translation table walk is IMPLEMENTATION DEFINED.

**SAS, bits [23:22]**

Syndrome Access Size. When ISV is 1, indicates the size of the access attempted by the faulting operation.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Byte</td>
</tr>
<tr>
<td>01</td>
<td>Halfword</td>
</tr>
<tr>
<td>10</td>
<td>Word</td>
</tr>
<tr>
<td>11</td>
<td>Doubleword</td>
</tr>
</tbody>
</table>

This field is UNKNOWN when the value of ISV is UNKNOWN.
This field is RES0 when the value of ISV is 0.

**SSE, bit [21]**

Syndrome Sign Extend. When ISV is 1, for a byte, halfword, or word load operation, indicates whether the data item must be sign extended. For these cases, the possible values of this bit are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Sign-extension not required.</td>
</tr>
<tr>
<td>1</td>
<td>Data item must be sign-extended.</td>
</tr>
</tbody>
</table>

For all other operations this bit is 0.
This field is UNKNOWN when the value of ISV is UNKNOWN.
This field is RES0 when the value of ISV is 0.

**SRT, bits [20:16]**

Syndrome Register transfer. When ISV is 1, the register number of the Rt operand of the faulting instruction. If the exception was taken from an Exception level that is using AArch32 then this is the AArch64 view of the register. See Mapping of the general-purpose registers between the Execution states on page D1-1963.

This field is UNKNOWN when the value of ISV is UNKNOWN.
This field is RES0 when the value of ISV is 0.

**SF, bit [15]**

Width of the register accessed by the instruction is Sixty-Four. When ISV is 1, the possible values of this bit are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Instruction loads/stores a 32-bit wide register.</td>
</tr>
<tr>
<td>1</td>
<td>Instruction loads/stores a 64-bit wide register.</td>
</tr>
</tbody>
</table>

**Note**

This field specifies the register width identified by the instruction, not the Execution state.

This field is UNKNOWN when the value of ISV is UNKNOWN.
This field is RES0 when the value of ISV is 0.

**AR, bit [14]**

Acquire/Release. When ISV is 1, the possible values of this bit are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Instruction did not have acquire/release semantics.</td>
</tr>
<tr>
<td>1</td>
<td>Instruction did have acquire/release semantics.</td>
</tr>
</tbody>
</table>

This field is UNKNOWN when the value of ISV is UNKNOWN.
This field is RES0 when the value of ISV is 0.

**Bit [13]**

Reserved, RES0.
SET, bits [12:11]
Synchronous Error Type. When the RAS Extension is implemented and DFSC is 010000, describes the state of the PE after taking the Data Abort exception. The possible values of this field are:

00   Recoverable error (UER).
01   Restartable error (UEO).
10   Uncontainable error (UC).
11   Corrected error (CE).

**Note**
Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in an unrecoverable PE state.

This field is RES0 if either:
- The RAS Extension is not implemented.
- The value returned in the DFSC field is not 010000.

FnV, bit [10]
FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

0   FAR is valid.
1   FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the DFSC code is 010000. It is RES0 for all other aborts.

EA, bit [9]
External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

CM, bit [8]
Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

0   The Data Abort was not generated by the execution of one of the system instructions identified in the description of value 1.
1   The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA instruction is not classified as a cache maintenance instruction, and therefore its execution cannot cause this field to be set to 1.

S1PTW, bit [7]
For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

0   Fault not on a stage 2 translation for a stage 1 translation table walk.
1   Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

WnR, bit [6]
Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location. The possible values of this bit are:

0   Abort caused by an instruction reading from a memory location.
1   Abort caused by an instruction writing to a memory location.
For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is **UNKNOWN** for:

- An External abort.
- A fault reported using a DFSC value of \texttt{110101} or \texttt{110001}, indicating an unsupported Exclusive or atomic access.

**DFSC, bits [5:0]**

Data Fault Status Code. Possible values of this field are:

- \texttt{000000} Address size fault, level 0 of translation or translation table base register
- \texttt{000001} Address size fault, level 1
- \texttt{000010} Address size fault, level 2
- \texttt{000011} Address size fault, level 3
- \texttt{000100} Translation fault, level 0
- \texttt{000101} Translation fault, level 1
- \texttt{000110} Translation fault, level 2
- \texttt{000111} Translation fault, level 3
- \texttt{001001} Access flag fault, level 1
- \texttt{001010} Access flag fault, level 2
- \texttt{001011} Access flag fault, level 3
- \texttt{001101} Permission fault, level 1
- \texttt{001110} Permission fault, level 2
- \texttt{001111} Permission fault, level 3
- \texttt{010000} Synchronous External abort, not on translation table walk
- \texttt{010001} Synchronous parity or ECC error on memory access, not on translation table walk
- \texttt{010100} Synchronous External abort, on translation table walk, level 0
- \texttt{010101} Synchronous External abort, on translation table walk, level 1
- \texttt{010110} Synchronous External abort, on translation table walk, level 2
- \texttt{010111} Synchronous External abort, on translation table walk, level 3
- \texttt{011000} Synchronous parity or ECC error on memory access on translation table walk, level 0
- \texttt{011011} Synchronous parity or ECC error on memory access on translation table walk, level 1
- \texttt{011101} Synchronous parity or ECC error on memory access on translation table walk, level 2
- \texttt{011111} Synchronous parity or ECC error on memory access on translation table walk, level 3
- \texttt{100001} Alignment fault
- \texttt{100000} TLB conflict abort
- \texttt{100001} Unsupported atomic hardware update fault, if the implementation includes \texttt{ARMv8.1-TTHM}. Otherwise reserved.
- \texttt{110100} IMPLEMENTATION DEFINED fault (Lockdown)
- \texttt{110101} IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access)
- \texttt{111101} Section Domain Fault, used only for faults reported in the \texttt{PAR_EL1}
- \texttt{111110} Page Domain Fault, used only for faults reported in the \texttt{PAR_EL1}
All other values are reserved. When the RAS Extension is implemented, 011000, 011100, 011101, 011110, and 011111, are reserved. For more information about the lookup level associated with a fault, see The level associated with MMU faults on page D4-2197.

Note
Because Access flag faults and Permission faults can only result from a Block or Page translation table descriptor, they cannot occur at level 0.

### ISS encoding for an exception from a trapped floating-point exception

This encoding is used by:

- Trapped floating-point exception taken from AArch32 state.
  - This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.

- Trapped floating-point exception taken from AArch64 state.
  - This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.

The ISS encoding for these exceptions is:

![ISS encoding diagram](attachment:iss_encoding_diagram.png)

#### Bit [24]
Reserve, RES0.

#### TFV, bit [23]
Trapped Fault Valid bit. Indicates whether the IDF, IXF, UFF, OFF, DZF, and IOF bits hold valid information about trapped floating-point exceptions. The possible values of this bit are:

- 0: The IDF, IXF, UFF, OFF, DZF, and IOF bits do not hold valid information about trapped floating-point exceptions and are UNKNOWN.
- 1: One or more floating-point exceptions occurred during an operation performed while executing the reported instruction. The IDF, IXF, UFF, OFF, DZF, and IOF bits indicate trapped floating-point exceptions that occurred. For more information see Floating-point exceptions and exception traps on page D1-1899.

It is IMPLEMENTATION DEFINED whether this field is set to 0 on an exception generated by a trapped floating point exception from a vector instruction.
Note

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from a vector instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.

Bits [22:11]

Reserved, RES0.

VECITR, bits [10:8]

For a trapped floating-point exception from an instruction executed in AArch32 state this field is RES1.
For a trapped floating-point exception from an instruction executed in AArch64 state this field is UNKNOWN.

IDF, bit [7]

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

0  Input denormal floating-point exception has not occurred.
1  Input denormal floating-point exception occurred during execution of the reported instruction.

Bits [6:5]

Reserved, RES0.

IXF, bit [4]

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

0  Inexact floating-point exception has not occurred.
1  Inexact floating-point exception occurred during execution of the reported instruction.

UFF, bit [3]

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

0  Underflow floating-point exception has not occurred.
1  Underflow floating-point exception occurred during execution of the reported instruction.

OFF, bit [2]

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

0  Overflow floating-point exception has not occurred.
1  Overflow floating-point exception occurred during execution of the reported instruction.

DZF, bit [1]

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

0  Divide by Zero floating-point exception has not occurred.
1  Divide by Zero floating-point exception occurred during execution of the reported instruction.
IOF, bit [0]
Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is **UNKNOWN**. Otherwise, the possible values of this bit are:

- **0** Invalid Operation floating-point exception has not occurred.
- **1** Invalid Operation floating-point exception occurred during execution of the reported instruction.

In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the **FPCR. {IDE, IXE, UFE, OFE, DZE, IOE}** bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the **FPSCR. {IDE, IXE, UFE, OFE, DZE, IOE}** bits enable each of the floating-point exception traps.

**ISS encoding for an SError interrupt**

This encoding is used by:

- SError interrupt.

The ISS encoding for these exceptions is:

```
   24 23 14 13 12 10 9 8 6 5 0
   RES0  AET RES0 DFSC
   IDS IESB
   EA
```

IDS, bit [24]

**IMPLEMENTATION DEFINED** syndrome. Possible values of this bit are:

- **0** Bits[23:0] of the ISS field are defined in this description.

  **Note**
  
  If the RAS Extension is not implemented, this means that bits[23:0] of the ISS field are **RES0**.

- **1** Bits[23:0] of the ISS field holds **IMPLEMENTATION DEFINED** syndrome information that can be used to provide additional information about the SError interrupt.

  **Note**
  
  This field was previously called **ISV**.

Bits [23:14]
Reserved, RES0.

IESB, bit [13]

Implicit error synchronization event.
Present only if **ARMv8.2-IESB** is implemented.
The possible values of this field are:

- **0** The SError interrupt was either not synchronized by the implicit error synchronization event or not taken immediately.
- **1** The SError interrupt was synchronized by the implicit error synchronization event and taken immediately.
This field is \texttt{RES0} if either:
- \texttt{ARMv8.2-IESB} is not implemented.
- The value returned in the \texttt{DFSC} field is not \texttt{010001}.

\textbf{Note}

\texttt{ARMv8.2} requires the implementation of the \texttt{RAS Extension} and \texttt{ARMv8.2-IESB}.

\textbf{AET, bits \{12:10\}}

Asynchronous Error Type.

When the \texttt{RAS Extension} is implemented and \texttt{DFSC} is \texttt{010001}, describes the state of the PE after taking the SError interrupt exception. The possible values of this field are:
- \texttt{000} Uncontainable error (UC).
- \texttt{001} Unrecoverable error (UEU).
- \texttt{010} Restartable error (UEO).
- \texttt{011} Recoverable error (UER).
- \texttt{110} Corrected error (CE).

All other values are reserved.

If multiple errors are taken as a single SError interrupt exception, the overall state of the PE is reported. For example, if both a Recoverable and Unrecoverable error occurred, the state is Unrecoverable.

\textbf{Note}

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

This field is \texttt{RES0} if either:
- The \texttt{RAS Extension} is not implemented.
- The value returned in the \texttt{DFSC} field is not \texttt{010001}.

\textbf{Note}

\texttt{ARMv8.2} requires the implementation of the \texttt{RAS Extension}.

\textbf{EA, bit \{9\}}

External abort type. When the \texttt{RAS Extension} is implemented, this bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field is \texttt{RES0} if either:
- The \texttt{RAS Extension} is not implemented.
- The value returned in the \texttt{DFSC} field is not \texttt{010001}.

\textbf{Note}

\texttt{ARMv8.2} requires the implementation of the \texttt{RAS Extension}.

\textbf{Bits \{8:6\}}

Reserved, \texttt{RES0}.

\textbf{DFSC, bits \{5:0\}}

Data Fault Status Code. When the \texttt{RAS Extension} is implemented, possible values of this field are:
- \texttt{000000} Uncategorized.
010001 Asynchronous SError interrupt.
All other values are reserved.
If the RAS Extension is not implemented, this field is RES0.

--- Note ---
ARMv8.2 requires the implementation of the RAS Extension.

**ISS encoding for an exception from a Breakpoint or Vector Catch debug exception**

This encoding is used by:

- Breakpoint exception from a lower Exception level, that might be using AArch32 or AArch64.
- Breakpoint exception taken without a change in Exception level.
- Vector Catch exception from AArch32 state.
  
  The only case where a Vector Catch exception is taken to an Exception level that is using AArch64 is when the exception is routed to EL2 and EL2 is using AArch64.

The ISS encoding for these exceptions is:

![ISS encoding diagram]

**Bits [24:6]**
Reserved, RES0.

**IFSC, bits [5:0]**
Instruction Fault Status Code. This field is set to 0b100010, to indicate a Debug exception.

For more information about generating these exceptions:
- For exceptions from AArch64, see Breakpoint exceptions on page D2-1995.
- For exceptions from AArch32, see Breakpoint exceptions on page G2-4754 and Vector Catch exceptions on page G2-4795.

**ISS encoding for an exception from a Software Step exception**

This encoding is used by:
- Software Step exception from a lower Exception level, that might be using AArch32 or AArch64.
- Software Step exception taken without a change in Exception level.

The ISS encoding for these exceptions is:
ISV, bit [24]

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:

0  EX bit is RES0.
1  EX bit is valid.

See the EX bit description for more information.

Bits [23:7]

Reserved, RES0.

EX, bit [6]

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

0  An instruction other than a Load-Exclusive instruction was stepped.
1  A Load-Exclusive instruction was stepped.

If the ISV bit is set to 0, this bit is RES0, indicating no syndrome data is available.

IFSC, bits [5:0]

Instruction Fault Status Code. This field is set to 0b100010, to indicate a Debug exception.

For more information about generating these exceptions, see Software Step exceptions on page D2-2032.

ISS encoding for an exception from a Watchpoint exception

This encoding is used by:

- Watchpoint exception from a lower Exception level, that might be using AArch32 or AArch64.
- Watchpoint exception taken without a change in Exception level.

The ISS encoding for these exceptions is:

Bits [24:9]

Reserved, RES0.

CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

0  The Data Abort was not generated by the execution of one of the system instructions identified in the description of value 1.
The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA instruction is not classified as a cache maintenance instruction, and therefore its execution cannot cause this field to be set to 1.

Bit [7]  
Reserved, RES0.

WnR, bit [6]  
Write not Read. Indicates whether the abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location. The possible values of this bit are:

0: Abort caused by an instruction reading from a memory location.
1: Abort caused by an instruction writing to a memory location.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction, this field is set to 0 if a read of the location would have generated a fault, otherwise it is set to 1.

DFSC, bits [5:0]  
Data Fault Status Code. This field is set to 0b100010, to indicate a Debug exception.

For more information about generating these exceptions, see Watchpoint exceptions on page D2-2016.

**ISS encoding for an exception from execution of a Breakpoint instruction**

This encoding is used by:

- BKPT instruction execution in AArch32 state.
- BRK instruction execution in AArch64 state.

This is reported in ESR_EL3 only if a BRK instruction is executed at EL3.

The ISS encoding for these exceptions is:

```
24 16 15 0
RES0 Comment
```

Bits [24:16]  
Reserved, RES0.

Comment, bits [15:0]  
Set to the instruction comment field value, zero extended as necessary. For the AArch32 BKPT instructions, the comment field is described as the immediate field.

For more information about generating these exceptions, see Breakpoint Instruction exceptions on page D2-1993.

**ISS encoding for an exception from ERET, ERETTA or ERETTAB instruction**

This encoding is used by:

- Trapped ERET, ERETTA, or ERETTAB instruction execution.

The ISS encoding for these exceptions is:
This EC code only applies when \texttt{HCR\_EL2.NV} is 1.

**Bits [24:2]**

Reserved, RES0.

**ERET, bit [1]**

Indicates whether an ERET or ERETA* instruction was trapped to EL2. Possible values are:

- 0 \hspace{1em} \text{ERET instruction.}
- 1 \hspace{1em} \text{ERETA* instruction.}

If this bit is 0, the ERETA field is RES0.

**ERETA, bit [0]**

Indicates whether an ERETTA or ERETAB instruction was trapped to EL2. Possible values are:

- 0 \hspace{1em} \text{ERETAA instruction.}
- 1 \hspace{1em} \text{ERETAB instruction.}

When ERET is 0, this bit is RES0.

For more information about generating these exceptions, see \textit{Traps to EL2 for Nested virtualization} on page D1-1941.

**ISS encoding for a Trapped Pointer Authentication instruction because HCR\_EL2.API == 0 or SCR\_EL3.API == 0**

This encoding is used by:

- Trapped Pointer Authentication instruction because HCR\_EL2.API == 0 or SCR\_EL3.API == 0.

The ISS encoding for these exceptions is:

\[
\begin{array}{c}
24 \\
\hline
2 \ 1 \ 0 \\
\hline
\end{array}
\]

Reserved, RES0.

For more information about generating these exceptions, see:

- \textit{Trap to EL3 accesses to Pointer authentication instructions} on page D1-1952.
- \textit{Trap to EL2 Non-secure EL0 accesses to Pointer authentication instructions} on page D1-1940
D10.2.40  FAR_EL1, Fault Address Register (EL1)

The FAR_EL1 characteristics are:

**Purpose**
Holds the faulting Virtual Address for all synchronous Instruction or Data Abort, PC alignment fault and Watchpoint exceptions that are taken to EL1.

**Configurations**
AArch64 System register FAR_EL1[31:0] is architecturally mapped to AArch32 System register DFAR (NS).
AArch64 System register FAR_EL1[63:32] is architecturally mapped to AArch32 System register IFAR (NS).
RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**
FAR_EL1 is a 64-bit register.

**Field descriptions**
The FAR_EL1 bit assignments are:

Faulting Virtual Address for synchronous exceptions taken to EL1

<table>
<thead>
<tr>
<th>63</th>
<th>62</th>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>??</td>
<td>??</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

**Bits [63:0]**
Faulting Virtual Address for synchronous exceptions taken to EL1. Exceptions that set the FAR_EL1 are Instruction Aborts (EC 0x20 or 0x21), Data Aborts (EC 0x24 or 0x25), PC alignment faults (EC 0x22), and Watchpoints (EC 0x34 or 0x35). ESR_EL1.EC holds the EC value for the exception.

For a synchronous External abort, if the VA that generated the abort was from an address range for which TCR_ELx.TBI[0] == 1 for the translation regime in use when the abort was generated, then the top eight bits of FAR_EL1 are UNKNOWN.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if ESR_EL1.FnV is 0, and the FAR_EL1 is UNKNOWN if ESR_EL1.FnV is 1.

For all other exceptions taken to EL1, the FAR_EL1 is UNKNOWN.

If a memory fault that sets FAR_EL1 is generated from a data cache maintenance or DC ZVA instruction, this field holds the address specified in the register argument of the instruction.

If the exception that updates FAR_EL1 is taken from an Exception level that is using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR_EL1 are 0x00000001:
- The faulting address was generated by a load or store instruction that sequentially incremented from address 0xffffffff. Such a load or store instruction is CONstrained UNpredictable. See Out of range VA on page K1-6399.
- The implementation treats such incrementing as setting bit[32] of the virtual address to 1.

For a Data Abort or Watchpoint exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see Address tagging in AArch64 state on page D4-2084.
Note

The address held in this field is an address accessed by the instruction fetch or data access that caused the exception that gave rise to the instruction or data abort. It is the lower address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores a mis-aligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

FAR_EL1 is made UNKNOWN on an exception return from EL1.

Accessing the FAR_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

\[
\begin{array}{l|lllll}
\text{<systemreg>} & \text{op0} & \text{op1} & \text{CRn} & \text{CRm} & \text{op2} \\
\hline
\text{FAR}\_\text{EL1} & 11 & 000 & 0110 & 0000 & 000 \\
\text{FAR}\_\text{EL12} & 11 & 101 & 0110 & 0000 & 000 \\
\end{array}
\]

Accessibility

The register is accessible in software as follows:

\[
\begin{array}{l|llllll}
\text{<systemreg>} & \text{E2H} & \text{TGE} & \text{NS} & \text{EL0} & \text{EL1} & \text{EL2} & \text{EL3} \\
\hline
\text{FAR}\_\text{EL1} & x & x & 0 & - & \text{RW} & \text{n/a} & \text{RW} \\
\text{FAR}\_\text{EL1} & 0 & 0 & 1 & - & \text{RW} & \text{RW} & \text{RW} \\
\text{FAR}\_\text{EL1} & 0 & 1 & 1 & - & \text{n/a} & \text{RW} & \text{RW} \\
\text{FAR}\_\text{EL1} & 1 & 0 & 1 & - & \text{RW} & \text{FAR}\_\text{EL2} & \text{RW} \\

\text{FAR}\_\text{EL12} & x & x & 0 & - & - & \text{n/a} & - \\
\text{FAR}\_\text{EL12} & 0 & 0 & 1 & - & - & - & - \\
\text{FAR}\_\text{EL12} & 0 & 1 & 1 & - & \text{n/a} & - & - \\
\text{FAR}\_\text{EL12} & 1 & 0 & 1 & - & - & \text{RW} & \text{RW} \\
\text{FAR}\_\text{EL12} & 1 & 1 & 1 & - & \text{n/a} & \text{RW} & \text{RW} \\
\end{array}
\]

This table applies to all instructions that can access this register.

When HCR\_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic FAR\_EL1 or FAR\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.
Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor FAR_EL12 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor FAR_EL12 are trapped to EL2.
D10.2.41 FAR_EL2, Fault Address Register (EL2)

The FAR_EL2 characteristics are:

**Purpose**

Holds the faulting Virtual Address for all synchronous Instruction or Data Abort, PC alignment fault and Watchpoint exceptions that are taken to EL2.

**Configurations**

AArch64 System register FAR_EL2[31:0] is architecturally mapped to AArch32 System register HDFAR.

AArch64 System register FAR_EL2[63:32] is architecturally mapped to AArch32 System register HIFAR.

AArch64 System register FAR_EL2[31:0] is architecturally mapped to AArch32 System register DFAR (S) when EL2 is implemented.

AArch64 System register FAR_EL2[63:32] is architecturally mapped to AArch32 System register IFAR (S) when EL2 is implemented.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

FAR_EL2 is a 64-bit register.

**Field descriptions**

The FAR_EL2 bit assignments are:

Faulting Virtual Address for synchronous exceptions taken to EL2

63 0

**Bits [63:0]**

Faulting Virtual Address for synchronous exceptions taken to EL2. Exceptions that set the FAR_EL2 are Instruction Aborts (EC 0x20 or 0x21), Data Aborts (EC 0x24 or 0x25), PC alignment faults (EC 0x22), and Watchpoints (EC 0x34 or 0x35). ESR_EL2.EC holds the EC value for the exception.

For a synchronous External abort, if the VA that generated the abort was from an address range for which TCR_ELx.TBI{<0|1>} == 1 for the translation regime in use when the abort was generated, then the top eight bits of FAR_EL2 are UNKNOWN.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if ESR_EL2.FnV is 0, and the FAR_EL2 is UNKNOWN if ESR_EL2.FnV is 1.

For all other exceptions taken to EL2, the FAR_EL2 is UNKNOWN.

If a memory fault that sets FAR_EL2 is generated from a data cache maintenance or DC ZVA instruction, this field holds the address specified in the register argument of the instruction.

If the exception that updates FAR_EL2 is taken from an Exception level that is using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR_ELx are 0x00000001:

- The faulting address was generated by a load or store instruction that sequentially incremented from address 0xFFFFFFFF. Such a load or store instruction is CONSTRAINED UNPREDICTABLE. See Out of range VA on page K1-6399.
- The implementation treats such incrementing as setting bit[32] of the virtual address to 1.
For a Data Abort or Watchpoint exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see *Address tagging in AArch64 state* on page D4-2084.

--- Note ---

The address held in this field is an address accessed by the instruction fetch or data access that caused the exception that gave rise to the instruction or data abort. It is the lower address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores a mis-aligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

FAR_EL2 is made UNKNOWN on an exception return from EL2.

**Accessing the FAR_EL2**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>FAR_EL2</td>
<td>11</td>
<td>100</td>
<td>0110</td>
<td>0000</td>
<td>000</td>
</tr>
<tr>
<td>FAR_EL1</td>
<td>11</td>
<td>000</td>
<td>0110</td>
<td>0000</td>
<td>000</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>FAR_EL2</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>FAR_EL2</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>FAR_EL2</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>FAR_EL2</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>FAR_EL2</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>FAR_EL1</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>FAR_EL1</td>
<td>0</td>
<td>0</td>
</tr>
<tr>

<tr>
<td>FAR_EL1</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>FAR_EL1</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

This table applies to all instructions that can access this register.
When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic FAR_EL2 or FAR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
D10.2.42 FAR_EL3, Fault Address Register (EL3)

The FAR_EL3 characteristics are:

**Purpose**

Holds the faulting Virtual Address for all synchronous Instruction or Data Abort and PC alignment fault exceptions that are taken to EL3.

**Configurations**

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

FAR_EL3 is a 64-bit register.

**Field descriptions**

The FAR_EL3 bit assignments are:

- **Bits [63:0]**

  Faulting Virtual Address for synchronous exceptions taken to EL3

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if ESR_EL3.FnV is 0, and the FAR_EL3 is UNKNOWN if ESR_EL3.FnV is 1.

For all other exceptions taken to EL3, the FAR_EL3 is UNKNOWN.

If a memory fault that sets FAR_EL3 is generated from a data cache maintenance or DC ZVA instruction, this field holds the address specified in the register argument of the instruction.

If the exception that updates FAR_EL3 is taken from an Exception level that is using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR_ELx are 0x00000001:

- The faulting address was generated by a load or store instruction that sequentially incremented from address 0xFFFFFFFF. Such a load or store instruction is CONSTRAINED UNPREDICTABLE. See Out of range VA on page K1-6399.

- The implementation treats such incrementing as setting bit[32] of the virtual address to 1.

For a Data Abort or Watchpoint exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see Address tagging in AArch64 state on page D4-2084.

**Note**

The address held in this register is an address accessed by the instruction fetch or data access that caused the exception that actually gave rise to the instruction or data abort. It is the lowest address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores a mis-aligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

FAR_EL3 is made UNKNOWN on an exception return from EL3.
Accessing the FAR_EL3

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>FAR_EL3</td>
<td>11</td>
<td>110</td>
<td>0110</td>
<td>0000</td>
<td>000</td>

</tbody>
</table>
D10.2.43 FPEXC32_EL2, Floating-Point Exception Control register

The FPEXC32_EL2 characteristics are:

**Purpose**

Allows access to the AArch32 register FPEXC from AArch64 state only. Its value has no effect on execution in AArch64 state.

**Configurations**

AArch64 System register FPEXC32_EL2 is architecturally mapped to AArch32 System register FPEXC.

If EL1 cannot use AArch32, this register is UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

FPEXC32_EL2 is a 32-bit register.

**Field descriptions**

The FPEXC32_EL2 bit assignments are:

EX, bit [31]

Exception bit. In ARMv8, this bit is RAZ/WI.

EN, bit [30]

Enables access to the Advanced SIMD and floating-point functionality from all Exception levels, except that setting this field to 0 does not disable the following:

- VMSR accesses to the FPEXC or FPSID.
- VMRS accesses from the FPEXC, FPSID, MVFR0, MVFR1, or MVFR2.

0

Accesses to the FPSCR, and any of the SIMD and floating-point registers Q0-Q15, including their views as D0-D31 registers or S0-S31 registers, are UNDEFINED at all Exception levels.

1

This control permits access to the Advanced SIMD and floating-point functionality at all Exception levels.

Execution of floating-point and Advanced SIMD instructions in AArch32 state can be disabled or trapped by the following controls:

- CPACR.cp10, or, if executing at EL0, CPACR_EL1.FPEN.
- FPEXC.EN.
• If executing in Non-secure state:
  — HCPTR.TCP10, or if EL2 is using AArch64, CPTR_EL2.TFP.
  — NSACR.cp10, or if EL3 is using AArch64, CPTR_EL3.TFP.
• For Advanced SIMD instructions only:
  — CPACR.ASEDIS.
  — If executing in Non-secure state, HCPTR.TASE and NSACR.NSTRCDIS.

See the descriptions of the controls for more information.

——— Note ————

When executing at EL0 using AArch32:
• If EL1 is using AArch64 then behavior is as if the value of FPEXC.EN is 1.
• In Non-secure state, if EL2 is using AArch64 and the value of HCR_EL2.{RW, TGE} is \{1, 1\} then behavior is as if the value of FPEXC.EN is 1.
• In Non-secure state, if EL2 is using AArch64 and the value of HCR_EL2.{RW, TGE} is \{0, 1\} then it is IMPLEMENTATION DEFINED whether the behavior is:
  — As if the value of FPEXC.EN is 1.
  — Determined by the value of FPEXC32_EL2.EN, as described in this field description. However, ARM deprecates using the value of FPEXC32_EL2.EN to determine behavior.

DEX, bit [29]

Defined synchronous exception on floating-point execution.
This field identifies whether a synchronous exception generated by the attempted execution of an instruction was generated by an unallocated encoding. The instruction must be in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr() returning TRUE. This field also indicates whether the FPEXC32_EL2.TFV field is valid.
The meaning of this bit is:
0  The exception was generated by the attempted execution of an unallocated instruction in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr(). If FPEXC32_EL2.TFV is RW then it is invalid and UNKNOWN. If FPEXC32_EL2.{IDF, IXF, UFF, OFF, DZF, IOF} are RW then they are invalid and UNKNOWN.
1  The exception was generated during the execution of an unallocated encoding. FPEXC32_EL2.TFV is valid and indicates the cause of the exception.

On an exception that sets this bit to 1 the exception-handling routine must clear this bit to 0.
On an implementation that both does not support trapping of floating-point exceptions and implements the AArch32 FPSCR.{Stride, Len} fields as RAZ, this bit is RES0.

FP2V, bit [28]

FPINST2 instruction valid bit. In ARMv8, this bit is RES0.

VV, bit [27]

VECITR valid bit. In ARMv8, this bit is RES0.
TFV, bit [26]
Trapped Fault Valid bit. Valid only when the value of FPEXC.DEX is 1. When valid, it indicates the cause of the exception and therefore whether the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are valid.

0 The exception was caused by the execution of a floating-point VABS, VADD, VDIV, VFMA, VFMS, VFNMA, VFNMS, VMLA, VMLS, VMOV, VMUL, VNEG, VNMLA, VNMLS, VNUL, VSQRT, or VSUB instruction when one or both of FPSCR.{Stride, Len} was non-zero. If the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are RW then they are invalid and UNKNWN.

1 FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} indicate the presence of trapped floating-point exceptions that had occurred at the time of the exception. Bits are set for all trapped exceptions that had occurred at the time of the exception.

This bit returns a status value and ignores writes.
When the value of FPEXC.DEX is 0 and this bit is RW, this bit is invalid and UNKNWN.
On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.
On an implementation that supports the trapping of floating-point exceptions and implements FPSCR.{Stride, Len} as RAZ, this bit is RAO/WI.

Bits [25:11]
Reserved, RES0.

VECITR, bits [10:8]
Vector iteration count. In ARMv8, this field is RES1.

IDF, bit [7]
Input Denormal trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Input Denormal exception occurred while FPSCR.IDE was 1:

0 Input Denormal exception has not occurred.
1 Input Denormal exception has occurred.

Input Denormal exceptions can occur only when FPSCR.FZ is 1.

Note
A half-precision floating-point value that is flushed to zero because the value of FPSCR.FZ16 is 1 does not generate an Input Denormal exception.

This bit must be cleared to 0 by the exception-handling routine.
When the value of FPEXC32_EL2.TFV is 0 and this bit is RW, this bit is invalid and UNKNWN.
On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

Bits [6:5]
Reserved, RES0.

IXF, bit [4]
Inexact trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Inexact exception occurred while FPSCR.IXE was 1:

0 Inexact exception has not occurred.
1 Inexact exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.
When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNWN.
On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.
UFF, bit [3]

Underflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Underflow exception occurred while FPSCR.UFE was 1:

0        Underflow exception has not occurred.
1        Underflow exception has occurred.

Underflow trapped exceptions can occur:

• On half-precision data-processing instructions only when FPSCR.FZ16 is 0.
• Otherwise only when FPSCR.FZ is 0.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC32_EL2.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

OFF, bit [2]

Overflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Overflow exception occurred while FPSCR.OFE was 1:

0        Overflow exception has not occurred.
1        Overflow exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

DZF, bit [1]

Divide by Zero trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether a Divide by Zero exception occurred while FPSCR.DZE was 1:

0        Divide by Zero exception has not occurred.
1        Divide by Zero exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

IOF, bit [0]

Invalid Operation trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Invalid Operation exception occurred while FPSCR.IOE was 1:

0        Invalid Operation exception has not occurred.
1        Invalid Operation exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

Accessing the FPEXC32_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:
MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If CPTR_EL2.TFP==1, Non-secure accesses to this register from EL2 are trapped to EL2.
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If CPTR_EL2.FPEN==00, Non-secure accesses to this register from EL2 are trapped to EL2.
  - If CPTR_EL2.FPEN==10, Non-secure accesses to this register from EL2 are trapped to EL2.
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 1):
  - If CPTR_EL2.FPEN==00, Non-secure accesses to this register from EL2 are trapped to EL2.
  - If CPTR_EL2.FPEN==10, Non-secure accesses to this register from EL2 are trapped to EL2.

- When EL3 is implemented and is using AArch64:
  - If CPTR_EL3.TFP==1, accesses to this register from EL2 and EL3 are trapped to EL3.
D10.2.44 HACR_EL2, Hypervisor Auxiliary Control Register

The HACR_EL2 characteristics are:

**Purpose**
Controls trapping to EL2 of IMPLEMENTATION DEFINED aspects of Non-secure EL1 or EL0 operation.

--- **Note** ---
ARM recommends the values in this register do not cause unnecessary traps to EL2 when HCR_EL2.{E2H, TGE} == \{1, 1\}.

**Configurations**
AArch64 System register HACR_EL2 is architecturally mapped to AArch32 System register HACR.
If EL2 is not implemented, this register is RES0 from EL3.
RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HACR_EL2 is a 32-bit register.

**Field descriptions**
The HACR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit assignment</th>
<th>Value</th>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
### D10.2.45 HCR_EL2, Hypervisor Configuration Register

The HCR_EL2 characteristics are:

**Purpose**

Provides configuration controls for virtualization, including defining whether various Non-secure operations are trapped to EL2.

**Configurations**

AArch64 System register HCR_EL2[31:0] is architecturally mapped to AArch32 System register HCR.

AArch64 System register HCR_EL2[63:32] is architecturally mapped to AArch32 System register HCR2.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HCR_EL2 is a 64-bit register.

**Field descriptions**

The HCR_EL2 bit assignments are:

#### Bits [63:45]

Reserved, RES0.

#### AT, bit [44]

*In ARMv8.3*

Present only if ARMv8.3-NV is implemented.

Address Translation. Non-secure EL1 execution of following address translation instructions is trapped to EL2:

- AT S1E0R, AT S1E0W, AT S1E1R, AT S1E1W, AT S1E1RP, AT S1E1WP

0  This control does not cause any instructions to be trapped.
Non-secure EL1 execution of the specified instructions is trapped to EL2.

If ARMv8.3-NV is not implemented, this field is RES0.

In ARMv8.2, ARMv8.1 and ARMv8.0.

Reserved, RES0.

NV1, bit [43]

In ARMv8.3

Present only if ARMv8.3-NV is implemented.

Nested virtualization. Non-secure EL1 accesses to registers VBAR_EL1, ELR_EL1, SPSR_EL1 are trapped to EL2.

0 This control does not cause any instructions to be trapped.

1 Non-secure EL1 accesses to the specified registers are trapped to EL2.

If HCR_EL2.NV is 1 and HCR_EL2.NV1 is 0 then the following effects also apply:

• Any exception taken from EL1, and taken to EL1, causes the SPSR_EL1.M[3:2] to be set to 0b10, and not 0b01.

If the bits HCR_EL2.NV and HCR_EL2.NV1 are both set to 1 then the following effects also apply:

• The Non-secure EL1 translation table Block and Page descriptors are as follows:
  — Bit[54] holds the PXN instead of the UXN.
  — Bit[53] is RES0.
  — Bit[6] is treated as 0 regardless of the actual value.

• If Hierarchical Permissions are enabled, the Non-secure EL1 translation table Table descriptors are as follows:
  — Bit[61] is treated as 0 regardless of the actual value.
  — Bit[60] holds the PXNTable instead of the UXNTable.
  — Bit[59] is RES0.

• When executing at Non-secure EL1, the PSTATE.PAN bit is treated as zero for all purposes except reading the value of the bit.

• When executing at Non-secure EL1, the LDTR* instructions are treated as the equivalent LDR* instructions, and the STTR* instructions are treated as the equivalent STR* instructions.

This bit is permitted to be cached in a TLB.

If ARMv8.3-NV is not implemented, this field is RES0.

In ARMv8.2, ARMv8.1 and ARMv8.0.

Reserved, RES0.

NV, bit [42]

In ARMv8.3

Present only if ARMv8.3-NV is implemented.

Nested virtualization. Traps functionality that is permitted at EL2 and would be UNDEFINED at Non-secure EL1 if this field was 0. This field traps to EL2:

• Non-secure EL1 accesses to Special-purpose registers that are not UNDEFINED at EL2.

• Non-secure EL1 accesses to System registers that are not UNDEFINED at EL2.

• Execution of EL1 or EL2 translation regime address translation and TLB maintenance instructions.

The possible values are:

0 This control does not cause any instructions to be trapped.
Non-secure EL1 accesses to the specified registers or the execution of the specified instructions are trapped to EL2. Non-secure EL1 read accesses to the \texttt{CurrentEL} register return a value of 0x2.

The System or Special-purpose registers for which accesses are trapped are as follows:
- Registers accessed using MRS or MSR with a name ending in \_EL2.
- Registers accessed using MRS or MSR with a name ending in \_EL12.
- Registers accessed using MRS or MSR with a name ending in \_EL02.
- Special-purpose registers \texttt{SPSR irq, SPSR abt, SPSR und, SPSR fiq} accessed using MRS or MSR.
- Special-purpose register \texttt{SP EL1} accessed using the dedicated MRS or MSR instruction.

The instructions for which the execution is trapped are as follows:
- EL2 translation regime Address Translation instructions and TLB maintenance instructions.
- EL1 translation regime Address Translation instructions and TLB maintenance instructions that are only accessible from EL2 and EL3.
- The \texttt{ERET, ERETTAA, and ERETTAB} instructions.

\textbf{Note}

The priority of this trap is higher than the priority of the HCR\_EL2.API trap. If both of these bits are set so that an EL1 execution of an \texttt{ERETAA} or \texttt{ERETAB} instruction is trapped to EL2, then the syndrome reported is 0x1A.

\textbf{Note}

SMC in an implementation that does not include EL3 and when HCR\_EL2.TSC is 1. HCR\_EL2.TSC bit is not RES0 in this case.

This bit is permitted to be cached in a TLB.

If ARMv8.3-NV is not implemented, this field is RES0.

\textit{In ARMv8.2, ARMv8.1 and ARMv8.0.}

Reserved, RES0.

\textbf{API, bit [41]}

\textit{In ARMv8.3}

Present only if ARMv8.3-PAuth is implemented.

Controls the use of instructions related to Pointer Authentication:
- \texttt{PACGA, XPACD, XPACI, and XPACLRI.}
- \texttt{AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZ, RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ, ERETTAA, ERETTAB, LDRAA and LDRAB when enabled for the Non-secure EL1 translation regime (that is the associated SCTLR\_EL1.En\&<N>;&<M>==1) in Non-secure EL0 when HCR\_EL2.TGE==0 || HCR\_EL2.E2H==0 or in Non-secure EL1.

Defined values are:

0 Use of instructions related to Pointer Authentication in Non-secure EL0 when HCR\_EL2.TGE==0 || HCR\_EL2.E2H==0, or in Non-secure EL1 when the instructions are enabled for the Non-secure EL1 translation regime, is trapped to EL2. If HCR\_EL2.NV is 1, the HCR\_EL2.NV trap takes precedence over the HCR\_EL2.API trap for the ERETTA2 and ERETTAB instructions.

1 This control does not cause any instructions to be trapped.
Note

If ARMv8.3-PAuth is implemented but EL2 is not implemented, the system behaves as if this bit is
1.

If ARMv8.3-PAuth is not implemented, this field is RES0.

In ARMv8.2, ARMv8.1 and ARMv8.0.

Reserved, RES0.

APK, bit [40]

In ARMv8.3

Present only if ARMv8.3-PAuth is implemented.

Trap registers holding "key" values for Pointer Authentication. Traps accesses to the following
registers from Non-secure EL1 to EL2:

- APIAKeyLo_EL1, APIAKeyHi_EL1, APIBKeyLo_EL1, APIBKeyHi_EL1,
  APDAKeyLo_EL1, APDAKeyHi_EL1, APDBKeyLo_EL1, APDBKeyHi_EL1,
  APGAKeyLo_EL1, and APGAKeyHi_EL1.

Defined values are:

- 0: Access to the registers holding "key" values for pointer authentication from non-secure
  EL1 are trapped to EL2.
- 1: This control does not cause any instructions to be trapped.

Note

If ARMv8.3-PAuth is implemented but EL2 is not implemented, the system behaves as if this bit is
1.

If ARMv8.3-PAuth is not implemented, this field is RES0.

In ARMv8.2, ARMv8.1 and ARMv8.0.

Reserved, RES0.

Bit [39]

Reserved, RES0.

MIOCNCE, bit [38]

Mismatched Inner/Outer Cacheable Non-Coherency Enable, for the Non-secure EL1&0 translation
regime.

0: For the Non-secure EL1&0 translation regime, for permitted accesses to a memory
location that use a common definition of the Shareability and Cacheability of the
location, there must be no loss of coherency if the Inner Cacheability attribute for those
accesses differs from the Outer Cacheability attribute.

1: For the Non-secure EL1&0 translation regime, for permitted accesses to a memory
location that use a common definition of the Shareability and Cacheability of the
location, there might be a loss of coherency if the Inner Cacheability attribute for those
accesses differs from the Outer Cacheability attribute.

For more information see Mismatched memory attributes on page B2-125.

This field can be implemented as RAZ/WI.

In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if
this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1, 1\}, the PE
ignores the value of this field for all purposes other than a direct read of this field.
TEA, bit [37]
Route synchronous External abort exceptions to EL2. If the RAS Extension is implemented, the possible values of this bit are:

0  Does not route synchronous External abort exceptions from Non-secure EL0 and EL1 to EL2.
1  Route synchronous External abort exceptions from Non-secure EL0 and EL1 to EL2, if not routed to EL3.

This bit resets to zero on a Warm reset into AArch32 state.
When the RAS Extension is not implemented, this field is RES0.

TERR, bit [36]
Trap Error record accesses. If the RAS Extension is implemented, the possible values of this bit are:

0  Does not trap accesses to error record registers from Non-secure EL1 to EL2.
1  Accesses to the ER* registers from Non-secure EL1 generate a Trap exception to EL2.

This bit resets to zero on a Warm reset into AArch32 state.
When the RAS Extension is not implemented, this field is RES0.

TLOR, bit [35]

**In ARMv8.3, ARMv8.2 and ARMv8.1**
Trap LOR registers. Traps accesses to the LORSA_EL1, LOREA_EL1, LORN_EL1, LORC_EL1, and LORID_EL1 registers from Non-secure EL1 to EL2.

0  This control does not cause any instructions to be trapped.
1  Non-secure EL1 accesses to the LOR registers are trapped to EL2.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

**In ARMv8.0.**
Reserved, RES0.

E2H, bit [34]

**In ARMv8.3, ARMv8.2 and ARMv8.1**
EL2 Host. Enables a configuration where a Host Operating System is running in EL2, and the Host Operating System's applications are running in EL0.

0  EL2 is running a hypervisor.
1  EL2 is running a Host Operating System.

For information on the behavior of this bit see *Behavior of HCR_EL2.E2H* on page D4-2183.
This bit is permitted to be cached in a TLB.
In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

**In ARMv8.0.**
Reserved, RES0.

ID, bit [33]
Stage 2 Instruction access cacheability disable. For the Non-secure EL1&0 translation regime, when HCR_EL2.VM==1, this control forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

0  This control has no effect on stage 2 of the Non-secure EL1&0 translation regime.
1  For the Non-secure EL1&0 translation regime, forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.
This bit has no effect on the EL2, EL2&0, or EL3 translation regimes.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2 {E2H, TGE} is \{1, 1\}, the PE ignores the value of this field for all purposes other than a direct read of this field.

**CD, bit [32]**

Stage 2 Data access cacheability disable. For the Non-secure EL1&0 translation regime, when HCR_EL2.VM==1, this control forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.

- **0**: This control has no effect on stage 2 of the Non-secure EL1&0 translation regime for data accesses and translation table walks.
- **1**: For the Non-secure EL1&0 translation regime, forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.

In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

This bit has no effect on the EL2, EL2&0, or EL3 translation regimes.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2 {E2H, TGE} is \{1, 1\}, the PE ignores the value of this field for all purposes other than a direct read of this field.

**RW, bit [31]**

Execution state control for lower Exception levels:

- **0**: Lower levels are all AArch32.
- **1**: The Execution state for EL1 is AArch64. The Execution state for EL0 is determined by the current value of PSTATE.nRW when executing at EL0.

If all lower Exception levels cannot use AArch32 then this bit is RAO/WI.

In an implementation that includes EL3, when SCR_EL3.NS==0, the PE behaves as if this bit has the same value as the SCR_EL3.RW bit for all purposes other than a direct read or write access of HCR_EL2.

The RW bit is permitted to be cached in a TLB.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2 {E2H, TGE} is \{1, 1\}, this field behaves as 1 for all purposes other than a direct read of the value of this bit.

**TRVM, bit [30]**

Trap Reads of Virtual Memory controls. Traps Non-secure EL1 reads of the virtual memory control registers to EL2, from both Execution states. The registers for which read accesses are trapped are as follows:

- Non-secure EL1 using AArch64: SCTLR_EL1, TTBR0_EL1, TTBR1_EL1, TCR_EL1, ESR_EL1, FAR_EL1, AFSR0_EL1, AFSR1_EL1, MAIR_EL1, AMAIR_EL1, CONTEXTIDR_EL1.
- Non-secure EL1 using AArch32: SCTLR, TTBR0, TTBR1, TTBCR, TTBCR2, DACR, DFSR, IFSR, DFAR, IFAR, ADFSR, AIFSR, PRRR, NMRR, MAIR0, MAIR1, AMAIR0, AMAIR1, CONTEXTIDR.

- **0**: This control does not cause any instructions to be trapped.
- **1**: Non-secure EL1 read accesses to the specified Virtual Memory controls are trapped to EL2.

In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

**HCD, bit [29]**

HVC instruction disable. Disables Non-secure state execution of HVC instructions, from both Execution states.

- **0**: HVC instruction execution is enabled at EL2 and Non-secure EL1.
HVC instructions are undefined at EL2 and Non-secure EL1. Any resulting exception is taken to the Exception level at which the HVC instruction is executed.

**Note**

HVC instructions are always undefined at EL0.

This bit is only implemented if EL3 is not implemented. Otherwise, it is RES0.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

**TDZ, bit [28]**

Traps DC ZVA instructions. Traps Non-secure EL0 and EL1 execution of DC ZVA instructions to EL2, from AArch64 state only.

0  This control does not cause any instructions to be trapped.

1  In AArch64 state, any attempt to execute a DC ZVA instruction at Non-secure EL1, or at Non-secure EL0 when the instruction is not undefined at EL0, is trapped to EL2. Reading the DCZID_EL0 returns a value that indicates that DC ZVA instructions are not supported.

In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1, 1\}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

**TGE, bit [27]**

Traps General Exceptions, from Non-secure EL0.

0  This control has no effect on execution at EL0.

1  When the value of SCR_EL3.NS is 0, this control has no effect on execution at EL0.

When the value of SCR_EL3.NS is 1, in all cases:

- All exceptions that would be routed to EL1 are routed to EL2.
- The SCTLR_EL1.M field, or the SCTLR.M field if EL1 is using AArch32, is treated as being 0 for all purposes other than returning the result of a direct read of SCTLR_EL1 or SCTLR.
- All virtual interrupts are disabled.
- Any implementation defined mechanisms for signaling virtual interrupts are disabled.
- An exception return to EL1 is treated as an illegal exception return.

When the value of SCR_EL3.NS is 1 and the value of HCR_EL2.E2H is 0, additionally:

- The HCR_EL2.{FMO, IMO, AMO} fields are treated as being 1 for all purposes other than a direct read or write access of HCR_EL2.
- The MDCR_EL2.{TDRA, TDOSA, TDA, TDE} fields are treated as being 1 for all purposes other than returning the result of a direct read of MDCR_EL2.

For information on the behavior of this bit when E2H is 1, see Behavior of HCR_EL2.E2H on page D4-2183.

HCR_EL2.TGE must not be cached in a TLB.

In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

**TVM, bit [26]**

Traps Virtual Memory controls. Traps Non-secure EL1 writes to the virtual memory control registers to EL2, from both Execution states. The registers for which write accesses are trapped are as follows:
Non-secure EL1 using AArch64: \texttt{SCTLR\_EL1, TTBR0\_EL1, TTBR1\_EL1, TCR\_EL1, ESR\_EL1, FAR\_EL1, AFSR0\_EL1, AFSR1\_EL1, MAIR\_EL1, AMAIR\_EL1, CONTEXTIDR\_EL1}.

Non-secure EL1 using AArch32: \texttt{SCTLR, TTBR0, TTBR1, TTBCR, TTBCR2, DACR, DFSR, IFSR, Dfar, IFAR, ADFSR, AIFSR, PRRR, NMRR, MAIR0, MAIR1, AMAIR0, AMAIR1, CONTEXTIDR}.

0 This control does not cause any instructions to be trapped.
1 Non-secure EL1 write accesses to the specified EL1 virtual memory control registers are trapped to EL2.

In an implementation that includes EL3, when the value of \texttt{SCR\_EL3.NS} is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR\_EL2.

When \texttt{HCR\_EL2.TGE} is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

\textbf{TTLB, bit [25]}

Trap TLB maintenance instructions. Traps Non-secure EL1 execution of TLB maintenance instructions to EL2, from both Execution states. This applies to the following instructions:

- When Non-secure EL1 is using AArch64, \texttt{TLBI\_VMALLE1IS, TLBI\_VAE1IS, TLBI\_ASIDE1IS, TLBI\_VAE1I1S, TLBI\_VAALE1IS, TLBI\_VMALLE1, TLBI\_VAE1, TLBI\_ASIDE1, TLBI\_VAE1I1, TLBI\_VAALE1}.
- When Non-secure EL1 is using AArch32, \texttt{TLBIALLIS, TLBMVAIIS, TLBIASIDIS, TLBIMVAAIS, TLBIMVALIS, ITIALLIS, ITLBIALL, ITLBMVA, ITLBIASID, DTLBIALL, DTLBMVA, DTLBIASID, TLBIALL, TLBMVA, TLBIASID, TLBIMVAA, TLBIMVAL, TLBMVAAL}.

0 This control does not cause any instructions to be trapped.
1 Non-secure EL1 execution of the specified TLB maintenance instructions are trapped to EL2.

In an implementation that includes EL3, when the value of \texttt{SCR\_EL3.NS} is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR\_EL2.

When \texttt{HCR\_EL2.TGE} is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

\textbf{TPU, bit [24]}

Trap cache maintenance instructions that operate to the Point of Unification. Traps execution of those cache maintenance instructions at Non-secure EL1 or EL0 using AArch64, and at Non-secure EL1 using AArch32, to EL2. This applies to the following instructions:

- When Non-secure EL0 is using AArch64, \texttt{IC\_IV\_AU, DC\_CV\_AU}. However, if the value of \texttt{SCTLR\_EL1.UCI} is 0 these instructions are UNDEFINED at EL0 and any resulting exception is higher priority than this trap to EL2.
- When Non-secure EL1 is using AArch64, \texttt{IC\_IV\_AU, IC\_IALLU, IC\_IALLUIS, DC\_CV\_AU}.
- When Non-secure EL1 is using AArch32, \texttt{ICIMVAU, ICIALLU, ICIALLUIS, DCCMVAU}.

\textbf{Note}

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:

- \texttt{IC\_IALLUIS} and \texttt{IC\_IALLU} are always UNDEFINED at EL0 using AArch64.
- \texttt{ICIMVAU, ICIALLU, ICIALLUIS, and DCCMVAU} are always UNDEFINED at EL0 using AArch32.

0 This control does not cause any instructions to be trapped.
1 Non-secure execution of the specified instructions is trapped to EL2.
If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the point of unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the point of unification instruction can be trapped when the value of this control is 1.

In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1, 1\}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

**TPCP, bit [23]**

*In ARMv8.3 and ARMv8.2*

Trap data or unified cache maintenance instructions that operate to the Point of Coherency or Persistence. Traps execution of those cache maintenance instructions at Non-secure EL1 or EL0 using AArch64, and at Non-secure EL1 using AArch32, to EL2. This applies to the following instructions:

- When Non-secure EL0 is using AArch64, DC CIV AC, DC CV AC, DC CV AP. However, if the value of SCTLR_EL1.UCI is 0 these instructions are UNDEFINED at EL0 and any resulting exception is higher priority than this trap to EL2.
- When Non-secure EL1 is using AArch64, DC IV AC, DC CIV AC, DC CV AC, DC CV AP.
- When Non-secure EL1 is using AArch32, DCIMV AC, DCCIMV AC, DCCMV AC.

**Note**

- An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:
  - DC IV AC is always UNDEFINED at EL0 using AArch64.
  - DCIMV AC, DCCIMV AC, and DCCMV AC are always UNDEFINED at EL0 using AArch32.
- In ARMv8.0 this field is named TPC. From ARMv8.2 it is named TPCP.

0  
This control does not cause any instructions to be trapped.

1  
Non-secure execution of the specified instructions is trapped to EL2.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, invalidate, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

If HCR_EL2.{E2H, TGE} is set to \{1, 1\}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

*In ARMv8.1 and ARMv8.0.*

Trap data or unified cache maintenance instructions that operate to the Point of Coherency. Traps execution of those cache maintenance instructions at Non-secure EL1 or EL0 using AArch64, and at Non-secure EL1 using AArch32, to EL2. This applies to the following instructions:

- When Non-secure EL0 is using AArch64, DC CIV AC, DC CV AC. However, if the value of SCTLR_EL1.UCI is 0 these instructions are UNDEFINED at EL0 and any resulting exception is higher priority than this trap to EL2.
- When Non-secure EL1 is using AArch64, DC IV AC, DC CIV AC, DC CV AC.
- When Non-secure EL1 is using AArch32, DCIMV AC, DCCIMV AC, DCCMV AC.
--- Note ---

• An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:
  — DC IVAC is always UNDEFINED at EL0 using AArch64.
  — DCIMVAC, DCCIMVAC, and DCCMVAC are always UNDEFINED at EL0 using AArch32.

• In ARMv8.0 this field is named TPC. From ARMv8.2 it is named TPCP.

0    This control does not cause any instructions to be trapped.
1    Non-secure execution of the specified instructions is trapped to EL2.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, invalidate, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

TSW, bit [22]

Trap data or unified cache maintenance instructions that operate by Set/Way. Traps execution of those cache maintenance instructions at Non-secure EL1 using AArch64, and at Non-secure EL1 using AArch32, to EL2. This applies to the following instructions:

• When Non-secure EL1 is using AArch64, DC ISW, DC CSW, DC CISW.
• When Non-secure EL1 is using AArch32, DCISW, DCCSW, DCCISW.

--- Note ---

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

0    This control does not cause any instructions to be trapped.
1    Non-secure execution of the specified instructions is trapped to EL2.

In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

TACR, bit [21]

Trap Auxiliary Control Registers. Traps Non-secure EL1 accesses to the Auxiliary Control Registers to EL2, from both Execution states. This applies to the following register accesses:

• Non-secure EL1 using AArch64: ACTLR_EL1.
• Non-secure EL1 using AArch32: ACTLR and, if implemented, ACTLR2.

0    This control does not cause any instructions to be trapped.
1    Non-secure EL1 accesses to the specified registers are trapped to EL2.

In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.
TIDCP, bit [20]

Trap IMPLEMENTATION DEFINED functionality. Traps Non-secure EL1 accesses to the encodings reserved for IMPLEMENTATION DEFINED functionality to EL2. This applies to the following register accesses:

AArch64: The following reserved encoding spaces:

- IMPLEMENTATION DEFINED system instructions, which are accessed using SYS and SYSL, with CRn == \{11, 15\}.
- IMPLEMENTATION DEFINED System registers, which are accessed using MRS and MSR with the \texttt{S3_<op1>_<Cn>_<Cm>_<op2>} register name.

AArch32: MCR and MRC instructions accessing the following encodings:

- All coproc==p15, CRn==c9, opc1 == \{0-7\}, CRm == \{c0-c2, c5-c8\}, opc2 == \{0-7\}.
- All coproc==p15, CRn==c10, opc1 ==\{0-7\}, CRm == \{c0, c1, c4, c8\}, opc2 == \{0-7\}.
- All coproc==p15, CRn==c11, opc1==\{0-7\}, CRm == \{c0-c8, c15\}, opc2 == \{0-7\}.

When the value of HCR_EL2.TIDCP is 1, it is IMPLEMENTATION DEFINED whether any of this functionality accessed from Non-secure EL0 is trapped to EL2. If it is not, then it is UNDEFINED, and any attempt to access it from Non-secure EL0 generates an exception that is taken to EL1.

0 This control does not cause any instructions to be trapped.
1 Non-secure EL1 accesses to or execution of the specified encodings reserved for IMPLEMENTATION DEFINED functionality are trapped to EL2.

In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

TSC, bit [19]

Trap SMC instructions. Traps Non-secure EL1 execution of SMC instructions to EL2, from both Execution states.

0 This control does not cause any instructions to be trapped.
1 If EL3 is implemented, then any attempt to execute an SMC instruction at Non-secure EL1 using AArch64 or Non-secure EL1 using AArch32 is trapped to EL2, regardless of the value of SCR_EL3.SMD.

If EL3 is not implemented, ARMv8.3-NV is implemented, and HCR_EL2.NV is 1, then any attempt to execute an SMC instruction at Non-secure EL1 using AArch64 is trapped to EL2.

In AArch32 state, the ARMv8-A architecture permits, but does not require, this trap to apply to conditional SMC instructions that fail their condition code check, in the same way as with traps on other conditional instructions.

If EL3 is not implemented, and HCR_EL2.NV is 0, this bit is RES0.

In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

TID3, bit [18]

Trap ID group 3. Traps Non-secure EL1 reads of the following registers to EL2:

AArch64: ID_PFR0_EL1, ID_PFR1_EL1, ID_DFR0_EL1, ID_AFR0_EL1, ID_MMFR0_EL1, ID_MMFR1_EL1, ID_MMFR2_EL1, ID_MMFR3_EL1, ID_JSR0_EL1, ID_JSR1_EL1, ID_JSR2_EL1, ID_JSR3_EL1, ID_JSR4_EL1, ID_JSR5_EL1, MVFR0_EL1, MVFR1_EL1, MVFR2_EL1, ID_AA64PFR0_EL1, ID_AA64PFR1_EL1, ID_AA64DFR0_EL1, ID_AA64DFR1_EL1, ID_AA64ISAR0_EL1, ID_AA64ISAR1_EL1, ID_AA64MMFR0_EL1, ID_AA64MMFR1_EL1, ID_AA64MMFR2_EL1, ID_AA64MMFR3_EL1, ID_AA64AFR0_EL1, ID_AA64AFR1_EL1, ID_AA64ZFR0_EL1 (where SVE is implemented), and ID_MMFR4_EL1, except that if ID_MMFR4_EL1 is implemented as RAZ/WI then it is IMPLEMENTATION DEFINED whether accesses to ID_MMFR4_EL1 are trapped.
It is IMPLEMENTATION DEFINED whether this field traps MRS accesses to encodings in the following range that are not already mentioned in this field description:

- \( Op0 == 3, op1 == 0, CRn == c0, CRm == \{c2-c7\}, op2 == \{0-7\} \).

AArch32: ID_PFR0, ID_PFR1, ID_DFR0, ID_AFR0, ID_MMFR0, ID_MMFR1, ID_MMFR2, ID_MMFR3, ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, ID_ISAR4, ID_MMFR4, MVFR0, MVFR1, MVFR2, and ID_MMFR4, except that if ID_MMFR4 is implemented as RAZ/WI then it is IMPLEMENTATION DEFINED whether accesses to ID_MMFR4 are trapped.

MRC access to any of the following encodings are also trapped:

- \( \text{coproc}==p15, \text{opc1} == 0, \text{CRn} == c0, \text{CRm} == \{c3-c7\}, \text{opc2} == \{0,1\} \).
- \( \text{coproc}==p15, \text{opc1} == 0, \text{CRn} == c0, \text{CRm} == c3, \text{opc2} == 2 \).
- \( \text{coproc}==p15, \text{opc1} == 0, \text{CRn} == c0, \text{CRm} == c5, \text{opc2} == \{4,5\} \).

It is IMPLEMENTATION DEFINED whether this bit traps MRC accesses to the following encodings:

- \( \text{coproc}==p15, \text{opc1} == 0, \text{CRn} == c0, \text{CRm} == c2, \text{opc2} == 7 \).
- \( \text{coproc}==p15, \text{opc1} == 0, \text{CRn} == c0, \text{CRm} == c3, \text{opc2} == \{3-7\} \).
- \( \text{coproc}==p15, \text{opc1} == 0, \text{CRn} == c0, \text{CRm} == \{c4, c6, c7\}, \text{opc2} == \{2-7\} \).
- \( \text{coproc}==p15, \text{opc1} == 0, \text{CRn} == c0, \text{CRm} == c5, \text{opc2} == \{2, 3, 6, 7\} \).

0  This control does not cause any instructions to be trapped.
1  The specified Non-secure EL1 read accesses to ID group 3 registers are trapped to EL2.

In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

**TID2, bit [17]**

Trap ID group 2. Traps the following register accesses to EL2:

**AArch64:**

- Non-secure EL1 reads of CTR_EL0, CCSIDR_EL1, CCSIDR2_EL1, CLIDR_EL1, and CSSELR_EL1.
- Non-secure EL0 reads of CTR_EL0, except that if the value of SCTLR_EL1.UCT is 0 then EL0 reads of CTR_EL0 are UNDEFINED and any resulting exception takes precedence over this trap.
- Non-secure EL1 writes to CSSELR_EL1.

**AArch32:**

- Non-secure EL1 reads of the CTR, CCSIDR, CCSIDR2, CLIDR, and CSSELR.
- Non-secure EL1 writes to the CSSELR.

0  This control does not cause any instructions to be trapped.
1  The specified Non-secure EL1 and EL0 accesses to ID group 2 registers are trapped to EL2.

In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1, 1\}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

**TID1, bit [16]**

Trap ID group 1. Traps Non-secure EL1 reads of the following registers are trapped to EL2:

**AArch64:** REVIDR_EL1, AIDR_EL1.

**AArch32:** TCMTR, TLBTR, REVIDR, AIDR.

0  This control does not cause any instructions to be trapped.
1 The specified Non-secure EL1 read accesses to ID group 1 registers are trapped to EL2.

In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

**TID0, bit [15]**

Trap ID group 0. Traps the following register accesses to EL2:

AArch64: None.

AArch32:

- Non-secure EL1 reads of the JIDR.
- If the JIDR is RAZ from Non-secure EL0, Non-secure EL0 of the JIDR.
- Non-secure EL1 reads of the FPSID.

---

**Note**

- It is IMPLEMENTATION DEFINED whether the JIDR is RAZ or UNDEFINED at EL0. If it is UNDEFINED at EL0 then any resulting exception takes precedence over this trap.
- The FPSID is not accessible at EL0 using AArch32.
- Writes to the FPSID are ignored, and not trapped by this control.

0 This control does not cause any instructions to be trapped.

1 The specified Non-secure EL1 read accesses to ID group 0 registers are trapped to EL2.

In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

In an AArch64-only implementation, this bit is RES0.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1, 1\}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

---

**TWE, bit [14]**

Traps Non-secure EL0 and EL1 execution of WFE instructions to EL2, from both Execution states.

0 This control does not cause any instructions to be trapped.

1 Any attempt to execute a WFE instruction at Non-secure EL0 or EL1 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWE or SCTLR_EL1.nTWE.

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

---

**Note**

Since a WFE can complete at any time, even without a Wakeup event, the traps on WFE are not guaranteed to be taken, even if the WFE is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1, 1\}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

---

**TWI, bit [13]**

Traps Non-secure EL0 and EL1 execution of WFI instructions to EL2, from both Execution states.

0 This control does not cause any instructions to be trapped.
Any attempt to execute a WFI instruction at Non-secure EL0 or EL1 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWI or SCTLR_EL1.nTWI.

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

--- Note ---

Since a WFI can complete at any time, even without a Wakeup event, the traps on WFI are not guaranteed to be taken, even if the WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

---

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

**DC, bit [12]**

Default Cacheability.

0  This control has no effect on the Non-secure EL1&0 translation regime.

1  In Non-secure state:

- When EL1 is using AArch64, the PE behaves as if the value of the SCTLR_EL1.M field is 0 for all purposes other than returning the value of a direct read of SCTLR_EL1.
- When EL1 is using AArch32, the PE behaves as if the value of the SCTLR.M field is 0 for all purposes other than returning the value of a direct read of SCTLR.
- The PE behaves as if the value of the HCR_EL2.VM field is 1 for all purposes other than returning the value of a direct read of HCR_EL2.
- The memory type produced by stage 1 of the EL1&0 translation regime is Normal Non-Shareable, Inner Write-Back Read-Allocate Write-Allocate, Outer Write-Back Read-Allocate Write-Allocate.

This field has no effect on the EL2, EL2&0, and EL3 translation regimes.

This field is permitted to be cached in a TLB.

In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this field.

**BSU, bits [11:10]**

Barrier Shareability upgrade. This field determines the minimum shareability domain that is applied to any barrier instruction executed from Non-secure EL1 or Non-secure EL0:

00  No effect

01  Inner Shareable

10  Outer Shareable

11  Full system

This value is combined with the specified level of the barrier held in its instruction, using the same principles as combining the shareability attributes from two stages of address translation.

In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0b00 for all purposes other than a direct read of the value of this bit.
FB, bit [9]

Force broadcast. Causes the following instructions to be broadcast within the Inner Shareable domain when executed from Non-secure EL1:

AArch32: BPIALL, TLBIAIALL, TLBIMVA, TLBIASID, DTLBIALL, DTLBIMVA, DTLBISID, ITLBIALL, ITLBMVA, ITLBIASID, TLBIMVAA, ICIALLU, TLBIMVALL.
AArch64: TLBIVMAE1, TLBV IAE1, TLBISIDE1, TLBIVAE1, TLBIVALE1, TLBIVALE1, ICIALE1.

0  This field has no effect on the operation of the specified instructions.
1  When one of the specified instruction is executed at Non-secure EL1, the instruction is broadcast within the Inner Shareable shareability domain.

In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

VSE, bit [8]

Virtual SError interrupt.

0  This mechanism is not making a virtual SError interrupt pending.
1  A virtual SError interrupt is pending because of this mechanism.

The virtual SError interrupt is only enabled when the value of HCR_EL2.{TGE, AMO} is {0, 1}.

In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

VI, bit [7]

Virtual IRQ Interrupt.

0  This mechanism is not making a virtual IRQ pending.
1  A virtual IRQ is pending because of this mechanism.

The virtual IRQ is enabled only when the value of HCR_EL2.{TGE, IMO} is {0, 1}.

In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

VF, bit [6]

Virtual FIQ Interrupt.

0  This mechanism is not making a virtual FIQ pending.
1  A virtual FIQ is pending because of this mechanism.

The virtual FIQ is enabled only when the value of HCR_EL2.{TGE, FMO} is {0, 1}.

In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

AMO, bit [5]

Physical SError interrupt routing.

0  When executing at Non-secure Exception levels below EL2, physical SError interrupts are not taken to EL2.

When the value of HCR_EL2.TGE is 0, if the PE is executing at EL2 using AArch64, physical SError interrupts are not taken unless they are routed to EL3 by the SCR_EL3.EA bit.

Virtual SError interrupts are disabled.

1  When executing at any Exception level in Non-secure state:

• Physical SError interrupts are taken to EL2 unless they are routed to EL3.
• If HCR_EL2.TGE==0 then virtual SError interrupts are enabled in the Non-secure state.

If the value of HCR_EL2.TGE is 1:
• Regardless of the value of the AMO bit, when executing in Non-secure state, physical asynchronous External aborts and SError interrupts target EL2 unless they are routed to EL3.
• When ARMv8.1-VHE is not implemented, or if HCR_EL2.E2H is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.
• When ARMv8.1-VHE is implemented and HCR_EL2.E2H is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see Asynchronous exception routing on page D1-1903.

In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

IMO, bit [4]

Physical IRQ Routing.
0  When executing at Non-secure Exception levels below EL2, physical IRQ interrupts are not taken to EL2.

When the value of HCR_EL2.TGE is 0, if the PE is executing at EL2 using AArch64, physical IRQ interrupts are not taken unless they are routed to EL3 by the SCR_EL3.IRQ bit.

Virtual IRQ interrupts are disabled.
1  When executing at any Exception level in Non-secure state:
• Physical IRQ interrupts are taken to EL2 unless they are routed to EL3.
• If HCR_EL2.TGE==0 then Virtual IRQ interrupts are enabled in Non-secure state.

If the value of HCR_EL2.TGE is 1:
• Regardless of the value of the IMO bit, when executing in Non-secure state, physical IRQ Interrupts target EL2 unless they are routed to EL3.
• When ARMv8.1-VHE is not implemented, or if HCR_EL2.E2H is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.
• When ARMv8.1-VHE is implemented and HCR_EL2.E2H is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see Asynchronous exception routing on page D1-1903.

In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

FMO, bit [3]

Physical FIQ Routing.
0  When executing at Non-secure Exception levels below EL2, physical FIQ interrupts are not taken to EL2.

When the value of HCR_EL2.TGE is 0, if the PE is executing at EL2 using AArch64, physical FIQ interrupts are not taken unless they are routed to EL3 by the SCR_EL3.FIQ bit.

Virtual FIQ interrupts are disabled.
1  When executing at any Exception level in Non-secure state:
• Physical FIQ interrupts are taken to EL2 unless they are routed to EL3.
• If HCR_EL2.TGE==0 then Virtual FIQ interrupts are enabled in Non-secure state.

If the value of HCR_EL2.TGE is 1:
• Regardless of the value of the FMO bit, when executing in Non-secure state, physical FIQ Interrupts target EL2 unless they are routed to EL3.
- When ARMv8.1-VHE is not implemented, or if HCR_EL2.E2H is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.
- When ARMv8.1-VHE is implemented and HCR_EL2.E2H is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see *Asynchronous exception routing on page D1-1903*.

In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

**PTW, bit [2]**

Protected Table Walk. In the Non-secure EL1&0 translation regime, a translation table access made as part of a stage 1 translation table walk is subject to a stage 2 translation. The combining of the memory type attributes from the two stages of translation means the access might be made to a type of Device memory. If this occurs then the value of this bit determines the behavior:

0  The translation table walk occurs as if it is to Normal Non-cacheable memory. This means it can be made speculatively.
1  The memory access generates a stage 2 Permission fault.

This field is permitted to be cached in a TLB.

In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

**SWIO, bit [1]**

Set/Way Invalidation Override. Causes Non-secure EL1 execution of the data cache invalidate by set/way instructions to perform a data cache clean and invalidate by set/way:

0  This control has no effect on the operation of data cache invalidate by set/way instructions.
1  Data cache invalidate by set/way instructions perform a data cache clean and invalidate by set/way.

When the value of this bit is 1:

AArch32: DCISW performs the same invalidation as a DCCISW instruction.
AArch64: DCISW performs the same invalidation as a DCISW instruction.

This bit can be implemented as RES1.

In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

**VM, bit [0]**

Virtualization enable. Enables stage 2 address translation for the Non-secure EL1&0 translation regime. Possible values of this bit are:

0  Non-secure EL1&0 stage 2 address translation disabled.
1  Non-secure EL1&0 stage 2 address translation enabled.

When the value of this bit is 1, data cache invalidate instructions executed at Non-secure EL1 perform a data cache clean and invalidate. For the invalidate by set/way instruction this behavior applies regardless of the value of the HCR_EL2.SWIO bit.

This bit is permitted to be cached in a TLB.

In an implementation that includes EL3, when the value of SCR_EL3.NS is 0 the PE behaves as if this field is 0 for all purposes other than a direct read or write access of HCR_EL2.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.[E2H, TGE] is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.
Accessing the HCR_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>HCR_EL2</td>
<td>11</td>
<td>100</td>
<td>0001</td>
<td>0001</td>
<td>000</td>
</tr>
</tbody>
</table>

Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>
</tr>
<tr>
<td>TGE</td>
<td></td>
</tr>
<tr>
<td>NS</td>
<td></td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
D10.2.46 HPFAR_EL2, Hypervisor IPA Fault Address Register

The HPFAR_EL2 characteristics are:

**Purpose**

Holds the faulting IPA for some aborts on a stage 2 translation taken to EL2.

**Configurations**

AArch64 System register HPFAR_EL2[31:0] is architecturally mapped to AArch32 System register HPFAR.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HPFAR_EL2 is a 64-bit register.

**Field descriptions**

The HPFAR_EL2 bit assignments are:

```
<table>
<thead>
<tr>
<th>63</th>
<th>44 43</th>
<th>40 39</th>
<th>4 3 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>FIPA[47:12]</td>
<td>RES0</td>
<td></td>
</tr>
<tr>
<td>FIPA[51:48]</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

Execution at EL1 or EL0 makes HPFAR_EL2 become UNKNOWN.

**Bits [63:44]**

Reserved, RES0.

**FIPA[51:48], bits [43:40]**

*In ARMv8.3 and ARMv8.2*

*In ARMv8.1 and ARMv8.0*

Reserved, RES0.

**FIPA[47:12], bits [39:4]**

Bits [47:12] of the faulting intermediate physical address. For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

When ARMv8.2-LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, FIPA[51:48] form the upper part of the address value. For implementations with fewer than 52 physical address bits, FIPA[51:48] are RES0.

The HPFAR_EL2 is written for:

- Translation or Access faults in the second stage of translation.
- An abort in the second stage of translation performed during the translation table walk of a first stage translation, caused by a Translation fault, an Access flag fault, or a Permission fault.
- A stage 2 Address size fault.
The address held in this register is an address accessed by the instruction fetch or data access that caused the exception that gave rise to the instruction or data abort. It is the lowest address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores a mis-aligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

For all other exceptions taken to EL2, this register is UNKNOWN.

In an implementation or a translation granule that does not support ARMv8.2-LPA, the upper bits of this field are RES0.

Bits [3:0]
Reserved, RES0.

Accessing the HPFAR_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>

</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
D10.2.47 HSTR_EL2, Hypervisor System Trap Register

The HSTR_EL2 characteristics are:

**Purpose**

Controls trapping to EL2 of Non-secure EL1 or lower AArch32 accesses to the System register in the coproc == 1111 encoding space, by the CRn value used to access the register using MCR or MRC instruction. When the register is accessible using an MCRR or MRRC instruction, this is the CRm value used to access the register.

**Configurations**

AArch64 System register HSTR_EL2 is architecturally mapped to AArch32 System register HSTR.

If EL2 is not implemented, this register is RES0 from EL3.

If no Exception level can use AArch32, then this register is RES0.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

HSTR_EL2 is a 32-bit register.

**Field descriptions**

The HSTR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-16</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>15-0</td>
<td>T&lt;n&gt;, bit [n], for n = 0 to 15</td>
</tr>
</tbody>
</table>

Fields T14 and T4 are RES0.

The remaining fields control whether Non-secure EL0 and EL1 accesses, using MCR, MRC, MCRR, and MRRC instructions, to the System registers in the coproc == 1111 encoding space are trapped to EL2:

- **0** This control has no effect on Non-secure EL0 or EL1 accesses to System registers.
- **1** Any Non-secure EL1 MCR or MRC access with coproc == 1111 and CRn == <n> is trapped to EL2. A Non-secure EL0 MCR or MRC access with these values is trapped to EL2 only if the access is not UNDEFINED when the value of this field is 0.
- Any Non-secure EL1 MCRR or MRRC access with coproc == 1111 and CRm == <n> is trapped to EL2. A Non-secure EL0 MCRR or MRRC access with these values is trapped to EL2 only if the access is not UNDEFINED when the value of this field is 0.

For example, when HSTR_EL2.T7 is 1, for instructions executed at Non-secure EL1:
- An MCR or MRC instruction with coproc set to 1111 and CRn set to c7 is trapped to EL2.
- An MCRR or MRRC instruction with coproc set to 1111 and CRm set to c7 is trapped to EL2.
When ARMv8.1-VHE is implemented, and the value of HCR_EL2.(E2H, TGE) is \{1, 1\}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

**Accessing the HSTR_EL2**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>HSTR_EL2</td>
<td>11</td>
<td>100</td>
<td>0001</td>
<td>0001</td>
<td>011</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>x x 0</td>

<tr>
<td>0 0 1</td>
<td>- - RW RW</td>
</tr>
<tr>
<td>0 1 1</td>
<td>- n/a RW RW</td>
</tr>
<tr>
<td>1 0 1</td>
<td>- - RW RW</td>
</tr>
<tr>
<td>1 1 1</td>
<td>- n/a RW RW</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
D10.2.48   ID-AA64AFR0_EL1, AArch64 Auxiliary Feature Register 0

The ID_AA64AFR0_EL1 characteristics are:

Purpose

Provides information about the IMPLEMENTATION DEFINED features of the PE in AArch64 state.

For general information about the interpretation of the ID registers see Principles of the ID scheme for fields in ID registers on page D10-2354.

Configurations

There are no configuration notes.

Attributes

ID_AA64AFR0_EL1 is a 64-bit register.

Field descriptions

The ID_AA64AFR0_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:32]</th>
<th>Reserved, RES0.</th>
</tr>

</tbody>
</table>

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
D10.2.49 ID_AA64AFR1_EL1, AArch64 Auxiliary Feature Register 1

The ID_AA64AFR1_EL1 characteristics are:

Purpose

Reserved for future expansion of information about the IMPLEMENTATION DEFINED features of the PE in AArch64 state.

For general information about the interpretation of the ID registers see Principles of the ID scheme for fields in ID registers on page D10-2354.

Configurations

There are no configuration notes.

Attributes

ID_AA64AFR1_EL1 is a 64-bit register.

Field descriptions

The ID_AA64AFR1_EL1 bit assignments are:

```
63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
```

RES0

Bits [63:0]

Reserved, RES0.

Accessing the ID_AA64AFR1_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>
Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
D10.2.50 ID_AA64DFR0_EL1, AArch64 Debug Feature Register 0

The ID_AA64DFR0_EL1 characteristics are:

**Purpose**

Provides top level information about the debug system in AArch64 state.

For general information about the interpretation of the ID registers see Principles of the ID scheme for fields in ID registers on page D10-2354.

**Configurations**

The external register EDDFR gives information from this register.

**Attributes**

ID_AA64DFR0_EL1 is a 64-bit register.

**Field descriptions**

The ID_AA64DFR0_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | PMSVer | CTX_CMPs | RES0 | WRPs | RES0 | BRPs | PMUVer | TraceVer | DebugVer |

**Bits [63:36]**

Reserved, RES0.

**PMSVer, bits [35:32]**

In ARMv8.3 and ARMv8.2

Statistical Profiling Extension version. When the Statistical Profiling Extension is implemented, the defined values of this field are:

- **0000**: No Statistical Profiling extension.
- **0001**: Version 1 of the Statistical Profiling extension present.

All other values are reserved.

When the Statistical Profiling Extension is not implemented this field is reserved, RES0.

In ARMv8.1 and ARMv8.0.

Reserved, RES0.

**CTX_CMPs, bits [31:28]**

Number of breakpoints that are context-aware, minus 1. These are the highest numbered breakpoints.

**Bits [27:24]**

Reserved, RES0.

**WRPs, bits [23:20]**

Number of watchpoints, minus 1. The value of 0b0000 is reserved.

**Bits [19:16]**

Reserved, RES0.

**BRPs, bits [15:12]**

Number of breakpoints, minus 1. The value of 0b0000 is reserved.
PMUVer, bits [11:8]

Performance Monitors Extension version. Indicates whether System register interface to Performance Monitors extension is implemented.

This field does not follow the standard ID scheme, but uses the Alternative ID scheme described in Alternative ID scheme used for the Performance Monitors Extension version on page D10-2356.

Defined values are:

0000  Performance Monitors Extension System registers not implemented.
0001  Performance Monitors Extension System registers implemented, PMUv3.
0100  Performance Monitors Extension System registers implemented, PMUv3, with a 16-bit evtCount field, and if EL2 is implemented, the addition of the MDCR_EL2.HPMD bit.
1111  IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value in new implementations.

ARMv8.1-PMU implements the functionality added by the value 0100.

All other values are reserved.

From ARMv8.1 the value 0001 is not permitted.

TraceVer, bits [7:4]

Trace support. Indicates whether System register interface to a trace macrocell is implemented.

Defined values are:

0000  Trace macrocell System registers not implemented.
0001  Trace macrocell System registers implemented.

All other values are reserved.

A value of 0b0000 only indicates that no System register interface to a trace macrocell is implemented. A trace macrocell might nevertheless be implemented without a System register interface.

DebugVer, bits [3:0]

Debug architecture version. Indicates presence of ARMv8 debug architecture.

0110  ARMv8 debug architecture.
0111  ARMv8 debug architecture with Virtualization Host Extensions.
1000  ARMv8.2 debug architecture

All other values are reserved.

ARMv8.2-Debug adds the functionality indicated by the value 1000.

• If ARMv8.1-VHE is not implemented the only permitted value is 0110.
• In an ARMv8.0 implementation the value 1000 is not permitted.

Accessing the ID_AA64DFR0_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>

</table>

**FHM, bits [51:48]**

*In ARMv8.3 and ARMv8.2*

Indicates whether FMLAL and FMLSL instructions are implemented.

0000  FMLAL and FMLSL instructions not implemented.

0001  FMLAL and FMLSL instructions implemented.

ARMv8.2-FHM implements the functionality identified by the value 0001.

*In ARMv8.1 and ARMv8.0.*

Reserved, RES0.

**DP, bits [47:44]**

*In ARMv8.3 and ARMv8.2*

Dot Product instructions implemented in AArch64 state. Defined values are:

0000  No Dot Product instructions implemented.

0001  UDOT and SDOT instructions implemented.

All other values are reserved.

ARMv8.2-DotProd implements the functionality identified by the value 0001.

*In ARMv8.1 and ARMv8.0.*

Reserved, RES0.

**SM4, bits [43:40]**

*In ARMv8.3 and ARMv8.2*

SM4 instructions implemented in AArch64 state. Defined values are:

0000  No SM4 instructions implemented.

0001  SM4E and SM4EKEY instructions implemented.
All other values are reserved.
This field must have the same value as ID_AA64ISAR0_EL1.SM3.

In ARMv8.1 and ARMv8.0.
Reserved, RES0.

SM3, bits [39:36]

In ARMv8.3 and ARMv8.2
SM3 instructions implemented in AArch64 state. Defined values are:

- 0000: No SM3 instructions implemented.
- 0001: SM3SS1, SM3TT1A, SM3TT1B, SM3TT2A, SM3TT2B, SM3PARTW1, and SM3PARTW2 instructions implemented.

All other values are reserved.
This field must have the same value as ID_AA64ISAR0_EL1.SM3.

SHA3, bits [35:32]

In ARMv8.3 and ARMv8.2
SHA3 instructions implemented in AArch64 state. Defined values are:

- 0000: No SHA3 instructions implemented.
- 0001: EOR3, RAX1, XAR, and BCAX instructions implemented.

All other values are reserved.
If the value of ID_AA64ISAR0_EL1.SHA1 is 0000, then this field must have the value 0000.
If the value of this field is 0001, then ID_AA64ISAR0_EL1.SHA2 must have the value 0010.

RDM, bits [31:28]

In ARMv8.3, ARMv8.2 and ARMv8.1
SQRDMLAH and SQRDMLSH instructions implemented in AArch64 state. Defined values are:

- 0000: No SQRDMLAH and SQRDMLSH instructions implemented.
- 0001: SQRDMLAH and SQRDMLSH instructions implemented.

All other values are reserved.
ARMv8.1-SIMD implements the functionality identified by the value 0001.
From ARMv8.1 the only permitted value is 0001.

Atomic, bits [23:20]

In ARMv8.3, ARMv8.2 and ARMv8.1
Atomic instructions implemented in AArch64 state. Defined values are:

- 0000: No Atomic instructions implemented.
- 0010: LDADD, LDCLR, LDEOR, LDSET, LDSMAX, LDSMIN, LDUMAX, LDUMIN, CAS, CASP, and SWP instructions implemented.

All other values are reserved.
ARMv8.1-Atomics implements the functionality identified by the value $0010$.

From ARMv8.1 the only permitted value is $0010$.

**In ARMv8.0.**

Reserved, RES0.

**CRC32, bits [19:16]**

CRC32 instructions implemented in AArch64 state. Defined values are:

- $0000$: No CRC32 instructions implemented.

All other values are reserved.

In ARMv8.0 the permitted values are $0000$ and $0001$.

From ARMv8.1 the only permitted value is $0001$.

**SHA2, bits [15:12]**

SHA2 instructions implemented in AArch64 state. Defined values are:

- $0000$: No SHA2 instructions implemented.
- $0001$: SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 instructions implemented.
- $0010$: As $0b0001$, plus SHA512H, SHA512H2, SHA512SU0, and SHA512SU1 instructions implemented.

All other values are reserved.

If the value of ID_AA64ISAR0_EL1.SHA1 is $0000$, then this field must have the value $0000$.

If the value of this field is $0010$, then ID_AA64ISAR0_EL1.SHA3 must have the value $0001$.

**SHA1, bits [11:8]**

SHA1 instructions implemented in AArch64 state. Defined values are:

- $0000$: No SHA1 instructions implemented.
- $0001$: SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 instructions implemented.

All other values are reserved.

If the value of ID_AA64ISAR0_EL1.SHA2 is $0000$, then this field must have the value $0000$.

**AES, bits [7:4]**

AES instructions implemented in AArch64 state. Defined values are:

- $0000$: No AES instructions implemented.
- $0001$: AESE, AESD, AESMC, and AESIMC instructions implemented.
- $0010$: As for $0001$, plus PMULL/PMULL2 instructions operating on 64-bit data quantities.

All other values are reserved.

**Bits [3:0]**

Reserved, RES0.

**Accessing the ID_AA64ISAR0_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>
This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID_AA64ISAR0_EL1</td>
<td>11</td>
<td>000</td>
<td>0000</td>
<td>0110</td>
<td>000</td>
</tr>
</tbody>
</table>

### Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
D10.2.53 ID_AA64ISAR1_EL1, AArch64 Instruction Set Attribute Register 1

The ID_AA64ISAR1_EL1 characteristics are:

**Purpose**

Provides information about the features and instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D10-2354.

**Configurations**

There are no configuration notes.

**Attributes**

ID_AA64ISAR1_EL1 is a 64-bit register.

**Field descriptions**

The ID_AA64ISAR1_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
<tr>

<td>DPB</td>
<td>Implemented in AArch64 state. Defined values are:</td>
</tr>
</tbody>
</table>

In ARMv8.3

Indicates whether an IMPLEMENTATION DEFINED algorithm is implemented in the PE for generic code authentication, in AArch64 state. Defined values are:

- 0000: Generic Authentication using an IMPLEMENTATION DEFINED algorithm is not implemented.
- 0001: Generic Authentication using an IMPLEMENTATION DEFINED algorithm is implemented. This involves the PACGA instruction.

All other values are reserved.

If the value of the GPA field is nonzero this field must have the value 0000.

In ARMv8.2, ARMv8.1 and ARMv8.0

Reserved, RES0.

In ARMv8.3

Indicates whether QARMA or Architected algorithm is implemented in the PE for generic code authentication, in AArch64 state. Defined values are:

- 0000: Generic Authentication using an Architected algorithm is not implemented.
- 0001: Generic Authentication using the QARMA algorithm is implemented. This involves the PACGA instruction.

All other values are reserved.

If the value of the GPI field is nonzero this field must have the value 0000.

In ARMv8.2, ARMv8.1 and ARMv8.0

Reserved, RES0.
LRCP, bits [23:20]

In ARMv8.3

Indicates support for weaker release consistency, RCpc based model. Defined values are:

0000  The LDAPRB, LDAPRH and LDAPR instructions are not implemented.
0001  The LDAPRB, LDAPRH and LDAPR instructions are implemented.

All other values are reserved.

In ARMv8.0, ARMv8.1 and ARMv8.2 the only permitted value is 0000.

From ARMv8.3 the only permitted value is 0001. This feature is identified as ARMv8.3-RCPC.

In ARMv8.2, ARMv8.1 and ARMv8.0.

Reserved, RES0.

FCMA, bits [19:16]

In ARMv8.3

Indicates support for complex number addition and multiplication where numbers are stored in vectors. Defined values are:

0000  The FCMLA and FCADD instructions are not implemented.
0001  The FCMLA and FCADD instructions are implemented.

All other values are reserved.

In ARMv8.0, ARMv8.1 and ARMv8.2 the only permitted value is 0000.

From ARMv8.3 the only permitted value is 0001. This feature is identified as ARMv8.3-CompNum.

In ARMv8.2, ARMv8.1 and ARMv8.0.

Reserved, RES0.

JSCVT, bits [15:12]

In ARMv8.3

Indicates support for javascript conversion from double precision floating point values to integers in AArch64 state. Defined values are:

0000  The FJCVTZS instruction is not implemented.
0001  The FJCVTZS instruction is implemented.

All other values are reserved.

In ARMv8.0, ARMv8.1 and ARMv8.2 the only permitted value is 0000.

From ARMv8.3 the only permitted value is 0001. This feature is identified as ARMv8.3-JSConv.

In ARMv8.2, ARMv8.1 and ARMv8.0.

Reserved, RES0.

API, bits [11:8]

In ARMv8.3

Indicates whether an IMPLEMENTATION DEFINED algorithm is implemented in the PE for address authentication, in AArch64 state. Defined values are:

0000  Address Authentication using an IMPLEMENTATION DEFINED algorithm is not implemented.
0001  Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented. This involves all Pointer Authentication instructions other than the PACGA instruction.

All other values are reserved.

If the value of the APA field is nonzero this field must have the value 0000.

In ARMv8.2, ARMv8.1 and ARMv8.0.

Reserved, RES0.
APA, bits [7:4]

In ARMv8.3

Indicates whether QARMA or Architected algorithm is implemented in the PE for address authentication, in AArch64 state. Defined values are:

- 0000: Address Authentication using an Architected algorithm is not implemented.
- 0001: Address Authentication using the QARMA algorithm is implemented. This involves all Pointer Authentication instructions other than the PACGA instruction.

All other values are reserved.

If the value of the API field is nonzero this field must have the value 0000.

In ARMv8.2, ARMv8.1 and ARMv8.0.

Reserved, RES0.

DPB, bits [3:0]

In ARMv8.3 and ARMv8.2

Indicates support for the DC CVAP instruction in AArch64 state. Defined values are:

- 0000: DC CVAP not supported.
- 0001: DC CVAP supported.

All other values are reserved.

ARMv8.2-DCPoP implements the functionality identified by the value 0001.

From ARMv8.2 the only permitted value is 0001.

In ARMv8.1 and ARMv8.0.

Reserved, RES0.

If API == 0000 and APA == 0000, then:

- The TCR_EL1.{TBID,TBID0}, TCR_EL2.{TBID0,TBID1}, TCR_EL2.TBID and TCR_EL3.TBID bits are RES0.
- APIAKeyHi_EL1, APIAKeyLo_EL1, APIBKeyHi_EL1, APIBKeyLo_EL1, APDAKeyHi_EL1, APDAKeyLo_EL1, APDBKeyHi_EL1, APDBKeyLo_EL1 are not allocated.
- SCTLR_ELx.EnLA, SCTLR_ELx.EnIB, SCTLR_ELx.EnDA, SCTLR_ELx.EnDB are all RES0.

If API == 0000 and APA == 0000 and GPI == 0000 and GPA == 0000, then:

- HCR_EL2.APK and HCR_EL2.API are RES0.
- SCR_EL3.APK and SCR_EL3.API are RES0.

Accessing the ID_AA64ISAR1_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  — If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  — If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
D10.2.54   ID_AA64MMFR0_EL1, AArch64 Memory Model Feature Register 0

The ID_AA64MMFR0_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers see Principles of the ID scheme for fields in ID registers on page D10-2354.

Configurations

There are no configuration notes.

Attributes

ID_AA64MMFR0_EL1 is a 64-bit register.

Field descriptions

The ID_AA64MMFR0_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:32]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>TGran4, bits [31:28]</td>
<td>Support for 4KB memory translation granule size. Defined values are:</td>
</tr>
<tr>
<td>0000</td>
<td>4KB granule supported.</td>
</tr>
<tr>
<td>1111</td>
<td>4KB granule not supported.</td>
</tr>
<tr>
<td>All other values are reserved.</td>
<td></td>
</tr>
<tr>
<td>TGran64, bits [27:24]</td>
<td>Support for 64KB memory translation granule size. Defined values are:</td>

</tr>
<tr>
<td>BigEndEL0, bits [19:16]</td>
<td>Mixed-endian support at EL0 only. Defined values are:</td>
</tr>
<tr>
<td>0000</td>
<td>No mixed-endian support at EL0. The SCTLR_EL1.E0E bit has a fixed value.</td>
</tr>
<tr>
<td>0001</td>
<td>Mixed-endian support at EL0. The SCTLR_EL1.E0E bit can be configured.</td>
</tr>
<tr>
<td>All other values are reserved.</td>
<td></td>
</tr>
</tbody>
</table>

This field is invalid and is RES0 if the BigEnd field, bits [11:8], is not 0000.
SNSMem, bits [15:12]
Secure versus Non-secure Memory distinction. Defined values are:
0000  Does not support a distinction between Secure and Non-secure Memory.
0001  Does support a distinction between Secure and Non-secure Memory.
All other values are reserved.

BigEnd, bits [11:8]
Mixed-endian configuration support. Defined values are:
0000  No mixed-endian support. The SCTLR_ELx.EE bits have a fixed value. See the
       BigEndEL0 field, bits[19:16], for whether EL0 supports mixed-endian.
0001  Mixed-endian support. The SCTLR_ELx.EE and SCTLR_EL1.E0E bits can be
       configured.
All other values are reserved.

ASIDBits, bits [7:4]
Number of ASID bits. Defined values are:
0000  8 bits.
0010  16 bits.
All other values are reserved.

PARange, bits [3:0]
Physical Address range supported. Defined values are:
0000  32 bits, 4GB.
0001  36 bits, 64GB.
0010  40 bits, 1TB.
0011  42 bits, 4TB.
0100  44 bits, 16TB.
0101  48 bits, 256TB.
0110  52 bits, 4PB.
0111  56 bits, 1TB.
All other values are reserved.
The value 0110 is permitted only if the implementation includes ARMv8.2-LPA, otherwise it is
reserved.

Accessing the ID_AA64MMFR0_EL1
This register can be read using MRS with the following syntax:
MRS <Xt>, <systemreg>
This syntax is encoded with the following settings in the instruction encoding:

**Bits [63:32]**

Reserved, RES0.

**XNX, bits [31:28]**

*In ARMv8.3 and ARMv8.2*

Support for execute-never control distinction by Exception level at stage 2. Defined values are:

- **0000** Distinction between EL0 and EL1 execute-never control at stage 2 not supported.
- **0001** Distinction between EL0 and EL1 execute-never control at stage 2 supported.

All other values are reserved.

ARMv8.2-TTS2UXN implements the functionality identified by the value **0001**.

From ARMv8.2, the only permitted value is **0001**.

**SpecSEI, bits [27:24]**

Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are:

- **0000** The PE never generates an SError interrupt due to an External abort on a speculative read.
- **0001** The PE might generate an SError interrupt due to an External abort on a speculative read.

All other values are reserved.

When the RAS Extension is not implemented, this field is RAZ.
PAN, bits [23:20]

In ARMv8.3, ARMv8.2 and ARMv8.1

Privileged Access Never. Indicates support for the PAN bit in PSTATE, SPSR_EL1, SPSR_EL2, SPSR_EL3, and DSPSR_EL0. Defined values are:

0000   PAN not supported.
0001   PAN supported.
0010   PAN supported and AT S1E1RP and AT S1E1WP instructions supported.

All other values are reserved.

ARMv8.1-PAN implements the functionality identified by the value 0001.
ARMv8.2-ATS1E1 implements the functionality added by the value 0010.
In ARMv8.1 the value 0000 is not permitted.
From ARMv8.2, the only permitted value is 0010.

In ARMv8.0.

Reserved, RES0.

LO, bits [19:16]

In ARMv8.3, ARMv8.2 and ARMv8.1

LORegions. Indicates support for LORegions. Defined values are:

0000   LORegions not supported.
0001   LORegions supported.

All other values are reserved.

ARMv8.1-LOR implements the functionality identified by the value 0001.
From ARMv8.1, the only permitted value is 0001.

In ARMv8.0.

Reserved, RES0.

HPDS, bits [15:12]

In ARMv8.3, ARMv8.2 and ARMv8.1

Hierarchical permission disables bits in translation tables. Defined values are:

0000   Disabling of hierarchical controls not supported.
0001   Disabling of hierarchical controls supported with the TCR_EL1:{HPD1, HPD0}, TCR_EL2.HPD or TCR_EL2:{HPD1, HPD0}, and TCR_EL3.HPD bits.
0010   As for value 0001, and adds possible hardware allocation of bits[62:59] of the translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use.

All other values are reserved.

ARMv8.1-HPD implements the functionality identified by the value 0001.
ARMv8.2-TTPBHA implements the functionality added by the value 0010.
From ARMv8.1 the value 0000 is not permitted.

In ARMv8.0.

Reserved, RES0.

VH, bits [11:8]

In ARMv8.3, ARMv8.2 and ARMv8.1

Virtualization Host Extensions. Defined values are:

0000   Virtualization Host Extensions not supported.
0001   Virtualization Host Extensions supported.

All other values are reserved.
ARMv8.1-VHE implements the functionality identified by the value 0001.
From ARMv8.1, the only permitted value is 0001.

In ARMv8.0.
Reserved, RES0.

VMIDBits, bits [7:4]

In ARMv8.3, ARMv8.2 and ARMv8.1
Number of VMID bits. Defined values are:
0000 8 bits
0010 16 bits
All other values are reserved.
ARMv8.1-VMID16 implements the functionality identified by the value 0010.
In ARMv8.1 and ARMv8.2, support for this feature is optional.

In ARMv8.0.
Reserved, RES0.

HAFDBS, bits [3:0]

In ARMv8.3, ARMv8.2 and ARMv8.1
Hardware updates to Access flag and Dirty state in translation tables. Defined values are:
0000 Hardware update of the Access flag and dirty state are not supported.
0001 Hardware update of the Access flag is supported.
0010 Hardware update of both the Access flag and dirty state is supported.
All other values are reserved.
ARMv8.1-VHE implements the functionality identified by the values 0001 and 0010.
In ARMv8.1 and ARMv8.2, support for this feature is optional.

In ARMv8.0.
Reserved, RES0.

Accessing the ID_AA64MMFR1_EL1

This register can be read using MRS with the following syntax:
MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TID3 == 1, Non-secure read accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TID3 == 1, Non-secure read accesses to this register from EL1 are trapped to EL2.
D10.2.56 ID_AA64MMFR2_EL1, AArch64 Memory Model Feature Register 2

The ID_AA64MMFR2_EL1 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers see Principles of the ID scheme for fields in ID registers on page D10-2354.

**Configurations**

This register is introduced in ARMv8.2.

**Attributes**

ID_AA64MMFR2_EL1 is a 64-bit register.

**Field descriptions**

The ID_AA64MMFR2_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>

**NV, bits [27:24]**

*In ARMv8.3*

If EL2 is implemented, indicates support for the use of Nested Virtualization. Defined values are:

- **0000**: Nested Virtualization is not supported.
- **0001**: The HCR_EL2.NV, HCR_EL2.NV1, HCR_EL2.AT bits are implemented.

All other values are reserved.

In ARMv8.2 the only permitted value is 0000.

From ARMv8.3 the permitted values are:

- **0000** when EL2 is not implemented.
- **0001** when EL2 is implemented. This feature is identified as ARMv8.3-NV.

**CCIDX, bits [23:20]**

*In ARMv8.3*

Support for the use of revised CCSIDR_EL1 register format. Defined values are:

- **0000**: 32-bit format implemented for all levels of the CCSIDR_EL1.
- **0001**: 64-bit format implemented for all levels of the CCSIDR_EL1.

All other values are reserved.

From ARMv8.3, the permitted values are 0000 and 0001. This feature is identified by the name ARMv8.3-CCIDX.

*In ARMv8.2*

Reserved, RES0.
VARange, bits [19:16]
Indicates support for a larger virtual address. Defined values are:
0000 VMAv8-64 supports 48-bit VAs.
0001 VMAv8-64 supports 52-bit VAs when using the 64KB translation granule. The other translation granules support 48-bit VAs.
All other values are reserved.
ARMv8.2-LVA implements the functionality identified by the value 0001.

IESB, bits [15:12]
Indicates support for the IESB bit in the SCTLR_ELx registers. Defined values are:
0000 IESB bit in the SCTLR_ELx registers is not supported.
0001 IESB bit in the SCTLR_ELx registers is supported.
All other values are reserved.
ARMv8.2-IESB implements the functionality identified by the value 0001.
From ARMv8.2 the only permitted value is 0001.

LSM, bits [11:8]
Indicates support for LSMAOE and nTLSMD bits in SCTLR_EL1 and SCTLR_EL2. Defined values are:
0000 LSMAOE and nTLSMD bits not supported.
0001 LSMAOE and nTLSMD bits supported.
All other values are reserved.
ARMv8.2-LSMAOC implements the functionality identified by the value 0001.

UAO, bits [7:4]
User Access Override. Defined values are:
0000 UAO not supported.
0001 UAO supported.
All other values are reserved.
ARMv8.2-UAO implements the functionality identified by the value 0001.
From ARMv8.2 the only permitted value is 0001.

CnP, bits [3:0]
Common not Private translations. Defined values are:
0000 Common not Private translations not supported.
0001 Common not Private translations supported.
All other values are reserved.
ARMv8.2-TTCNP implements the functionality identified by the value 0001.
From ARMv8.2, the only permitted value is 0001.

Accessing the ID_AA64MMFR2_EL1
This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>
This syntax is encoded with the following settings in the instruction encoding:

```
<systemreg> op0 op1 CRn CRm op2
ID_AA64MMFR2_EL1  11  000  0000  0111  010
```

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0 EL1 EL2 EL3</td>

<td>- n/a RO RO</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
D10.2.57  ID_AA64PFR0_EL1, AArch64 Processor Feature Register 0

The ID_AA64PFR0_EL1 characteristics are:

**Purpose**

Provides additional information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D10-2354.

**Configurations**

The external register EDPFR gives information from this register.

**Attributes**

ID_AA64PFR0_EL1 is a 64-bit register.

**Field descriptions**

The ID_AA64PFR0_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-36</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>35-32</td>

<td>EL0</td>
</tr>
</tbody>
</table>

**Bits [63:36]**

Reserved, RES0.

**SVE, bits [35:32]**

*In ARMv8.3 and ARMv8.2*

Scalable Vector Extension. Defined values are:

- 0000  SVE is not implemented.
- 0001  SVE is implemented.

All other values are reserved.

*In ARMv8.1 and ARMv8.0.*

Reserved, RES0.

**RAS, bits [31:28]**

RAS Extension version. The defined values of this field are:

- 0000  No RAS Extension.
- 0001  Version 1 of the RAS Extension present.

All other values are reserved.

**GIC, bits [27:24]**

System register GIC interface support. Defined values are:

- 0000  No System register interface to the GIC is supported.
- 0001  System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.

All other values are reserved.
AdvSIMD, bits [23:20]

Advanced SIMD. Defined values are:

- **0000** Advanced SIMD is implemented, including support for the following SISD and SIMD operations:
  - Integer byte, halfword, word and doubleword element operations.
  - Single-precision and double-precision floating-point arithmetic.
  - Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.

- **0001** As for 0000, and also includes support for half-precision floating-point arithmetic.

- **1111** Advanced SIMD is not implemented.

All other values are reserved.

This field must have the same value as the FP field.

The permitted values are:

- **0000** in an implementation with Advanced SIMD support that does not include the ARMv8.2-FP16 extension.
- **0001** in an implementation with Advanced SIMD support that includes the ARMv8.2-FP16 extension.
- **1111** in an implementation without Advanced SIMD support.

FP, bits [19:16]

Floating-point. Defined values are:

- **0000** Floating-point is implemented, and includes support for:
  - Single-precision and double-precision floating-point types.
  - Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.

- **0001** As for 0000, and also includes support for half-precision floating-point arithmetic.

- **1111** Floating-point is not implemented.

All other values are reserved.

This field must have the same value as the AdvSIMD field.

The permitted values are:

- **0000** in an implementation with floating-point support that does not include the ARMv8.2-FP16 extension.
- **0001** in an implementation with floating-point support that includes the ARMv8.2-FP16 extension.
- **1111** in an implementation without floating-point support.

EL3, bits [15:12]

EL3 Exception level handling. Defined values are:

- **0000** EL3 is not implemented.
- **0001** EL3 can be executed in AArch64 state only.
- **0010** EL3 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

EL2, bits [11:8]

EL2 Exception level handling. Defined values are:

- **0000** EL2 is not implemented.
- **0001** EL2 can be executed in AArch64 state only.
- **0010** EL2 can be executed in either AArch64 or AArch32 state.
All other values are reserved.

**EL1, bits [7:4]**

EL1 Exception level handling. Defined values are:
- **0001** EL1 can be executed in AArch64 state only.
- **0010** EL1 can be executed in either AArch64 or AArch32 state.
All other values are reserved.

**EL0, bits [3:0]**

EL0 Exception level handling. Defined values are:
- **0001** EL0 can be executed in AArch64 state only.
- **0010** EL0 can be executed in either AArch64 or AArch32 state.
All other values are reserved.

**Accessing the ID_AA64PFR0_EL1**

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>

</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
D10.2.58  ID_AA64PFR1_EL1, AArch64 Processor Feature Register 1

The ID_AA64PFR1_EL1 characteristics are:

**Purpose**

Reserved for future expansion of information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers see Principles of the ID scheme for fields in ID registers on page D10-2354.

**Configurations**

There are no configuration notes.

**Attributes**

ID_AA64PFR1_EL1 is a 64-bit register.

**Field descriptions**

The ID_AA64PFR1_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Range</th>
<th>Description</th>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  — If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  — If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
D10.2.59 ID_AFR0_EL1, AArch32 Auxiliary Feature Register 0

The ID_AFR0_EL1 characteristics are:

Purpose

Provides information about the IMPLEMENTATION DEFINED features of the PE in AArch32 state. Must be interpreted with the Main ID Register, MIDR_EL1. For general information about the interpretation of the ID registers see Principles of the ID scheme for fields in ID registers on page D10-2354.

Configurations

AArch64 System register ID_AFR0_EL1 is architecturally mapped to AArch32 System register ID_AFR0. In an implementation that supports only AArch64 state, this register is UNKNOWN.

Attributes

ID_AFR0_EL1 is a 32-bit register.

Field descriptions

The ID_AFR0_EL1 bit assignments are:

<table>
<thead>
<tr>

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
D10.2.60  ID_DFR0_EL1, AArch32 Debug Feature Register 0

The ID_DFR0_EL1 characteristics are:

**Purpose**

Provides top level information about the debug system in AArch32 state.

Must be interpreted with the Main ID Register, MIDR_EL1.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D10-2354.

**Configurations**

AArch64 System register ID_DFR0_EL1 is architecturally mapped to AArch32 System register ID_DFR0.

In an implementation that supports only AArch64 state, this register is UNKNOWN.

**Attributes**

ID_DFR0_EL1 is a 32-bit register.

**Field descriptions**

The ID_DFR0_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-28</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>27-24</td>
<td>PerfMon</td>
</tr>
<tr>
<td>23-20</td>
<td>MProfDbg</td>
</tr>
<tr>
<td>19-16</td>
<td>MMapTrc</td>
</tr>
<tr>
<td>15-12</td>
<td>CopTrc</td>
</tr>
<tr>
<td>11-8</td>
<td>MMapDbg</td>
</tr>
<tr>
<td>7-4</td>
<td>CopSDbg</td>
</tr>
<tr>
<td>3-0</td>
<td>CopDbg</td>
</tr>
</tbody>
</table>

**Bits [31:28]**

Reserved, RES0.

**PerfMon, bits [27:24]**

Performance Monitors. Support for System registers-based ARM Performance Monitors Extension, using registers in the coproc == 1111 encoding space, for A and R profile processors.

This field does not follow the standard ID scheme, but uses the Alternative ID scheme described in *Alternative ID scheme used for the Performance Monitors Extension version* on page D10-2356.

Defined values are:

- **0000**: Performance Monitors Extension System registers not implemented.
- **0001**: Support for Performance Monitors Extension version 1 (PMUv1) System registers.
- **0010**: Support for Performance Monitors Extension version 2 (PMUv2) System registers.
- **0011**: Support for Performance Monitors Extension version 3 (PMUv3) System registers.
- **0100**: Support for Performance Monitors Extension version 3 (PMUv3) System registers, with a 16-bit evtCount field.
- **1111**: IMPLEMENTATION DEFINED form of Performance Monitors System registers supported. PMUv3 not supported. Arm does not recommend this value in new implementations.

All other values are reserved.

**ARMv8.1-PMU** implements the functionality added by the value 0100.

In any ARMv8 implementation the values 0001 and 0010 are not permitted.

From ARMv8.1 the value 0011 is not permitted.
Note

In ARMv7, the value 0000 can mean that PMUv1 is implemented. PMUv1 is not permitted in an ARMv8 implementation.

MProfDbg, bits [23:20]
M Profile Debug. Support for memory-mapped debug model for M profile processors. Defined values are:

0000  Not supported.
0001  Support for M profile Debug architecture, with memory-mapped access.

All other values are reserved.
In ARMv8-A the only permitted value is 0000.

MMapTrc, bits [19:16]
Memory Mapped Trace. Support for memory-mapped trace model. Defined values are:

0000  Not supported.
0001  Support for ARM trace architecture, with memory-mapped access.

All other values are reserved.
In ARMv8-A the permitted values are 0000 and 0001.
In the Trace registers, the ETMIDR gives more information about the implementation.

CopTrc, bits [15:12]
Support for System registers-based trace model, using registers in the coproc == 1110 encoding space. Defined values are:

0000  Not supported.
0001  Support for ARM trace architecture, with System registers access.

All other values are reserved.
In ARMv8-A the permitted values are 0000 and 0001.
In the Trace registers, the ETMIDR gives more information about the implementation.

MMapDbg, bits [11:8]
Memory Mapped Debug. Support for v7 memory-mapped debug model, for A and R profile processors.
In ARMv8-A this field is RES0.
The optional memory map defined by ARMv8 is not compatible with ARMv7.

CopSDbg, bits [7:4]
Support for a System registers-based Secure debug model, using registers in the coproc = 1110 encoding space, for an A profile processor that includes EL3.
If EL3 is not implemented and the implemented Security state is Non-Secure state, this field is RES0. Otherwise, this field reads the same as bits [3:0].

CopDbg, bits [3:0]
Support for System registers-based debug model, using registers in the coproc == 1110 encoding space, for A and R profile processors. Defined values are:

0000  Not supported.
0010  Support for ARMv6, v6 Debug architecture, with System registers access.
0011  Support for ARMv6, v6.1 Debug architecture, with System registers access.
0100  Support for ARMv7, v7 Debug architecture, with System registers access.
0101  Support for ARMv7, v7.1 Debug architecture, with System registers access.
0110 Support for ARMv8 debug architecture, with System registers access.
0111 Support for ARMv8 debug architecture, with System registers access, and Virtualization Host extensions.
1000 Support for ARMv8.2 debug architecture.

All other values are reserved.

**ARMv8.2-Debug** adds the functionality indicated by the value 1000.
- In any ARMv8 implementation, the values 0000, 0010, 0011, 0100, and 0101 are not permitted.
- If ARMv8.1-VHE is not implemented the only permitted value is 0110.
- In an ARMv8.0 implementation the value 1000 is not permitted.

### Accessing the ID_DFR0_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID_DFR0_EL1</td>
<td>11</td>
<td>000</td>
<td>000</td>
<td>001</td>
<td>010</td>
</tr>
</tbody>
</table>

### Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>TGE</td>
<td>- RO n/a RO</td>
</tr>
<tr>
<td>NS</td>
<td>- RO RO RO</td>
</tr>
</tbody>
</table>

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
D10.2.61 ID_ISAR0_EL1, AArch32 Instruction Set Attribute Register 0

The ID_ISAR0_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see Principles of the ID scheme for fields in ID registers on page D10-2354.

Configurations

AArch64 System register ID_ISAR0_EL1 is architecturally mapped to AArch32 System register ID_ISAR0.

In an implementation that supports only AArch64 state, this register is UNKNOWN.

Attributes

ID_ISAR0_EL1 is a 32-bit register.

Field descriptions

The ID_ISAR0_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit assignments</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 28 27</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>24 23 20 19</td>
<td>Divide, Debug</td>
</tr>
<tr>
<td>16 15 12 11</td>
<td>Coproc, CmpBranch</td>
</tr>
<tr>
<td>8 7 4 3 0</td>
<td>BitField, BitCount, SWAP</td>
</tr>
</tbody>
</table>

Res0

Reserved, RES0.

Divide, bits [27:24]

Indicates the implemented Divide instructions. Defined values are:

0000 None implemented.
0001 Adds SDIV and UDIV in the T32 instruction set.
0010 As for 0001, and adds SDIV and UDIV in the A32 instruction set.

All other values are reserved.

In ARMv8-A the only permitted value is 0010.

Debug, bits [23:20]

Indicates the implemented Debug instructions. Defined values are:

0000 None implemented.
0001 Adds BKPT.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

Coproc, bits [19:16]

Indicates the implemented System register access instructions. Defined values are:

0000 None implemented, except for instructions separately attributed by the architecture to provide access to AArch32 System registers and System instructions.
0001 Adds generic CDP, LDC, MCR, MRC, and STC.
0010 As for 0001, and adds generic CDP2, LDC2, MCR2, MRC2, and STC2.
0011 As for 0010, and adds generic MCRR and MRRC.
0100 As for 0011, and adds generic MCRR2 and MRRC2.
All other values are reserved.
In ARMv8-A the only permitted value is 0000.

**CmpBranch, bits [15:12]**
Indicates the implemented combined Compare and Branch instructions in the T32 instruction set.
Defined values are:
0000 None implemented.
0001 Adds CBNZ and CBZ.
All other values are reserved.
In ARMv8-A the only permitted value is 0001.

**BitField, bits [11:8]**
Indicates the implemented BitField instructions. Defined values are:
0000 None implemented.
0001 Adds BFC, BFI, SBFX, and UBFX.
All other values are reserved.
In ARMv8-A the only permitted value is 0001.

**BitCount, bits [7:4]**
Indicates the implemented Bit Counting instructions. Defined values are:
0000 None implemented.
0001 Adds CLZ.
All other values are reserved.
In ARMv8-A the only permitted value is 0001.

**Swap, bits [3:0]**
Indicates the implemented Swap instructions in the A32 instruction set. Defined values are:
0000 None implemented.
0001 Adds SWP and SWPB.
All other values are reserved.
In ARMv8-A the only permitted value is 0000.

**Accessing the ID_ISAR0_EL1**
This register can be read using MRS with the following syntax:
MRS <Xt>, <systemreg>
This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID_ISAR0_EL1</td>
<td>11</td>
<td>000</td>
<td>0000</td>
<td>0010</td>
<td>000</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>TGE</td>
<td>RO n/a RO RO</td>
</tr>
<tr>
<td>NS</td>
<td></td>
</tr>
<tr>
<td>x</td>
<td>x 0 1 1</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
D10.2.62   ID_ISAR1_EL1, AArch32 Instruction Set Attribute Register 1

The ID_ISAR1_EL1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D10-2354.

**Configurations**

AArch64 System register ID_ISAR1_EL1 is architecturally mapped to AArch32 System register ID_ISAR1.

In an implementation that supports only AArch64 state, this register is UNKNOWN.

**Attributes**

ID_ISAR1_EL1 is a 32-bit register.

**Field descriptions**

The ID_ISAR1_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>28</th>
<th>27</th>
<th>24</th>
<th>23</th>
<th>20</th>
<th>19</th>
<th>16</th>
<th>15</th>
<th>12</th>
<th>11</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Jazelle</td>
<td>Interwork</td>
<td>Immediate</td>
<td>IfThen</td>
<td>Extend</td>
<td>Except_AR</td>
<td>Except</td>
<td>Endian</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Jazelle, bits [31:28]**

Indicates the implemented Jazelle extension instructions. Defined values are:

0000   No support for Jazelle.
0001   Adds the BXJ instruction, and the J bit in the PSR. This setting might indicate a trivial implementation of the Jazelle extension.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

**Interwork, bits [27:24]**

Indicates the implemented Interworking instructions. Defined values are:

0000   None implemented.
0001   Adds the BX instruction, and the T bit in the PSR.
0010   As for 0001, and adds the BLX instruction. PC loads have BX-like behavior.
0011   As for 0010, and guarantees that data-processing instructions in the A32 instruction set with the PC as the destination and the S bit clear have BX-like behavior.

All other values are reserved.

In ARMv8-A the only permitted value is 0011.

**Immediate, bits [23:20]**

Indicates the implemented data-processing instructions with long immediates. Defined values are:

0000   None implemented.
0001   Adds:
   •   The MOVT instruction.
• The MOV instruction encodings with zero-extended 16-bit immediates.
• The T32 ADD and SUB instruction encodings with zero-extended 12-bit immediates, and the other ADD, ADR, and SUB encodings cross-referenced by the pseudocode for those encodings.

All other values are reserved.
In ARMv8-A the only permitted value is 0001.

IfThen, bits [19:16]
Indicates the implemented If-Then instructions in the T32 instruction set. Defined values are:
  0000  None implemented.
  0001  Adds the IT instructions, and the IT bits in the PSRs.
All other values are reserved.
In ARMv8-A the only permitted value is 0001.

Extend, bits [15:12]
Indicates the implemented Extend instructions. Defined values are:
  0000  No scalar sign-extend or zero-extend instructions are implemented, where scalar instructions means non-Advanced SIMD instructions.
  0001  Adds the SXTB, SXTH, UXTB, and UXTH instructions.
  0010  As for 0001, and adds the SXTB16, SXTAB, SXTAB16, SXTAH, UXTB16, UXTAB, UXTAB16, and UXTAH instructions.
All other values are reserved.
In ARMv8-A the only permitted value is 0010.

Except_AR, bits [11:8]
Indicates the implemented A and R profile exception-handling instructions. Defined values are:
  0000  None implemented.
  0001  Adds the SRS and RFE instructions, and the A and R profile forms of the CPS instruction.
All other values are reserved.
In ARMv8-A the only permitted value is 0001.

Except, bits [7:4]
Indicates the implemented exception-handling instructions in the ARM instruction set. Defined values are:
  0000  Not implemented. This indicates that the User bank and Exception return forms of the LDM and STM instructions are not implemented.
  0001  Adds the LDM (exception return), LDM (user registers), and STM (user registers) instruction versions.
All other values are reserved.
In ARMv8-A the only permitted value is 0001.

Endian, bits [3:0]
Indicates the implemented Endian instructions. Defined values are:
  0000  None implemented.
  0001  Adds the SETEND instruction, and the E bit in the PSRs.
All other values are reserved.
In ARMv8-A the permitted values are 0000 and 0001.
Accessing the ID_ISAR1_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
D10.2.63 ID_ISAR2_EL1, AArch32 Instruction Set Attribute Register 2

The ID_ISAR2_EL1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see Principles of the ID scheme for fields in ID registers on page D10-2354.

**Configurations**

AArch64 System register ID_ISAR2_EL1 is architecturally mapped to AArch32 System register ID_ISAR2.

In an implementation that supports only AArch64 state, this register is UNKNOWN.

**Attributes**

ID_ISAR2_EL1 is a 32-bit register.

**Field descriptions**

The ID_ISAR2_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reversal</td>
<td>Indicates the implemented Reversal instructions. Defined values are:</td>
</tr>
<tr>
<td>PSR_AR</td>
<td>Indicates the implemented A and R profile instructions to manipulate the PSR. Defined values are:</td>
</tr>
<tr>
<td>MultU</td>
<td></td>
</tr>
<tr>
<td>MultS</td>
<td></td>
</tr>
<tr>
<td>Mult</td>
<td></td>
</tr>
<tr>
<td>MemHint</td>
<td></td>
</tr>
<tr>
<td>LoadStore</td>
<td></td>
</tr>
<tr>
<td>MultiAccessInt</td>
<td></td>
</tr>
</tbody>
</table>

**Reversal, bits [31:28]**

Indicates the implemented Reversal instructions. Defined values are:

- 0000: None implemented.
- 0001: Adds the REV, REV16, and REVSH instructions.
- 0010: As for 0001, and adds the RBIT instruction.

All other values are reserved.

In ARMv8-A the only permitted value is 0010.

**PSR_AR, bits [27:24]**

Indicates the implemented A and R profile instructions to manipulate the PSR. Defined values are:

- 0000: None implemented.
- 0001: Adds the MRS and MSR instructions, and the exception return forms of data-processing instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

The exception return forms of the data-processing instructions are:

- In the A32 instruction set, data-processing instructions with the PC as the destination and the S bit set. These instructions might be affected by the WithShifts attribute.
- In the T32 instruction set, the SUBS PC,LR,#N instruction.
MultU, bits [23:20]
Indicates the implemented advanced unsigned Multiply instructions. Defined values are:

0000  None implemented.
0001  Adds the UMULL and UMLAL instructions.
0010  As for 0001, and adds the UMAAL instruction.

All other values are reserved.
In ARMv8-A the only permitted value is 0010.

MultS, bits [19:16]
Indicates the implemented advanced signed Multiply instructions. Defined values are:

0000  None implemented.
0001  Adds the SMULL and SMLAL instructions.
0010  As for 0001, and adds the SMLABB, SMLABT, SMLALBB, SMLALBT, SMLALTB, SMLALTT, SMLATB, SMLATT, SMLAWB, SMLAWT, SMULBB, SMULBT, SMULTB, SMULTT, SMULWB, and SMULWT instructions. Also adds the Q bit in the PSRs.
0011  As for 0010, and adds the SMLAD, SMLADX, SMLAD, SMLALDX, SMLSD, SMLSDX, SMLSLD, SMLSLDX, SMLLA, SMLAR, SMMLS, SMMLSR, SMMLUL, SMMLUR, SMUAD, SMUADX, SMUSD, and SMUSDX instructions.

All other values are reserved.
In ARMv8-A the only permitted value is 0011.

Mult, bits [15:12]
Indicates the implemented additional Multiply instructions. Defined values are:

0000  No additional instructions implemented. This means only MUL is implemented.
0001  Adds the MLA instruction.
0010  As for 0001, and adds the MLS instruction.

All other values are reserved.
In ARMv8-A the only permitted value is 0010.

MultiAccessInt, bits [11:8]
Indicates the support for interruptible multi-access instructions. Defined values are:

0000  No support. This means the LDM and STM instructions are not interruptible.
0001  LDM and STM instructions are restartable.
0010  LDM and STM instructions are continuable.

All other values are reserved.
In ARMv8-A the only permitted value is 0000.

MemHint, bits [7:4]
Indicates the implemented Memory Hint instructions. Defined values are:

0000  None implemented.
0001  Adds the PLD instruction.
0010  Adds the PLD instruction. (0001 and 0010 have identical effects.)
0011  As for 0001 (or 0010), and adds the PLI instruction.
0100  As for 0011, and adds the PLDW instruction.

All other values are reserved.
In ARMv8-A the only permitted value is 0100.
LoadStore, bits [3:0]

Indicates the implemented additional load/store instructions. Defined values are:
0000  No additional load/store instructions implemented.
0001  Adds the LDRD and STRD instructions.
0010  As for 0001, and adds the Load Acquire (LDAB, LDAH, LDA, LDAEXB, LDAEXH, LDAEX, LDAEXD) and Store Release (STLB, STLH, STL, STLEXB, STLEXH, STLEX, STLEXD) instructions.

All other values are reserved.
In ARMv8-A the only permitted value is 0010.

Accessing the ID_ISAR2_EL1

This register can be read using MRS with the following syntax:
MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  — If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  — If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
D10.2.64 ID_ISAR3_EL1, AArch32 Instruction Set Attribute Register 3

The ID_ISAR3_EL1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see Principles of the ID scheme for fields in ID registers on page D10-2354.

**Configurations**

AArch64 System register ID_ISAR3_EL1 is architecturally mapped to AArch32 System register ID_ISAR3.

In an implementation that supports only AArch64 state, this register is UNKNOWN.

**Attributes**

ID_ISAR3_EL1 is a 32-bit register.

**Field descriptions**

The ID_ISAR3_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>28</th>
<th>27</th>
<th>24</th>
<th>23</th>
<th>20</th>
<th>19</th>
<th>16</th>
<th>15</th>
<th>12</th>
<th>11</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>T32EE</td>
<td>TrueNOP</td>
<td>T32Copy</td>
<td>TabBranch</td>
<td>SynchPrim</td>
<td>SVC</td>
<td>SIMD</td>
<td>Saturate</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**T32EE, bits [31:28]**

Indicates the implemented T32EE instructions. Defined values are:

- **0000** None implemented.
- **0001** Adds the ENTERX and LEA_VEX instructions, and modifies the load behavior to include null checking.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

**TrueNOP, bits [27:24]**

Indicates the implemented true NOP instructions. Defined values are:

- **0000** None implemented. This means there are no NOP instructions that do not have any register dependencies.
- **0001** Adds true NOP instructions in both the T32 and A32 instruction sets. This also permits additional NOP-compatible hints.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

**T32Copy, bits [23:20]**

Indicates the support for T32 non flag-setting MOV instructions. Defined values are:

- **0000** Not supported. This means that in the T32 instruction set, encoding T1 of the MOV (register) instruction does not support a copy from a low register to a low register.
- **0001** Adds support for T32 instruction set encoding T1 of the MOV (register) instruction, copying from a low register to a low register.

All other values are reserved.
In ARMv8-A the only permitted value is 0001.

**TabBranch, bits [19:16]**

Indicates the implemented Table Branch instructions in the T32 instruction set. Defined values are:

- **0000**: None implemented.
- **0001**: Adds the TBB and TBH instructions.
- All other values are reserved.

In ARMv8-A the only permitted value is 0001.

**SynchPrim, bits [15:12]**

Used in conjunction with ID_ISAR4.SynchPrim_frac to indicate the implemented Synchronization Primitive instructions. Defined values are:

- **0000**: If SynchPrim_frac == 0000, no Synchronization Primitives implemented.
- **0001**: If SynchPrim_frac == 0000, adds the LDREX and STREX instructions.
  - If SynchPrim_frac == 0011, also adds the CLREX, LDREXB, STREXB, and STREXH instructions.
- **0010**: If SynchPrim_frac == 0000, as for [0001, 0011] and also adds the LDREXD and STREXD instructions.
- All other combinations of SynchPrim and SynchPrim_frac are reserved.

In ARMv8-A the only permitted value is 0010.

**SVC, bits [11:8]**

Indicates the implemented SVC instructions. Defined values are:

- **0000**: Not implemented.
- **0001**: Adds the SVC instruction.
- All other values are reserved.

In ARMv8-A the only permitted value is 0001.

**SIMD, bits [7:4]**

Indicates the implemented SIMD instructions. Defined values are:

- **0000**: None implemented.
- **0001**: Adds the SSAT and USAT instructions, and the Q bit in the PSRs.
- **0011**: As for 0001, and adds the PKHBT, PKHTB, QADD16, QADD8, QASX, QSUB16, QSUB8, QSAX, SADD16, SADD8, SASX, SEL, SHADD16, SHADD8, SHASX, SHSUB16, SHSUB8, SHSAX, SSAT16, SSUB16, SSUB8, SSAX, SXTAB16, SXTB16, UADD16, UADD8, UASX, UHADD16, UHADD8, UHASX, UHSUB16, UHSUB8, UHSAX, UQADD16, UQADD8, UQASX, UQSUB16, UQSUB8, UQSAX, USAD8, USADA8, USAT16, USUB16, USUB8, USAX, UXTAB16, and UXTB16 instructions. Also adds support for the GE[3:0] bits in the PSRs.
- All other values are reserved.

In ARMv8-A the only permitted value is 0011.

The SIMD field relates only to implemented instructions that perform SIMD operations on the general-purpose registers. In an implementation that supports floating-point and Advanced SIMD instructions, MVFR0, MVFR1, and MVFR2 give information about the implemented Advanced SIMD instructions.

**Saturate, bits [3:0]**

Indicates the implemented Saturate instructions. Defined values are:

- **0000**: None implemented. This means no non-Advanced SIMD saturate instructions are implemented.
- **0001**: Adds the QADD, QDADD, QDSUB, and QSUB instructions, and the Q bit in the PSRs.
All other values are reserved.
In ARMv8-A the only permitted value is 0001.

**Accessing the ID_ISAR3_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID_ISAR3_EL1</td>
<td>11</td>
<td>000</td>
<td>000</td>
<td>010</td>
<td>011</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>x x 0</td>
<td>- RO n/a RO</td>
</tr>
<tr>
<td>x 0 1</td>
<td>- RO RO RO</td>
</tr>
<tr>
<td>x 1 1</td>
<td>- n/a RO RO</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
### D10.2.65 ID_ISAR4_EL1, AArch32 Instruction Set Attribute Register 4

The ID_ISAR4_EL1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see Principles of the ID scheme for fields in ID registers on page D10-2354.

**Configurations**

AArch64 System register ID_ISAR4_EL1 is architecturally mapped to AArch32 System register ID_ISAR4.

In an implementation that supports only AArch64 state, this register is UNKNOWN.

**Attributes**

ID_ISAR4_EL1 is a 32-bit register.

**Field descriptions**

The ID_ISAR4_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>28</th>
<th>27</th>
<th>24</th>
<th>23</th>
<th>20</th>
<th>19</th>
<th>16</th>
<th>15</th>
<th>12</th>
<th>11</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>SWP_fraction</td>
<td>PSR_M</td>
<td>Barrier</td>
<td>SMC</td>
<td>Writeback</td>
<td>WithShifts</td>
<td>Unpriv</td>
<td>SynchPrim_fraction</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**SWP_fraction**, bits [31:28]

Indicates support for the memory system locking the bus for SWP or SWPB instructions. Defined values are:

- 0000: SWP or SWPB instructions not implemented.
- 0001: SWP or SWPB implemented but only in a uniprocessor context. SWP and SWPB do not guarantee whether memory accesses from other masters can come between the load memory access and the store memory access of the SWP or SWPB.

All other values are reserved. This field is valid only if the ID_ISAR0.Swap_instrs field is 0000. In ARMv8-A the only permitted value is 0000.

**PSR_M**, bits [27:24]

Indicates the implemented M profile instructions to modify the PSRs. Defined values are:

- 0000: None implemented.
- 0001: Adds the M profile forms of the CPS, MRS, and MSR instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.
SynchPrim_frac, bits [23:20]

Used in conjunction with ID_ISAR3.SynchPrim to indicate the implemented Synchronization Primitive instructions. Possible values are:

- **0000**
  - If SynchPrim == 0000, no Synchronization Primitives implemented. If SynchPrim == 0001, adds the LDREX and STREX instructions. If SynchPrim == 0010, also adds the CLREX, LDREXB, LDREXH, STREXB, STREXH, LDREXD, and STREXD instructions.

- **0011**
  - If SynchPrim == 0001, adds the LDREX, STREX, CLREX, LDREXB, LDREXH, STREXB, and STREXH instructions.

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In ARMv8-A the only permitted value is 0000.

Barrier, bits [19:16]

Indicates the implemented Barrier instructions in the A32 and T32 instruction sets. Defined values are:

- **0000**
  - None implemented. Barrier operations are provided only as System instructions in the (coproc==1111) encoding space.

- **0001**
  - Adds the DMB, DSB, and ISB barrier instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

SMC, bits [15:12]

Indicates the implemented SMC instructions. Defined values are:

- **0000**
  - None implemented.

- **0001**
  - Adds the SMC instruction.

All other values are reserved.

In ARMv8-A the permitted values are 0001 and 0000.

If EL1 cannot use AArch32 then this field has the value 0000.

Writeback, bits [11:8]

Indicates the support for Writeback addressing modes. Defined values are:

- **0000**
  - Basic support. Only the LDM, STM, PUSH, POP, SRS, and RFE instructions support writeback addressing modes. These instructions support all of their writeback addressing modes.

- **0001**
  - Adds support for all of the writeback addressing modes.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

WithShifts, bits [7:4]

Indicates the support for instructions with shifts. Defined values are:

- **0000**
  - Nonzero shifts supported only in MOV and shift instructions.

- **0001**
  - Adds support for shifts of loads and stores over the range LSL 0-3.

- **0011**
  - As for 0001, and adds support for other constant shift options, both on load/store and other instructions.

- **0100**
  - As for 0011, and adds support for register-controlled shift options.

All other values are reserved.

In ARMv8-A the only permitted value is 0100.
**Unpriv, bits [3:0]**

Indicates the implemented unprivileged instructions. Defined values are:

- **0000**  None implemented. No T variant instructions are implemented.
- **0001**  Adds the LDRBT, LDRT, STRBT, and STRT instructions.
- **0010**  As for 0001, and adds the LDRHT, LDRSBT, LDRSHT, and STRHT instructions.

All other values are reserved.

In ARMv8-A the only permitted value is **0010**.

**Accessing the ID_ISAR4_EL1**

This register can be read using MRS with the following syntax:

\[
\text{MRS <Xt>, <systemreg>}
\]

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID_ISAR4_EL1</td>
<td>11</td>
<td>000</td>
<td>0000</td>
<td>0010</td>
<td>100</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If **HCR_EL2.TID3==1**, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If **HCR_EL2.TID3==1**, Non-secure read accesses to this register from EL1 are trapped to EL2.
D10.2.66  ID_ISAR5_EL1, AArch32 Instruction Set Attribute Register 5

The ID_ISAR5_EL1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, and ID_ISAR4_EL1.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D10-2354.

**Configurations**

AArch64 System register ID_ISAR5_EL1 is architecturally mapped to AArch32 System register ID_ISAR5.

In an implementation that supports only AArch64 state, this register is UNKNOWN.

**Attributes**

ID_ISAR5_EL1 is a 32-bit register.

**Field descriptions**

The ID_ISAR5_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>28</th>
<th>27</th>
<th>24</th>
<th>23</th>
<th>20</th>
<th>19</th>
<th>16</th>
<th>15</th>
<th>12</th>
<th>11</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>VCMA</td>
<td>RDM</td>
<td>RES0</td>
<td>CRC32</td>
<td>SHA2</td>
<td>SHA1</td>
<td>AES</td>
<td>SEVL</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**VCMA, bits [31:28]**

*In ARMv8.3*

Indicates AArch32 support for complex number addition and multiplication where numbers are stored in vectors. Defined values are:

- 0000  The VCMLA and VCMADD instructions are not implemented in AArch32.
- 0001  The VCMLA and VCMADD instructions are implemented in AArch32.

All other values are reserved.

In ARMv8.0, ARMv8.1 and ARMv8.2 the only permitted value is 0000.

From ARMv8.3 the only permitted value is 0001. This feature is identified as ARMv8.3-CompNum.

*In ARMv8.2, ARMv8.1 and ARMv8.0.*

Reserved, RES0.

**RDM, bits [27:24]**

*In ARMv8.3, ARMv8.2 and ARMv8.1*

Indicates whether the VQRDMLAH and VQRDMLSH instructions are implemented in AArch32 state. Defined values are:

- 0000  No VQRDMLAH and VQRDMLSH instructions implemented.
- 0001  VQRDMLAH and VQRDMLSH instructions implemented.

All other values are reserved.

ARMv8.1-SIMD implements the functionality identified by the value 0001.

From ARMv8.1 the only permitted value is 0001.

*In ARMv8.0.*

Reserved, RES0.
Bits [23:20]
Reserved, RES0.

CRC32, bits [19:16]
Indicates whether the CRC32 instructions are implemented in AArch32 state.

0000  No CRC32 instructions implemented.
0001  CRC32B, CRC32H, CRC32W, CRC32CB, CRC32CH, and CRC32CW instructions implemented.

All other values are reserved.
In ARMv8.0 the permitted values are 0000 and 0001.
From ARMv8.1 the only permitted value is 0001.

SHA2, bits [15:12]
Indicates whether the SHA2 instructions are implemented in AArch32 state.

0000  No SHA2 instructions implemented.
0001  SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 implemented.

All other values are reserved.
In ARMv8-A the permitted values are 0000 and 0001.

SHA1, bits [11:8]
Indicates whether the SHA1 instructions are implemented in AArch32 state.

0000  No SHA1 instructions implemented.
0001  SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 implemented.

All other values are reserved.
In ARMv8-A the permitted values are 0000 and 0001.

AES, bits [7:4]
Indicates whether the AES instructions are implemented in AArch32 state.

0000  No AES instructions implemented.
0001  AESE, AESD, AESMC, and AESIMC implemented.
0010  As for 0001, plus VMULL (polynomial) instructions operating on 64-bit data quantities.

All other values are reserved.
In ARMv8-A the permitted values are 0000 and 0010.

SEVL, bits [3:0]
Indicates whether the SEVL instruction is implemented in AArch32 state.

0000  SEVL is implemented as a NOP.
0001  SEVL is implemented as Send Event Local.

All other values are reserved.
In ARMv8-A the only permitted value is 0001.

Accessing the ID_ISAR5_EL1
This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>
This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID_ISAR5_EL1</td>
<td>11</td>
<td>000</td>
<td>0000</td>
<td>0010</td>
<td>101</td>
</tr>
</tbody>
</table>

### Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
D10.2.67   ID_ISAR6_EL1, AArch32 Instruction Set Attribute Register 6

The ID_ISAR6_EL1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1 and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D10-2354.

**Configurations**

AArch64 System register ID_ISAR6_EL1 is architecturally mapped to AArch32 System register ID_ISAR6.

In an implementation that supports only AArch64 state, this register is UNKNOWN.

This register is introduced in ARMv8.2.

**Attributes**

ID_ISAR6_EL1 is a 32-bit register.

**Field descriptions**

The ID_ISAR6_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 12 11 8 7 4 3 0</td>
<td>RES0</td>
</tr>
</tbody>
</table>

**Bits [31:12]**

Reserved, RES0.

**FHM, bits [11:8]**

Indicates whether VFMAL and VFMSL instructions are implemented.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>VFMAL and VMFSL instructions not implemented.</td>
</tr>
<tr>
<td>0001</td>
<td>VFMAL and VMFSL instructions implemented.</td>
</tr>
</tbody>
</table>

*ARMv8.2-FHM* implements the functionality identified by the value 0001.

**DP, bits [7:4]**

Indicates the support for dot product instructions in AArch32 state.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>No dot product instructions implemented.</td>
</tr>
<tr>
<td>0001</td>
<td>VUDOT and VSDOT instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

*ARMv8.2-DotProd* implements the functionality identified by the value 0001.

**JSCVT, bits [3:0]**

*In ARMv8.3*

Indicates whether the Javascript conversion instruction is implemented in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>The VJCVT instruction is not implemented.</td>
</tr>
<tr>
<td>0001</td>
<td>The VJCVT instruction is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.
In ARMv8.0, ARMv8.1 and ARMv8.2 the only permitted value is 0000.
From ARMv8.3 the only permitted value is 0001. This feature is identified as ARMv8.3-JSConv.

In ARMv8.2.

Reserved, RES0.

Accessing the ID_ISAR6_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID_ISAR6_EL1</td>
<td>11</td>
<td>000</td>
<td>000</td>
<td>0010</td>
<td>111</td>
</tr>
</tbody>
</table>

Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>TGE</td>
<td>RO n/a RO RO</td>
</tr>
<tr>
<td>NS</td>
<td>x x 0 1 1</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
D10.2.68   ID_MMFR0_EL1, AArch32 Memory Model Feature Register 0

The ID_MMFR0_EL1 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with ID_MMFR1_EL1, ID_MMFR2_EL1, ID_MMFR3_EL1, and ID_MMFR4_EL1.

For general information about the interpretation of the ID registers see Principles of the ID scheme for fields in ID registers on page D10-2354.

**Configurations**

AArch64 System register ID_MMFR0_EL1 is architecturally mapped to AArch32 System register ID_MMFR0.

In an implementation that supports only AArch64 state, this register is UNKNOWN.

**Attributes**

ID_MMFR0_EL1 is a 32-bit register.

**Field descriptions**

The ID_MMFR0_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>InnerShr</td>
<td>Indicate the innermost shareability domain implemented. Defined values are:</td>
</tr>
<tr>
<td>30</td>
<td>FCSE</td>
<td>Indicate whether the implementation includes the FCSE. Defined values are:</td>
</tr>
<tr>
<td>29</td>
<td>AuxReg</td>
<td>Indicate support for Auxiliary registers. Defined values are:</td>
</tr>
<tr>
<td>28</td>
<td>TCM</td>
<td></td>
</tr>
<tr>
<td>27</td>
<td>ShareLvl</td>
<td>Indicate the permutation of the implementation. Defined values are:</td>
</tr>
<tr>
<td>26</td>
<td>OuterShr</td>
<td></td>
</tr>
<tr>
<td>25</td>
<td>PMSA</td>
<td></td>
</tr>
<tr>
<td>24</td>
<td>VMSA</td>
<td></td>
</tr>
</tbody>
</table>

**InnerShr, bits [31:28]**

Indicates the innermost shareability domain implemented. Defined values are:

- **0000**: Implemented as Non-cacheable.
- **0001**: Implemented with hardware coherency support.
- **1111**: Shareability ignored.

All other values are reserved.

In ARMv8 the permitted values are **0000**, **0001**, and **1111**.

This field is valid only if the implementation supports two levels of shareability, as indicated by ID_MMFR0_EL1.ShareLvl having the value **0001**.

When ID_MMFR0_EL1.ShareLvl is zero, this field is UNK.

**FCSE, bits [27:24]**

Indicates whether the implementation includes the FCSE. Defined values are:

- **0000**: Not supported.
- **0001**: Support for FCSE.

All other values are reserved.

In ARMv8 the only permitted value is **0000**.

**AuxReg, bits [23:20]**

Auxiliary Registers. Indicates support for Auxiliary registers. Defined values are:

- **0000**: None supported.
- **0001**: Support for Auxiliary Control Register only.
0010  Support for Auxiliary Fault Status Registers (AIFSR and ADFSR) and Auxiliary Control Register.

All other values are reserved.

In ARMv8 the only permitted value is 0010.

--- Note ---

Accesses to unimplemented Auxiliary registers are UNDEFINED.

---

TCM, bits [19:16]

Indicates support for TCMs and associated DMAs. Defined values are:

- 0000  Not supported.
- 0001  Support is IMPLEMENTATION DEFINED. ARMv7 requires this setting.
- 0010  Support for TCM only, ARMv6 implementation.
- 0011  Support for TCM and DMA, ARMv6 implementation.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

ShareLvl, bits [15:12]

Shareability Levels. Indicates the number of shareability levels implemented. Defined values are:

- 0000  One level of shareability implemented.
- 0001  Two levels of shareability implemented.

All other values are reserved.

In ARMv8 the only permitted value is 0001.

OuterShr, bits [11:8]

Outermost Shareability. Indicates the outermost shareability domain implemented. Defined values are:

- 0000  Implemented as Non-cacheable.
- 0001  Implemented with hardware coherency support.
- 1111  Shareability ignored.

All other values are reserved.

In ARMv8 the permitted values are 0000, 0001, and 1111.

PMSA, bits [7:4]

Indicates support for a PMSA. Defined values are:

- 0000  Not supported.
- 0001  Support for IMPLEMENTATION DEFINED PMSA.
- 0010  Support for PMSAv6, with a Cache Type Register implemented.
- 0011  Support for PMSAv7, with support for memory subsections. ARMv7-R profile.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

VMSA, bits [3:0]

Indicates support for a VMSA. Defined values are:

- 0000  Not supported.
- 0001  Support for IMPLEMENTATION DEFINED VMSA.
- 0010  Support for VMSAv6, with Cache and TLB Type Registers implemented.
0011 Support for VMSAv7, with support for remapping and the Access flag. ARMv7-A profile.
0100 As for 0011, and adds support for the PXN bit in the Short-descriptor translation table format descriptors.
0101 As for 0100, and adds support for the Long-descriptor translation table format. All other values are reserved.
In ARMv8-A the only permitted value is 0101.

Accessing the ID_MMFR0_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID_MMFR0_EL1</td>
<td>11</td>
<td>000</td>
<td>0001</td>
<td>100</td>
<td></td>
</tr>
</tbody>
</table>

Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>

</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

• When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  — If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

• When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  — If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
D10.2.69  ID_MMFR1_EL1, AArch32 Memory Model Feature Register 1

The ID_MMFR1_EL1 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with ID_MMFR0_EL1, ID_MMFR2_EL1, ID_MMFR3_EL1, and ID_MMFR4_EL1.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D10-2354.

**Configurations**

AArch64 System register ID_MMFR1_EL1 is architecturally mapped to AArch32 System register ID_MMFR1.

In an implementation that supports only AArch64 state, this register is UNKNOWN.

**Attributes**

ID_MMFR1_EL1 is a 32-bit register.

**Field descriptions**

The ID_MMFR1_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>28</th>
<th>27</th>
<th>24</th>
<th>23</th>
<th>20</th>
<th>19</th>
<th>16</th>
<th>15</th>
<th>12</th>
<th>11</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**BPred, bits [31:28]**

Branch Predictor. Indicates branch predictor management requirements. Defined values are:

- **0000**  No branch predictor, or no MMU present. Implies a fixed MPU configuration.
- **0001**  Branch predictor requires flushing on:
  - Enabling or disabling a stage of address translation.
  - Writing new data to instruction locations.
  - Writing new mappings to the translation tables.
  - Changes to the TTBR0, TTBR1, or TTBCR registers.
  - Changes to the ContextID or ASID, or to the FCSE ProcessID if this is supported.
- **0010**  Branch predictor requires flushing on:
  - Enabling or disabling a stage of address translation.
  - Writing new data to instruction locations.
  - Writing new mappings to the translation tables.
  - Any change to the TTBR0, TTBR1, or TTBCR registers without a change to the corresponding ContextID or ASID, or FCSE ProcessID if this is supported.
- **0011**  Branch predictor requires flushing only on writing new data to instruction locations.
- **0100**  For execution correctness, branch predictor requires no flushing at any time.

All other values are reserved.

In ARMv8-A the permitted values are 0010, 0011, or 0100. For values other than 0000 and 0100 the ARM Architecture Reference Manual, or the product documentation, might give more information about the required maintenance.
L1TstCln, bits [27:24]
Level 1 cache Test and Clean. Indicates the supported Level 1 data cache test and clean operations, for Harvard or unified cache implementations. Defined values are:

0000  None supported.
0001  Supported Level 1 data cache test and clean operations are:
   •  Test and clean data cache.
0010  As for 0001, and adds:
   •  Test, clean, and invalidate data cache.
All other values are reserved.
In ARMv8-A the only permitted value is 0000.

L1Uni, bits [23:20]
Level 1 Unified cache. Indicates the supported entire Level 1 cache maintenance operations for a unified cache implementation. Defined values are:

0000  None supported.
0001  Supported entire Level 1 cache operations are:
   •  Invalidate cache, including branch predictor if appropriate.
   •  Invalidate branch predictor, if appropriate.
0010  As for 0001, and adds:
   •  Clean cache, using a recursive model that uses the cache dirty status bit.
   •  Clean and invalidate cache, using a recursive model that uses the cache dirty status bit.
All other values are reserved.
In ARMv8-A the only permitted value is 0000.

L1Hvd, bits [19:16]
Level 1 Harvard cache. Indicates the supported entire Level 1 cache maintenance operations for a Harvard cache implementation. Defined values are:

0000  None supported.
0001  Supported entire Level 1 cache operations are:
   •  Invalidate instruction cache, including branch predictor if appropriate.
   •  Invalidate branch predictor, if appropriate.
0010  As for 0001, and adds:
   •  Invalidate data cache.
   •  Invalidate data cache and instruction cache, including branch predictor if appropriate.
0011  As for 0010, and adds:
   •  Clean data cache, using a recursive model that uses the cache dirty status bit.
   •  Clean and invalidate data cache, using a recursive model that uses the cache dirty status bit.
All other values are reserved.
In ARMv8-A the only permitted value is 0000.

L1UniSW, bits [15:12]
Level 1 Unified cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a unified cache implementation. Defined values are:

0000  None supported.
0001  Supported Level 1 unified cache line maintenance operations by set/way are:
    • Clean cache line by set/way.

0010  As for 0001, and adds:
    • Clean and invalidate cache line by set/way.

0011  As for 0010, and adds:
    • Invalidate cache line by set/way.

All other values are reserved.
In ARMv8-A the only permitted value is 0000.

L1HvdSW, bits [11:8]
Level 1 Harvard cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a Harvard cache implementation. Defined values are:

0000  None supported.
0001  Supported Level 1 Harvard cache line maintenance operations by set/way are:
    • Clean data cache line by set/way.
    • Clean and invalidate data cache line by set/way.

0010  As for 0001, and adds:
    • Invalidate data cache line by set/way.

0011  As for 0010, and adds:
    • Invalidate instruction cache line by set/way.

All other values are reserved.
In ARMv8-A the only permitted value is 0000.

L1UniVA, bits [7:4]
Level 1 Unified cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a unified cache implementation. Defined values are:

0000  None supported.
0001  Supported Level 1 unified cache line maintenance operations by VA are:
    • Clean cache line by VA.
    • Invalidate cache line by VA.
    • Clean and invalidate cache line by VA.

0010  As for 0001, and adds:
    • Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.
In ARMv8-A the only permitted value is 0000.

L1HvdVA, bits [3:0]
Level 1 Harvard cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a Harvard cache implementation. Defined values are:

0000  None supported.
0001  Supported Level 1 Harvard cache line maintenance operations by VA are:
    • Clean data cache line by VA.
    • Invalidate data cache line by VA.
    • Clean and invalidate data cache line by VA.
    • Clean instruction cache line by VA.

0010  As for 0001, and adds:
    • Invalidate branch predictor by VA, if branch predictor is implemented.
All other values are reserved. In ARMv8-A the only permitted value is 0000.

Accessing the ID_MMFR1_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID_MMFR1_EL1</td>
<td>11</td>
<td>000</td>
<td>000</td>
<td>001</td>
<td>101</td>
</tr>
</tbody>
</table>

Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>x x 0</td>
<td>- RO n/a RO</td>
</tr>
<tr>
<td>x 0 1</td>
<td>- RO RO RO</td>
</tr>
<tr>
<td>x 1 1</td>
<td>- n/a RO RO</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
D10.2.70 ID_MMFR2_EL1, AArch32 Memory Model Feature Register 2

The ID_MMFR2_EL1 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32 state. Must be interpreted with ID_MMFR0_EL1, ID_MMFR1_EL1, ID_MMFR3_EL1, and ID_MMFR4_EL1.

For general information about the interpretation of the ID registers see Principles of the ID scheme for fields in ID registers on page D10-2354.

**Configurations**

AArch64 System register ID_MMFR2_EL1 is architecturally mapped to AArch32 System register ID_MMFR2.

In an implementation that supports only AArch64 state, this register is UNKNOWN.

**Attributes**

ID_MMFR2_EL1 is a 32-bit register.

**Field descriptions**

The ID_MMFR2_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-28</td>
<td>HWAccFlg</td>
<td>Hardware Access Flag. In earlier versions of the ARM Architecture, this field indicates support for a Hardware Access flag, as part of the VMSAv7 implementation. Defined values are: 0000: Not supported. 0001: Support for VMSAv7 Access flag, updated in hardware. All other values are reserved. In ARMv8 the only permitted value is 0000.</td>
</tr>
<tr>
<td>27-24</td>
<td>WFIStall</td>
<td>Wait For Interrupt Stall. Indicates the support for Wait For Interrupt (WFI) stalling. Defined values are: 0000: Not supported. 0001: Support for WFI stalling. All other values are reserved. In ARMv8 the permitted values are 0000 and 0001.</td>
</tr>
<tr>
<td>23-20</td>
<td>MemBarr</td>
<td>Memory Barrier. Indicates the supported memory barrier System instructions in the (coproc==1111) encoding space: 0000: None supported. 0001: Supported memory barrier System instructions are: • Data Synchronization Barrier (DSB).</td>
</tr>
<tr>
<td>19-16</td>
<td>UniTLB</td>
<td></td>
</tr>
<tr>
<td>15-12</td>
<td>HvdTLB</td>
<td></td>
</tr>
<tr>
<td>11-8</td>
<td>L1HvdRng</td>
<td></td>
</tr>
<tr>
<td>7-4</td>
<td>L1HvdBG</td>
<td></td>
</tr>
<tr>
<td>3-0</td>
<td>L1HvdFG</td>
<td></td>
</tr>
</tbody>
</table>
0010 As for 0001, and adds:
  • Instruction Synchronization Barrier (ISB).
  • Data Memory Barrier (DMB).

All other values are reserved.
In ARMv8 the only permitted value is 0010.
ARM deprecates the use of these operations. ID_ISAR4.Barrier_inrs indicates the level of support for the preferred barrier instructions.

**UniTLB, bits [19:16]**

Unified TLB. Indicates the supported TLB maintenance operations, for a unified TLB implementation. Defined values are:

0000 Not supported.
0001 Supported unified TLB maintenance operations are:
  • Invalidate all entries in the TLB.
  • Invalidate TLB entry by VA.
0010 As for 0001, and adds:
  • Invalidate TLB entries by ASID match.
0011 As for 0010, and adds:
  • Invalidate instruction TLB and data TLB entries by VA All ASID. This is a shared unified TLB operation.
0100 As for 0011, and adds:
  • Invalidate Hyp mode unified TLB entry by VA.
  • Invalidate entire Non-secure PL1&0 unified TLB.
  • Invalidate entire Hyp mode unified TLB.
0101 As for 0100, and adds the following operations: TLBIMVALLIS, TLBIMVAALIS, TLBIMVALHIS, TLBIMVAL, TLBIMVAAL, TLBIMVALH, TLBIMVALH.
0110 As for 0101, and adds the following operations: TLBIIIPAS2IS, TLBIIIPAS2LIS, TLBIIIPAS2, TLBIIIPAS2L.

All other values are reserved.
In ARMv8-A the only permitted value is 0110.

**HvdTLB, bits [15:12]**

If the Unified TLB field (UniTLB, bits [19:16]) is not 0000, then the meaning of this field is IMPLEMENTATION DEFINED. ARM deprecates the use of this field by software.

**L1HvdRng, bits [11:8]**

Level 1 Harvard cache Range. Indicates the supported Level 1 cache maintenance range operations, for a Harvard cache implementation. Defined values are:

0000 Not supported.
0001 Supported Level 1 Harvard cache maintenance range operations are:
  • Invalidate data cache range by VA.
  • Invalidate instruction cache range by VA.
  • Clean data cache range by VA.
  • Clean and invalidate data cache range by VA.

All other values are reserved.
In ARMv8 the only permitted value is 0000.
L1HvdBG, bits [7:4]
Level 1 Harvard cache Background fetch. Indicates the supported Level 1 cache background fetch operations, for a Harvard cache implementation. When supported, background fetch operations are non-blocking operations. Defined values are:

0000 Not supported.
0001 Supported Level 1 Harvard cache background fetch operations are:
   • Fetch instruction cache range by VA.
   • Fetch data cache range by VA.

All other values are reserved.
In ARMv8 the only permitted value is 0000.

L1HvdFG, bits [3:0]
Level 1 Harvard cache Foreground fetch. Indicates the supported Level 1 cache foreground fetch operations, for a Harvard cache implementation. When supported, foreground fetch operations are blocking operations. Defined values are:

0000 Not supported.
0001 Supported Level 1 Harvard cache foreground fetch operations are:
   • Fetch instruction cache range by VA.
   • Fetch data cache range by VA.

All other values are reserved.
In ARMv8 the only permitted value is 0000.

Accessing the ID_MMFR2_EL1
This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

</tr>
<tr>
<td>x 1 1</td>
<td>- n/a RO RO</td>
</tr>
</tbody>
</table>
Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
D10.2.71   ID_MMFR3_EL1, AArch32 Memory Model Feature Register 3

The ID_MMFR3_EL1 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with ID_MMFR0_EL1, ID_MMFR1_EL1, ID_MMFR2_EL1, and ID_MMFR4_EL1.

For general information about the interpretation of the ID registers see Principles of the ID scheme for fields in ID registers on page D10-2354.

**Configurations**

AArch64 System register ID_MMFR3_EL1 is architecturally mapped to AArch32 System register ID_MMFR3.

In an implementation that supports only AArch64 state, this register is UNKNOWN.

**Attributes**

ID_MMFR3_EL1 is a 32-bit register.

**Field descriptions**

The ID_MMFR3_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 28 27 24 23 20 19 16 15 12 11 8 7 4 3 0</td>
<td>Supersec</td>
</tr>
</tbody>
</table>

**Supersec, bits [31:28]**

Supersections. On a VMSA implementation, indicates whether Supersections are supported. Defined values are:

0000  Supersections supported.
1111  Supersections not supported.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 1111.

**CMemSz, bits [27:24]**

Cached Memory Size. Indicates the physical memory size supported by the caches. Defined values are:

0000  4GB, corresponding to a 32-bit physical address range.
0001  64GB, corresponding to a 36-bit physical address range.
0010  1TB or more, corresponding to a 40-bit or larger physical address range.

All other values are reserved.

In ARMv8-A the permitted values are 0000, 0001, and 0010.

**CohWalk, bits [23:20]**

Coherent Walk. Indicates whether Translation table updates require a clean to the point of unification. Defined values are:

0000  Updates to the translation tables require a clean to the point of unification to ensure visibility by subsequent translation table walks.
Updates to the translation tables do not require a clean to the point of unification to ensure visibility by subsequent translation table walks.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

**PAN, bits [19:16]**

*In ARMv8.3, ARMv8.2 and ARMv8.1*

Privileged Access Never. Indicates support for the PAN bit in CPSR, SPSR, and DSPSR in AArch32 state. Defined values are:

- 0000: PAN not supported.
- 0001: PAN supported.
- 0010: PAN supported and ATS1CPRP and ATS1CPWP instructions supported.

All other values are reserved.

ARMv8.1-PAN implements the functionality identified by the value 0001.

ARMv8.2-ATS1E1 implements the functionality added by the value 0010.

In ARMv8.1 the value 0000 is not permitted.

From ARMv8.2, the only permitted value is 0010.

**In ARMv8.0**

Reserved, RES0.

**MaintBest, bits [15:12]**

Maintenance Broadcast. Indicates whether Cache, TLB, and branch predictor operations are broadcast. Defined values are:

- 0000: Cache, TLB, and branch predictor operations only affect local structures.
- 0001: Cache and branch predictor operations affect structures according to shareability and defined behavior of instructions. TLB operations only affect local structures.
- 0010: Cache, TLB, and branch predictor operations affect structures according to shareability and defined behavior of instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0010.

**BPMaint, bits [11:8]**

Branch Predictor Maintenance. Indicates the supported branch predictor maintenance operations in an implementation with hierarchical cache maintenance operations. Defined values are:

- 0000: None supported.
- 0001: Supported branch predictor maintenance operations are:
  - Invalidate all branch predictors.
- 0010: As for 0001, and adds:
  - Invalidate branch predictors by VA.

All other values are reserved.

In ARMv8-A the only permitted value is 0010.

**CMaintSW, bits [7:4]**

Cache Maintenance by Set/Way. Indicates the supported cache maintenance operations by set/way, in an implementation with hierarchical caches. Defined values are:

- 0000: None supported.
- 0001: Supported hierarchical cache maintenance instructions by set/way are:
  - Invalidate data cache by set/way.
  - Clean data cache by set/way.
D10 AArch64 System Register Descriptions
D10.2 General system control registers

• Clean and invalidate data cache by set/way.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

In a unified cache implementation, the data cache maintenance operations apply to the unified caches.

CMaintVA, bits [3:0]

Cache Maintenance by Virtual Address. Indicates the supported cache maintenance operations by VA, in an implementation with hierarchical caches. Defined values are:

0000 None supported.

0001 Supported hierarchical cache maintenance operations by VA are:
  • Invalidate data cache by VA.
  • Clean data cache by VA.
  • Clean and invalidate data cache by VA.
  • Invalidate instruction cache by VA.
  • Invalidate all instruction cache entries.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

In a unified cache implementation, data cache maintenance operations apply to the unified caches, and the instruction cache maintenance instructions are not implemented.

Accessing the ID_MMFR3_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) &&
  (HCR_EL2.TGE == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
D10.2.72  ID_MMFR4_EL1, AArch32 Memory Model Feature Register 4

The ID_MMFR4_EL1 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with ID_MMFR0_EL1, ID_MMFR1_EL1, ID_MMFR2_EL1, and ID_MMFR3_EL1.

For general information about the interpretation of the ID registers see Principles of the ID scheme for fields in ID registers on page D10-2354.

**Configurations**

AArch64 System register ID_MMFR4_EL1 is architecturally mapped to AArch32 System register ID_MMFR4.

In an implementation that supports only AArch64 state, this register is UNKNOWN.

**Attributes**

ID_MMFR4_EL1 is a 32-bit register.

**Field descriptions**

The ID_MMFR4_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>28</th>
<th>27</th>
<th>24</th>
<th>23</th>
<th>20</th>
<th>19</th>
<th>16</th>
<th>15</th>
<th>12</th>
<th>11</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAZ</td>

<td>XNX</td>
<td>AC2</td>
<td>SpecSEI</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:28]**

Reserved, RAZ.

**CCIDX, bits [27:24]**

*In ARMv8.3*

Support for use of the revised CCSIDR format and the presence of the CCSIDR2 is indicated. Defined values are:

0000  32-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is not implemented.

0001  64-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is implemented.

All other values are reserved.

From ARMv8.3, the permitted values are 0000 and 0001. This feature is identified as ARMv8.3-CCIDX.

*In ARMv8.2, ARMv8.1 and ARMv8.0.*

Reserved, RAZ.

**LSM, bits [23:20]**

*In ARMv8.3 and ARMv8.2*

Indicates support for LSMAOE and nTLSMD bits in HSCTLR and SCTLR. Defined values are:

0000  LSMAOE and nTLSMD bits not supported.

0001  LSMAOE and nTLSMD bits supported.

All other values are reserved.
ARMv8.2-LSMAOC implements the functionality identified by the value 0001.

**In ARMv8.1 and ARMv8.0.**

Reserved, RAZ.

**HPDS, bits [19:16]**

*In ARMv8.3 and ARMv8.2*

Hierarchical permission disables bits in translation tables. Defined values are:

- 0000: Disabling of hierarchical controls not supported.
- 0001: Supports disabling of hierarchical controls using the TTBCR2.HPD0, TTBCR2.HPD1, and HTCSR.HPD bits.
- 0010: As for value 0001, and adds possible hardware allocation of bits[62:59] of the translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use.

All other values are reserved.

ARMv8.2-AA32HPD implements the functionality identified by the value 0001.

ARMv8.2-TTPBHA implements the functionality added by the value 0010.

--- **Note** ---

The value 0000 implies that the encoding for TTBCR2 is unallocated.

---

**In ARMv8.1 and ARMv8.0.**

Reserved, RAZ.

**CnP, bits [15:12]**

*In ARMv8.3 and ARMv8.2*

Common not Private translations. Defined values are:

- 0000: Common not Private translations not supported.
- 0001: Common not Private translations supported.

All other values are reserved.

ARMv8.2-TTCNP implements the functionality identified by the value 0001.

From ARMv8.2 the only permitted value is 0001.

**In ARMv8.1 and ARMv8.0.**

Reserved, RAZ.

**XNX, bits [11:8]**

*In ARMv8.3 and ARMv8.2*

Support for execute-never control distinction by Exception level at stage 2. Defined values are:

- 0000: Distinction between EL0 and EL1 execute-never control at stage 2 not supported.
- 0001: Distinction between EL0 and EL1 execute-never control at stage 2 supported.

All other values are reserved.

ARMv8.2-TTS2UXN implements the functionality identified by the value 0001.

When ARMv8.2-TTS2UXN is implemented:

- If all of the following conditions are true it is IMPLEMENTATION DEFINED whether the value of ID_MMFR4_EL1.XNX is 0000 or 0001:
  - ID_AA64MMFR1_EL1.XNX ==1.
  - EL2 cannot use AArch32.
  - EL1 can use AArch32.
- If EL2 can use AArch32 then the only permitted value is 0001.
In ARMv8.1 and ARMv8.0.

Reserved, RAZ.

AC2, bits [7:4]
Indicates the extension of the ACTLR and HACTLR registers using ACTLR2 and HACTLR2.
Defined values are:
0000 ACTLR2 and HACTLR2 are not implemented.
0001 ACTLR2 and HACTLR2 are implemented.
All other values are reserved.
In ARMv8.0 and ARMv8.1 the permitted values are 0000 and 0001.
From ARMv8.2, the only permitted value is 0001.

SpecSEI, bits [3:0]
Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are:
0000 The PE never generates an SError interrupt due to an External abort on a speculative read.
0001 The PE might generate an SError interrupt due to an External abort on a speculative read.
All other values are reserved.
When the RAS Extension is not implemented, this field is RAZ.

Accessing the ID_MMFR4_EL1
This register can be read using MRS with the following syntax:
MRS <Xt>, <systemreg>
This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>

</tbody>
</table>
Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0) && (HCR_EL2.TID3==1):
  - If the register is not RAZ/WI, Non-secure read accesses to this register from EL1 are trapped to EL2. Otherwise it is IMPLEMENTATION DEFINED whether Non-secure EL1 read accesses to this register are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0) && (HCR_EL2.TID3==1):
  - If the register is not RAZ/WI, Non-secure read accesses to this register from EL1 are trapped to EL2. Otherwise it is IMPLEMENTATION DEFINED whether Non-secure EL1 read accesses to this register are trapped to EL2.
ID_PFR0_EL1, AArch32 Processor Feature Register 0

The ID_PFR0_EL1 characteristics are:

Purpose

Gives top-level information about the instruction sets supported by the PE in AArch32 state.

Must be interpreted with ID_PFR1_EL1.

For general information about the interpretation of the ID registers see Principles of the ID scheme for fields in ID registers on page D10-2354.

Configurations

AArch64 System register ID_PFR0_EL1 is architecturally mapped to AArch32 System register ID_PFR0.

In an implementation that supports only AArch64 state, this register is UNKNOWN.

Attributes

ID_PFR0_EL1 is a 32-bit register.

Field descriptions

The ID_PFR0_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>28-27</th>
<th>16-15</th>
<th>12-11</th>
<th>8-7</th>
<th>4-3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>RES0</td>
<td>State3</td>
<td>State2</td>
<td>State1</td>
<td>State0</td>
<td></td>
</tr>
</tbody>
</table>

RAS, bits [31:28]

RAS Extension version. The defined values of this field are:

0000  No RAS Extension.
0001  Version 1 of the RAS Extension present.

All other values are reserved.

Bits [27:16]

Reserved, RES0.

State3, bits [15:12]

T32EE instruction set support. Defined values are:

0000  Not implemented.
0001  T32EE instruction set implemented.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

State2, bits [11:8]

Jazelle extension support. Defined values are:

0000  Not implemented.
0001  Jazelle extension implemented, without clearing of JOSCR.CV on exception entry.
0010  Jazelle extension implemented, with clearing of JOSCR.CV on exception entry.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.
State1, bits [7:4]
T32 instruction set support. Defined values are:
0000  T32 instruction set not implemented.
0001  T32 encodings before the introduction of Thumb-2 technology implemented:
  •  All instructions are 16-bit.
  •  A BL or BLX is a pair of 16-bit instructions.
  •  32-bit instructions other than BL and BLX cannot be encoded.
0011  T32 encodings after the introduction of Thumb-2 technology implemented, for all
       16-bit and 32-bit T32 basic instructions.
All other values are reserved.
In ARMv8-A the only permitted value is 0011.

State0, bits [3:0]
A32 instruction set support. Defined values are:
0000  A32 instruction set not implemented.
0001  A32 instruction set implemented.
All other values are reserved.
In ARMv8-A the only permitted value is 0001.

Accessing the ID_PFR0_EL1
This register can be read using MRS with the following syntax:
MRS <Xt>, <systemreg>
This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID_PFR0_EL1</td>
<td>11</td>
<td>000</td>
<td>0000</td>
<td>0001</td>
<td>00</td>
</tr>
</tbody>
</table>

Accessibility
The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE  NS</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

Traps and Enables
For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for
exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:
•  When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  —  If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
• When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) &&
  (HCR_EL2.TGE == 0):
  — If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
D10.2.74  ID_PFR1_EL1, AArch32 Processor Feature Register 1

The ID_PFR1_EL1 characteristics are:

**Purpose**

Gives information about the AArch32 programmers' model.

Must be interpreted with ID_PFR0_EL1.

For general information about the interpretation of the ID registers see Principles of the ID scheme for fields in ID registers on page D10-2354.

**Configurations**

AArch64 System register ID_PFR1_EL1 is architecturally mapped to AArch32 System register ID_PFR1.

In an implementation that supports only AArch64 state, this register is UNKNOWN.

**Attributes**

ID_PFR1_EL1 is a 32-bit register.

**Field descriptions**

The ID_PFR1_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>28</th>
<th>27</th>
<th>24</th>
<th>23</th>
<th>20</th>
<th>19</th>
<th>16</th>
<th>15</th>
<th>12</th>
<th>11</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIC</td>
<td>Virt_frac</td>
<td>Sec_frac</td>
<td>GenTimer</td>
<td>MPregMod</td>
<td>Security</td>
<td>ProgMod</td>
<td>Virtualization</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**GIC, bits [31:28]**

System register GIC CPU interface. Defined values are:

- **0000** No System register interface to the GIC CPU interface is supported.
- **0001** System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.

All other values are reserved.

**Virt_frac, bits [27:24]**

Virtualization fractional field. When the Virtualization field is **0000**, determines the support for features from the ARMv7 Virtualization Extensions. Defined values are:

- **0000** No features from the ARMv7 Virtualization Extensions are implemented.
- **0001** The following features of the ARMv7 Virtualization Extensions are implemented:
  - The SCR.SIF bit, if EL3 is implemented.
  - The modifications to the SCR.AW and SCR.FW bits described in the Virtualization Extensions, if EL3 is implemented.
  - The MSR (banked register) and MRS (banked register) instructions.
  - The ERET instruction.

All other values are reserved.

In ARMv8-A the permitted values are:

- **0000** when EL2 is implemented.
- **0001** when EL2 is not implemented.

This field is only valid when the value of ID_PFR1_EL1.Virtualization is 0, otherwise it holds the value **0000**.
Note

The ID_ISAR registers do not identify whether the instructions added by the ARMv7 Virtualization Extensions are implemented.

Sec_frac, bits [23:20]

Security fractional field. When the Security field is 0000, determines the support for features from the ARMv7 Security Extensions. Defined values are:

0000   No features from the ARMv7 Security Extensions are implemented.
0001   The following features from the ARMv7 Security Extensions are implemented:
        •   The VBAR register.
        •   The TTBCR.PD0 and TTBCR.PD1 bits.
0010   As for 0001, plus the ability to access Secure or Non-secure physical memory is supported.

All other values are reserved.

In ARMv8-A the permitted values are:
•   0000 when EL3 is implemented.
•   0001 or 0010 when EL3 is not implemented.

This field is only valid when the value of ID_PFR1_EL1.Security is 0, otherwise it holds the value 0000.

GenTimer, bits [19:16]

Generic Timer support. Defined values are:

0000   Not implemented.
0001   Generic Timer implemented.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

Virtualization, bits [15:12]

Virtualization support. Defined values are:

0000   EL2, Hyp mode, and the HVC instruction not implemented.
0001   EL2, Hyp mode, the HVC instruction, and all the features described by Virt_frac == 0001 implemented.

All other values are reserved.

In ARMv8-A the permitted values are:
•   0000 when EL2 is not implemented.
•   0001 when EL2 is implemented.

In an implementation that includes EL2, if EL2 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0001.
If EL1 cannot use AArch32 then this field has the value 0000.

Note

The ID_ISARs do not identify whether the HVC instruction is implemented.

MProgMod, bits [11:8]

M profile programmers' model support. Defined values are:

0000   Not supported.
0010   Support for two-stack programmers' model.

All other values are reserved.
In ARMv8-A the only permitted value is 0000.

Security, bits [7:4]

Security support. Defined values are:

- 0000: EL3, Monitor mode, and the SMC instruction not implemented.
- 0001: EL3, Monitor mode, the SMC instruction, and all the features described by Sec_frac == 0001 implemented.
- 0010: As for 0001, and adds the ability to set the NSACR.RFR bit. Not permitted in ARMv8 as the NSACR.RFR bit is RES0.

All other values are reserved.

In ARMv8-A the permitted values are:
- 0000 when EL3 is not implemented.
- 0001 when EL3 is implemented.

In an implementation that includes EL3, if EL3 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0001.

If EL1 cannot use AArch32 then this field has the value 0000.

ProgMod, bits [3:0]

Support for the standard programmers' model for ARMv4 and later. Model must support User, FIQ, IRQ, Supervisor, Abort, Undefined, and System modes. Defined values are:

- 0000: Not supported.
- 0001: Supported.

All other values are reserved.

In ARMv8-A the permitted values are 0001 and 0000.

If EL1 cannot use AArch32 then this field has the value 0000.

Accessing the ID_PFR1_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID_PFR1_EL1</td>
<td>11</td>
<td>000</td>
<td>0001</td>
<td>001</td>
<td></td>
</tr>
</tbody>
</table>

Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>
</tr>
<tr>
<td>TGE</td>
<td>RO</td>

<td>-</td>
</tr>
<tr>
<td>EL1</td>
<td>-</td>
</tr>
<tr>
<td>EL2</td>
<td>-</td>
</tr>
<tr>
<td>EL3</td>
<td>-</td>
</tr>
</tbody>
</table>
Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
### D10.2.75 IFSR32_EL2, Instruction Fault Status Register (EL2)

The IFSR32_EL2 characteristics are:

**Purpose**

Allows access to the AArch32 IFSR register from AArch64 state only. Its value has no effect on execution in AArch64 state.

**Configurations**

AArch64 System register IFSR32_EL2 is architecturally mapped to AArch32 System register IFSR.

If EL1 is AArch64 only, this register is UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

IFSR32_EL2 is a 32-bit register.

**Field descriptions**

The IFSR32_EL2 bit assignments are:

When TTBCR.EAE==0:

<table>
<thead>
<tr>
<th>31</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>8</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>RES0</td>
<td>RES0</td>
<td>FS[3:0]</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

FnV

- **Bits [31:17]**
  
  Reserved, RES0.

- **FnV, bit [16]**
  
  FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.
  
  0: IFAR is valid.
  
  1: IFAR is not valid, and holds an UNKNOWN value.
  
  This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

- **Bits [15:13]**
  
  Reserved, RES0.

- **ExT, bit [12]**
  
  External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.
  
  In an implementation that does not provide any classification of External aborts, this bit is RES0.
  
  For aborts other than External aborts this bit always returns 0.
Bit [11]  
Reserved, RES0.

FS[4], bit [10]  
See FS[3:0], bits [3:0] for description of the FS field.

LPAE, bit [9]  
On taking a Data Abort exception, this bit is set as follows:
0  Using the Short-descriptor translation table formats.
1  Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

Bits [8:4]  
Reserved, RES0.

FS[3:0], bits [3:0]  
Fault status bits. Interpreted with bit [10]. Possible values of FS[4:0] are:
00001  PC alignment fault
00010  Debug exception
00011  Access flag fault, level 1
00101  Translation fault, level 1
00110  Access flag fault, level 2
00111  Translation fault, level 2
01000  Synchronous External abort, not on translation table walk
01001  Domain fault, level 1
01011  Domain fault, level 2
01100  Synchronous External abort, on translation table walk, level 1
01101  Permission fault, level 1
01110  Synchronous External abort, on translation table walk, level 2
01111  Permission fault, level 2
10000  TLB conflict abort
10100  IMPLEMENTATION DEFINED fault (Lockdown fault)
11001  Synchronous parity or ECC error on memory access, not on translation table walk
11100  Synchronous parity or ECC error on translation table walk, level 1
11110  Synchronous parity or ECC error on translation table walk, level 2

All other values are reserved.

When the RAS Extension is implemented, 11001, 11100, and 11110, are reserved.

*When TTBCR.EAE==1:*
Bits [31:17]
Reserved, RES0.

FnV, bit [16]
FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

0 IFAR is valid.
1 IFAR is not valid, and holds an UNKNOWN value.

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

Bits [15:13]
Reserved, RES0.

ExT, bit [12]
External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

Bits [11:10]
Reserved, RES0.

LPAE, bit [9]
On taking a Data Abort exception, this bit is set as follows:

0 Using the Short-descriptor translation table formats.
1 Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

Bits [8:6]
Reserved, RES0.

STATUS, bits [5:0]
Fault status bits. All encodings not shown below are reserved:

000000 Address size fault in TTBR0 or TTBR1
00001 Address size fault, level 1
000010 Address size fault, level 2
000011 Address size fault, level 3
000101 Translation fault, level 1
000110 Translation fault, level 2
000111 Translation fault, level 3
001001 Access flag fault, level 1
001010 Access flag fault, level 2
001011 Access flag fault, level 3
001101 Permission fault, level 1
001110 Permission fault, level 2
001111 Permission fault, level 3
010000 Synchronous External abort, not on translation table walk
010101 Synchronous External abort, on translation table walk, level 1
010110  Synchronous External abort, on translation table walk, level 2
010111  Synchronous External abort, on translation table walk, level 3
011000  Synchronous parity or ECC error on memory access, not on translation table walk
011101  Synchronous parity or ECC error on memory access on translation table walk, level 1
011110  Synchronous parity or ECC error on memory access on translation table walk, level 2
011111  Synchronous parity or ECC error on memory access on translation table walk, level 3
100001  PC alignment fault
100010  Debug exception
110000  TLB conflict abort

All other values are reserved.

When the RAS Extension is implemented, 011000, 011101, 011110, and 011111, are reserved.

The lookup level associated with a fault is:

• For a fault generated on a translation table walk, the lookup level of the walk being performed.
• For a Translation fault, the lookup level of the translation table that gave the fault. If a fault occurs because a stage of address translation is disabled, or because the input address is outside the range specified by the appropriate base address register or registers, the fault is reported as a fault at level 1.
• For an Access flag fault, the lookup level of the translation table that gave the fault.
• For a Permission fault, including a Permission fault caused by hierarchical permissions, the lookup level of the final level of translation table accessed for the translation. That is, the lookup level of the translation table that returned a Block or Page descriptor.

**Accessing the IFSR32_EL2**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>IFSR32_EL2</td>
<td>11</td>
<td>100</td>
<td>0101</td>
<td>0000</td>
<td>001</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td></td>
</tr>
<tr>
<td>TGE</td>

Non-Confidential
Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
D10.2.76 ISR_EL1, Interrupt Status Register

The ISR_EL1 characteristics are:

**Purpose**

Shows the pending status of the IRQ, FIQ, or SError interrupt. When executing at EL2, EL3 or secure EL1, this shows the pending status of the physical interrupts. When executing at Non-secure EL1:

- If the HCR_EL2.[IMO,FMO,AMO] bit has a value of 1, the corresponding ISR_EL1.[I,F,A] bit shows the pending status of the virtual IRQ, FIQ, or SError.
- If the HCR_EL2.[IMO,FMO,AMO] bit has a value of 0, the corresponding ISR_EL1.[I,F,A] bit shows the pending status of the physical IRQ, FIQ, or SError.

**Configurations**

AArch64 System register ISR_EL1 is architecturally mapped to AArch32 System register ISR.

**Attributes**

ISR_EL1 is a 32-bit register.

**Field descriptions**

The ISR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-9</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>8</td>
<td>A, SError pending</td>
</tr>
<tr>
<td>7</td>
<td>I, IRQ pending</td>
</tr>
<tr>
<td>6</td>
<td>F, FIQ pending</td>
</tr>
<tr>
<td>5-0</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

**Accessing the ISR_EL1**

This register can be read using MRS with the following syntax:
MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISR_EL1</td>
<td>11</td>
<td>000</td>
<td>1100</td>
<td>0001</td>
<td>00</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>
D10.2.77 LORC_EL1, LORegion Control (EL1)

The LORC_EL1 characteristics are:

**Purpose**

Enables and disables LORegions, and selects the current LORegion descriptor.

**Configurations**

If no LORegion descriptors are supported by the PE, then this register is RES0.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

**Attributes**

LORC_EL1 is a 64-bit register.

**Field descriptions**

The LORC_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>62-10</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>9-2</td>
<td>DS, Descriptor Select. Selects the current LORegion descriptor accessed by LORSA_EL1, LOREA_EL1, and LORN_EL1. If the number of LORegion descriptors supported is 256. If the number is less than 256, then bits[63:M+2] are RES0, where M is Log2(Number of LORegion descriptors supported by the implementation). If this field points to an LORegion descriptor that is not supported by an implementation, then the registers LORN_EL1, LOREA_EL1, and LORSA_EL1 are RES0.</td>
</tr>
<tr>
<td>1</td>
<td>EN, Enable. Indicates whether LORegions are enabled: 0 Disabled. Memory accesses do not match any LORegions. 1 Enabled. Memory accesses may match a LORegion. This bit is permitted to be cached in a TLB. When this register has an architecturally-defined reset value, this field resets to 0.</td>
</tr>
</tbody>
</table>

**Accessing the LORC_EL1**

This register can be read using MRS with the following syntax:
MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>

</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

1. When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
   - If HCR_EL2.TLOR==1, Non-secure accesses to this register from EL1 are trapped to EL2.
2. When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) &&
   (HCR_EL2.TGE == 0):
   - If HCR_EL2.TLOR==1, Non-secure accesses to this register from EL1 are trapped to EL2.
3. When EL3 is implemented and is using AArch64 and SCR_EL3.NS == 1:
   - If SCR_EL3.TLOR==1, Non-secure accesses to this register from EL1 and EL2 are trapped to EL3.
D10.2.78 LOREA_EL1, LORegion End Address (EL1)

The LOREA_EL1 characteristics are:

**Purpose**

Holds the physical address of the end of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

**Configurations**

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- LORC_EL1.DS points to a LORegion that is not supported by the PE.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

**Attributes**

LOREA_EL1 is a 64-bit register.

**Field descriptions**

The LOREA_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>52 51</th>
<th>48 47</th>
<th>16 15</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>EA[51:48]</td>
<td>EA[47:16]</td>
<td>RES0</td>
<td></td>
</tr>
</tbody>
</table>

Any of the fields in this register are permitted to be cached in a TLB.

**Bits [63:52]**

Reserved, RES0.

**EA[51:48], bits [51:48]**

*In ARMv8.3 and ARMv8.2*

*In ARMv8.1*

Reserved, RES0.

**EA[47:16], bits [47:16]**

Bits [47:16] of the end physical address of an LORegion described in the current LORegion descriptor selected by LORC_EL1.DS. Bits[15:0] of this address are defined to be 0xFFFF.

When ARMv8.2-LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, EA[51:48] form the upper part of the address value. Otherwise, for implementations with fewer than 52 physical address bits, EA[51:48] are RES0.

**Bits [15:0]**

Reserved, RES0.

**Accessing the LOREA_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:
MSR `<systemreg>, <Xt>`

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOREA_EL1</td>
<td>11</td>
<td>000</td>
<td>1010</td>
<td>0100</td>
<td>001</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>

<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TLOR==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TLOR==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If SCR_EL3.TLOR==1, Non-secure accesses to this register from EL1 and EL2 are trapped to EL3.
D10.2.79 LORID_EL1, LORegionID (EL1)

The LORID_EL1 characteristics are:

**Purpose**
Indicates the number of LORegions and LORegion descriptors supported by the PE.

**Configurations**
If no LORegion descriptors are implemented, then the registers LORC_EL1, LORN_EL1, LOREA_EL1, and LORSA_EL1 are RES0.
RW fields in this register reset to architecturally UNKNOWN values.
This register is introduced in ARMv8.1.

**Attributes**
LORID_EL1 is a 64-bit register.

**Field descriptions**
The LORID_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits [63:24]</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>LD, bits [23:16]</td>
<td>Number of LORegion descriptors supported by the PE. This is an 8-bit binary number.</td>
</tr>
<tr>
<td>Bits [15:8]</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>LR, bits [7:0]</td>
<td>Number of LORegions supported by the PE. This is an 8-bit binary number.</td>
</tr>
</tbody>
</table>

**Note**
If LORID_EL1 indicates that no LORegions are implemented, then LoadLOAcquire and StoreLORelease will behave as LoadAcquire and StoreRelease.

**Accessing the LORID_EL1**
This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>LORID_EL1</td>
<td>11</td>
<td>000</td>
<td>1010</td>
<td>0100</td>
<td>111</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>
</tr>
<tr>
<td>TGE</td>
<td></td>

<td>NS</td>
<td></td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td></td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TLOR==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TLOR==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If SCR_EL3.TLOR==1, accesses to this register from EL1 and EL2 are trapped to EL3.
D10.2.80 LORN_EL1, LORegion Number (EL1)

The LORN_EL1 characteristics are:

**Purpose**

Holds the number of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

**Configurations**

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- LORC_EL1.DS points to a LORegion that is not supported by the PE.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

**Attributes**

LORN_EL1 is a 64-bit register.

**Field descriptions**

The LORN_EL1 bit assignments are:

![LORN_EL1 Bit assignments](image)

Any of the fields in this register are permitted to be cached in a TLB.

**Bits [63:8]**

Reserved, RES0.

**Num, bits [7:0]**

Number of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

The maximum number of LORegions supported by the PE is 256. If the maximum number is less than 256, then bits[8:N] are RES0, where N is (Log2(Number of LORegions supported by the PE)).

If this field points to a LORegion that is not supported by the PE, then the current LORegion descriptor does not match any LORegion.

**Accessing the LORN_EL1**

This register can be read using MRS with the following syntax:

\[ \text{MRS } \langle Xt \rangle, \langle \text{systemreg} \rangle \]

This register can be written using MSR (register) with the following syntax:

\[ \text{MSR } \langle \text{systemreg} \rangle, \langle Xt \rangle \]

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>LORN_EL1</td>
<td>11</td>
<td>000</td>
<td>1010</td>
<td>0100</td>
<td>010</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>E2H</th>
<th>TGE</th>
<th>NS</th>
<th>EL0</th>
<th>EL1</th>
<th>EL2</th>
<th>EL3</th>
</tr>
</thead>
<tbody>
<tr>

<td>RW</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
<td>1</td>
<td>-</td>
<td>n/a</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TLOR==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TLOR==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If SCR_EL3.TLOR==1, Non-secure accesses to this register from EL1 and EL2 are trapped to EL3.
D10.2.81 LORSA_EL1, LORegion Start Address (EL1)

The LORSA_EL1 characteristics are:

**Purpose**

Indicates whether the current LORegion descriptor selected by LORC_EL1.DS is enabled, and holds the physical address of the start of the LORegion.

**Configurations**

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- LORC_EL1.DS points to a LORegion that is not supported by the PE.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

**Attributes**

LORSA_EL1 is a 64-bit register.

**Field descriptions**

The LORSA_EL1 bit assignments are:

Any of the fields in this register are permitted to be cached in a TLB.

**Bits [63:52]**

Reserved, RES0.

**SA[51:48]**

Reserved, RES0.

In **ARMv8.3 and ARMv8.2**

In **ARMv8.1**

Reserved, RES0.

**SA[47:16], bits [47:16]**

Bits [47:16] of the start physical address of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS. Bits[15:0] of this address are defined to be 0x0000.

When **ARMv8.2-LPA** is implemented, and 52-bit addresses and a 64KB translation granule are in use, SA[51:48] form the upper part of the address value. Otherwise, for implementations with fewer than 52 physical address bits, SA[51:48] are RES0.

**Bits [15:1]**

Reserved, RES0.
Valid, bit [0]

Indicates whether the current LORegion Descriptor is enabled.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Disabled</td>
</tr>
<tr>
<td>1</td>
<td>Enabled</td>
</tr>
</tbody>
</table>

When this register has an architecturally-defined reset value, this field resets to 0.

Accessing the LORSA_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>LORSA_EL1</td>
<td>11</td>
<td>000</td>
<td>1010</td>
<td>0100</td>
<td>000</td>
</tr>
</tbody>
</table>

Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>

</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TLOR==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TLOR==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If SCR_EL3.TLOR==1, Non-secure accesses to this register from EL1 and EL2 are trapped to EL3.
D10.2.82 MAIR_EL1, Memory Attribute Indirection Register (EL1)

The MAIR_EL1 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL1.

Configurations

AArch64 System register MAIR_EL1[31:0] is architecturally mapped to AArch32 System register PRRR when TTBCR.EAE==0.
AArch64 System register MAIR_EL1[31:0] is architecturally mapped to AArch32 System register MAIR0 when TTBCR.EAE==1.
AArch64 System register MAIR_EL1[63:32] is architecturally mapped to AArch32 System register NMRR when TTBCR.EAE==0.
AArch64 System register MAIR_EL1[63:32] is architecturally mapped to AArch32 System register MAIR1 when TTBCR.EAE==1.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

MAIR_EL1 is a 64-bit register.

Field descriptions

The MAIR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>56 55</th>
<th>48 47</th>
<th>40 39</th>
<th>32 31</th>
<th>24 23</th>
<th>16 15</th>
<th>8 7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attr7</td>
<td>Attr6</td>
<td>Attr5</td>
<td>Attr4</td>
<td>Attr3</td>
<td>Attr2</td>
<td>Attr1</td>
<td>Attr0</td>
<td></td>
</tr>
</tbody>
</table>

MAIR_EL1 is permitted to be cached in a TLB.

Attr<n>, bits [8n+7:8n], for n = 0 to 7

Bits [7:4] are encoded as follows:

<table>
<thead>
<tr>
<th>Attr&lt;n&gt;[7:4]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>Device memory. See encoding of Attr&lt;n&gt;[3:0] for the type of Device memory.</td>
</tr>
<tr>
<td>00RW</td>
<td>Normal memory, Outer Write-Through Transient</td>
</tr>
<tr>
<td>0100</td>
<td>Normal memory, Outer Non-cacheable</td>
</tr>
<tr>
<td>01RW</td>
<td>Normal memory, Outer Write-Back Transient</td>
</tr>
<tr>
<td>10RW</td>
<td>Normal memory, Outer Write-Through Non-transient</td>
</tr>
<tr>
<td>11RW</td>
<td>Normal memory, Outer Write-Back Non-transient</td>
</tr>
</tbody>
</table>

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.
The meaning of bits [3:0] depends on the value of bits [7:4]:

<table>
<thead>
<tr>
<th>Attr&lt;n&gt;[3:0]</th>
<th>Meaning when Attr&lt;n&gt;[7:4] is 0000</th>
<th>Meaning when Attr&lt;n&gt;[7:4] is not 0000</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>Device-nGnRnE memory</td>
<td>UNPREDICTABLE</td>
</tr>
<tr>
<td>00RW, RW not 00</td>
<td>UNPREDICTABLE</td>
<td>Normal memory, Inner Write-Through Transient</td>
</tr>
<tr>
<td>0100</td>
<td>Device-nGnRE memory</td>
<td>Normal memory, Inner Non-cacheable</td>
</tr>
<tr>
<td>01RW, RW not 00</td>
<td>UNPREDICTABLE</td>
<td>Normal memory, Inner Write-Back Transient</td>
</tr>
<tr>
<td>1000</td>
<td>Device-nGRE memory</td>
<td>Normal memory, Inner Write-Through Non-transient (RW=00)</td>
</tr>
<tr>
<td>10RW, RW not 00</td>
<td>UNPREDICTABLE</td>
<td>Normal memory, Inner Write-Through Non-transient</td>
</tr>
<tr>
<td>1100</td>
<td>Device-GRE memory</td>
<td>Normal memory, Inner Write-Back Non-transient (RW=00)</td>
</tr>
<tr>
<td>11RW, RW not 00</td>
<td>UNPREDICTABLE</td>
<td>Normal memory, Inner Write-Back Non-transient</td>
</tr>
</tbody>
</table>

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

<table>
<thead>
<tr>
<th>R or W</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No Allocate</td>
</tr>
<tr>
<td>1</td>
<td>Allocate</td>
</tr>
</tbody>
</table>

### Accessing the MAIR_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAIR_EL1</td>
<td>11</td>
<td>000</td>
<td>1010</td>
<td>0010</td>
<td>000</td>
</tr>
<tr>
<td>MAIR_EL12</td>
<td>11</td>
<td>101</td>
<td>1010</td>
<td>0010</td>
<td>000</td>
</tr>
</tbody>
</table>

### Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>MAIR_EL1</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>MAIR_EL1</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>MAIR_EL1</td>
<td>0</td>
<td>1</td>
</tr>
</tbody>
</table>
This table applies to all instructions that can access this register.

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic MAIR_EL1 or MAIR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor MAIR_EL12 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor MAIR_EL12 are trapped to EL2.
D10.2.83 MAIR_EL2, Memory Attribute Indirection Register (EL2)

The MAIR_EL2 characteristics are:

**Purpose**

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL2.

**Configurations**

AArch64 System register MAIR_EL2[31:0] is architecturally mapped to AArch32 System register HMAIR0.

AArch64 System register MAIR_EL2[63:32] is architecturally mapped to AArch32 System register HMAIR1.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

MAIR_EL2 is a 64-bit register.

**Field descriptions**

The MAIR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Attribute</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-56</td>
<td>Attr7</td>
</tr>
<tr>
<td>48-40</td>
<td>Attr6</td>
</tr>
<tr>
<td>47-39</td>
<td>Attr5</td>
</tr>
<tr>
<td>32-24</td>
<td>Attr4</td>
</tr>
<tr>
<td>24-16</td>
<td>Attr3</td>
</tr>
<tr>
<td>15-8</td>
<td>Attr2</td>
</tr>
<tr>
<td>7-0</td>
<td>Attr1</td>
</tr>
</tbody>
</table>

MAIR_EL2 is permitted to be cached in a TLB.

**Attr<n>, bits [8n+7:8n], for n = 0 to 7**

Bits [7:4] are encoded as follows:

<table>
<thead>
<tr>
<th>Attr&lt;n&gt;[7:4]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>Device memory. See encoding of Attr&lt;n&gt;[3:0] for the type of Device memory.</td>
</tr>
<tr>
<td>00RW, RW not 0</td>
<td>Normal memory, Outer Write-Through Transient</td>
</tr>
<tr>
<td>0100</td>
<td>Normal memory, Outer Non-cacheable</td>
</tr>
<tr>
<td>01RW, RW not 0</td>
<td>Normal memory, Outer Write-Back Transient</td>
</tr>
<tr>
<td>10RW</td>
<td>Normal memory, Outer Write-Through Non-transient</td>
</tr>
<tr>
<td>11RW</td>
<td>Normal memory, Outer Write-Back Non-transient</td>
</tr>
</tbody>
</table>

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.
The meaning of bits [3:0] depends on the value of bits [7:4]:

<table>
<thead>
<tr>
<th>Attr&lt;n&gt;[3:0]</th>
<th>Meaning when Attr&lt;n&gt;[7:4] is 0000</th>
<th>Meaning when Attr&lt;n&gt;[7:4] is not 0000</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>Device-nGnRnE memory</td>
<td>UNPREDICTABLE</td>
</tr>
<tr>
<td>00RW, RW not 00</td>
<td>UNPREDICTABLE</td>
<td>Normal memory, Inner Write-Through Transient</td>
</tr>
<tr>
<td>0100</td>
<td>Device-nGnRE memory</td>
<td>Normal memory, Inner Non-cacheable</td>
</tr>
<tr>
<td>01RW, RW not 00</td>
<td>UNPREDICTABLE</td>
<td>Normal memory, Inner Write-Back Transient</td>
</tr>
<tr>
<td>1000</td>
<td>Device-nGRE memory</td>
<td>Normal memory, Inner Write-Through Non-transient (RW=00)</td>
</tr>
<tr>
<td>10RW, RW not 00</td>
<td>UNPREDICTABLE</td>
<td>Normal memory, Inner Write-Through Non-transient</td>
</tr>
<tr>
<td>1100</td>
<td>Device-GRE memory</td>
<td>Normal memory, Inner Write-Back Non-transient (RW=00)</td>
</tr>
<tr>
<td>11RW, RW not 00</td>
<td>UNPREDICTABLE</td>
<td>Normal memory, Inner Write-Back Non-transient</td>
</tr>
</tbody>
</table>

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

<table>
<thead>

### Accessing the MAIR_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAIR_EL2</td>
<td>11</td>
<td>100</td>
<td>1010</td>
<td>0010</td>
<td>000</td>
</tr>
<tr>
<td>MAIR_EL1</td>
<td>11</td>
<td>000</td>
<td>1010</td>
<td>0010</td>
<td>000</td>
</tr>
</tbody>
</table>

### Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>MAIR_EL2</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>MAIR_EL2</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>MAIR_EL2</td>
<td>0</td>
<td>1</td>
</tr>
</tbody>
</table>
This table applies to all instructions that can access this register.

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic MAIR_EL2 or MAIR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64](#) on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>

</tbody>
</table>
D10.2.84 MAIR_EL3, Memory Attribute Indirection Register (EL3)

The MAIR_EL3 characteristics are:

**Purpose**

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL3.

**Configurations**

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

MAIR_EL3 is a 64-bit register.

**Field descriptions**

The MAIR_EL3 bit assignments are:

MAIR_EL3 is permitted to be cached in a TLB.

**Attr<n>, bits [8n+7:8n], for n = 0 to 7**

Bits [7:4] are encoded as follows:

<table>
<thead>
<tr>
<th>Attr&lt;n&gt;[7:4]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>Device memory. See encoding of Attr&lt;n&gt;[3:0] for the type of Device memory.</td>
</tr>
<tr>
<td>00RW</td>
<td>Normal memory, Outer Write-Through Transient</td>
</tr>
<tr>
<td>0100</td>
<td>Normal memory, Outer Non-cacheable</td>
</tr>
<tr>
<td>01RW</td>
<td>Normal memory, Outer Write-Back Transient</td>
</tr>
<tr>
<td>10RW</td>
<td>Normal memory, Outer Write-Through Non-transient</td>
</tr>
<tr>
<td>11RW</td>
<td>Normal memory, Outer Write-Back Non-transient</td>
</tr>
</tbody>
</table>

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

<table>
<thead>
<tr>
<th>Attr&lt;n&gt;[3:0]</th>
<th>Meaning when Attr&lt;n&gt;[7:4] is 0000</th>
<th>Meaning when Attr&lt;n&gt;[7:4] is not 0000</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>Device-nGnRnE memory</td>
<td>UNPREDICTABLE</td>
</tr>
<tr>
<td>00RW</td>
<td>UNPREDICTABLE</td>
<td>Normal memory, Inner Write-Through Transient</td>
</tr>
<tr>
<td>0100</td>
<td>Device-nGnRE memory</td>
<td>Normal memory, Inner Non-cacheable</td>
</tr>
<tr>
<td>01RW</td>
<td>UNPREDICTABLE</td>
<td>Normal memory, Inner Write-Back Transient</td>
</tr>
<tr>
<td>1000</td>
<td>Device-nGRE memory</td>
<td>Normal memory, Inner Write-Through Non-transient (RW=00)</td>
</tr>
</tbody>
</table>
Accessing the MAIR_EL3

This register can be read using MRS with the following syntax:

\[ \text{MRS} \text{ <Xt}, \text{ <systemreg}> \]

This register can be written using MSR (register) with the following syntax:

\[ \text{MSR} \text{ <systemreg>, <Xt>} \]

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAIR_EL3</td>
<td>11</td>
<td>110</td>
<td>1010</td>
<td>0010</td>

</tbody>
</table>
D10.2.85  MIDR_EL1, Main ID Register

The MIDR_EL1 characteristics are:

**Purpose**

Provides identification information for the PE, including an implementer code for the device and a device ID number.

**Configurations**

AArch64 System register MIDR_EL1 is architecturally mapped to AArch32 System register MIDR.

AArch64 System register MIDR_EL1 is architecturally mapped to External register MIDR_EL1.

**Attributes**

MIDR_EL1 is a 32-bit register.

**Field descriptions**

The MIDR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Implementer</th>
<th>Variant</th>
<th>PartNum</th>
<th>Revision</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x41</td>
<td>A</td>
<td></td>
<td></td>

</tr>
</tbody>
</table>

**Implementer, bits [31:24]**

The Implementer code. This field must hold an implementer code that has been assigned by ARM. Assigned codes include the following:

<table>
<thead>
<tr>
<th>Hex representation</th>
<th>ASCII representation</th>
<th>Implementer</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x41</td>
<td>A</td>
<td>ARM Limited</td>
</tr>
<tr>
<td>0x42</td>

<td>Qualcomm Inc.</td>
</tr>
<tr>
<td>0x56</td>
<td>V</td>
<td>Marvell International Ltd.</td>
</tr>
<tr>
<td>0x69</td>
<td>i</td>
<td>Intel Corporation</td>
</tr>
</tbody>
</table>

ARM can assign codes that are not published in this manual. All values not assigned by ARM are reserved and must not be used.
Variant, bits [23:20]

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

Architecture, bits [19:16]

The permitted values of this field are:

- 0001 ARMv4
- 0010 ARMv4T
- 0011 ARMv5 (obsolete)
- 0100 ARMv5T
- 0101 ARMv5TE
- 0110 ARMv5TEJ
- 0111 ARMv6
- 1111 Architectural features are individually identified in the ID_* registers, see ID registers on page K13-6609.

All other values are reserved.

PartNum, bits [15:4]

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by ARM, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the device.

Accessing the MIDR_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>MIDR_EL1</td>
<td>11</td>
<td>0000</td>
<td>0000</td>
<td>0000</td>
<td>000</td>
</tr>
</tbody>
</table>

Accessibility

The register is accessible in software as follows:
D10.2.86 MPIDR_EL1, Multiprocessor Affinity Register

The MPIDR_EL1 characteristics are:

**Purpose**

In a multiprocessor system, provides an additional PE identification mechanism for scheduling purposes.

**Configurations**

AArch64 System register MPIDR_EL1 is architecturally mapped to AArch32 System register MPIDR.

The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

In a uniprocessor system ARM recommends that each Aff<n> field of this register returns a value of 0.

**Attributes**

MPIDR_EL1 is a 64-bit register.

**Field descriptions**

The MPIDR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>40</th>
<th>39</th>
<th>32</th>
<th>31</th>
<th>30</th>
<th>29</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>16</th>
<th>15</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>

<td>U</td>
<td>RES0</td>
<td>Aff2</td>
<td>Aff1</td>
<td>Aff0</td>
<td>MT</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:40]**

Reserved, RES0.

**Aff3, bits [39:32]**

Affinity level 3. Highest level affinity field.

**Bit [31]**

Reserved, RES1.

**U, bit [30]**

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system. The possible values of this bit are:

0 Processor is part of a multiprocessor system.
1 Processor is part of a uniprocessor system.

**Bits [29:25]**

Reserved, RES0.

**MT, bit [24]**

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. The possible values of this bit are:

0 Performance of PEs at the lowest affinity level is largely independent.
1 Performance of PEs at the lowest affinity level is very interdependent.
Aff2, bits [23:16]
Affinity level 2. Second highest level affinity field.

Aff1, bits [15:8]
Affinity level 1. Third highest level affinity field.

Aff0, bits [7:0]
Affinity level 0. Lowest level affinity field.

Accessing the MPIDR_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPIDR_EL1</td>
<td>11</td>
<td>000</td>
<td>0000</td>
<td>0000</td>
<td>101</td>
</tr>
</tbody>
</table>

Access

- RO: Read only
- n/a: Not applicable
D10.2.87 MVFR0_EL1, AArch32 Media and VFP Feature Register 0

The MVFR0_EL1 characteristics are:

Purpose
Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.
Must be interpreted with MVFR1_EL1 and MVFR2_EL1.
For general information about the interpretation of the ID registers see Principles of the ID scheme for fields in ID registers on page D10-2354.

Configurations
AArch64 System register MVFR0_EL1 is architecturally mapped to AArch32 System register MVFR0.
In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.
In an AArch64-only implementation, this register is UNKNOWN.

Attributes
MVFR0_EL1 is a 32-bit register.

Field descriptions
The MVFR0_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Floating-Point Rounding modes</td>
<td>FPRound</td>
<td>Floating-Point Rounding modes. Indicates whether the floating-point implementation provides support for rounding modes. Defined values are:</td>
</tr>
<tr>
<td>28</td>
<td></td>
<td></td>
<td>0000 Not implemented, or only Round to Nearest mode supported, except that Round towards Zero mode is supported for VCVT instructions that always use that rounding mode regardless of the FPSCR setting.</td>
</tr>
<tr>
<td>27</td>
<td></td>
<td></td>
<td>0001 All rounding modes supported.</td>
</tr>
<tr>
<td>24</td>
<td>Short Vectors</td>
<td>FPShVec</td>
<td>Short Vectors. Indicates whether the floating-point implementation provides support for the use of short vectors. Defined values are:</td>

<tr>
<td>23</td>
<td></td>
<td></td>
<td>0000 Short vectors not supported.</td>
</tr>
<tr>
<td>19</td>
<td>Square Root</td>
<td>FPSqrt</td>
<td>Square Root. Indicates whether the floating-point implementation provides support for the ARMv6 VFP square root operations. Defined values are:</td>
</tr>
<tr>
<td>16</td>
<td></td>
<td></td>
<td>0000 Not supported in hardware.</td>
</tr>
<tr>
<td>12</td>
<td>Floating-Point Divide</td>
<td>FPDivide</td>
<td>Floating-Point Divide. Indicates whether the floating-point implementation provides support for the use of floating-point divide operations. Defined values are:</td>
</tr>
<tr>
<td>8</td>
<td>Floating-Point Trap</td>
<td>FPTrap</td>
<td>Floating-Point Trap. Indicates whether the floating-point implementation provides support for the use of floating-point trap operations. Defined values are:</td>
</tr>
<tr>
<td>4</td>
<td>Floating-Point Divide</td>
<td>FPDP</td>
<td>Floating-Point Divide. Indicates whether the floating-point implementation provides support for the use of floating-point divide operations. Defined values are:</td>
</tr>
<tr>
<td>3</td>
<td>Floating-Point Divide</td>
<td>FPSP</td>
<td>Floating-Point Divide. Indicates whether the floating-point implementation provides support for the use of floating-point divide operations. Defined values are:</td>
</tr>
<tr>
<td>0</td>
<td>SIMD Register</td>
<td>SIMDReg</td>
<td>SIMD Register. Indicates whether the floating-point implementation provides support for the use of SIMD operations. Defined values are:</td>
</tr>
</tbody>
</table>

In ARMv8-A the permitted values are 0000 and 0001.
0001  Supported.
All other values are reserved.
In ARMv8-A the permitted values are 0000 and 0001.
The VSQRT.F32 instruction also requires the single-precision floating-point attribute, bits [7:4],
and the VSQRT.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

FPDivide, bits [19:16]
Indicates whether the floating-point implementation provides support for VFP divide operations.
Defined values are:
0000  Not supported in hardware.
0001  Supported.
All other values are reserved.
In ARMv8-A the permitted values are 0000 and 0001.
The VDIV.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and
the VDIV.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

FPTrap, bits [15:12]
Floating Point Exception Trapping. Indicates whether the floating-point implementation provides
support for exception trapping. Defined values are:
0000  Not supported.
0001  Supported.
All other values are reserved.
A value of 0001 indicates that, when the corresponding trap is enabled, a floating-point exception
generates an exception.

FPDP, bits [11:8]
Double Precision. Indicates whether the floating-point implementation provides support for
double-precision operations. Defined values are:
0000  Not supported in hardware.
0001  Supported, VFPv2.
0010  Supported, VFPv3, VFPv4, or ARMv8. VFPv3 and ARMv8 add an instruction to load
a double-precision floating-point constant, and conversions between double-precision
and fixed-point values.
All other values are reserved.
In ARMv8-A the permitted values are 0000 and 0010.
A value of 0b0001 or 0b0010 indicates support for all VFP double-precision instructions in the
supported version of VFP, except that, in addition to this field being nonzero:
• VSQRT.F64 is only available if the Square root field is 0001.
• VDIV.F64 is only available if the Divide field is 0001.
• Conversion between double-precision and single-precision is only available if the
single-precision field is nonzero.

FPSP, bits [7:4]
Single Precision. Indicates whether the floating-point implementation provides support for
single-precision operations. Defined values are:
0000  Not supported in hardware.
0001  Supported, VFPv2.
0010  Supported, VFPv3 or VFPv4. VFPv3 adds an instruction to load a single-precision floating-point constant, and conversions between single-precision and fixed-point values.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0010.

A value of 0b0001 or 0b0010 indicates support for all VFP single-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F32 is only available if the Square root field is 0001.
- VDIV.F32 is only available if the Divide field is 0001.
- Conversion between double-precision and single-precision is only available if the double-precision field is nonzero.

**SIMDReg, bits [3:0]**

Advanced SIMD registers. Indicates whether the Advanced SIMD and floating-point implementation provides support for the Advanced SIMD and floating-point register bank. Defined values are:

- 0000  The implementation has no Advanced SIMD and floating-point support.
- 0001  The implementation includes floating-point support with 16 x 64-bit registers.
- 0010  The implementation includes Advanced SIMD and floating-point support with 32 x 64-bit registers.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0010.

**Accessing the MVFR0_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>MVFR0_EL1</td>
<td>11</td>
<td>000</td>
<td>0000</td>
<td>0011</td>
<td>000</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>
Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  — If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  — If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
D10.2.88 MVFR1_EL1, AArch32 Media and VFP Feature Register 1

The MVFR1_EL1 characteristics are:

**Purpose**

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with MVFR0_EL1 and MVFR2_EL1.

For general information about the interpretation of the ID registers see Principles of the ID scheme for fields in ID registers on page D10-2354.

**Configurations**

AArch64 System register MVFR1_EL1 is architecturally mapped to AArch32 System register MVFR1.

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

In an AArch64-only implementation, this register is UNKNOWN.

**Attributes**

MVFR1_EL1 is a 32-bit register.

**Field descriptions**

The MVFR1_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>28 27 24 23</th>
<th>20 19</th>
<th>16 15</th>
<th>12 11</th>
<th>8 7</th>
<th>4 3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>FPHP</td>
<td>SIMDHP</td>
<td>SIMDSP</td>
<td>SIMDInt</td>
<td>SIMDL</td>
<td>FPDA</td>
<td>FPFIZ</td>
</tr>
</tbody>
</table>

**SIMDFMAC, bits [31:28]**

Advanced SIMD Fused Multiply-Accumulate. Indicates whether the Advanced SIMD implementation provides fused multiply accumulate instructions. Defined values are:

0000 Not implemented.

0001 Implemented.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

The Advanced SIMD and floating-point implementations must provide the same level of support for these instructions.

**FPHP, bits [27:24]**

Floating Point Half Precision. Indicates the level of half-precision floating-point support. Defined values are:

0000 Not supported.

0001 Floating-point half-precision conversion instructions are supported for conversion between single-precision and half-precision.

0010 As for 0001, and adds instructions for conversion between double-precision and half-precision.

0011 As for 0010, and adds support for half-precision floating-point arithmetic.

All other values are reserved.
In ARMv8-A the permitted values are:

- **0000** in an implementation without floating-point support.
- **0010** in an implementation with floating-point support that does not include the ARMv8.2-FP16 extension.
- **0011** in an implementation with floating-point support that includes the ARMv8.2-FP16 extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the SIMDHP field, meaning the permitted values are:

<table>
<thead>
<tr>
<th>Half Precision instructions supported</th>
<th>FPHP</th>
<th>SIMDHP</th>
</tr>
</thead>
<tbody>
<tr>
<td>No support</td>
<td>0000</td>
<td>0000</td>
</tr>
<tr>
<td>Conversions only</td>
<td>0010</td>
<td>0001</td>
</tr>
<tr>
<td>Conversions and arithmetic</td>
<td>0011</td>
<td>0010</td>
</tr>
</tbody>
</table>

**SIMDHP, bits [23:20]**

Advanced SIMD Half Precision. Indicates the level of half-precision floating-point support. Defined values are:

- **0000** Not supported.
- **0001** SIMD half-precision conversion instructions are supported for conversion between single-precision and half-precision.
- **0010** As for **0001**, and adds support for half-precision floating-point arithmetic.

All other values are reserved.

In ARMv8-A the permitted values are:

- **0000** in an implementation without SIMD floating-point support.
- **0001** in an implementation with SIMD floating-point support that does not include the ARMv8.2-FP16 extension.
- **0010** in an implementation with SIMD floating-point support that includes the ARMv8.2-FP16 extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the FPHP field, meaning the permitted values are:

<table>
<thead>
<tr>
<th>Half Precision instructions supported</th>
<th>FPHP</th>
<th>SIMDHP</th>
</tr>
</thead>
<tbody>
<tr>
<td>No support</td>
<td>0000</td>
<td>0000</td>
</tr>
<tr>
<td>Conversions only</td>
<td>0010</td>
<td>0001</td>
</tr>
<tr>
<td>Conversions and arithmetic</td>
<td>0011</td>
<td>0010</td>
</tr>
</tbody>
</table>

**SIMDSP, bits [19:16]**

Advanced SIMD Single Precision. Indicates whether the Advanced SIMD and floating-point implementation provides single-precision floating-point instructions. Defined values are:

- **0000** Not implemented.
- **0001** Implemented. This value is permitted only if the SIMDInt field is **0001**.

All other values are reserved.

In ARMv8-A the permitted values are **0000** and **0001**.
SIMDInt, bits [15:12]
Advanced SIMD Integer. Indicates whether the Advanced SIMD and floating-point implementation provides integer instructions. Defined values are:

- 0000: Not implemented.
- 0001: Implemented.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

SIMDLS, bits [11:8]
Advanced SIMD Load/Store. Indicates whether the Advanced SIMD and floating-point implementation provides load/store instructions. Defined values are:

- 0000: Not implemented.
- 0001: Implemented.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

FPDNaN, bits [7:4]
Default NaN mode. Indicates whether the floating-point implementation provides support only for the Default NaN mode. Defined values are:

- 0000: Not implemented, or hardware supports only the Default NaN mode.
- 0001: Hardware supports propagation of NaN values.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

FPFtZ, bits [3:0]
Flush to Zero mode. Indicates whether the floating-point implementation provides support only for the Flush-to-Zero mode of operation. Defined values are:

- 0000: Not implemented, or hardware supports only the Flush-to-Zero mode of operation.
- 0001: Hardware supports full denormalized number arithmetic.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

Accessing the MVFR1_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>MVFR1_EL1</td>
<td>11</td>
<td>000</td>
<td>0000</td>
<td>0011</td>
<td>001</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
D10.2.89 MVFR2_EL1, AArch32 Media and VFP Feature Register 2

The MVFR2_EL1 characteristics are:

**Purpose**
Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.
Must be interpreted with MVFR0_EL1 and MVFR1_EL1.
For general information about the interpretation of the ID registers see Principles of the ID scheme for fields in ID registers on page D10-2354.

**Configurations**
AArch64 System register MVFR2_EL1 is architecturally mapped to AArch32 System register MVFR2.
In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.
In an AArch64-only implementation, this register is UNKNOWN.

**Attributes**
MVFR2_EL1 is a 32-bit register.

**Field descriptions**
The MVFR2_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [31:8]</th>
<th>31 8 7 4 3 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
</tr>
<tr>
<td>FPMisc</td>
<td></td>
</tr>
<tr>
<td>SIMDMisc</td>
<td></td>
</tr>
</tbody>
</table>

Reserved, RES0.

**FPMisc, bits [7:4]**
Indicates whether the floating-point implementation provides support for miscellaneous VFP features.
0000  Not implemented, or no support for miscellaneous features.
0001  Support for Floating-point selection.
0010  As 0001, and Floating-point Conversion to Integer with Directed Rounding modes.
0011  As 0010, and Floating-point Round to Integer Floating-point.
0100  As 0011, and Floating-point MaxNum and MinNum.
All other values are reserved.
In ARMv8-A the permitted values are 0000 and 0100.

**SIMDMisc, bits [3:0]**
Indicates whether the Advanced SIMD implementation provides support for miscellaneous Advanced SIMD features.
0000  Not implemented, or no support for miscellaneous features.
0001  Floating-point Conversion to Integer with Directed Rounding modes.
0010  As 0001, and Floating-point Round to Integer Floating-point.
0011  As 0010, and Floating-point MaxNum and MinNum.
All other values are reserved.
In ARMv8-A the permitted values are 0000 and 0011.

**Accessing the MVFR2_EL1**

This register can be read using MRS with the following syntax:

\[
\text{MRS } <\text{Xt}>, <\text{systemreg}>
\]

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>MVFR2_EL1</td>
<td>11</td>
<td>000</td>
<td>0000</td>
<td>0011</td>
<td>010</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
D10.2.90 PAR_EL1, Physical Address Register

The PAR_EL1 characteristics are:

**Purpose**

Returns the output address (OA) from an Address translation instruction that executed successfully, or fault information if the instruction did not execute successfully.

**Configurations**

AArch64 System register PAR_EL1 is architecturally mapped to AArch32 System register PAR. RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PAR_EL1 is a 64-bit register.

**Field descriptions**

The PAR_EL1 bit assignments are:

*For all register layouts:*

F, bit [0]

Indicates whether the instruction performed a successful address translation.

- 0 Address translation completed successfully.
- 1 Address translation aborted.

*When PAR_EL1.F==0:*

<table>
<thead>
<tr>
<th>63</th>
<th>56 55</th>
<th>52 51</th>
<th>48 47</th>
<th>12 11 10 9 8 7 6</th>
<th>1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATTR</td>
<td>RES0</td>
<td>PA[51:48]</td>
<td>PA[47:12]</td>
<td>NS</td>
<td>SH</td>
</tr>
</tbody>
</table>

This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR_EL1 can return a value that indicates the resulting attributes, rather than the values that appear in the translation table descriptors. More precisely:

- The ATTR and SH fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the translation table descriptors.
- See the NS bit description for constraints on the value it returns.

**ATTR, bits [63:56]**

Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in MAIR_EL1, MAIR_EL2, and MAIR_EL3.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.
Bits [55:52]  
Reserved, RES0.

PA[51:48], bits [51:48]  
*In ARMv8.3 and ARMv8.2*  
Extension to PA[47:12]. See PA[47:12] for more details.

*In ARMv8.1 and ARMv8.0.*  
Reserved, RES0.

PA[47:12], bits [47:12]  
Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[47:12].

When ARMv8.2-LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, PA[51:48] form the upper part of the address value. Otherwise, for implementations with fewer than 52 physical address bits, the upper bits of this field, corresponding to address bits that are not implemented, are RES0.

Bit [11]  
Reserved, RES1.

IMP DEF, bit [10]  
IMPLEMENTATION DEFINED.

NS, bit [9]  
Non-secure. The NS attribute for a translation table entry from a Secure translation regime. For a result from a Secure translation regime, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is **UNKNOWN**.

SH, bits [8:7]  
Shareability attribute, for the returned output address. Permitted values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

The value 01 is reserved.

--- **Note** ---

This field returns the value 10 for:

- Any type of Device memory.
- Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

Bits [6:1]  
Reserved, RES0.

F, bit [0]  
Indicates whether the instruction performed a successful address translation.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Address translation completed successfully.</td>
</tr>
</tbody>
</table>
When PAR_EL1.F==1:

<table>
<thead>
<tr>
<th>63</th>
<th>56 55</th>
<th>52 51</th>
<th>48 47</th>
<th>12 11 10 9 8 7 6 1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMP DEF</td>
<td>IMP DEF</td>
<td>IMP DEF</td>
<td>RES0</td>
<td>S</td>
</tr>
</tbody>
</table>

This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

**IMP DEF, bits [63:56]**
IMPLEMENTATION DEFINED.

**IMP DEF, bits [55:52]**
IMPLEMENTATION DEFINED.

**IMP DEF, bits [51:48]**
IMPLEMENTATION DEFINED.

**Bits [47:12]**
Reserved, RES0.

**Bit [11]**
Reserved, RES1.

**Bit [10]**
Reserved, RES0.

**S, bit [9]**
Indicates the translation stage at which the translation aborted:
- 0 Translation aborted because of a fault in the stage 1 translation.
- 1 Translation aborted because of a fault in the stage 2 translation.

**PTW, bit [8]**
If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.

**Bit [7]**
Reserved, RES0.

**FST, bits [6:1]**
Fault status code, as shown in the Data Abort ESR encoding.

**F, bit [0]**
Indicates whether the instruction performed a successful address translation.
- 1 Address translation aborted.

**Accessing the PAR_EL1**

This register can be read using MRS with the following syntax:
MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>PAR_EL1</td>
<td>11</td>
<td>000</td>
<td>0111</td>
<td>0100</td>
<td>000</td>
</tr>
</tbody>
</table>

Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS EL0 EL1 EL2 EL3</td>
<td>RW n/a RW RW RW</td>
</tr>

<td>-</td>
</tr>
<tr>
<td>x 1 1</td>
<td>-</td>
</tr>
</tbody>
</table>
D10.2.91  REVIDR_EL1, Revision ID Register

The REVIDR_EL1 characteristics are:

Purpose
Provides implementation-specific minor revision information.

Configurations
AArch64 System register REVIDR_EL1 is architecturally mapped to AArch32 System register REVIDR.
If REVIDR_EL1 has the same value as MIDR_EL1, then its contents have no significance.

Attributes
REVIDR_EL1 is a 32-bit register.

Field descriptions
The REVIDR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMPLEMENTATION DEFINED</td>
<td></td>
</tr>
</tbody>
</table>

IMPLEMENTATION DEFINED, bits [31:0]
IMPLEMTNATION DEFINED.

Accessing the REVIDR_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>REVIDR_EL1</td>
<td>11</td>
<td>000</td>
<td>0000</td>
<td>0000</td>
<td>110</td>
</tr>
</tbody>
</table>

Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>x x 0</td>
<td>- RO n/a RO</td>
</tr>
<tr>
<td>x 0 1</td>
<td>- RO RO RO</td>
</tr>
<tr>
<td>x 1 1</td>
<td>- n/a RO RO</td>
</tr>
</tbody>
</table>
Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  — If HCR_EL2.TID1==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  — If HCR_EL2.TID1==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
D10.2.92  RMR_EL1, Reset Management Register (EL1)

The RMR_EL1 characteristics are:

**Purpose**

If EL1 is the highest implemented Exception level and this register is implemented:

- A write to the register at EL1 can request a Warm reset.
- If EL1 can use AArch32 and AArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

**Configurations**

AArch64 System register RMR_EL1 is architecturally mapped to AArch32 System register RMR when EL1 is highest implemented Exception level.

Only implemented if EL1 is the highest implemented Exception level. In this case:

- If EL1 can use AArch32 and AArch64 then this register must be implemented.
- If EL1 cannot use AArch32 then it is IMPLEMENTATION DEFINED whether the register is implemented.

See the field descriptions for the reset values. These apply whenever the register is implemented.

**Attributes**

RMR_EL1 is a 32-bit register.

**Field descriptions**

The RMR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:2</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>1</td>
<td>Reset Request (RR)</td>
</tr>
<tr>
<td>0</td>
<td>AArch64 (AA64)</td>
</tr>
</tbody>
</table>

**Bits [31:2]**

Reserved, RES0.

**RR, bit [1]**

Reset Request. Setting this bit to 1 requests a Warm reset.
This field resets to 0 on a Warm or Cold reset.

**AA64, bit [0]**

When EL1 can use AArch32, determines which Execution state the PE boots into after a Warm reset:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>AArch32</td>
</tr>
<tr>
<td>1</td>
<td>AArch64</td>
</tr>
</tbody>
</table>

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If EL1 cannot use AArch32 this bit is RAO/WI.

When implemented as a RW field, this field resets to 1 on a Cold reset.

**Accessing the RMR_EL1**

This register can be read using MRS with the following syntax:
MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>RMR_EL1</td>
<td>11</td>
<td>000</td>
<td>1100</td>
<td>0000</td>
<td>010</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>E2H</td>
<td>EL0, EL1, EL2, EL3</td>
</tr>
<tr>
<td>EL1 is the highest implemented Exception level.</td>
<td>x</td>
<td>x</td>
</tr>
</tbody>
</table>

When RMR_EL1 is not implemented, the encoding for this register is **UNDEFINED**.
D10.2.93  RMR_EL2, Reset Management Register (EL2)

The RMR_EL2 characteristics are:

**Purpose**

If EL2 is the highest implemented Exception level and this register is implemented:

- A write to the register at EL2 can request a Warm reset.
- If EL2 can use AArch32 and AArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

**Configurations**

AArch64 System register RMR_EL2 is architecturally mapped to AArch32 System register HRMR. Only implemented if EL2 is the highest implemented Exception level. In this case:

- If EL2 can use AArch32 and AArch64 then this register must be implemented.
- If EL2 cannot use AArch32 then it is IMPLEMENTATION DEFINED whether the register is implemented.

See the field descriptions for the reset values. These apply whenever the register is implemented.

**Attributes**

RMR_EL2 is a 32-bit register.

**Field descriptions**

The RMR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>30</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>2</td>
<td>RR, bit [1]</td>
</tr>
<tr>
<td>1</td>
<td>Reset Request. Setting this bit to 1 requests a Warm reset. This field resets to 0 on a Warm or Cold reset.</td>
</tr>
<tr>
<td>0</td>
<td>AA64, bit [0]</td>
</tr>
</tbody>
</table>

- **RR, bit [1]**
  - Reset Request. Setting this bit to 1 requests a Warm reset.
  - This field resets to 0 on a Warm or Cold reset.

- **AA64, bit [0]**
  - When EL2 can use AArch32, determines which Execution state the PE boots into after a Warm reset:
    - 0  AArch32.
    - 1  AArch64.
  - On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.
  - If EL2 cannot use AArch32 this bit is RAO/WI.
  - When implemented as a RW field, this field resets to 1 on a Cold reset.

**Accessing the RMR_EL2**

This register can be read using MRS with the following syntax:
MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

```
<systemreg> | op0 | op1 | CRn | CRm | op2
---|---|---|---|---|---
RMR_EL2 | 11 | 100 | 1100 | 0000 | 010
```

### Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>EL2 is the highest implemented Exception level.</td>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>EL2 is the highest implemented Exception level.</td>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

When RMR_EL2 is not implemented, the encoding for this register is UNDEFINED.

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64](#) on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
D10.2.94 RMR_EL3, Reset Management Register (EL3)

The RMR_EL3 characteristics are:

**Purpose**

If EL3 is the implemented and this register is implemented:

- A write to the register at EL3 can request a Warm reset.
- If EL3 can use AArch32 and AArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

**Configurations**

AArch64 System register RMR_EL3 is architecturally mapped to AArch32 System register RMR when EL3 is implemented.

When EL3 is implemented:

- If EL3 can use AArch32 and AArch64 then this register must be implemented.
- If EL3 cannot use AArch32 then it is IMPLEMENTATION DEFINED whether the register is implemented.

See the field descriptions for the reset values. These apply whenever the register is implemented.

**Attributes**

RMR_EL3 is a 32-bit register.

**Field descriptions**

The RMR_EL3 bit assignments are:

```
<table>
<thead>
<tr>
<th>Bit</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:2</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>1</td>
<td>Reset Request. Setting this bit to 1 requests a Warm reset. This field resets to 0 on a Warm or Cold reset.</td>
</tr>
<tr>
<td>0</td>
<td>When EL3 can use AArch32, determines which Execution state the PE boots into after a Warm reset:</td>
</tr>
<tr>
<td></td>
<td>0 AArch32.</td>
</tr>
<tr>
<td></td>
<td>1 AArch64.</td>
</tr>
</tbody>
</table>
```

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If EL3 cannot use AArch32 this bit is RAO/WI.

When implemented as a RW field, this field resets to 1 on a Cold reset.

**Accessing the RMR_EL3**

This register can be read using MRS with the following syntax:
MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>RMR_EL3</td>
<td>11</td>
<td>110</td>
<td>1100</td>
<td>0000</td>
<td>010</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>EL3 is the highest implemented Exception level.</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>EL3 is the highest implemented Exception level.</td>
<td>x</td>
<td>0</td>

<tr>
<td>EL3 is the highest implemented Exception level.</td>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

When RMR_EL3 is not implemented, the encoding for this register is **UNDEFINED**.
D10.2.95   RVBAR_EL1, Reset Vector Base Address Register (if EL2 and EL3 not implemented)

The RVBAR_EL1 characteristics are:

**Purpose**
If EL1 is the highest Exception level implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch64 state.

**Configurations**
Only implemented if the highest Exception level implemented is EL1.

**Attributes**
RVBAR_EL1 is a 64-bit register.

**Field descriptions**
The RVBAR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reset Address</td>
<td>The IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 64-bit state. Bits[1:0] of this register are 00, as this address must be aligned, and the address must be within the physical address size supported by the PE.</td>
</tr>
</tbody>
</table>

**Accessing the RVBAR_EL1**
This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>RVBAR_EL1</td>
<td>11</td>
<td>000</td>
<td>1100</td>
<td>0000</td>
<td>001</td>
</tr>
</tbody>
</table>

**Accessibility**
The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>EL1 is the highest implemented Exception level.</td>
<td>E2H TGE NS</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td></td>
<td>x x x</td>
<td>RO n/a n/a</td>
</tr>
</tbody>
</table>

When EL1 is not the highest implemented Exception level, the encoding for this register is UNDEFINED.
D10.2.96  **RVBAR_EL2, Reset Vector Base Address Register (if EL3 not implemented)**

The RVBAR_EL2 characteristics are:

**Purpose**

If EL2 is the highest Exception level implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch64 state.

**Configurations**

Only implemented if the highest Exception level implemented is EL2.

**Attributes**

RVBAR_EL2 is a 64-bit register.

**Field descriptions**

The RVBAR_EL2 bit assignments are:

```
<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reset Address</td>
</tr>
<tr>
<td>62-0</td>
<td>IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 64-bit state. Bits[1:0] of this register are 00, as this address must be aligned, and the address must be within the physical address size supported by the PE.</td>
</tr>
</tbody>
</table>
```

**Accessing the RVBAR_EL2**

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>RVBAR_EL2</td>
<td>11</td>
<td>100</td>
<td>1100</td>
<td>0000</td>
<td>001</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>EL2 is the highest implemented Exception level.</td>
<td>E2H=1, TGE=0, NS=1</td>
<td>EL0=1, EL1=1, EL2=n/a, EL3=n/a</td>
</tr>
<tr>
<td></td>
<td></td>
<td>RO=n/a, n/a</td>
</tr>
</tbody>
</table>

When EL2 is not the highest implemented Exception level, the encoding for this register is UNDEFINED.
D10.2.97 RVBAR_EL3, Reset Vector Base Address Register (if EL3 implemented)

The RVBAR_EL3 characteristics are:

**Purpose**

If EL3 is the highest Exception level implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch64 state.

**Configurations**

Only implemented if the highest Exception level implemented is EL3.

**Attributes**

RVBAR_EL3 is a 64-bit register.

**Field descriptions**

The RVBAR_EL3 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Reset Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 0</td>
<td></td>
</tr>
</tbody>
</table>

Reset Address. The IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 64-bit state. Bits[1:0] of this register are 00, as this address must be aligned, and the address must be within the physical address size supported by the PE.

**Accessing the RVBAR_EL3**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>RVBAR_EL3</td>
<td>11</td>
<td>110</td>
<td>1100</td>
<td>0000</td>
<td>001</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>EL3 is the highest implemented Exception level.</td>
<td>x x 0</td>
<td>- - n/a RO</td>
</tr>
<tr>
<td>EL3 is the highest implemented Exception level.</td>
<td>x 0 1</td>
<td>- - - RO</td>
</tr>
<tr>
<td>EL3 is the highest implemented Exception level.</td>
<td>x 1 1</td>
<td>- n/a - RO</td>
</tr>
</tbody>
</table>

When EL3 is not the highest implemented Exception level, the encoding for this register is UNDEFINED.
D10.2.98  **S3\_<op1>\_<Cn>\_<Cm>\_<op2>**, IMPLEMENTATION DEFINED registers

The S3\_<op1>\_<Cn>\_<Cm>\_<op2> characteristics are:

**Purpose**
- This area of the instruction set space is reserved for IMPLEMENTATION DEFINED registers.

**Configurations**
- There are no configuration notes.

**Attributes**
- S3\_<op1>\_<Cn>\_<Cm>\_<op2> is a 64-bit register.

**Field descriptions**
- The S3\_<op1>\_<Cn>\_<Cm>\_<op2> bit assignments are:

```
 63 0
     IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [63:0]
IMPLEMENTATION DEFINED.
```

**Accessing the S3\_<op1>\_<Cn>\_<Cm>\_<op2>**

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>S3_&lt;op1&gt;_&lt;Cn&gt;_&lt;Cm&gt;_&lt;op2&gt;</td>
<td>11</td>
<td>op1&lt;2:0&gt;</td>
<td>Cn&lt;3:0&gt;</td>
<td>Cm&lt;3:0&gt;</td>
<td>op2&lt;2:0&gt;</td>
</tr>
</tbody>
</table>

- <op1> is in the range 0 - 7.
- <CRn> can take the values: 11, 15.
- <CRm> is in the range 0 - 15.
- <op2> is in the range 0 - 7.

The value of <Cn> must be either 11 or 15. Other values may refer to architecturally-defined registers.

**Accessibility**

The accessibility of registers with these encodings is IMPLEMENTATION DEFINED.
Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and $(SCR\_EL3\_NS == 1) \&\& (HCR\_EL2\_E2H == 0)$:
  - If $HCR\_EL2\_TIDCP==1$, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and $(SCR\_EL3\_NS == 1) \&\& (HCR\_EL2\_E2H == 1) \&\& (HCR\_EL2\_TGE == 0)$:
  - If $HCR\_EL2\_TIDCP==1$, Non-secure accesses to this register from EL1 are trapped to EL2.
D10.2.99 SCR_EL3, Secure Configuration Register

The SCR_EL3 characteristics are:

**Purpose**

Defines the configuration of the current Security state. It specifies:

- The Security state of EL0 and EL1, either Secure or Non-secure.
- The Execution state at lower Exception levels.
- Whether IRQ, FIQ, SError interrupts, and External abort exceptions are taken to EL3.

**Configurations**

AArch64 System register SCR_EL3 can be mapped to AArch32 System register SCR, but this is not architecturally mandated.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

SCR_EL3 is a 32-bit register.

**Field descriptions**

The SCR_EL3 bit assignments are:

![SCR_EL3 Diagram](image-url)

**Bits [31:18]**

Reserved, RES0.

**API, bit [17]**

In ARMv8.3

Present only if ARMv8.3-PAuth is implemented.

Controls the use of instructions related to Pointer Authentication:

- PACGA, XPACD, XPACI, and XPACLRI.
• AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZ, RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ, ERETA, ERETAB, LDRAA and LDRAB when:
  — enabled for the Non-secure EL1 translation regime (that is the associated SCTLR_EL1.En<N><M> ==1) in Non-secure EL0 when HCR_EL2.TGE==0 || HCR_EL2.E2H==0, in Non-secure EL1 or in Secure EL1.
  — enabled for the Non-secure EL2 translation regime (that is the associated SCTLR_EL2.En<N><M> ==1) in Non-secure EL0 when HCR_EL2.TGE==1 && HCR_EL2.E2H==1 or in EL2.

Defined values are:
0 The use of any instruction related to pointer authentication in any Exception level except EL3 when the instructions are enabled are trapped to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.API bit.
1 This control does not cause any instructions to be trapped.

—— Note ————
If ARMv8.3-PAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

——— Note ————
If ARMv8.3-PAuth is not implemented, this field is RES0.

In ARMv8.2, ARMv8.1 and ARMv8.0.
Reserved, RES0.

APK, bit [16]

In ARMv8.3

Present only if ARMv8.3-PAuth is implemented.

Trap registers holding "key" values for Pointer Authentication. Traps accesses to the following registers from EL2, and Secure or Non-secure EL1 to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.APK bit or other traps:
• APIAKeyLo_EL1, APIAKeyHi_EL1, APIBKeyLo_EL1, APIBKeyHi_EL1, APDAKeyLo_EL1, APDAKeyHi_EL1, APDBKeyLo_EL1, APDBKeyHi_EL1, APGAKeyLo_EL1, and APGAKeyHi_EL1.

Defined values are:
0 Access to the registers holding "key" values for pointer authentication from Secure or Non-secure EL1 or from EL2 are trapped to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.APK bit or other traps.
1 This control does not cause any instructions to be trapped.

—— Note ————
If ARMv8.3-PAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

——— Note ————
If ARMv8.3-PAuth is not implemented, this field is RES0.

In ARMv8.2, ARMv8.1 and ARMv8.0.
Reserved, RES0.

TERR, bit [15]

Trap Error record accesses. If the RAS Extension is implemented, the possible values of this bit are:
0 Does not trap accesses to record registers from EL1 and EL2 to EL3.
1 Accesses to the ER* registers from EL1 and EL2 generate a Trap exception to EL3.
This bit resets to 0 on Warm reset.
When the RAS Extension is not implemented, this field is RES0.

**TLOR, bit [14]**

*In ARMv8.3, ARMv8.2 and ARMv8.1*

Trap LOR registers. Traps accesses to the LORSA_EL1, LOREA_EL1, LORN_EL1, LORC_EL1, and LORID_EL1 registers from EL1 and EL2 to EL3, unless the access has been trapped to EL2.

- **0**: This control does not cause any instructions to be trapped.
- **1**: EL1 and EL2 accesses to the LOR registers that are not UNDEFINED are trapped to EL3, unless it is trapped HCR_EL2.TLOR.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

*In ARMv8.0.*

Reserved, RES0.

**TWE, bit [13]**

Traps EL2, EL1, and EL0 execution of WFE instructions to EL3, from both Security states and both Execution states.

- **0**: This control does not cause any instructions to be trapped.
- **1**: Any attempt to execute a WFE instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWE, HCR.TWE, SCTLR_EL1.nTWE, SCTLR_EL2.nTWE, or HCR_EL2.TWE.

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

--- **Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

**TWI, bit [12]**

Traps EL2, EL1, and EL0 execution of WFI instructions to EL3, from both Security states and both Execution states.

- **0**: This control does not cause any instructions to be trapped.
- **1**: Any attempt to execute a WFI instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWI, HCR.TWI, SCTLR_EL1.nTWI, SCTLR_EL2.nTWI, or HCR_EL2.TWI.

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

--- **Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.
ST, bit [11]

Traps Secure EL1 accesses to the Counter-timer Physical Secure timer registers to EL3, from AArch64 state only.

0 Secure EL1 using AArch64 accesses to the CNTPS_TVAL_EL1, CNTPS_CTL_EL1, and CNTPS_CVAL_EL1 are trapped to EL3.
1 This control does not cause any instructions to be trapped.

RW, bit [10]

Execution state control for lower Exception levels.

0 Lower levels are all AArch32.
1 The next lower level is AArch64.
If EL2 is present:
• EL2 is AArch64.
• EL2 controls EL1 and EL0 behaviors.
If EL2 is not present:
• EL1 is AArch64.
• EL0 is determined by the Execution state described in the current process state when executing at EL0.

If all lower Exception levels cannot use AArch32 then this bit is RAO/WI.
This bit is permitted to be cached in a TLB.

SIF, bit [9]

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction fetch from Non-secure memory. The possible values for this bit are:

0 Secure state instruction fetches from Non-secure memory are permitted.
1 Secure state instruction fetches from Non-secure memory are not permitted.

This bit is permitted to be cached in a TLB.

HCE, bit [8]

Hypervisor Call instruction enable. Enables HVC instructions at EL3, EL2, and Non-secure EL1, in both Execution states.

0 HVC instructions are UNDEFINED at EL3, EL2, and Non-secure EL1, and any resulting exception is taken from the current Exception level to the current Exception level.
1 HVC instructions are enabled at EL1 and above.

Note

HVC instructions are always UNDEFINED at EL0.

If EL2 is not implemented, this bit is RES0.

SMD, bit [7]

Secure Monitor Call disable. Disables SMC instructions at EL1 and above, from both Security states and both Execution states.

0 SMC instructions are enabled at EL1 and above.
1 SMC instructions are UNDEFINED at EL1 and above.

Note

SMC instructions are always UNDEFINED at EL0.

Bit [6]

Reserved, RES0.
Bits [5:4]
Reserved, RES1.

EA, bit [3]
External Abort and SError interrupt routing.
0 When executing at Exception levels below EL3, External aborts and SError interrupts are not taken to EL3.
   In addition, when executing at EL3:
   • SError interrupts are not taken.
   • External aborts are taken to EL3.
1 When executing at any Exception level, External aborts and SError interrupts are taken to EL3.
For more information, see Asynchronous exception routing on page D1-1903.

FIQ, bit [2]
Physical FIQ Routing.
0 When executing at Exception levels below EL3, physical FIQ interrupts are not taken to EL3.
   When executing at EL3, physical FIQ interrupts are not taken.
1 When executing at any Exception level, physical FIQ interrupts are taken to EL3.
For more information, see Asynchronous exception routing on page D1-1903.

IRQ, bit [1]
Physical IRQ Routing.
0 When executing at Exception levels below EL3, physical IRQ interrupts are not taken to EL3.
   When executing at EL3, physical IRQ interrupts are not taken.
1 When executing at any Exception level, physical IRQ interrupts are taken to EL3.
For more information, see Asynchronous exception routing on page D1-1903.

NS, bit [0]
Non-secure bit.
0 Indicates that EL0 and EL1 are in Secure state, and so memory accesses from those Exception levels can access Secure memory.
   When executing at EL3:
   • The AT S1E2R, AT S1E2W, TLBI VAE2, TLBI VALE2, TLBI VAE2IS, TLBI VALE2IS, TLBI ALLE2, and TLBI ALLE2IS System instructions are UNDEFINED.
   • Each AT S1E** System instruction executes as the corresponding AT S1E** instruction. For example, AT S1E0R executes as AT S1E0R.
   • Each of the TLBI IPAS2E1, TLBI IPAS2E1IS, TLBI IPAS2LE1, and TLBI IPAS2LE1IS System instructions executes as a NOP.
   • A TLBI VMALLS12E1 System instruction executes as TLBI VMALLE1, and a TLBI VMALLS12E1IS System instruction executes as TLBI VMALLE1IS.
1 Indicates that EL0 and EL1 are in Non-secure state, and so memory accesses from those Exception levels cannot access Secure memory.

Note
EL2 is not supported in the Secure state. When SCR_EL3.NS==0, it is not possible to enter EL2, and the EL2 state has no effect on execution. See Virtualization on page D1-1856.
Accessing the SCR_EL3

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCR_EL3</td>
<td>11</td>
<td>110</td>
<td>0001</td>
<td>0001</td>
<td>000</td>
</tr>
</tbody>
</table>

Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>NS</td>
</tr>
<tr>
<td>0 0 1</td>
<td>-</td>

<tr>
<td>1 0 1</td>
<td>-</td>
</tr>
<tr>
<td>1 1 1</td>
<td>-</td>
</tr>
</tbody>
</table>
D10.2.100  SCTLR_EL1, System Control Register (EL1)

The SCTLR_EL1 characteristics are:

Purpose

Provides top level control of the system, including its memory system, at EL1 and EL0.

Configurations

AArch64 System register SCTLR_EL1 is architecturally mapped to AArch32 System register SCTLR.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL1 using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

SCTLR_EL1 is a 32-bit register.

Field descriptions

The SCTLR_EL1 bit assignments are:

In ARMv8.3

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL1\&0 translation regime.

Possible values of this bit are:

0  Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.
1  Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.
Note

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In ARMv8.2, ARMv8.1 and ARMv8.0.

Reserved, RES0.

EnIB, bit [30]

In ARMv8.3

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

Possible values of this bit are:

0    Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.
1    Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.

Note

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In ARMv8.2, ARMv8.1 and ARMv8.0.

Reserved, RES0.

LSMAOE, bit [29]

In ARMv8.3 and ARMv8.2

Load Multiple and Store Multiple Atomicity and Ordering Enable. When the OPTIONAL feature ARMv8.2-LSMAOC is implemented, defined values are:

0    For all memory accesses at EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.
1    The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL0 is as defined for ARMv8.0.

This bit is permitted to be cached in a TLB.

If this bit is not implemented, it is RES1.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

This field resets to a value that is architecturally UNKNOWN.

In ARMv8.1 and ARMv8.0.

Reserved, RES1.

nTLSMD, bit [28]

In ARMv8.3 and ARMv8.2

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory. When the OPTIONAL feature ARMv8.2-LSMAOC is implemented, defined values are:

0    All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.
1

All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.
If this bit is not implemented, it is RES1.
When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.
This field resets to a value that is architecturally UNKNOWN.

**In ARMv8.1 and ARMv8.0.**

Reserved, RES1.

**EnDA, bit [27]**

**In ARMv8.3**

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL1&0 translation regime.
Possible values of this bit are:
0  Pointer authentication (using the APDAKey_EL1 key) of instruction addresses is not enabled.
1  Pointer authentication (using the APDAKey_EL1 key) of instruction addresses is enabled.

--- **Note** ---

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

---

**In ARMv8.2, ARMv8.1 and ARMv8.0.**

Reserved, RES0.

**UCI, bit [26]**

Traps EL0 execution of cache maintenance instructions to EL1, from AArch64 state only.
0  Any attempt to execute a DC CVAU, DC CVAC, DC CVAC, DC CVAP, or IC IVAU instruction at EL0 using AArch64 is trapped to EL1.
1  This control does not cause any instructions to be trapped.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.
If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.
If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the point of unification instruction can be trapped when the value of this control is 1.
If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate by VA to the point of unification instruction can be trapped when the value of this control is 1.
This field resets to a value that is architecturally UNKNOWN.

**EE, bit [25]**

Endianness of data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime.
The possible values of this bit are:

0  Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are little-endian.
1  Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.
If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.
The EE bit is permitted to be cached in a TLB.
When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1, 1\}, this bit has no effect on the PE.
When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to an IMPLEMENTATION DEFINED value.

E0E, bit [24]

Endianness of data accesses at EL0.
The possible values of this bit are:

0  Explicit data accesses at EL0 are little-endian.
1  Explicit data accesses at EL0 are big-endian.

If an implementation only supports Little-endian accesses at EL0 then this bit is RES0. This option is not permitted when SCTLR_EL1.EE is RES1.
If an implementation only supports Big-endian accesses at EL0 then this bit is RES1. This option is not permitted when SCTLR_EL1.EE is RES0.
This bit has no effect on the endianness of LDR, LDRH, LDRSH, STTR, and STRT instructions executed at EL1.
When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1, 1\}, this bit has no effect on execution at EL0.
If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

SPAN, bit [23]

In ARMv8.3, ARMv8.2 and ARMv8.1
Set Privileged Access Never, on taking an exception to EL1.
0  PSTATE.PAN is set to 1 on taking an exception to EL1.
1  The value of PSTATE.PAN is left unchanged on taking an exception to EL1.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1, 1\}, this bit has no effect on execution at EL0.
This field resets to a value that is architecturally UNKNOWN.

In ARMv8.0.

Reserved, RES1.

Bit [22]

Reserved, RES1.

IESB, bit [21]

In ARMv8.3 and ARMv8.2
Implicit error synchronization event enable. Possible values are:

0  Disabled.
1  An implicit error synchronization event is added:
   • After each exception taken to EL1.
• Before the operational pseudocode of each ERET instruction executed at EL1.

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSx instruction taken to EL1 and before each DRPS instruction executed at EL1, in addition to the other cases where it is added.

This field is part of ARMv8.2-IESB.

This field resets to a value that is architecturally UNKNOWN.

In ARMv8.1 and ARMv8.0.

Reserved, RES0.

Bit [20]

Reserved, RES1.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL1&0 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

0   This control has no effect on memory access permissions.
1   Any region that is writable in the EL1&0 translation regime is forced to XN for accesses from software executing at EL1 or EL0.

The WXN bit is permitted to be cached in a TLB.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

This field resets to a value that is architecturally UNKNOWN.

nTWE, bit [18]

Traps EL0 execution of WFE instructions to EL1, from both Execution states.

0   Any attempt to execute a WFE instruction at EL0 is trapped to EL1, if the instruction would otherwise have caused the PE to enter a low-power state.
1   This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

This field resets to a value that is architecturally UNKNOWN.

Bit [17]

Reserved, RES0.

nTWI, bit [16]

Traps EL0 execution of WFI instructions to EL1, from both Execution states.

0   Any attempt to execute a WFI instruction at EL0 is trapped EL1, if the instruction would otherwise have caused the PE to enter a low-power state.
1   This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.
----- Note -----  
Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1, 1\}, this bit has no effect on execution at EL0.

This field resets to a value that is architecturally UNKNOWN.

UCT, bit [15]  
Traps EL0 accesses to the CTR_EL0 to EL1, from AArch64 state only.

0    Accesses to the CTR_EL0 from EL0 using AArch64 are trapped to EL1.

1    This control does not cause any instructions to be trapped.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1, 1\}, this bit has no effect on execution at EL0.

This field resets to a value that is architecturally UNKNOWN.

DZE, bit [14]  
Traps EL0 execution of DC ZVA instructions to EL1, from AArch64 state only.

0    Any attempt to execute a DC ZVA instruction at EL0 using AArch64 is trapped to EL1. Reading DCZID_EL0.DZP from EL0 returns 1, indicating that DC ZVA instructions are not supported.

1    This control does not cause any instructions to be trapped.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1, 1\}, this bit has no effect on execution at EL0.

This field resets to a value that is architecturally UNKNOWN.

EnDB, bit [13]  
In ARMv8.3

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

Possible values of this bit are:

0    Pointer authentication (using the APDBKey_EL1 key) of instruction addresses is not enabled.

1    Pointer authentication (using the APDBKey_EL1 key) of instruction addresses is enabled.

----- Note -----  
This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In ARMv8.2, ARMv8.1 and ARMv8.0.

Reserved, RES0.

I, bit [12]  
Instruction access Cacheability control, for accesses at EL0 and EL1:

0    All instruction access to Normal memory from EL0 and EL1 are Non-cacheable for all levels of instruction and unified cache.
If the value of SCTLR_EL1.M is 0, instruction accesses from stage 1 of the EL1&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.

1 This control has no effect on the Cacheability of instruction access to Normal memory from EL0 and EL1.

If the value of SCTLR_EL1.M is 0, instruction accesses from stage 1 of the EL1&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

When the value of the HCR_EL2.DC bit is 1, then instruction access to Normal memory from EL0 and EL1 are Cacheable regardless of the value of the SCTLR_EL1.M bit.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

When this register has an architecturally-defined reset value, this field resets to 0.

Bit [11]
Reserved, RES1.

Bit [10]
Reserved, RES0.

UMA, bit [9]
User Mask Access. Traps EL0 execution of MSR and MRS instructions that access the PSTATE.{D, A, I, F} masks to EL1, from AArch64 state only.

0 Any attempt at EL0 using AArch64 to execute an MSR, MSR(register), or MSR(immediate) instruction that accesses the DAIF is trapped to EL1.

1 This control does not cause any instructions to be trapped.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

This field resets to a value that is architecturally UNKNOWN.

SED, bit [8]
SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.

0 SETEND instruction execution is enabled at EL0 using AArch32.

1 SETEND instructions are UNDEFINED at EL0 using AArch32.

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

If EL0 cannot use AArch32, this bit is RES1.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

ITD, bit [7]
IT Disable. Disables some uses of IT instructions at EL0 using AArch32.

0 All IT instruction functionality is enabled at EL0 using AArch32.

1 Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED:
   • All encodings of the IT instruction with hw1[3:0]=1000.
   • All encodings of the subsequent instruction with the following values for hw1:
     11xxxxxxxxxxxx
     All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.
D10.2 General system control registers

All instructions in Miscellaneous 16-bit instructions on page F3-3137.

ADD Rd, PC, #imm
LDR Rd, [PC, #imm]
ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.
ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers UNPREDICTABLE cases with BLX Rn.

These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.

It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:

• A 16-bit instruction, that can only be followed by another 16-bit instruction.
• The first half of a 32-bit instruction.

This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.

An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see Changes to an ITD control by an instruction in an IT block on page E1-2988

If EL0 cannot use AArch32, this bit is RES1.

ITD is optional, but if it is implemented in the SCTLR then it must also be implemented in the SCTLR_EL1. If it is not implemented then this bit is RAZ/WI.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

Bit [6]
Reserved, RES0.

CP15BEN, bit [5]

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==1111) encoding space from EL0:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is UNDEFINED.</td>
</tr>
<tr>
<td>1</td>
<td>EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is enabled.</td>
</tr>
</tbody>
</table>

If EL0 cannot use AArch32, this bit is RES0.

CP15BEN is optional, but if it is implemented in the SCTLR then it must also be implemented in the SCTLR_EL1. If it is not implemented then this bit is RAZ/WI.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.
SA0, bit [4]
SP Alignment check enable for EL0. When set to 1, if a load or store instruction executed at EL0 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see SP alignment checking on page D1-1868.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

This field resets to a value that is architecturally UNKNOWN.

SA, bit [3]
SP Alignment check enable. When set to 1, if a load or store instruction executed at EL1 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see SP alignment checking on page D1-1868.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

This field resets to a value that is architecturally UNKNOWN.

C, bit [2]
Cacheability control, for data accesses.
0 All data access to Normal memory from EL0 and EL1, and all Normal memory accesses to the EL1&0 stage 1 translation tables, are Non-cacheable for all levels of data and unified cache.
1 This control has no effect on the Cacheability of:
  • Data access to Normal memory from EL0 and EL1.
  • Normal memory accesses to the EL1&0 stage 1 translation tables.

When the value of the HCR_EL2.DC bit is 1, the PE ignores SCLTR.C. This means that Non-secure EL0 and Non-secure EL1 data accesses to Normal memory are Cacheable.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

When this register has an architecturally-defined reset value, this field resets to 0.

A, bit [1]
Alignment check enable. This is the enable bit for Alignment fault checking at EL1 and EL0:
0 Alignment fault checking disabled when executing at EL1 or EL0.
  Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.

1 Alignment fault checking enabled when executing at EL1 or EL0.
  All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

This field resets to a value that is architecturally UNKNOWN.

M, bit [0]
MMU enable for EL1 and EL0 stage 1 address translation. Possible values of this bit are:
0 EL1 and EL0 stage 1 address translation disabled.
  See the SCTLR_EL1.1 field for the behavior of instruction accesses to Normal memory.
1 EL1 and EL0 stage 1 address translation enabled.
If the value of HCR_EL2.{DC, TGE} is not \{0, 0\} then in Non-secure state the PE behaves as if the value of the SCTLR_EL1.M field is 0 for all purposes other than returning the value of a direct read of the field.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1, 1\}, this bit has no effect on the PE.

When this register has an architecturally-defined reset value, this field resets to 0.

**Accessing the SCTLR_EL1**

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCTLR_EL1</td>
<td>11</td>
<td>000</td>
<td>001</td>
<td>000</td>
<td>000</td>
</tr>
<tr>
<td>SCTLR_EL12</td>
<td>11</td>
<td>101</td>
<td>001</td>
<td>000</td>
<td>000</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>SCTLR_EL1</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>SCTLR_EL1</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>SCTLR_EL1</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>SCTLR_EL1</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>SCTLR_EL1</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>SCTLR_EL12</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>SCTLR_EL12</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>SCTLR_EL12</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>SCTLR_EL12</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>SCTLR_EL12</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

This table applies to all instructions that can access this register.

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic SCTLR_EL1 or SCTLR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.
Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor SCTLR_EL12 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor SCTLR_EL12 are trapped to EL2.
D10.2.101 SCTL_EL2, System Control Register (EL2)

The SCTL_EL2 characteristics are:

**Purpose**

Provides top level control of the system, including its memory system, at EL2.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1, 1\}, these controls apply also to execution at Non-secure EL0.

**Configurations**

AArch64 System register SCTL_EL2 is architecturally mapped to AArch32 System register HSCTLR.

If EL2 is not implemented, this register is RES0 from EL3.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

SCTL_EL2 is a 32-bit register.

**Field descriptions**

The SCTL_EL2 bit assignments are:

When HCR_EL2.{E2H, TGE} ≠ \{1, 1\}:

This format applies in all ARMv8.0 implementations, and from ARMv8.1 in Secure state.

**EnIA, bit [31]**

*In ARMv8.3*

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

Possible values of this bit are:

0    Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.
Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.

--- Note ---
This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

**In ARMv8.2, ARMv8.1 and ARMv8.0.**
Reserved, RES0.

**EnIB, bit [30]**

**In ARMv8.3**
Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL2&0 translation regime.
Possible values of this bit are:
0  Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.
1  Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.

--- Note ---
This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

**In ARMv8.2, ARMv8.1 and ARMv8.0.**
Reserved, RES0.

**Bits [29:28]**
Reserved, RES1.

**EnDA, bit [27]**

**In ARMv8.3**
Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL2&0 translation regime.
Possible values of this bit are:
0  Pointer authentication (using the APDAKey_EL1 key) of instruction addresses is not enabled.
1  Pointer authentication (using the APDAKey_EL1 key) of instruction addresses is enabled.

--- Note ---
This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

**In ARMv8.2, ARMv8.1 and ARMv8.0.**
Reserved, RES0.
Bit [26]

Reserved, RES0.

EE, bit [25]

Endianness of data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime.

The possible values of this bit are:

- 0: Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime are little-endian.
- 1: Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to an IMPLEMENTATION DEFINED value.

Bit [24]

Reserved, RES0.

Bits [23:22]

Reserved, RES1.

IESB, bit [21]

In ARMv8.3 and ARMv8.2

Implicit error synchronization event enable. Possible values are:

- 0: Disabled.
- 1: An implicit error synchronization event is added:
  - After each exception taken to EL2.
  - Before the operational pseudocode of each ERET instruction executed at EL2.

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSx instruction taken to EL2 and before each DRPS instruction executed at EL2, in addition to the other cases where it is added.

This field is part of ARMv8.2-IESB.

This field resets to a value that is architecturally UNKNOWN.

In ARMv8.1 and ARMv8.0.

Reserved, RES0.

Bit [20]

Reserved, RES0.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL2 or EL2&0 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

- 0: This control has no effect on memory access permissions.
Any region that is writable in the EL2 or EL2&0 translation regime is forced to XN for accesses from software executing at EL2.

The WXN bit is permitted to be cached in a TLB.

This field resets to a value that is architecturally UNKNOWN.

Bit [18]
Reserved, RES1.

Bit [17]
Reserved, RES0.

Bit [16]
Reserved, RES1.

Bits [15:14]
Reserved, RES0.

EnDB, bit [13]

In ARMv8.3
Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL2&0 translation regime.
Possible values of this bit are:
0 Pointer authentication (using the APDBKey_EL1 key) of instruction addresses is not enabled.
1 Pointer authentication (using the APDBKey_EL1 key) of instruction addresses is enabled.

Note
This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In ARMv8.2, ARMv8.1 and ARMv8.0.
Reserved, RES0.

I, bit [12]
Instruction access Cacheability control, for accesses at EL2:
0 All instruction access to Normal memory from EL2 are Non-cacheable for all levels of instruction and unified cache.
   If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
1 This control has no effect on the Cacheability of instruction access to Normal memory from EL2.
   If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.
This bit has no effect on the EL1&0 or EL3 translation regimes.
When this register has an architecturally-defined reset value, this field resets to 0.

Bit [11]
Reserved, RES1.
Bits [10:6]
Reserved, RES0.

Bits [5:4]
Reserved, RES1.

SA, bit [3]
SP Alignment check enable. When set to 1, if a load or store instruction executed at EL2 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see SP alignment checking on page D1-1868.
This field resets to a value that is architecturally UNKNOWN.

C, bit [2]
Cacheability control, for data accesses.
0 All data access to Normal memory from EL2, and all Normal memory accesses to the EL2 translation tables, are Non-cacheable for all levels of data and unified cache.
1 This control has no effect on the Cacheability of:
   • Data access to Normal memory from EL2.
   • Normal memory accesses to the EL2 translation tables.
This bit has no effect on the EL1&0 or EL3 translation regimes.
When this register has an architecturally-defined reset value, this field resets to 0.

A, bit [1]
Alignment check enable. This is the enable bit for Alignment fault checking at EL2:
0 Alignment fault checking disabled when executing at EL2.
   Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.
1 Alignment fault checking enabled when executing at EL2.
   All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.
Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.
This field resets to a value that is architecturally UNKNOWN.

M, bit [0]
MMU enable for EL2 stage 1 address translation. Possible values of this bit are:
0 EL2 stage 1 address translation disabled.
   See the SCTLR_EL2.I field for the behavior of instruction accesses to Normal memory.
1 EL2 stage 1 address translation enabled.
When this register has an architecturally-defined reset value, this field resets to 0.
When HCR_EL2.{E2H, TGE} == {1, 1}:

This format applies only from ARMv8.1 and only in Non-secure state when HCR_EL2.{E2H, TGE} == {1, 1}.

EnIA, bit [31]

In ARMv8.3

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

Possible values of this bit are:

0 Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.

1 Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.

Note

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

EnIB, bit [30]

In ARMv8.2 and ARMv8.1.

Reserved, RES0.

EnIB, bit [30]

In ARMv8.3

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

Possible values of this bit are:

0 Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.

1 Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.
Note

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

**In ARMv8.2 and ARMv8.1.**
Reserved, RES0.

**LSMAOE, bit [29]**

**In ARMv8.3 and ARMv8.2**

Load Multiple and Store Multiple Atomicity and Ordering Enable. When the OPTIONAL feature ARMv8.2-LSMAOC is implemented, defined values are:

0 For all memory accesses at EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.

1 The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL0 is as defined for ARMv8.0.

This bit is permitted to be cached in a TLB.
If this bit is not implemented, it is RES1.
This field resets to a value that is architecturally UNKNOWN.

**In ARMv8.1.**
Reserved, RES1.

**nTLSMD, bit [28]**

**In ARMv8.3 and ARMv8.2**

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory. When the OPTIONAL feature ARMv8.2-LSMAOC is implemented, defined values are:

0 All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.

1 All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.
If this bit is not implemented, it is RES1.
This field resets to a value that is architecturally UNKNOWN.

**In ARMv8.1.**
Reserved, RES1.

**EnDA, bit [27]**

**In ARMv8.3**

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

Possible values of this bit are:

0 Pointer authentication (using the APDAKey_EL1 key) of instruction addresses is not enabled.

1 Pointer authentication (using the APDAKey_EL1 key) of instruction addresses is enabled.
Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In ARMv8.2 and ARMv8.1.

Reserved, RES0.

UCI, bit [26]

Traps EL0 execution of cache maintenance instructions to EL2, from AArch64 state only.

0 Any attempt to execute a DC CVAU, DC CIVAC, DC CVAC, DC CVAP, or IC IVAU instruction at EL0 using AArch64 is trapped to EL2.

1 This control does not cause any instructions to be trapped.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the point of unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate by VA to the point of unification instruction can be trapped when the value of this control is 1.

This field resets to a value that is architecturally UNKNOWN.

EE, bit [25]

Endianness of data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL2&0 translation regime.

The possible values of this bit are:

0 Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL2&0 translation regime are little-endian.

1 Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL2&0 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to an IMPLEMENTATION DEFINED value.

E0E, bit [24]

Endianness of data accesses at EL0.

The possible values of this bit are:

0 Explicit data accesses at EL0 are little-endian.

1 Explicit data accesses at EL0 are big-endian.

If an implementation only supports Little-endian accesses at EL0 then this bit is RES0. This option is not permitted when SCTLR_EL1.EE is RES1.
If an implementation only supports Big-endian accesses at EL0 then this bit is RES1. This option is not permitted when SCTLR_EL1.EE is RES0.

This bit has no effect on the endianness of LDTR, LDTRH, LDTRSH, LDTRSW, STTR, and STTRH instructions executed at EL1.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

**SPAN, bit [23]**

Set Privileged Access Never, on taking an exception to EL2.

0 PSTATE.PAN is set to 1 on taking an exception to EL2.

1 The value of PSTATE.PAN is left unchanged on taking an exception to EL2.

This field resets to a value that is architecturally UNKNOWN.

**Bit [22]**

Reserved, RES1.

**IESB, bit [21]**

*In ARMv8.3 and ARMv8.2*

Implicit error synchronization event enable. Possible values are:

0 Disabled.

1 An implicit error synchronization event is added:
  - After each exception taken to EL2.
  - Before the operational pseudocode of each ERET instruction executed at EL2.

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its **Effective value** might be 0 or 1 regardless of the value of the field. If the **Effective value** of the field is 1, then an implicit error synchronization event is added after each DCPSx instruction taken to EL2 and before each DRPS instruction executed at EL2, in addition to the other cases where it is added.

This field is part of **ARMv8.2-IESB**.

This field resets to a value that is architecturally UNKNOWN.

*In ARMv8.1.*

Reserved, RES0.

**Bit [20]**

Reserved, RES1.

**WXN, bit [19]**

Write permission implies XN (Execute-never). For the EL2 or EL2&0 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

0 This control has no effect on memory access permissions.

1 Any region that is writable in the EL2 or EL2&0 translation regime is forced to XN for accesses from software executing at EL2.

The WXN bit is permitted to be cached in a TLB.

This field resets to a value that is architecturally UNKNOWN.

**nTWE, bit [18]**

Traps EL0 execution of WFE instructions to EL2, from both Execution states.

0 Any attempt to execute a WFE instruction at EL0 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state.

1 This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.
**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

This field resets to a value that is architecturally UNKNOWN.

**Bit [17]**

Reserved, RES0.

**nTWI, bit [16]**

Traps EL0 execution of WFI instructions to EL2, from both Execution states.

0 Any attempt to execute a WFI instruction at EL0 is trapped EL2, if the instruction would otherwise have caused the PE to enter a low-power state.

1 This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

This field resets to a value that is architecturally UNKNOWN.

**UCT, bit [15]**

Traps EL0 accesses to the CTR_EL0 to EL2, from AArch64 state only.

0 Accesses to the CTR_EL0 from EL0 using AArch64 are trapped to EL2.

1 This control does not cause any instructions to be trapped.

This field resets to a value that is architecturally UNKNOWN.

**DZE, bit [14]**

Traps EL0 execution of DC ZVA instructions to EL2, from AArch64 state only.

0 Any attempt to execute a DC ZVA instruction at EL0 using AArch64 is trapped to EL2. Reading DCZID_EL0.DZP from EL0 returns 1, indicating that DC ZVA instructions are not supported.

1 This control does not cause any instructions to be trapped.

This field resets to a value that is architecturally UNKNOWN.

**EnDB, bit [13]**

In ARMv8.3

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

Possible values of this bit are:

0 Pointer authentication (using the APDBKey_EL1 key) of instruction addresses is not enabled.

1 Pointer authentication (using the APDBKey_EL1 key) of instruction addresses is enabled.
--- Note ---
This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

---

In ARMv8.2 and ARMv8.1.
Reserved, RES0.

I, bit [12]
Instruction access Cacheability control, for accesses at EL2 and EL0:
0 All instruction access to Normal memory from EL2 and EL0 are Non-cacheable for all levels of instruction and unified cache.
   If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
1 This control has no effect on the Cacheability of instruction access to Normal memory from EL2 and EL0.
   If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.
This bit has no effect on the EL3 translation regimes.
When this register has an architecturally-defined reset value, this field resets to 0.

Bit [11]
Reserved, RES1.

Bits [10:9]
Reserved, RES0.

SED, bit [8]
SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.
0 SETEND instruction execution is enabled at EL0 using AArch32.
1 SETEND instructions are UNDEFINED at EL0 using AArch32.
If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.
If EL0 cannot use AArch32, this bit is RES1.
If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

ITD, bit [7]
IT Disable. Disables some uses of IT instructions at EL0 using AArch32.
0 All IT instruction functionality is enabled at EL0 using AArch32.
1 Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED:
   • All encodings of the IT instruction with hw1[3:0]=1000.
   • All encodings of the subsequent instruction with the following values for hw1:
     11xxxxxxxxxxxx
     All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.
     1011xxxxxxxx
     All instructions in Miscellaneous 16-bit instructions on page F3-3137.
ADD Rd, PC, #imm

LDR Rd, [PC, #imm]

ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.

ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers UNPREDICTABLE cases with BLX Rn.

These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.

It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:

- A 16-bit instruction, that can only be followed by another 16-bit instruction.
- The first half of a 32-bit instruction.

This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.

An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see Changes to an ITD control by an instruction in an IT block on page E1-2988

If EL0 cannot use AArch32, this bit is RES1.

ITD is optional, but if it is implemented in the SCTLR then it must also be implemented in the SCTLR_EL1. If it is not implemented then this bit is RAZ/WI.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

Bit [6]
Reserved, RES0.

CP15BEN, bit [5]
System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==1111) encoding space from EL0:

0 EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is UNDEFINED.
1 EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is enabled.

If EL0 cannot use AArch32, this bit is RES0.

CP15BEN is optional, but if it is implemented in the SCTLR then it must also be implemented in the SCTLR_EL1. If it is not implemented then this bit is RAO/WI.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

SA0, bit [4]
SP Alignment check enable for EL0. When set to 1, if a load or store instruction executed at EL0 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see SP alignment checking on page D1-1868. This field resets to a value that is architecturally UNKNOWN.

SA, bit [3]
SP Alignment check enable. When set to 1, if a load or store instruction executed at EL2 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see SP alignment checking on page D1-1868. This field resets to a value that is architecturally UNKNOWN.
C, bit [2]

Cacheability control, for data accesses.

0  All data access to Normal memory from EL2 and EL0, and all Normal memory accesses to the EL2&0 translation tables, are Non-cacheable for all levels of data and unified cache.

1  This control has no effect on the Cacheability of:
   • Data access to Normal memory from EL2 and EL0.
   • Normal memory accesses to the EL2&0 translation tables.

This bit has no effect on the EL3 translation regimes.

When this register has an architecturally-defined reset value, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL2 and EL0:

0  Alignment fault checking disabled when executing at EL2 and EL0.
   Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.

1  Alignment fault checking enabled when executing at EL2 and EL0.
   All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

This field resets to a value that is architecturally UNKNOWN.

M, bit [0]

MMU enable for EL2&0 stage 1 address translation. Possible values of this bit are:

0  EL2&0 stage 1 address translation disabled.
   See the SCTLR_EL2.I field for the behavior of instruction accesses to Normal memory.

1  EL2&1 stage 1 address translation enabled.

When this register has an architecturally-defined reset value, this field resets to 0.

Accessing the SCTLR_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCTLR_EL2</td>
<td>11</td>
<td>100</td>
<td>0001</td>
<td>0000</td>
<td>000</td>
</tr>
<tr>
<td>SCTLR_EL1</td>
<td>11</td>
<td>000</td>
<td>0001</td>
<td>0000</td>
<td>000</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>SCTLR_EL2</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>SCTLR_EL2</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>SCTLR_EL2</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>SCTLR_EL2</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>SCTLR_EL2</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>SCTLR_EL1</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>SCTLR_EL1</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>SCTLR_EL1</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>SCTLR_EL1</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>SCTLR_EL1</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

This table applies to all instructions that can access this register.

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic SCTLR_EL2 or SCTLR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
**D10.2.102  SCTLR_EL3, System Control Register (EL3)**

The SCTLR_EL3 characteristics are:

**Purpose**

Provides top level control of the system, including its memory system, at EL3.

**Configurations**

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL3 using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

SCTLR_EL3 is a 32-bit register.

**Field descriptions**

The SCTLR_EL3 bit assignments are:

```
| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10  6  5  4  3  2  1  0 |

| I      |  RES0  |  C     |  A     |  M     |  SA  |  RES1  |  RES1  |  EnDB  |  RES0  |      |      |      |
```

**EnIA, bit [31]**

*In ARMv8.3*

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL3 translation regime.

Possible values of this bit are:

- **0**: Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.
- **1**: Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.

**Note**

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.
In ARMv8.2, ARMv8.1 and ARMv8.0.
Reserved, RES0.

EnIB, bit [30]

In ARMv8.3
Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL3 translation regime.
Possible values of this bit are:
0 Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.
1 Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.

Note This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In ARMv8.2, ARMv8.1 and ARMv8.0.
Reserved, RES0.

Bits [29:28]
Reserved, RES1.

EnDA, bit [27]

In ARMv8.3
Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL3 translation regime.
Possible values of this bit are:
0 Pointer authentication (using the APDAKey_EL1 key) of instruction addresses is not enabled.
1 Pointer authentication (using the APDAKey_EL1 key) of instruction addresses is enabled.

Note This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In ARMv8.2, ARMv8.1 and ARMv8.0.
Reserved, RES0.

Bit [26]
Reserved, RES0.

EE, bit [25]
Endianness of data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime.
The possible values of this bit are:
0 Explicit data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime are little-endian.
Explicit data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to an IMPLEMENTATION DEFINED value.

**Bit [24]**

Reserved, RES0.

**Bits [23:22]**

Reserved, RES1.

**IESB, bit [21]**

*In ARMv8.3 and ARMv8.2*

Implicit error synchronization event enable. Possible values are:

- **0** Disabled.
- **1** An implicit error synchronization event is added:
  - After each exception taken to EL3.
  - Before the operational pseudocode of each ERET instruction executed at EL3.

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSx instruction taken to EL3 and before each DRPS instruction executed at EL3, in addition to the other cases where it is added.

This field is part of ARMv8.2-IESB.

This field resets to a value that is architecturally UNKNOWN.

*In ARMv8.1 and ARMv8.0*

Reserved, RES0.

**Bit [20]**

Reserved, RES0.

**WXN, bit [19]**

Write permission implies XN (Execute-never). For the EL3 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

- **0** This control has no effect on memory access permissions.
- **1** Any region that is writable in the EL3 translation regime is forced to XN for accesses from software executing at EL3.

The WXN bit is permitted to be cached in a TLB.

This field resets to a value that is architecturally UNKNOWN.

Reserved, RES1.
Bits [15:14]  
Reserved, RES0.

EnDB, bit [13]  
In ARMv8.3  
Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL3 translation regime.  
Possible values of this bit are:

0  Pointer authentication (using the APDBKey_EL1 key) of instruction addresses is not enabled.
1  Pointer authentication (using the APDBKey_EL1 key) of instruction addresses is enabled.

——— Note ————
This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In ARMv8.2, ARMv8.1 and ARMv8.0.  
Reserved, RES0.

I, bit [12]  
Instruction access Cacheability control, for accesses at EL3:

0  All instruction access to Normal memory from EL3 are Non-cacheable for all levels of instruction and unified cache.  
   If the value of SCTLR_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.

1  This control has no effect on the Cacheability of instruction access to Normal memory from EL3.  
   If the value of SCTLR_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.  
When this register has an architecturally-defined reset value, this field resets to 0.

Bit [11]  
Reserved, RES1.

Bits [10:6]  
Reserved, RES0.

Bits [5:4]  
Reserved, RES1.

SA, bit [3]  
SP Alignment check enable. When set to 1, if a load or store instruction executed at EL3 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see SP alignment checking on page D1-1868.

This field resets to a value that is architecturally UNKNOWN.
C, bit [2]

Cacheability control, for data accesses.

0 All data access to Normal memory from EL3, and all Normal memory accesses to the EL3 translation tables, are Non-cacheable for all levels of data and unified cache.

1 This control has no effect on the Cacheability of:
   • Data access to Normal memory from EL3.
   • Normal memory accesses to the EL3 translation tables.

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.

When this register has an architecturally-defined reset value, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL3:

0 Alignment fault checking disabled when executing at EL3.

Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.

1 Alignment fault checking enabled when executing at EL3.

All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

This field resets to a value that is architecturally UNKNOWN.

M, bit [0]

MMU enable for EL3 stage 1 address translation. Possible values of this bit are:

0 EL3 stage 1 address translation disabled.

See the SCTLR_EL3.I field for the behavior of instruction accesses to Normal memory.

1 EL3 stage 1 address translation enabled.

When this register has an architecturally-defined reset value, this field resets to 0.

Accessing the SCTLR_EL3

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCTLR_EL3</td>
<td>11</td>
<td>110</td>
<td>0001</td>
<td>0000</td>
<td>000</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td></td>
</tr>
<tr>
<td>TGE</td>
<td></td>

<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>
D10.2.103 TCR_EL1, Translation Control Register (EL1)

The TCR_EL1 characteristics are:

**Purpose**

The control register for stage 1 of the EL1&0 translation regime.

**Configurations**

AArch64 System register TCR_EL1[31:0] is architecturally mapped to AArch32 System register TTBCR.

AArch64 System register TCR_EL1[63:32] is architecturally mapped to AArch32 System register TTBCR2.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

TCR_EL1 is a 64-bit register.

**Field descriptions**

The TCR_EL1 bit assignments are:

Any of the bits in TCR_EL1 are permitted to be cached in a TLB.

**Bits [63:55]**

Reserved, RES0.

**NFD1, bit [54]**

*In ARMv8.3 and ARMv8.2*

Present only if SVE is implemented.

Non-fault translation table walk disable for translations using TTBR1_EL1.

This bit controls whether to perform a translation table walk in response to an SVE non-fault access from EL0 for an address that is translated using TTBR1_EL1. The affected access types are:

- All accesses due to an SVE non-fault contiguous load instruction.
• Only the speculative accesses due to an SVE first-fault gather load. Speculative accesses due to an SVE first-fault contiguous load are not affected.
• Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

See *The Scalable Vector Extension (SVE)* on page A1-72 for more information.

Defined values are:

0   Perform translation table walks using TTBR1_EL1.
1   A TLB miss on an address that is translated using TTBR1_EL1 due to an SVE non-fault access generates a Translation fault. No translation table walk is performed.

If SVE is not implemented, this field is RES0.

In *ARMv8.1 and ARMv8.0.*

Reserved, RES0.

NFD0, bit [53]

In *ARMv8.3 and ARMv8.2*  
Present only if SVE is implemented.

Non-fault translation table walk disable for translations using TTBR0_EL1.

This bit controls whether to perform a translation table walk in response to an SVE non-fault access from EL0 for an address that is translated using TTBR0_EL1. The affected access types are:

• All accesses due to an SVE non-fault contiguous load instruction.
• Only the speculative accesses due to an SVE first-fault gather load. Speculative accesses due to an SVE first-fault contiguous load are not affected.
• Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

See *The Scalable Vector Extension (SVE)* on page A1-72 for more information.

Defined values are:

0   Perform translation table walks using TTBR0_EL1.
1   A TLB miss on an address that is translated using TTBR0_EL1 due to an SVE non-fault access generates a Translation fault. No translation table walk is performed.

If SVE is not implemented, this field is RES0.

In *ARMv8.1 and ARMv8.0.*

Reserved, RES0.

TBID1, bit [52]

In *ARMv8.3*  
Present only if ARMv8.3-PAuth is implemented.

Controls the use of the top byte of instruction addresses for address matching. Defined values are:

0   TCR_EL1.TBI1 applies to Instruction and Data accesses.
1   TCR_EL1.TBI1 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by TTBR1_EL1.

If ARMv8.3-PAuth is not implemented, this field is RES0.

In *ARMv8.2, ARMv8.1 and ARMv8.0.*

Reserved, RES0.

TBID0, bit [51]

In *ARMv8.3*  
Present only if ARMv8.3-PAuth is implemented.
Controls the use of the top byte of instruction addresses for address matching. Defined values are:

- **0**: TCR_EL1.TBI0 applies to Instruction and Data accesses.
- **1**: TCR_EL1.TBI0 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by TTBR0_EL1.

If ARMv8.3-PAuth is not implemented, this field is **RES0**.

**In ARMv8.2, ARMv8.1 and ARMv8.0.**

Reserved, **RES0**.

**HWU162, bit [50]**

**In ARMv8.3 and ARMv8.2**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL1.

Defined values are:

- **0**: For translations using TTBR1_EL1, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- **1**: For translations using TTBR1_EL1, bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

This bit is **RES0** if ARMv8.2-TTPBHA is not implemented.

The **Effective value** of this field is 0 if the value of TCR_EL1.HPD1 is 0.

**In ARMv8.1 and ARMv8.0.**

Reserved, **RES0**.

**HWU161, bit [49]**

**In ARMv8.3 and ARMv8.2**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL1.

Defined values are:

- **0**: For translations using TTBR1_EL1, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- **1**: For translations using TTBR1_EL1, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

This bit is **RES0** if ARMv8.2-TTPBHA is not implemented.

The **Effective value** of this field is 0 if the value of TCR_EL1.HPD1 is 0.

**In ARMv8.1 and ARMv8.0.**

Reserved, **RES0**.

**HWU160, bit [48]**

**In ARMv8.3 and ARMv8.2**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL1.

Defined values are:

- **0**: For translations using TTBR1_EL1, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- **1**: For translations using TTBR1_EL1, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

This bit is **RES0** if ARMv8.2-TTPBHA is not implemented.
The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

In ARMv8.1 and ARMv8.0.
Reserved, RES0.

HWU159, bit [47]

In ARMv8.3 and ARMv8.2

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL1.

Defined values are:

0 For translations using TTBR1_EL1, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
1 For translations using TTBR1_EL1, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

This bit is RES0 if ARMv8.2-TTPBHA is not implemented.

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

In ARMv8.1 and ARMv8.0.
Reserved, RES0.

HWU062, bit [46]

In ARMv8.3 and ARMv8.2

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

Defined values are:

0 For translations using TTBR0_EL1, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
1 For translations using TTBR0_EL1, bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

This bit is RES0 if ARMv8.2-TTPBHA is not implemented.

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

In ARMv8.1 and ARMv8.0.
Reserved, RES0.

HWU061, bit [45]

In ARMv8.3 and ARMv8.2

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

Defined values are:

0 For translations using TTBR0_EL1, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
1 For translations using TTBR0_EL1, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

This bit is RES0 if ARMv8.2-TTPBHA is not implemented.

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

In ARMv8.1 and ARMv8.0.
Reserved, RES0.
HWU060, bit [44]

In ARMv8.3 and ARMv8.2

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

Defined values are:

0  For translations using TTBR0_EL1, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
1  For translations using TTBR0_EL1, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

This bit is RES0 if ARMv8.2-TTPBHA is not implemented.

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

In ARMv8.1 and ARMv8.0.

Reserved, RES0.

HWU059, bit [43]

In ARMv8.3 and ARMv8.2

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

Defined values are:

0  For translations using TTBR0_EL1, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
1  For translations using TTBR0_EL1, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

This bit is RES0 if ARMv8.2-TTPBHA is not implemented.

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

In ARMv8.1 and ARMv8.0.

Reserved, RES0.

HPD1, bit [42]

In ARMv8.3, ARMv8.2 and ARMv8.1

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR1_EL1.

Defined values are:

0  Hierarchical permissions are enabled.
1  Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

This bit is RES0 if ARMv8.1-HPD is not implemented.

In ARMv8.0.

Reserved, RES0.

HPD0, bit [41]

In ARMv8.3, ARMv8.2 and ARMv8.1

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR0_EL1.

Defined values are:

0  Hierarchical permissions are enabled.
1  Hierarchical permissions are disabled.
When disabled, the permissions are treated as if the bits are zero.
This bit is RES0 if ARMv8.1-HPD is not implemented.

In ARMv8.0.
Reserved, RES0.

HD, bit [40]

In ARMv8.3, ARMv8.2 and ARMv8.1
Hardware management of dirty state in stage 1 translations from EL0 and EL1.
Defined values are:
0 Stage 1 hardware management of dirty state disabled.
1 Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.
This bit is RES0 if ARMv8.1-TTHM is not implemented.

In ARMv8.0.
Reserved, RES0.

HA, bit [39]

In ARMv8.3, ARMv8.2 and ARMv8.1
Hardware Access flag update in stage 1 translations from EL0 and EL1.
Defined values are:
0 Stage 1 Access flag update disabled.
1 Stage 1 Access flag update enabled.
This bit is RES0 if ARMv8.1-TTHM is not implemented.

In ARMv8.0.
Reserved, RES0.

TBI1, bit [38]
Top Byte ignored - indicates whether the top byte of an address is used for address match for the TTBR1_EL1 region, or ignored and used for tagged addresses. Defined values are:
0 Top Byte used in the address calculation.
1 Top Byte ignored in the address calculation.
This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by TTBR1_EL1. It has an effect whether the EL1&0 translation regime is enabled or not.
If ARMv8.3-PAuth is implemented and TCR_EL1.TBID1 is 1, then this field only applies to Data accesses.
Otherwise, if the value of TBI1 is 1 and bit [55] of the target address to be stored to the PC is 1, then bits[63:56] of that target address are also set to 1 before the address is stored in the PC, in the following cases:
• A branch or procedure return within EL0 or EL1.
• An exception taken to EL1.
• An exception return to EL0 or EL1.

TBI0, bit [37]
Top Byte ignored - indicates whether the top byte of an address is used for address match for the TTBR0_EL1 region, or ignored and used for tagged addresses. Defined values are:
0 Top Byte used in the address calculation.
1 Top Byte ignored in the address calculation.
This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by TTBR0_EL1. It has an effect whether the EL1&0 translation regime is enabled or not.

If ARMv8.3-PAuth is implemented and TCR_EL1.TBID0 is 1, then this field only applies to Data accesses.

Otherwise, if the value of TB10 is 1 and bit [55] of the target address to be stored to the PC is 1, then bits[63:56] of that target address are also set to 1 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

AS, bit [36]

ASID Size. Defined values are:

- 0 8 bit - the upper 8 bits of TTBR0_EL1 and TTBR1_EL1 are ignored by hardware for every purpose except reading back the register, and are treated as if they are all zeros for when used for allocation and matching entries in the TLB.
- 1 16 bit - the upper 16 bits of TTBR0_EL1 and TTBR1_EL1 are used for allocation and matching in the TLB.

If the implementation has only 8 bits of ASID, this field is RES0.

Bit [35]

Reserved, RES0.

IPS, bits [34:32]

Intermediate Physical Address Size.

- 000 32 bits, 4GB.
- 001 36 bits, 64GB.
- 010 40 bits, 1TB.
- 011 42 bits, 4TB.
- 100 44 bits, 16TB.
- 101 48 bits, 256TB.
- 110 52 bits, 4PB

Other values are reserved.

The reserved values behave in the same way as the 101 or 110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

The value 110 is permitted only if ARMv8.2-LPA is implemented and the translation granule size is 64KB.

In an implementation that supports 52-bit PAs, if the value of this field is not 110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL1 are 0000.

TG1, bits [31:30]

Granule size for the TTBR1_EL1.

- 01 16KB
- 10 4KB
- 11 64KB

Other values are reserved.
If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

**SH1, bits [29:28]**
Shareability attribute for memory associated with translation table walks using TTBR1_EL1.
Defined values are:
- 00 Non-shareable
- 10 Outer Shareable
- 11 Inner Shareable
Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONstrained Unpredictable, as described in Reserved values in System and memory-mapped registers and translation table entries on page K1-6427.

**ORGN1, bits [27:26]**
Outer cacheability attribute for memory associated with translation table walks using TTBR1_EL1.
- 00 Normal memory, Outer Non-cacheable
- 01 Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable
- 10 Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable
- 11 Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable

**IRGN1, bits [25:24]**
Inner cacheability attribute for memory associated with translation table walks using TTBR1_EL1.
- 00 Normal memory, Inner Non-cacheable
- 01 Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable
- 10 Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable
- 11 Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable

**EPD1, bit [23]**
Translation table walk disable for translations using TTBR1_EL1. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR1_EL1. The encoding of this bit is:
- 0 Perform translation table walks using TTBR1_EL1.
- 1 A TLB miss on an address that is translated using TTBR1_EL1 generates a Translation fault. No translation table walk is performed.

**A1, bit [22]**
Selects whether TTBR0_EL1 or TTBR1_EL1 defines the ASID. The encoding of this bit is:
- 0 TTBR0_EL1.ASID defines the ASID.
- 1 TTBR1_EL1.ASID defines the ASID.

**T1SZ, bits [21:16]**
The size offset of the memory region addressed by TTBR1_EL1. The region size is $2^{(64-\text{T1SZ})}$ bytes. The maximum and minimum possible values for T1SZ depend on the level of translation table and the memory translation granularity size, as described in the AArch64 Virtual Memory System Architecture chapter.
TG0, bits [15:14]
Granule size for the TTBR0_EL1.
00 4KB
01 64KB
10 16KB
Other values are reserved.
If the value is programmed to either a reserved value, or a size that has not been implemented, then
the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED
choice of the sizes that has been implemented for all purposes other than the value read back from
this register.
It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value
that corresponds to the size chosen.

SH0, bits [13:12]
Shareability attribute for memory associated with translation table walks using TTBR0_EL1.
00 Non-shareable
10 Outer Shareable
11 Inner Shareable
Other values are reserved. The effect of programming this field to a Reserved value is that behavior
is CONSTRAINED UNPREDICTABLE, as described in Reserved values in System and memory-mapped
registers and translation table entries on page K1-6427.

ORGN0, bits [11:10]
Outer cacheability attribute for memory associated with translation table walks using TTBR0_EL1.
00 Normal memory, Outer Non-cacheable
01 Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable
10 Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable
11 Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable

IRGN0, bits [9:8]
Inner cacheability attribute for memory associated with translation table walks using TTBR0_EL1.
00 Normal memory, Inner Non-cacheable
01 Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable
10 Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable
11 Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable

EPD0, bit [7]
Translation table walk disable for translations using TTBR0_EL1. This bit controls whether a
translation table walk is performed on a TLB miss, for an address that is translated using
TTBR0_EL1. The encoding of this bit is:
0 Perform translation table walks using TTBR0_EL1.
1 A TLB miss on an address that is translated using TTBR0_EL1 generates a Translation
fault. No translation table walk is performed.

Bit [6]
Reserved, RES0.

T0SZ, bits [5:0]
The size offset of the memory region addressed by TTBR0_EL1. The region size is \(2^{64-T0SZ}\) bytes.
The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

**Accessing the TCR_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCR_EL1</td>
<td>11</td>
<td>000</td>
<td>0010</td>
<td>0000</td>
<td>010</td>
</tr>
<tr>
<td>TCR_EL12</td>
<td>11</td>
<td>101</td>
<td>0010</td>
<td>0000</td>
<td>010</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>

</tr>
</tbody>
</table>

This table applies to all instructions that can access this register.

When **HCR_EL2**[E2H] is 1, without explicit synchronization, access from EL3 using the mnemonic **TCR_EL1** or **TCR_EL12** are not guaranteed to be ordered with respect to accesses using the other mnemonic.
Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor TCR_EL12 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor TCR_EL12 are trapped to EL2.
D10.2.104 TCR_EL2, Translation Control Register (EL2)

The TCR_EL2 characteristics are:

Purpose

The control register for stage 1 of the EL2, or EL2&0, translation regime:

- When the Effective value of HCR_EL2.E2H is 0, this register controls stage 1 of the EL2 translation regime, that supports a single VA range, translated using TTBR0_EL2.
- When the value of HCR_EL2.E2H is 1, this register controls stage 1 of the EL2&0 translation regime, that supports both:
  - A lower VA range, translated using TTBR0_EL2.
  - A higher VA range, translated using TTBR1_EL2.

Configurations

AArch64 System register TCR_EL2 is architecturally mapped to AArch32 System register HTCR.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TCR_EL2 is a 64-bit register.

Field descriptions

The TCR_EL2 bit assignments are:

When HCR_EL2.E2H==0:

This format applies in Secure state, and in all Armv8.0 implementations.

Any of the bits in TCR_EL2 are permitted to be cached in a TLB.

Bits [63:32]

Reserved, RES0.

Bit [31]

Reserved, RES1.

Bit [30]

Reserved, RES0.
TBID, bit [29]

**In ARMv8.3**

Present only if ARMv8.3-PAuth is implemented.

Controls the use of the top byte of instruction addresses for address matching. Defined values are:

0  TCR_EL2.TBI applies to Instruction and Data accesses.
1  TCR_EL2.TBI applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by TTBR0_EL2.

If ARMv8.3-PAuth is not implemented, this field is RES0.

**In ARMv8.2, ARMv8.1 and ARMv8.0.**

Reserved, RES0.

HWU62, bit [28]

**In ARMv8.3 and ARMv8.2**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

Defined values are:

0  Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
1  Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.

This bit is RES0 if ARMv8.2-TTPBHA is not implemented.

The *Effective value* of this field is 0 if the value of TCR_EL2.HPD is 0.

**In ARMv8.1 and ARMv8.0.**

Reserved, RES0.

HWU61, bit [27]

**In ARMv8.3 and ARMv8.2**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

Defined values are:

0  Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
1  Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.

This field is RES0 if ARMv8.2-TTPBHA is not implemented.

The *Effective value* of this field is 0 if the value of TCR_EL2.HPD is 0.

**In ARMv8.1 and ARMv8.0.**

Reserved, RES0.

HWU60, bit [26]

**In ARMv8.3 and ARMv8.2**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

Defined values are:

0  Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
1  Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.
This bit is RES0 if ARMv8.2-TTPBHA is not implemented.
The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

In ARMv8.1 and ARMv8.0.
Reserved, RES0.

HWU59, bit [25]

In ARMv8.3 and ARMv8.2
Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.
Defined values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>1</td>
<td>Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.</td>
</tr>
</tbody>
</table>

This bit is RES0 if ARMv8.2-TTPBHA is not implemented.
The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

In ARMv8.1 and ARMv8.0.
Reserved, RES0.

HPD, bit [24]

In ARMv8.3, ARMv8.2 and ARMv8.1
Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR0_EL2.
Defined values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Hierarchical permissions are enabled.</td>
</tr>
<tr>
<td>1</td>
<td>Hierarchical permissions are disabled.</td>
</tr>
</tbody>
</table>

Note
In this case bit[61] (APTable[0]) and bit[59] (PXNTable) of the next level descriptor attributes are required to be ignored by the PE, and are no longer reserved, allowing them to be used by software.

When disabled, the permissions are treated as if the bits are zero.
This bit is RES0 if ARMv8.1-HPD is not implemented.

In ARMv8.0.
Reserved, RES0.

Bit [23]
Reserved, RES1.

HD, bit [22]

In ARMv8.3, ARMv8.2 and ARMv8.1
Hardware management of dirty state in stage 1 translations from EL2.
Defined values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Stage 1 hardware management of dirty state disabled.</td>
</tr>
<tr>
<td>1</td>
<td>Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.</td>
</tr>
</tbody>
</table>

This bit is RES0 if ARMv8.1-TTHM is not implemented.

In ARMv8.0.
Reserved, RES0.
HA, bit [21]

**In ARMv8.3, ARMv8.2 and ARMv8.1**

Hardware Access flag update in stage 1 translations from EL2.

Defined values are:

0  Stage 1 Access flag update disabled.
1  Stage 1 Access flag update enabled.

This bit is RES0 if ARMv8.1-TTHM is not implemented.

**In ARMv8.0.**

Reserved, RES0.

TBI, bit [20]

Top Byte ignored - indicates whether the top byte of an address is used for address match for the TTBR0_EL2 region, or ignored and used for tagged addresses.

0  Top Byte used in the address calculation.
1  Top Byte ignored in the address calculation.

This affects addresses generated in EL2 using AArch64 where the address would be translated by tables pointed to by TTBR0_EL2. It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If ARMv8.3-PAuth is implemented and TCR_EL2.TBID is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI is 1, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL2.
- An exception taken to EL2.
- An exception return to EL2.

Bit [19]

Reserved, RES0.

PS, bits [18:16]

Physical Address Size.

000  32 bits, 4GB.
001  36 bits, 64GB.
010  40 bits, 1TB.
011  42 bits, 4TB.
100  44 bits, 16TB.
101  48 bits, 256TB.
110  52 bits, 4PB

Other values are reserved.

The reserved values behave in the same way as the 101 or 110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

The value 110 is permitted only if ARMv8.2-LPA is implemented and the translation granule size is 64KB.

In an implementation that supports 52-bit PAs, if the value of this field is not 110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL2 are 0000.
TG0, bits [15:14]

Granule size for the TTBR0_EL2.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>4KB</td>
</tr>
<tr>
<td>01</td>
<td>64KB</td>
</tr>
<tr>
<td>10</td>
<td>16KB</td>
</tr>
</tbody>
</table>

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using TTBR0_EL2.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Non-shareable</td>
</tr>
<tr>
<td>10</td>
<td>Outer Shareable</td>
</tr>
<tr>
<td>11</td>
<td>Inner Shareable</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in Reserved values in System and memory-mapped registers and translation table entries on page K1-6427.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using TTBR0_EL2.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Normal memory, Outer Non-cacheable</td>
</tr>
<tr>
<td>01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable</td>
</tr>
<tr>
<td>10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable</td>
</tr>
<tr>
<td>11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable</td>
</tr>
</tbody>
</table>

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using TTBR0_EL2.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Normal memory, Inner Non-cacheable</td>
</tr>
<tr>
<td>01</td>
<td>Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable</td>
</tr>
<tr>
<td>10</td>
<td>Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable</td>
</tr>
<tr>
<td>11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable</td>
</tr>
</tbody>
</table>

Bits [7:6]

Reserved, RES0.

T0SZ, bits [5:0]

The size offset of the memory region addressed by TTBR0_EL2. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.
When HCR_EL2.E2H==1:

This view of the register is only valid from ARMv8.1, in Non-secure state, when HCR_EL2.E2H is 1.

Any of the bits in TCR_EL2 are permitted to be cached in a TLB.

**Bits [63:55]**

Reserved, RES0.

**NFD1, bit [54]**

In ARMv8.3 and ARMv8.2

Present only if SVE is implemented.

Non-fault translation table walk disable for translations using TTBR1_EL2.

This bit controls whether to perform a translation table walk in response to an SVE non-fault access from EL0 for an address that is translated using TTBR1_EL2. The affected access types are:

- All accesses due to an SVE non-fault contiguous load instruction.
- Only the speculative accesses due to an SVE first-fault gather load. Speculative accesses due to an SVE first-fault contiguous load are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

See *The Scalable Vector Extension (SVE)* on page A1-72 for more information.

Defined values are:

- 0: Perform translation table walks using TTBR1_EL2.
- 1: A TLB miss on an address that is translated using TTBR1_EL2 due to an SVE non-fault access generates a Translation fault. No translation table walk is performed.

If SVE is not implemented, this field is RES0.

In ARMv8.1

Reserved, RES0.

**NFD0, bit [53]**

In ARMv8.3 and ARMv8.2

Present only if SVE is implemented.
Non-fault translation table walk disable for translations using TTBR0_EL2.

This bit controls whether to perform a translation table walk in response to an SVE non-fault access from EL0 for an address that is translated using TTBR0_EL2. The affected access types are:

- All accesses due to an SVE non-fault contiguous load instruction.
- Only the speculative accesses due to an SVE first-fault gather load. Speculative accesses due to an SVE first-fault contiguous load are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

See The Scalable Vector Extension (SVE) on page A1-72 for more information.

Defined values are:
0 Perform translation table walks using TTBR0_EL2.
1 A TLB miss on an address that is translated using TTBR0_EL2 due to an SVE non-fault access generates a Translation fault. No translation table walk is performed.

If SVE is not implemented, this field is RES0.

In ARMv8.1.
Reserved, RES0.

TBID1, bit [52]

In ARMv8.3
Present only if ARMv8.3-PAuth is implemented.
Controls the use of the top byte of instruction addresses for address matching. Defined values are:
0 TCR_EL2.TBI1 applies to Instruction and Data accesses.
1 TCR_EL2.TBI1 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by TTBR1_EL2.
If ARMv8.3-PAuth is not implemented, this field is RES0.

In ARMv8.2 and ARMv8.1.
Reserved, RES0.

TBID0, bit [51]

In ARMv8.3
Present only if ARMv8.3-PAuth is implemented.
Controls the use of the top byte of instruction addresses for address matching. Defined values are:
0 TCR_EL2.TBI0 applies to Instruction and Data accesses.
1 TCR_EL2.TBI0 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by TTBR0_EL2.
If ARMv8.3-PAuth is not implemented, this field is RES0.

In ARMv8.2 and ARMv8.1.
Reserved, RES0.

HWU162, bit [50]

In ARMv8.3 and ARMv8.2
Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL2.
Defined values are:
0 For translations using TTBR1_EL2, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
1 For translations using TTBR1_EL2, bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

This bit is RES0 if ARMv8.2-TTPBHA is not implemented.
The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

**In ARMv8.1.**
Reserved, RES0.

**HWU161, bit [49]**

**In ARMv8.3 and ARMv8.2**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL2.

Defined values are:

0 For translations using TTBR1_EL2, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

1 For translations using TTBR1_EL2, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

This bit is RES0 if ARMv8.2-TTPBHA is not implemented.
The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

**In ARMv8.1.**
Reserved, RES0.

**HWU160, bit [48]**

**In ARMv8.3 and ARMv8.2**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL2.

Defined values are:

0 For translations using TTBR1_EL2, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

1 For translations using TTBR1_EL2, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

This bit is RES0 if ARMv8.2-TTPBHA is not implemented.
The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

**In ARMv8.1.**
Reserved, RES0.

**HWU159, bit [47]**

**In ARMv8.3 and ARMv8.2**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL2.

Defined values are:

0 For translations using TTBR1_EL2, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

1 For translations using TTBR1_EL2, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

This bit is RES0 if ARMv8.2-TTPBHA is not implemented.
The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.
**In ARMv8.1.**

Reserved, RES0.

HWU062, bit [46]

**In ARMv8.3 and ARMv8.2**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

Defined values are:

0 For translations using TTBR0_EL1, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

1 For translations using TTBR0_EL1, bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

This bit is RES0 if ARMv8.2-TTPBHA is not implemented.

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

**In ARMv8.1.**

Reserved, RES0.

HWU061, bit [45]

**In ARMv8.3 and ARMv8.2**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

Defined values are:

0 For translations using TTBR0_EL1, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

1 For translations using TTBR0_EL1, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

This bit is RES0 if ARMv8.2-TTPBHA is not implemented.

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

**In ARMv8.1.**

Reserved, RES0.

HWU060, bit [44]

**In ARMv8.3 and ARMv8.2**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

Defined values are:

0 For translations using TTBR0_EL1, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

1 For translations using TTBR0_EL1, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

This bit is RES0 if ARMv8.2-TTPBHA is not implemented.

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

**In ARMv8.1.**

Reserved, RES0.
HWU059, bit [43]

*In ARMv8.3 and ARMv8.2*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

Defined values are:

0  For translations using TTBR0_EL1, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

1  For translations using TTBR0_EL1, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

This bit is RES0 if ARMv8.2-TTPBHA is not implemented.

The *Effective value* of this field is 0 if the value of TCR_EL2.HPD0 is 0.

*In ARMv8.1.*

Reserved, RES0.

HPD1, bit [42]

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR1_EL2.

Defined values are:

0  Hierarchical permissions are enabled.

1  Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

This bit is RES0 if ARMv8.1-HPD is not implemented.

HPD0, bit [41]

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR0_EL2.

Defined values are:

0  Hierarchical permissions are enabled.

1  Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

This bit is RES0 if ARMv8.1-HPD is not implemented.

HD, bit [40]

Hardware management of dirty state in stage 1 translations from EL2.

Defined values are:

0  Stage 1 hardware management of dirty state disabled.

1  Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.

This bit is RES0 if ARMv8.1-TTHM is not implemented.

HA, bit [39]

Hardware Access flag update in stage 1 translations from EL2.

Defined values are:

0  Stage 1 Access flag update disabled.

1  Stage 1 Access flag update enabled.

This bit is RES0 if ARMv8.1-TTHM is not implemented.
TBII, bit [38]

Top Byte ignored - indicates whether the top byte of an address is used for address match for the TTBR1_EL2 region, or ignored and used for tagged addresses. Defined values are:

0  Top Byte used in the address calculation.
1  Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL2 using AArch64 where the address would be translated by tables pointed to by TTBR1_EL2. It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If ARMv8.3-PAuth is implemented and TCR_EL2.TBID1 is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBII is 1 and bit [55] of the target address to be stored to the PC is 1, then bits[63:56] of that target address are also set to 1 before the address is stored in the PC, in the following cases:

• A branch or procedure return within EL0 or EL1.
• An exception taken to EL1.
• An exception return to EL0 or EL1.

TBIO, bit [37]

Top Byte ignored - indicates whether the top byte of an address is used for address match for the TTBR0_EL2 region, or ignored and used for tagged addresses. Defined values are:

0  Top Byte used in the address calculation.
1  Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL2 using AArch64 where the address would be translated by tables pointed to by TTBR0_EL2. It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If ARMv8.3-PAuth is implemented and TCR_EL2.TBIO0 is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBIO is 1 and bit [55] of the target address to be stored to the PC is 1, then bits[63:56] of that target address are also set to 1 before the address is stored in the PC, in the following cases:

• A branch or procedure return within EL0 or EL1.
• An exception taken to EL1.
• An exception return to EL0 or EL1.

AS, bit [36]

ASID Size. Defined values are:

0  8 bit - the upper 8 bits of TTBR0_EL2 and TTBR1_EL2 are ignored by hardware for every purpose except reading back the register, and are treated as if they are all zeros for when used for allocation and matching entries in the TLB.
1  16 bit - the upper 16 bits of TTBR0_EL2 and TTBR1_EL2 are used for allocation and matching in the TLB.

If the implementation has only 8 bits of ASID, this field is RES0.

Bit [35]

Reserved, RES0.

IPS, bits [34:32]

Intermediate Physical Address Size.

000  32 bits, 4GB.
001  36 bits, 64GB.
010  40 bits, 1TB.
The reserved values behave in the same way as the 10 or 110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

The value 110 is permitted only if ARMv8.2-LPA is implemented and the translation granule size is 64KB.

In an implementation that supports 52-bit PAs, if the value of this field is not 110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL2 are 0000.

**TG1, bits [31:30]**

Granule size for the TTBR1_EL2.

- 01: 16KB
- 10: 4KB
- 11: 64KB

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

**SH1, bits [29:28]**

Shareability attribute for memory associated with translation table walks using TTBR1_EL2.

Defined values are:

- 00: Non-shareable
- 10: Outer Shareable
- 11: Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in Reserved values in System and memory-mapped registers and translation table entries on page K1-6427.

**ORGN1, bits [27:26]**

Outer cacheability attribute for memory associated with translation table walks using TTBR1_EL2.

- 00: Normal memory, Outer Non-cacheable
- 01: Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable
- 10: Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable
- 11: Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable

**IRGN1, bits [25:24]**

Inner cacheability attribute for memory associated with translation table walks using TTBR1_EL2.

- 00: Normal memory, Inner Non-cacheable
- 01: Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable
- 10: Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable
- 11: Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable
EPD1, bit [23]
Translation table walk disable for translations using TTBR1_EL2. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR1_EL2. The encoding of this bit is:
0 Perform translation table walks using TTBR1_EL2.
1 A TLB miss on an address that is translated using TTBR1_EL2 generates a Translation fault. No translation table walk is performed.

A1, bit [22]
Selects whether TTBR0_EL2 or TTBR1_EL2 defines the ASID. The encoding of this bit is:
0 TTBR0_EL2.ASID defines the ASID.
1 TTBR1_EL2.ASID defines the ASID.

T1SZ, bits [21:16]
The size offset of the memory region addressed by TTBR1_EL2. The region size is 2^{64-T1SZ} bytes.
The maximum and minimum possible values for T1SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

TG0, bits [15:14]
Granule size for the TTBR0_EL2.
00 4KB
01 64KB
10 16KB
Other values are reserved.
If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.
It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

SH0, bits [13:12]
Shareability attribute for memory associated with translation table walks using TTBR0_EL2.
00 Non-shareable
10 Outer Shareable
11 Inner Shareable
Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in Reserved values in System and memory-mapped registers and translation table entries on page K1-6427.

ORGN0, bits [11:10]
Outer cacheability attribute for memory associated with translation table walks using TTBR0_EL2.
00 Normal memory, Outer Non-cacheable
01 Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable
10 Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable
11 Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable

IRGN0, bits [9:8]
Inner cacheability attribute for memory associated with translation table walks using TTBR0_EL2.
00 Normal memory, Inner Non-cacheable
01  Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable
10  Normal memory, Inner Write-Through Read-Allocate Write-Allocate Cacheable
11  Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable

**EPD0, bit [7]**
Translation table walk disable for translations using TTBR0_EL2. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR0_EL2. The encoding of this bit is:
0  Perform translation table walks using TTBR0_EL2.
1  A TLB miss on an address that is translated using TTBR0_EL2 generates a Translation fault. No translation table walk is performed.

**Bit [6]**
Reserved, RES0.

**T0SZ, bits [5:0]**
The size offset of the memory region addressed by TTBR0_EL2. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

**Accessing the TCR_EL2**
This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCR_EL2</td>
<td>11</td>
<td>100</td>
<td>0010</td>
<td>0000</td>
<td>010</td>
</tr>
<tr>
<td>TCR_EL1</td>
<td>11</td>
<td>000</td>
<td>0010</td>
<td>0000</td>
<td>010</td>
</tr>
</tbody>
</table>

**Accessibility**
The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>TCR_EL2</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>TCR_EL2</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>TCR_EL2</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>TCR_EL2</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>TCR_EL2</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>TCR_EL1</td>
<td>x</td>
<td>x</td>
</tr>
</tbody>
</table>
This table applies to all instructions that can access this register.

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic TCR_EL2 or TCR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
D10.2.105   TCR_EL3, Translation Control Register (EL3)

The TCR_EL3 characteristics are:

**Purpose**

The control register for stage 1 of the EL3 translation regime.

**Configurations**

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

TCR_EL3 is a 32-bit register.

**Field descriptions**

The TCR_EL3 bit assignments are:

Any of the bits in TCR_EL3 are permitted to be cached in a TLB.

**Bit [31]**

Reserved, RES1.

**Bit [30]**

Reserved, RES0.

**TBID, bit [29]**

*In ARMv8.3*

Present only if ARMv8.3-PAuth is implemented.

Controls the use of the top byte of instruction addresses for address matching. Defined values are:

0   TCR_EL3.TBI applies to Instruction and Data accesses.
1   TCR_EL3.TBI applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by TTBR0_EL3.

If ARMv8.3-PAuth is not implemented, this field is RES0.

*In ARMv8.2, ARMv8.1 and ARMv8.0.*

Reserved, RES0.
HWU62, bit [28]

*In ARMv8.3 and ARMv8.2*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

Defined values are:

0: Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

1: Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

This bit is RES0 if ARMv8.2-TTPBHA is not implemented.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

*In ARMv8.1 and ARMv8.0.*

Reserved, RES0.

HWU61, bit [27]

*In ARMv8.3 and ARMv8.2*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

Defined values are:

0: Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

1: Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

This bit is RES0 if ARMv8.2-TTPBHA is not implemented.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

*In ARMv8.1 and ARMv8.0.*

Reserved, RES0.

HWU60, bit [26]

*In ARMv8.3 and ARMv8.2*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

Defined values are:

0: Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

1: Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

This bit is RES0 if ARMv8.2-TTPBHA is not implemented.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

*In ARMv8.1 and ARMv8.0.*

Reserved, RES0.

HWU59, bit [25]

*In ARMv8.3 and ARMv8.2*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

Defined values are:

0: Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

This bit is RES0 if ARMv8.2-TTPBHA is not implemented.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

**In ARMv8.1 and ARMv8.0.**

Reserved, RES0.

**HPD, bit [24]**

**In ARMv8.3, ARMv8.2 and ARMv8.1**

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR0_EL3.

Defined values are:

0  Hierarchical permissions are enabled.
1  Hierarchical permissions are disabled.

**Note**

In this case bit [61] (APTable[0]) and bit [59] (PXNTable) of the next level descriptor attributes are required to be ignored by the PE, and are no longer reserved, allowing them to be used by software.

When disabled, the permissions are treated as if the bits are zero.

This bit is RES0 if ARMv8.1-HPD is not implemented.

**In ARMv8.0.**

Reserved, RES0.

**Bit [23]**

Reserved, RES1.

**HD, bit [22]**

**In ARMv8.3, ARMv8.2 and ARMv8.1**

Hardware management of dirty state in stage 1 translations from EL3.

Defined values are:

0  Stage 1 hardware management of dirty state disabled.
1  Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.

This bit is RES0 if ARMv8.1-TTHM is not implemented.

**In ARMv8.0.**

Reserved, RES0.

**HA, bit [21]**

**In ARMv8.3, ARMv8.2 and ARMv8.1**

Hardware Access flag update in stage 1 translations from EL3.

Defined values are:

0  Stage 1 Access flag update disabled.
1  Stage 1 Access flag update enabled.

This bit is RES0 if ARMv8.1-TTHM is not implemented.

**In ARMv8.0.**

Reserved, RES0.
TBI, bit [20]

Top Byte ignored - indicates whether the top byte of an address is used for address match for the TTBR0_EL3 region, or ignored and used for tagged addresses.

0  Top Byte used in the address calculation.
1  Top Byte ignored in the address calculation.

This affects addresses generated in EL3 using AArch64 where the address would be translated by tables pointed to by TTBR0_EL3. It has an effect whether the EL3 translation regime is enabled or not.

If ARMv8.3-PAuth is implemented and TCR_EL3.TBID is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI is 1, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

• A branch or procedure return within EL3.
• A exception taken to EL3.
• An exception return to EL3.

Bit [19]

Reserved, RES0.

PS, bits [18:16]

Physical Address Size.

000  32 bits, 4GB.
001  36 bits, 64GB.
010  40 bits, 1TB.
011  42 bits, 4TB.
100  44 bits, 16TB.
101  48 bits, 256TB.
110  52 bits, 4PB

Other values are reserved.

The reserved values behave in the same way as the 101 or 110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

The value 110 is permitted only if ARMv8.2-LPA is implemented and the translation granule size is 64KB.

In an implementation that supports 52-bit PAs, if the value of this field is not 110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL3 are 0000.

TG0, bits [15:14]

Granule size for the TTBR0_EL3.

00  4KB
01  64KB
10  16KB

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.
SH0, bits [13:12]  
Shareability attribute for memory associated with translation table walks using TTBR0_EL3.  
00 Non-shareable  
10 Outer Shareable  
11 Inner Shareable  

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in Reserved values in System and memory-mapped registers and translation table entries on page K1-6427.

ORGN0, bits [11:10]  
Outer cacheability attribute for memory associated with translation table walks using TTBR0_EL3.  
00 Normal memory, Outer Non-cacheable  
01 Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable  
10 Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable  
11 Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable

IRGN0, bits [9:8]  
Inner cacheability attribute for memory associated with translation table walks using TTBR0_EL3.  
00 Normal memory, Inner Non-cacheable  
01 Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable  
10 Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable  
11 Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable

Bits [7:6]  
Reserved, RES0.

T0SZ, bits [5:0]  
The size offset of the memory region addressed by TTBR0_EL3. The region size is $2^{(64-T0SZ)}$ bytes.  
The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Accessing the TCR_EL3  
This register can be read using MRS with the following syntax:  
MRS <Xt>, <systemreg>  
This register can be written using MSR (register) with the following syntax:  
MSR <systemreg>, <Xt>  
This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

D10.2.106 TPIDR_EL0, EL0 Read/Write Software Thread ID Register

The TPIDR_EL0 characteristics are:

**Purpose**

Provides a location where software executing at EL0 can store thread identifying information, for OS management purposes.

The PE makes no use of this register.

**Configurations**

AArch64 System register TPIDR_EL0[31:0] is architecturally mapped to AArch32 System register TPIDRURW.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

TPIDR_EL0 is a 64-bit register.

**Field descriptions**

The TPIDR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Thread ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>??</td>

D10.2.107 TPIDR_EL1, EL1 Software Thread ID Register

The TPIDR_EL1 characteristics are:

Purpose

Provides a location where software executing at EL1 can store thread identifying information, for OS management purposes.

The PE makes no use of this register.

Configurations

AArch64 System register TPIDR_EL1[31:0] is architecturally mapped to AArch32 System register TPIDRPRW.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TPIDR_EL1 is a 64-bit register.

Field descriptions

The TPIDR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Thread ID</td>
<td>Thread identifying information stored by software running at this Exception level.</td>
</tr>
</tbody>
</table>

Accessing the TPIDR_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>

</table>
D10.2.108  **TPIDR_EL2, EL2 Software Thread ID Register**

The TPIDR_EL2 characteristics are:

**Purpose**

Provides a location where software executing at EL2 can store thread identifying information, for OS management purposes.

The PE makes no use of this register.

**Configurations**

AArch64 System register TPIDR_EL2[31:0] is architecturally mapped to AArch32 System register HTPIDR.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

TPIDR_EL2 is a 64-bit register.

**Field descriptions**

The TPIDR_EL2 bit assignments are:

```
63 0
   Thread ID
```

**Bits [63:0]**

Thread ID. Thread identifying information stored by software running at this Exception level.

**Accessing the TPIDR_EL2**

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>TPIDR_EL2</td>
<td>11</td>
<td>100</td>
<td>1101</td>
<td>0000</td>
<td>010</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
D10.2.109   TPIDR_EL3, EL3 Software Thread ID Register

The TPIDR_EL3 characteristics are:

Purpose

Provides a location where software executing at EL3 can store thread identifying information, for OS management purposes.

The PE makes no use of this register.

Configurations

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TPIDR_EL3 is a 64-bit register.

Field descriptions

The TPIDR_EL3 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Description</th>

- x: Read/Write
- 0: Read
- n/a: Not accessible
- RW: Read/Write
D10.2.110 TPIDRRO_EL0, EL0 Read-Only Software Thread ID Register

The TPIDRRO_EL0 characteristics are:

**Purpose**

Provides a location where software executing at EL1 or higher can store thread identifying information that is visible to software executing at EL0, for OS management purposes.

The PE makes no use of this register.

**Configurations**

AArch64 System register TPIDRRO_EL0[31:0] is architecturally mapped to AArch32 System register TPIDRRO.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

TPIDRRO_EL0 is a 64-bit register.

**Field descriptions**

The TPIDRRO_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Thread ID. Thread identifying information stored by software running at this Exception level.</td>
</tr>
</tbody>
</table>

**Accessing the TPIDRRO_EL0**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>TPIDRRO_EL0</td>
<td>11</td>
<td>011</td>
<td>1101</td>
<td>0000</td>
<td>011</td>
</tr>
</tbody>
</table>
### Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0</td>
</tr>
<tr>
<td>x x 0</td>
<td>RO</td>
</tr>
<tr>
<td>x 0 1</td>
<td>RO</td>
</tr>
<tr>
<td>x 1 1</td>
<td>RO</td>
</tr>
</tbody>
</table>
D10.2.111 TTBR0_EL1, Translation Table Base Register 0 (EL1)

The TTBR0_EL1 characteristics are:

**Purpose**

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the EL1&0 translation regime, and other information for this translation regime.

**Configurations**

AArch64 System register TTBR0_EL1 is architecturally mapped to AArch32 System register TTBR0.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

TTBR0_EL1 is a 64-bit register.

**Field descriptions**

The TTBR0_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>ASID</td>
</tr>
<tr>
<td>47</td>
<td>BADDR</td>
</tr>
<tr>
<td>1</td>
<td>CnP</td>
</tr>
</tbody>
</table>

Any of the fields in this register are permitted to be cached in a TLB.

**ASID, bits [63:48]**

An ASID for the translation table base address. The TCR_EL1.A1 field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

**BADDR, bits [47:1]**

Translation table base address, A[47:x] or A[51:x], bits[47:1].

--- Note ---

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes ARMv8.2-LPA and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

---

In an implementation that includes ARMv8.2-LPA, if the value of TCR_EL1.IPS is 110, then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address, where z is determined as follows:
  - If x >= 6 then z=x.
  - Otherwise, z=6.
- When z>=x register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When x>6 register bits[(x-1):6] are RES0.
• Register bit[1] is RES0.
• Bits[5:2] of the stage 1 translation table base address are zero.
• In an implementation that includes ARMv8.2-TTCNP bit[0] of the stage 1 translation table base address is zero.

--- Note ---

• In an implementation that includes ARMv8.2-LPA a TCR_EL1.IPS value of 110, that selects an IPA size of 52 bits, is permitted only when using the 64KB translation granule.
• When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of TCR_EL1.IPS is 110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of TCR_EL1.IPS is not 110 then:
• Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
• Register bits[(x-1):1] are RES0.
• If the implementation supports 52-bit PAs and IPAs then bits[51:49] of the translation table base addresses used in this stage of translation are 0b0000.

--- Note ---

This definition applies:
• To an implementation that includes ARMv8.2-LPA and is using a translation granule smaller than 64KB.
• To any implementation that does not include ARMv8.2-LPA.

If any TTBR0_EL1[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using TTBR0_EL1, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:
• Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
• The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL1.T0SZ, the stage of translation, and the translation granule size.

CnP, bit [0]

In ARMv8.3 and ARMv8.2

Common not Private. In an implementation that includes ARMv8.2-TTCNP, indicates whether each entry that is pointed to by TTBR0_EL1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL1.CnP is 1.

0  The translation table entries pointed to by TTBR0_EL1, for the current translation regime and ASID, are permitted to differ from corresponding entries for TTBR0_EL1 for other PEs in the Inner Shareable domain. This is not affected by:
• The value of TTBR0_EL1.CnP on those other PEs.
• The value of the current ASID or, in Non-secure state, the value of the current VMID.

1  The translation table entries pointed to by TTBR0_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL1.CnP is 1 and all of the following apply:
• The translation table entries are pointed to by TTBR0_EL1.
• The translation tables relate to the same translation regime.
The ASID is the same as the current ASID.
- In Non-secure state, the VMID is the same as the current VMID.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

**Note**

If the value of the TTBR0_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are **CONSTRAINED UNPREDICTABLE**, see **CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values** on page K1-6414.

In an implementation that does not include ARMv8.2-TTCNP this field is res0.

In ARMv8.1 and ARMv8.0.

Reserved, res0.

### Accessing the TTBR0_EL1

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>TTBR0_EL1</td>
<td>11</td>
<td>000</td>
<td>0010</td>
<td>0000</td>
<td>00</td>
</tr>
<tr>
<td>TTBR0_EL12</td>
<td>11</td>
<td>101</td>
<td>0010</td>
<td>0000</td>
<td>00</td>
</tr>
</tbody>
</table>

### Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>TTBR0_EL1</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>TTBR0_EL1</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>TTBR0_EL1</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>TTBR0_EL1</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>TTBR0_EL1</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>TTBR0_EL12</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>TTBR0_EL12</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>
When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic TTBR0_EL1 or TTBR0_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor TTBR0_EL12 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor TTBR0_EL12 are trapped to EL2.
D10.2.112 TTBR0_EL2, Translation Table Base Register 0 (EL2)

The TTBR0_EL2 characteristics are:

**Purpose**

When HCR_EL2.E2H is 0, holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL2 translation regime, and other information for this translation regime.

When HCR_EL2.E2H is 1, holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the EL2&0 translation regime, and other information for this translation regime.

**Configurations**

AArch64 System register TTBR0_EL2 is architecturally mapped to AArch32 System register HTTBR.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

TTBR0_EL2 is a 64-bit register.

**Field descriptions**

The TTBR0_EL2 bit assignments are:

```
63 48 47
 ASID ??
```

Any of the fields in this register are permitted to be cached in a TLB.

**ASID, bits [63:48]**

In *ARMv8.3, ARMv8.2 and ARMv8.1*

When HCR_EL2.E2H is 0, this field is RES0.

When HCR_EL2.E2H is 1, it holds an ASID for the translation table base address. The TCR_EL2.A1 field selects either TTBR0_EL2.ASID or TTBR1_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

In *ARMv8.0.0.*

Reserved, RES0.

**BADDR, bits [47:1]**

Translation table base address, A[47:x] or A[51:x], bits[47:1].

--- **Note**

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes ARMv8.2-LPA and is using the 64KB translation granularity.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.
In an implementation that includes ARMv8.2-LPA, if the value of TCR_EL2.{I}PS is 110, then:

- Register bits[47;x] hold bits[47:x] of the stage 1 translation table base address, where x is determined as follows:
  - If x >= 6 then z=x.
  - Otherwise, z=6.
- When z>x register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When x>6 register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes ARMv8.2-TTCNP bit[0] of the stage 1 translation table base address is zero.

**Note**

In an implementation that includes ARMv8.2-LPA:

- A TCR_EL2.{I}PS value of 110, that selects an OA size of 52 bits, is permitted only when using the 64KB translation granule.
- The OA size is specified by:
  - The value of TCR_EL2.PS when the value of HCR_EL2.E2H is 0.
  - The value of TCR_EL2.IPS when the value of HCR_EL2.E2H is 1.

When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of TCR_EL2.{I}PS is 110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of TCR_EL2.{I}PS is not 110 then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs then bits[51:49] of the translation table base addresses used in this stage of translation are 0b0000.

**Note**

This definition applies:

- To an implementation that includes ARMv8.2-LPA and is using a translation granule smaller than 64KB.
- To any implementation that does not include ARMv8.2-LPA.

If any TTBR0_EL2[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using TTBR0_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL2.T0SZ, the stage of translation, and the translation granule size.
CnP, bit [0]

*In ARMv8.3 and ARMv8.2*

Common not Private. In an implementation that includes ARMv8.2-TTCNP, indicates whether each entry that is pointed to by TTBR0_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL2.CnP is 1.

0  The translation table entries pointed to by TTBR0_EL2 for the current translation regime, and ASID if applicable, are permitted to differ from corresponding entries for TTBR0_EL2 for other PEs in the Inner Shareable domain. This is not affected by:
   • The value of TTBR0_EL2.CnP on those other PEs.
   • When the current translation regime is the EL2&0 regime, the value of the current ASID.

1  The translation table entries pointed to by TTBR0_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL2.CnP is 1 and all of the following apply:
   • The translation table entries are pointed to by TTBR0_EL2.
   • The translation tables relate to the same translation regime.
   • If that translation regime is the EL2&0 regime, the ASID is the same as the current ASID.

---

**Note**

If the value of the TTBR0_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are **CONSTRAINED UNPREDICTABLE**, see **CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values on page K1-6414.**

---

In an implementation that does not include ARMv8.2-TTCNP this field is RES0.

*In ARMv8.1 and ARMv8.0.*

Reserved, RES0.

**Accessing the TTBR0_EL2**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>TTBR0_EL2</td>
<td>11</td>
<td>100</td>
<td>0010</td>
<td>0000</td>
<td>000</td>
</tr>
<tr>
<td>TTBR0_EL1</td>
<td>11</td>
<td>000</td>
<td>0010</td>
<td>0000</td>
<td>000</td>
</tr>
</tbody>
</table>
### Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>E2H</td>
<td>TGE</td>

<td>TTBR0_EL1</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

This table applies to all instructions that can access this register.

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic TTBR0_EL2 or TTBR0_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
D10.2.113 TTBR0_EL3, Translation Table Base Register 0 (EL3)

The TTBR0_EL3 characteristics are:

**Purpose**

Holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL3 translation regime, and other information for this translation regime.

**Configurations**

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

TTBR0_EL3 is a 64-bit register.

**Field descriptions**

The TTBR0_EL3 bit assignments are:

Any of the fields in this register are permitted to be cached in a TLB.

**Bits [63:48]**

Reserved, RES0.

**BADDR, bits [47:1]**

Translation table base address, A[47:x] or A[51:x].

--- Note ---

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes ARMv8.2-LPA and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes ARMv8.2-LPA, if the value of TCR_EL3.PS is 110 then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address, where z is determined as follows:
  - If x >= 6 then z=x.
  - Otherwise, z=6.
- When z>=x register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When x>6 register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes ARMv8.2-TTCNP bit[0] of the stage 1 translation table base address is zero.
Note

- In an implementation that includes ARMv8.2-LPA a TCR_EL3.PS value of 110, that selects a PA size of 52 bits, is permitted only when using the 64KB translation granule.
- When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of TCR_EL3.PS is 110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of TCR_EL3.PS is not 110 then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs then bits[51:49] of the translation table base addresses used in this stage of translation are 0b0000.

Note

This definition applies:

- To an implementation that includes ARMv8.2-LPA and is using a translation granule smaller than 64KB.
- To any implementation that does not include ARMv8.2-LPA.

If any TTBR0_EL3[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using TTBR0_EL3, then the translation table base address might be misaligned, with effects that are CONstrained UNpredictable, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how \( x \) is calculated based on the value of TCR_EL3.T0SZ, the stage of translation, and the translation granule size.

CnP, bit [0]

In ARMv8.3 and ARMv8.2

Common not Private. In an implementation that includes ARMv8.2-TTCNP, indicates whether each entry that is pointed to by TTBR0_EL3 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL3.CnP is 1.

0 The translation table entries pointed to by TTBR0_EL3, for the current translation regime, are permitted to differ from corresponding entries for TTBR0_EL3 for other PEs in the Inner Shareable domain. This is not affected by the value of TTBR0_EL3.CnP on those other PEs.

1 The translation table entries pointed to by TTBR0_EL3 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL3.CnP is 1 and the translation table entries are pointed to by TTBR0_EL3.

Note

If the value of the TTBR0_EL3.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL3s do not point to the same translation table entries the results of translations using TTBR0_EL3 are CONstrained UNpredictable, see CONstrained UNpredictable behaviors due to caching of control or data values on page K1-6414.

In an implementation that does not include ARMv8.2-TTCNP this field is RES0.

In ARMv8.1 and ARMv8.0.

Reserved, RES0.
Accessing the TTBR0_EL3

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>

### D10.2.114 TTBR1_EL1, Translation Table Base Register 1 (EL1)

The TTBR1_EL1 characteristics are:

**Purpose**

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the EL1&0 stage 1 translation regime, and other information for this translation regime.

**Configurations**

AArch64 System register TTBR1_EL1 is architecturally mapped to AArch32 System register TTBR1.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

TTBR1_EL1 is a 64-bit register.

**Field descriptions**

The TTBR1_EL1 bit assignments are:

- **ASID**, bits [63:48]
  - An ASID for the translation table base address. The TCR_EL1.A1 field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.
  - If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

- **BADDR**, bits [47:1]
  - Translation table base address, A[47:x] or A[51:x], bits[47:1].

**Note**

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes ARMv8.2-LPA and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes ARMv8.2-LPA, if the value of TCR_EL1.IPS is 110, then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address, where z is determined as follows:
  - If x >= 6 then z=x.
  - Otherwise, z=6.
- When z>=x register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When x>6 register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes ARMv8.2-TTCNP bit[0] of the stage 1 translation table base address is zero.

**Note**

- In an implementation that includes ARMv8.2-LPA a TCR_EL1.IPS value of 110, that selects an IPA size of 52 bits, is permitted only when using the 64KB translation granule.
- When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of TCR_EL1.IPS is 110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the *Effective value* of TCR_EL1.IPS is not 110 then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs then bits[51:49] of the translation table base addresses used in this stage of translation are 0b0000.

**Note**

This definition applies:

- To an implementation that includes ARMv8.2-LPA and is using a translation granule smaller than 64KB.
- To any implementation that does not include ARMv8.2-LPA.

If any TTBR1_EL1[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using TTBR1_EL1, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL1.T1SZ, the stage of translation, and the translation granule size.

**CnP, bit[0]**

*In ARMv8.3 and ARMv8.2*

Common not Private. In an implementation that includes ARMv8.2-TTCNP, indicates whether each entry that is pointed to by TBR1_EL1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1_EL1.CnP is 1.

0 The translation table entries pointed to by TTBR1_EL1, for the current translation regime and ASID, are permitted to differ from corresponding entries for TTBR1_EL1 for other PEs in the Inner Shareable domain. This is not affected by:

- The value of TTBR1_EL1.CnP on those other PEs.
- The value of the current ASID or, in Non-secure state, the value of the current VMID.

1 The translation table entries pointed to by TTBR1_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1_EL1.CnP is 1 and all of the following apply:

- The translation table entries are pointed to by TTBR1_EL1.
- The translation tables relate to the same translation regime.
- The ASID is the same as the current ASID.
- In Non-secure state, the VMID is the same as the current VMID.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

--- Note ---

If the value of the TTBR1_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values on page K1-6414.

In an implementation that does not include ARMv8.2-TTCNP this field is RES0.

**In ARMv8.1 and ARMv8.0.**

Reserved, RES0.

### Accessing the TTBR1_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>TTBR1_EL1</td>
<td>11</td>
<td>000</td>
<td>0010</td>
<td>0000</td>
<td>001</td>
</tr>
<tr>
<td>TTBR1_EL12</td>
<td>11</td>
<td>101</td>
<td>0010</td>
<td>0000</td>
<td>001</td>
</tr>
</tbody>
</table>

### Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>TTBR1_EL1</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>TTBR1_EL1</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>TTBR1_EL1</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>TTBR1_EL1</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>TTBR1_EL1</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>TTBR1_EL12</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>TTBR1_EL12</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>
This table applies to all instructions that can access this register.

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic TTBR1_EL1 or TTBR1_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor TTBR1_EL12 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor TTBR1_EL12 are trapped to EL2.
### D10.2.115 TTBR1_EL2, Translation Table Base Register 1 (EL2)

The TTBR1_EL2 characteristics are:

**Purpose**

When HCR_EL2.E2H is 1, holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the EL2&0 translation regime, and other information for this translation regime.

**Note**

When HCR_EL2.E2H is 0, the contents of this register are ignored by the PE, except for a direct read or write of the register.

**Configurations**

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

**Attributes**

TTBR1_EL2 is a 64-bit register.

**Field descriptions**

The TTBR1_EL2 bit assignments are:

```
   63  48  47  1  0

   ASID  BADDR

   2   2
   CnP  
```

Any of the fields in this register are permitted to be cached in a TLB.

**ASID, bits [63:48]**

An ASID for the translation table base address. The TCR_EL2.A1 field selects either TTBR0_EL2.ASID or TTBR1_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

**BADDR, bits [47:1]**

Translation table base address, A[47:x] or A[51:x], bits[47:1].

**Note**

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes ARMv8.2-LPA and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes ARMv8.2-LPA, if the value of TCR_EL2.1 PS is 110, then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address, where z is determined as follows:
  - If x >= 6 then z=x.
  - Otherwise, z=6.
• Register bits[5:2] hold bits[51:48] of the stage 1 translation table base address.
• When \( z > x \) register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
• When \( x > 6 \) register bits[(x-1):6] are RES0.
• Register bit[1] is RES0.
• Bits[5:2] of the stage 1 translation table base address are zero.
• In an implementation that includes ARMv8.2-TTCNP bit[0] of the stage 1 translation table base address is zero.

---

**Note**

• In an implementation that includes ARMv8.2-LPA a TCR_EL2.IPS value of 110, that selects an OA size of 52 bits, is permitted only when using the 64KB translation granule.
• When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of TCR_EL2.IPS is 110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

---

If the *Effective value* of TCR_EL2.IPS is not 110 then:

• Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
• Register bits[(x-1):1] are RES0.
• If the implementation supports 52-bit PAs and IPAs then bits[51:49] of the translation table base addresses used in this stage of translation are 0b0000.

---

**Note**

This definition applies:

• To an implementation that includes ARMv8.2-LPA and is using a translation granule smaller than 64KB.
• To any implementation that does not include ARMv8.2-LPA.

---

If any TTBR1_EL2[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using TTBR1_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

• Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
• The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how \( x \) is calculated based on the value of TCR_EL2.T1SZ, the stage of translation, and the translation granule size.

CnP, bit [0]

*In ARMv8.3 and ARMv8.2*

Common not Private. In an implementation that includes ARMv8.2-TTCNP, indicates whether each entry that is pointed to by TBR1_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1_EL2.CnP is 1.

0 The translation table entries pointed to by TTBR1_EL2 for the current ASID are permitted to differ from corresponding entries for TTBR1_EL2 for other PEs in the Inner Shareable domain. This is not affected by:

• The value of TTBR1_EL2.CnP on those other PEs.
• The value of the current ASID.
The translation table entries pointed to by TTBR1_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1_EL2.CnP is 1 and all of the following apply:

- The translation table entries are pointed to by TTBR1_EL2.
- The ASID is the same as the current ASID.

**Note**

- TTBR1_EL2 is accessible only when the value of HCR_EL2.E2H is 1, meaning the current translation regime is the EL2&0 regime.
- If the value of the TTBR1_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see *CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values* on page K1-6414.

In an implementation that does not include ARMv8.2-TTCNP this field is RES0.

**Accessing the TTBR1_EL2**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>TTBR1_EL2</td>
<td>11</td>
<td>100</td>
<td>0010</td>
<td>0000</td>
<td>001</td>
</tr>
<tr>
<td>TTBR1_EL1</td>
<td>11</td>
<td>000</td>
<td>0010</td>
<td>0000</td>
<td>001</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>TTBR1_EL1</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>TTBR1_EL1</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>
This table applies to all instructions that can access this register.

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic TTBR1_EL2 or TTBR1_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
D10.2.116  VBAR_EL1, Vector Base Address Register (EL1)

The VBAR_EL1 characteristics are:

**Purpose**

Holds the vector base address for any exception that is taken to EL1.

**Configurations**

AArch64 System register VBAR_EL1[31:0] is architecturally mapped to AArch32 System register VBAR.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

VBAR_EL1 is a 64-bit register.

**Field descriptions**

The VBAR_EL1 bit assignments are:

```
  63  11  10  0
     |     |     
     |     |     
     |     |     
Vector Base Address  RES0
```

**Bits [63:11]**

Vector Base Address. Base address of the exception vectors for exceptions taken to EL1.

If the implementation does not support ARMv8.2-LVA, then:

- If tagged addresses are being used, bits [55:48] of VBAR_EL1 must be the same or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:48] of VBAR_EL1 must be the same or else the use of the vector address will result in a recursive exception.

If the implementation supports ARMv8.2-LVA, then:

- If tagged addresses are being used, bits [55:52] of VBAR_EL1 must be the same or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:52] of VBAR_EL1 must be the same or else the use of the vector address will result in a recursive exception.

**Bits [10:0]**

Reserved, RES0.

**Accessing the VBAR_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>
This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

<td>1</td>
</tr>
</tbody>
</table>

This table applies to all instructions that can access this register.

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic VBAR_EL1 or VBAR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor VBAR_EL12 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If HCR_EL2.NV1==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor VBAR_EL12 are trapped to EL2.
D10.2.117  **VBAR_EL2, Vector Base Address Register (EL2)**

The VBAR_EL2 characteristics are:

**Purpose**

Holds the vector base address for any exception that is taken to EL2.

**Configurations**

AArch64 System register VBAR_EL2[31:0] is architecturally mapped to AArch32 System register HVBAR.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

VBAR_EL2 is a 64-bit register.

**Field descriptions**

The VBAR_EL2 bit assignments are:

![Bit assignments diagram]

**Bits [63:11]**

Vector Base Address. Base address of the exception vectors for exceptions taken to EL2.

If the implementation does not support ARMv8.2-LVA, then:

- If tagged addresses are being used, bits [55:48] of VBAR_EL2 must be 0 or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:48] of VBAR_EL2 must be 0 or else the use of the vector address will result in a recursive exception.

If the implementation supports ARMv8.2-LVA, then:

- If tagged addresses are being used, bits [55:52] of VBAR_EL2 must be the same or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:52] of VBAR_EL2 must be the same or else the use of the vector address will result in a recursive exception.

**Bits [10:0]**

Reserved, RES0.

**Accessing the VBAR_EL2**

This register can be read using MRS with the following syntax:

\[
\text{MRS} \ <Xt>, \ <\text{systemreg}>
\]

This register can be written using MSR (register) with the following syntax:

\[
\text{MSR} \ <\text{systemreg}>, \ <Xt>
\]
This syntax is encoded with the following settings in the instruction encoding:

<table>

**Accessing the VBAR_EL3**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>VBAR_EL3</td>
<td>11</td>
<td>110</td>
<td>1100</td>
<td>0000</td>
<td>000</td>
</tr>
</tbody>
</table>
### Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>

</tbody>
</table>
D10.2.119 VMPIDR_EL2, Virtualization Multiprocessor ID Register

The VMPIDR_EL2 characteristics are:

**Purpose**

Holds the value of the Virtualization Multiprocessor ID. This is the value returned by Non-secure EL1 reads of MPIDR_EL1.

**Configurations**

AArch64 System register VMPIDR_EL2[31:0] is architecturally mapped to AArch32 System register VMPIDR.

If EL2 is not implemented, reads of this register return the value of the MPIDR_EL1, and writes to the register are ignored.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

VMPIDR_EL2 is a 64-bit register.

**Field descriptions**

The VMPIDR_EL2 bit assignments are:

**Bits [63:40]**

Reserved, RES0.

**Aff3, bits [39:32]**

Affinity level 3. Highest level affinity field.

**Bit [31]**

Reserved, RES1.

**U, bit [30]**

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Processor is part of a multiprocessor system.</td>
</tr>
<tr>
<td>1</td>
<td>Processor is part of a uniprocessor system.</td>
</tr>
</tbody>
</table>

**Bits [29:25]**

Reserved, RES0.

**MT, bit [24]**

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Performance of PEs at the lowest affinity level is largely independent.</td>
</tr>
<tr>
<td>1</td>
<td>Performance of PEs at the lowest affinity level is very interdependent.</td>
</tr>
</tbody>
</table>

**Aff2, bits [23:16]**

Affinity level 2. Second highest level affinity field.
Aff1, bits [15:8]
Affinity level 1. Third highest level affinity field.

Aff0, bits [7:0]
Affinity level 0. Lowest level affinity field.

Accessing the VMPIDR_EL2

This register can be read using MRS with the following syntax:
MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:
MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>VMPIDR_EL2</td>
<td>11</td>
<td>100</td>
<td>0000</td>
<td>0000</td>
<td>101</td>
</tr>
</tbody>
</table>

Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>

</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
D10.2.120  VPIDR_EL2, Virtualization Processor ID Register

The VPIDR_EL2 characteristics are:

Purpose

Holds the value of the Virtualization Processor ID. This is the value returned by Non-secure EL1 reads of MIDR_EL1.

Configurations

AArch64 System register VPIDR_EL2 is architecturally mapped to AArch32 System register VPIDR.

If EL2 is not implemented, reads of this register return the value of the MIDR_EL1, and writes to the register are ignored.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

VPIDR_EL2 is a 32-bit register.

Field descriptions

The VPIDR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit assignments</th>
<th>Hex representation</th>
<th>ASCII representation</th>
<th>Implementer</th>

</tbody>
</table>

ARM can assign codes that are not published in this manual. All values not assigned by ARM are reserved and must not be used.
Variant, bits [23:20]

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

Architecture, bits [19:16]

The permitted values of this field are:

- 0001  ARMv4
- 0010  ARMv4T
- 0011  ARMv5 (obsolete)
- 0100  ARMv5T
- 0101  ARMv5TE
- 0110  ARMv5TEJ
- 0111  ARMv6
- 1111  Architectural features are individually identified in the ID_* registers, see ID registers on page K13-6609.

All other values are reserved.

PartNum, bits [15:4]

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by ARM, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the device.

Accessing the VPIDR_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>VPIDR_EL2</td>
<td>11</td>
<td>100</td>
<td>0000</td>
<td>0000</td>
<td>00</td>
</tr>
</tbody>
</table>

Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>
</tr>
<tr>
<td>TGE</td>
<td>n/a</td>
</tr>
<tr>
<td>NS</td>
<td>-</td>
</tr>
</tbody>
</table>
Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  — If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  — If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
D10.2.121  VTCR_EL2, Virtualization Translation Control Register

The VTCR_EL2 characteristics are:

**Purpose**

The control register for stage 2 of the EL1&0 translation regime.

**Configurations**

AArch64 System register VTCR_EL2 is architecturally mapped to AArch32 System register VTCR.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

VTCR_EL2 is a 32-bit register.

**Field descriptions**

The VTCR_EL2 bit assignments are:

Any of the bits in VTCR_EL2 are permitted to be cached in a TLB.

**Bit [31]**

Reserved, RES1.

**Bits [30:29]**

Reserved, RES0.

**HWU62, bit [28]**

*In ARMv8.3 and ARMv8.2*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 2 translation table Block or Page entry.

Defined values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Bit[62] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>1</td>
<td>Bit[62] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
</tbody>
</table>

This bit is RES0, if ARMv8.2-TTPBHA is not implemented.
In ARMv8.1 and ARMv8.0.
Reserved, RES0.

HWU61, bit [27]

In ARMv8.3 and ARMv8.2
Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 2 translation table Block or Page entry.
Defined values are:
0  Bit[61] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
1  Bit[61] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.
This bit is RES0, if ARMv8.2-TTPBHA is not implemented.

In ARMv8.1 and ARMv8.0.

Reserved, RES0.

HWU60, bit [26]

In ARMv8.3 and ARMv8.2
Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 2 translation table Block or Page entry.
Defined values are:
0  Bit[60] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
1  Bit[60] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.
This bit is RES0 if ARMv8.2-TTPBHA is not implemented.

In ARMv8.1 and ARMv8.0.
Reserved, RES0.

HWU59, bit [25]

In ARMv8.3 and ARMv8.2
Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 2 translation table Block or Page entry.
Defined values are:
0  Bit[59] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
1  Bit[59] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.
This bit is RES0 if ARMv8.2-TTPBHA is not implemented.

In ARMv8.1 and ARMv8.0.
Reserved, RES0.

Bits [24:23]
Reserved, RES0.

HD, bit [22]

In ARMv8.3, ARMv8.2 and ARMv8.1
Hardware management of dirty state in stage 2 translations from Non-secure EL0 and EL1.
Defined values are:
0  Stage 2 hardware management of dirty state disabled.
1 Stage 2 hardware management of dirty state enabled, only if the HA bit is also set to 1.
This bit is RES0 if ARMv8.1-TTHM is not implemented.

In ARMv8.0,
Reserved, RES0.

HA, bit [21]

In ARMv8.3, ARMv8.2 and ARMv8.1
Hardware Access flag update in stage 2 translations from Non-secure EL0 and EL1.
Defined values are:
0 Stage 2 Access flag update disabled.
1 Stage 2 Access flag update enabled.
This bit is RES0 if ARMv8.1-TTHM is not implemented.

In ARMv8.0,
Reserved, RES0.

Bit [20]
Reserved, RES0.

VS, bit [19]

In ARMv8.3, ARMv8.2 and ARMv8.1
VMID Size.
Defined values are:
0 8 bit - the upper 8 bits of VTTBR_EL2 are ignored by the hardware, and treated as if they are all zeros, for every purpose except when reading back the register.
1 16 bit - the upper 8 bits of VTTBR_EL2 are used for allocation and matching in the TLB.
If the implementation only supports an 8-bit VMID, this field is RES0.
This bit is RES0 if ARMv8.1-VMID16 is not implemented.

In ARMv8.0,
Reserved, RES0.

PS, bits [18:16]
Physical Address Size.
000 32 bits, 4GB.
001 36 bits, 64GB.
010 40 bits, 1TB.
011 42 bits, 4TB.
100 44 bits, 16TB.
101 48 bits, 256TB.
110 52 bits, 4PB
Other values are reserved.
The reserved values behave in the same way as the 101 or 110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.
The value 110 is permitted only if ARMv8.2-LPA is implemented and the translation granule size is 64KB.
In an implementation that supports 52-bit PAs, if the value of this field is not 110, then bits[51:48] of every translation table base address for the stage of translation controlled by VTCR_EL2 are 0000.
TG0, bits [15:14]
Granule size for the VTTBR_EL2.
00  4KB
01  64KB
10  16KB
Other values are reserved.
If the value is programmed to either a reserved value, or a size that has not been implemented, then
the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED
choice of the sizes that has been implemented for all purposes other than the value read back from
this register.
It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value
that corresponds to the size chosen.

SH0, bits [13:12]
Shareability attribute for memory associated with translation table walks using VTTBR_EL2.
00  Non-shareable
10  Outer Shareable
11  Inner Shareable
Other values are reserved. The effect of programming this field to a Reserved value is that behavior
is CONSTRAINED UNPREDICTABLE, as described in Reserved values in System and memory-mapped
registers and translation table entries on page K1-6427.

ORGN0, bits [11:10]
Outer cacheability attribute for memory associated with translation table walks using VTTBR_EL2.
00  Normal memory, Outer Non-cacheable
01  Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable
10  Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable
11  Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable

IRGN0, bits [9:8]
Inner cacheability attribute for memory associated with translation table walks using VTTBR_EL2.
00  Normal memory, Inner Non-cacheable
01  Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable
10  Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable
11  Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable

SL0, bits [7:6]
Starting level of the VTCR_EL2 addressed region. The meaning of this field depends on the value
of VTCR_EL2.TG0 (the granule size).
00  If TG0 is 00 (4KB granule), start at level 2. If TG0 is 10 (16KB granule) or 01 (64KB
    granule), start at level 3.
01  If TG0 is 00 (4KB granule), start at level 1. If TG0 is 10 (16KB granule) or 01 (64KB
    granule), start at level 2.
10  If TG0 is 00 (4KB granule), start at level 0. If TG0 is 10 (16KB granule) or 01 (64KB
    granule), start at level 1.
All other values are reserved. If this field is programmed to a reserved value, or to a value that is not
consistent with the programming of T0SZ, then a stage 2 level 0 Translation fault is generated.

T0SZ, bits [5:0]
The size offset of the memory region addressed by VTTBR_EL2. The region size is 2^{(64-T0SZ)} bytes.
The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

If this field is programmed to a value that is not consistent with the programming of SL0 then a stage 2 level 0 Translation fault is generated.

**Accessing the VTCR_EL2**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>VTCR_EL2</td>
<td>11</td>
<td>100</td>
<td>0010</td>
<td>0001</td>
<td>010</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>
</tr>
<tr>
<td>TGE</td>
<td>n/a</td>
</tr>
<tr>
<td>NS</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
D10.2.122 VTTBR_EL2, Virtualization Translation Table Base Register

The VTTBR_EL2 characteristics are:

**Purpose**

Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the Non-secure EL1&0 translation regime, and other information for this translation regime.

**Configurations**

AArch64 System register VTTBR_EL2 is architecturally mapped to AArch32 System register VTTBR.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

VTTBR_EL2 is a 64-bit register.

**Field descriptions**

The VTTBR_EL2 bit assignments are:

```
  63  56  55  48  47  1  0
  VMID[15:8] VMID[7:0] BADDR
```

Any of the fields in this register are permitted to be cached in a TLB.

**VMID[15:8], bits [63:56]**

*In ARMv8.3, ARMv8.2 and ARMv8.1*

Extension to VMID[7:0]. See VMID[7:0] for more details.

*In ARMv8.0,*

Reserved, RES0.

**VMID[7:0], bits [55:48]**

The VMID for the translation table.

It is IMPLEMENTATION DEFINED whether the VMID is 8 bits or 16 bits.

If the implementation has an 8-bit VMID, then VMID[15:8] are RES0.

If the implementation has a 16-bit VMID, then:

- The VTCR_EL2.VS bit selects whether VMID[15:8] are ignored by the hardware for every purpose except reading back the register, or whether these bits are used for allocation and matching in the TLB.
- The 16-bit VMID is only supported when EL2 is using AArch64. This means the hardware must ignore VMID[15:8] when EL2 is using AArch32.

**BADDR, bits [47:1]**

Translation table base address, A[47:x] or A[51:x], bits[47:1].

--- Note ---

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes ARMv8.2-LPA and is using the 64KB translation granule.
A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes ARMv8.2-LPA, if the value of VTCR_EL2.PS is 110, then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address, where z is determined as follows:
  - If \( x \geq 6 \) then \( z=x \).
  - Otherwise, \( z=6 \).
- When \( z>x \) register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When \( x>6 \) register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes ARMv8.2-TTCNP bit[0] of the stage 1 translation table base address is zero.

**Note**

- In an implementation that includes ARMv8.2-LPA a VTCR_EL2.PS value of 110, that selects a PA size of 52 bits, is permitted only when using the 64KB translation granule.
- When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of VTCR_EL2.PS is 110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the \textit{Effective value} of VTCR_EL2.PS is not 110 then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs then bits[51:49] of the translation table base addresses used in this stage of translation are 0b0000.

**Note**

This definition applies:

- To an implementation that includes ARMv8.2-LPA and is using a translation granule smaller than 64KB.
- To any implementation that does not include ARMv8.2-LPA.

If any VTTBR_EL2[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using VTTBR_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[(x-1):0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how \( x \) is calculated based on the value of VTCR_EL2.T0SZ, the stage of translation, and the translation granule size.
CnP, bit [0]

In ARMv8.3 and ARMv8.2

Common not Private. In an implementation that includes ARMv8.2-TTCNP, indicates whether each entry that is pointed to by VTTBR_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VTTBR_EL2.CnP is 1.

0  The translation table entries pointed to by VTTBR_EL2 are permitted to differ from the entries for VTTBR_EL2 for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.

1  The translation table entries pointed to by VTTBR_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VTTBR_EL2.CnP is 1 and the VMID is the same as the current VMID.

Note

If the value of VTTBR_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VTTBR_EL2s do not point to the same translation table entries when using the current VMID then the results of translations using VTTBR_EL2 are CONSTRAINED UNPREDICTABLE, see CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values on page K1-6414.

In ARMv8.1 and ARMv8.0.

Reserved, RES0.

Accessing the VTTBR_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
D10.3 Debug registers

This section lists the Debug System registers in AArch64 state, in alphabetic order:

- The principal encoding space for debug registers is \( \text{op0} = 0b10, \text{op1} = \{0, 3, 4\} \). Instructions for accessing debug System registers on page D9-2333 summarizes the registers in this encoding space and lists them in order of their encodings.

- In addition, the following registers in the \( \text{op0} = 0b11 \) encoding space are classified as Debug registers:
  - DLR_EL0.
  - DSPSR_EL0.
  - MDCR_EL2.
  - MDCR_EL3.
  - SDER32_EL3.
D10.3.1 DBGAUTHSTATUS_EL1, Debug Authentication Status register

The DBGAUTHSTATUS_EL1 characteristics are:

**Purpose**

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

**Configurations**

AArch64 System register DBGAUTHSTATUS_EL1 is architecturally mapped to AArch32 System register DBGAUTHSTATUS.

AArch64 System register DBGAUTHSTATUS_EL1 is architecturally mapped to External register DBGAUTHSTATUS_EL1.

**Attributes**

DBGAUTHSTATUS_EL1 is a 32-bit register.

**Field descriptions**

The DBGAUTHSTATUS_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Locations</th>
<th>Field Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-8</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>7-6</td>
<td>SNID</td>
</tr>
<tr>
<td>5-4</td>
<td>SID</td>
</tr>
<tr>
<td>3-2</td>
<td>NSID</td>
</tr>
<tr>
<td></td>
<td>NSNID</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**SNID, bits [7:6]**

Secure non-invasive debug. Possible values of this field are:

- 00: Not implemented. EL3 is not implemented and the implemented Security state is Non-secure state.
- 10: Implemented and disabled. ExternalSecureNoninvasiveDebugEnabled() == FALSE.
- 11: Implemented and enabled. ExternalSecureNoninvasiveDebugEnabled() == TRUE.

Other values are reserved.

**SID, bits [5:4]**

Secure invasive debug. Possible values of this field are:

- 00: Not implemented. EL3 is not implemented and the implemented Security state is Non-secure state.
- 10: Implemented and disabled. ExternalSecureInvasiveDebugEnabled() == FALSE.
- 11: Implemented and enabled. ExternalSecureInvasiveDebugEnabled() == TRUE.

Other values are reserved.

**NSNID, bits [3:2]**

Non-secure non-invasive debug. Possible values of this field are:

- 00: Not implemented. EL3 is not implemented and the implemented Security state is Secure state.
- 10: Implemented and disabled. ExternalNoninvasiveDebugEnabled() == FALSE.
- 11: Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.
Other values are reserved.

**NSID, bits [1:0]**

Non-secure invasive debug. Possible values of this field are:

00 Not implemented. EL3 is not implemented and the implemented Security state is Secure state.
10 Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE.
11 Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE.

Other values are reserved.

### Accessing the DBGAUTHSTATUS_EL1

This register can be read using MRS with the following syntax:

\[ \text{MRS <Xt>, <systemreg>} \]

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBGAUTHSTATUS_EL1</td>
<td>10</td>
<td>000</td>
<td>0111</td>
<td>1110</td>
<td>110</td>
</tr>
</tbody>
</table>

### Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0</td>
</tr>
<tr>
<td>x x 0</td>
<td>-</td>
</tr>
<tr>
<td>x 0 1</td>
<td>-</td>
</tr>
<tr>
<td>x 1 1</td>
<td>-</td>
</tr>
</tbody>
</table>

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TDA==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If MDCR_EL3.TDA==1, read accesses to this register from EL1 and EL2 are trapped to EL3.
D10.3.2  DBGBCR<n>_EL1, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n>_EL1 characteristics are:

**Purpose**

Holds control information for a breakpoint. Forms breakpoint n together with value register DBGBVR<n>_EL1.

**Configurations**

AArch64 System register DBGBCR<n>_EL1 is architecturally mapped to AArch32 System register DBGBCR<n>.

AArch64 System register DBGBCR<n>_EL1 is architecturally mapped to External register DBGBCR<n>_EL1.

If breakpoint n is not implemented then this register is unallocated.

This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

**Attributes**

DBGBCR<n>_EL1 is a 32-bit register.

**Field descriptions**

The DBGBCR<n>_EL1 bit assignments are:

| 31 | 24 | 23 | 20 | 19 | 16 | 15 | 14 | 13 | 12 | 9 | 8 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | BT | LBN | SSC | RES0 | BAS | PMC | E | RES0 | HMC |

**Bits [31:24]**

Reserved, RES0.

**BT, bits [23:20]**

Breakpoint Type. Possible values are:

- 0000  Unlinked instruction address match.
- 0001  Linked instruction address match.
- 0010  Unlinked Context ID match.
- 0011  Linked Context ID match.
- 0100  Unlinked CONTEXTIDR_EL1 match (introduced in ARMv8.1).
- 0110  Linked CONTEXTIDR_EL1 match (introduced in ARMv8.1).
- 1000  Unlinked VMID match.
- 1001  Linked VMID match.
- 1010  Unlinked VMID and Context ID match.
- 1011  Linked VMID and Context ID match.
- 1100  Unlinked CONTEXTIDR_EL2 match (introduced in ARMv8.1).
- 1101  Linked CONTEXTIDR_EL2 match (introduced in ARMv8.1).
- 1110  Unlinked Full Context ID match (introduced in ARMv8.1).
- 1111  Linked Full Context ID match (introduced in ARMv8.1).
The field breaks down as follows:

- **BT[3:1]: Base type.**
  - 000  
    Match address. `DBGBVR<n>_EL1` is the address of an instruction.
  - 001  
    Match Context ID. In most cases, the `DBGBVR<n>_EL1.ContextID` must match the `CONTEXTIDR_EL1` value. However, when ARMv8.1-VHE is implemented, EL2 is using AArch64, and the Effective value of `HCR_EL2.E2H` is 1, if either the PE is executing at Non-secure EL0 with `HCR_EL2.TGE` set to 1, or the PE is executing at EL2, then `DBGBVR<n>_EL1.ContextID` must match the `CONTEXTIDR_EL2` value.
  - 011  
    Match `CONTEXTIDR_EL1`. `DBGBVR<n>_EL1.ContextID` is a Context ID compared against `CONTEXTIDR_EL1`.
  - 100  
    Match VMID. `DBGBVR<n>_EL1.VMID` is a VMID compared against `VTTBR_EL2.VMID`.
  - 101  
    Match VMID and Context ID. `DBGBVR<n>_EL1.ContextID` is a Context ID compared against `CONTEXTIDR_EL1`, and `DBGBVR<n>_EL1.VMID` is a VMID compared against `VTTBR_EL2.VMID`.
  - 110  
    Match `CONTEXTIDR_EL2`. `DBGBVR<n>_EL1.ContextID2` is a Context ID compared against `CONTEXTIDR_EL2`.
  - 111  
    Match Full Context ID. `DBGBVR<n>_EL1.ContextID` is compared against `CONTEXTIDR_EL1`, and `DBGBVR<n>_EL1.ContextID2` is compared against `CONTEXTIDR_EL2`.

- **BT[0]: Enable linking.**
  
  All other values are reserved. Constraints on breakpoint programming mean other values are reserved under some conditions. For more information, including the effect of programming this field to a reserved value, see [Reserved DBGBCR<n>_EL1.BT values](#) on page D2-2011.

  This field resets to a value that is architectually **UNKNOWN**.

**LBN, bits [19:16]**

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an **UNKNOWN** value.

This field is ignored when the value of `DBGBVR<n>_EL1.E` is 0.

This field resets to a value that is architecturally **UNKNOWN**.

**SSC, bits [15:14]**

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information, including the effect of programming the fields to a reserved set of values, see [Reserved DBGBCR<n>_EL1.{SSC, HMC, PMC} values](#) on page D2-2011.

For more information on the operation of the SSC, HMC, and PMC fields, see [Execution conditions for which a breakpoint generates Breakpoint exceptions](#) on page D2-2006.

This field resets to a value that is architecturally **UNKNOWN**.

**HMC, bit [13]**

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the SSC, bits [15:14] description.

For more information on the operation of the SSC, HMC, and PMC fields, see [Execution conditions for which a breakpoint generates Breakpoint exceptions](#) on page D2-2006.

This field resets to a value that is architecturally **UNKNOWN**.
Bits [12:9]

Reserved, RES0.

BAS, bits [8:5]

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state. In an AArch64-only implementation, this field is reserved, RES1.

The permitted values depend on the breakpoint type.
For Address match breakpoints, the permitted values are:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Match instruction at</th>
<th>Constraint for debuggers</th>
</tr>
</thead>
<tbody>
<tr>
<td>0011</td>
<td>DBGBVR&lt;(n)&gt; _EL1</td>
<td>Use for T32 instructions.</td>
</tr>
<tr>
<td>1100</td>
<td>DBGBVR&lt;(n)&gt; _EL1+2</td>
<td>Use for T32 instructions.</td>
</tr>
<tr>
<td>1111</td>
<td>DBGBVR&lt;(n)&gt; _EL1</td>
<td>Use for A64 and A32 instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved. For more information, see Reserved DBGBCR<\(n\)>_EL1.BAS values on page D2-2012.

For more information on using the BAS field in address match breakpoints, see Using the BAS field in Address Match breakpoints on page G2-4768.

For Context matching breakpoints, this field is RES1 and ignored.
If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

Bits [4:3]

Reserved, RES0.

PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the DBGBCR<\(n\)>_EL1.SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see Execution conditions for which a breakpoint generates Breakpoint exceptions on page D2-2006.

This field resets to a value that is architecturally UNKNOWN.

E, bit [0]

Enable breakpoint DBGBVR<\(n\)> _EL1. Possible values are:

0   Breakpoint disabled.
1   Breakpoint enabled.

This field resets to a value that is architecturally UNKNOWN.

Accessing the DBGBCR<\(n\)>_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>
This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBGBCR&lt;n&gt;_EL1</td>
<td>10</td>
<td>000</td>
<td>0000</td>
<td>n&lt;3:0&gt;</td>
<td>101</td>
</tr>
</tbody>
</table>

- `<CRm>` is in the range 0 - 15.

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>
</tr>
<tr>
<td>TGE</td>
<td>RW</td>
</tr>
<tr>
<td>NS</td>
<td>-</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TDA==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If MDCR_EL3.TDA==1, accesses to this register from EL1 and EL2 are trapped to EL3.
- If the register access does not generate an exception then:
  - If EDSCR.TDA==1, and OSLSR_EL1.OSLK==0, and halting is allowed, accesses to this register from EL1, EL2, and EL3 generate a Software Access debug event.
D10.3.3 DBGBVR<n>_EL1, Debug Breakpoint Value Registers, n = 0 - 15

The DBGBVR<n>_EL1 characteristics are:

Purpose
Holds a virtual address, or a VMID and/or a context ID, for use in breakpoint matching. Forms breakpoint n together with control register DBGBCR<n>_EL1.

Configurations
AArch64 System register DBGBVR<n>_EL1[31:0] is architecturally mapped to AArch32 System register DBGBVR<n>. If the breakpoint is context-aware and EL2 is implemented then AArch64 System register DBGBVR<n>_EL1[63:32] is architecturally mapped to AArch32 System register DBGBXVR<n>. Otherwise there is no System register access to DBGBVR<n>_EL1[63:32] from AArch32 state. AArch64 System register DBGBVR<n>_EL1 is architecturally mapped to External register DBGBVR<n>_EL1. If breakpoint n is not implemented then this register is unallocated. This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

Attributes
How this register is interpreted depends on the value of DBGBCR<n>_EL1.BT.
• When DBGBCR<n>_EL1.BT is 0b000x, this register holds a virtual address.
• When DBGBCR<n>_EL1.BT is 0b001x, 0b011x, or 0b110x, this register holds a Context ID.
• When DBGBCR<n>_EL1.BT is 0b100x, this register holds a VMID.
• When DBGBCR<n>_EL1.BT is 0b101x, this register holds a VMID and a Context ID.
• When DBGBCR<n>_EL1.BT is 0b111x, this register holds two Context ID values.
For other values of DBGBCR<n>_EL1.BT, this register is RES0.

Field descriptions
The DBGBVR<n>_EL1 bit assignments are:

When DBGBCR<n>_EL1.BT==0b000x:

<table>
<thead>
<tr>
<th>63</th>
<th>53 52</th>
<th>49 48</th>
<th>2 1 0</th>
</tr>
</thead>
</table>

RESS[14:4], bits [63:53]
Reserved. Sign extended. Software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1. Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:
• The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
• The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.
VA[52:49], bits [52:49]

In ARMv8.3 and ARMv8.2
This field resets to a value that is architecturally UNKNOWN.

In ARMv8.1 and ARMv8.0.

VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.
When ARMv8.2-LVA is implemented, and 52-bit addresses and a 64KB translation granule are in use, VA[52:49] form the upper part of the address value. Otherwise, VA[52:49] are RESS.
This field resets to a value that is architecturally UNKNOWN.

Bits [1:0]
Reserved, RES0.

When DBGBCR<n>_EL1.BT==0b001x:

Bits [63:32]
Reserved, RES0.

ContextID, bits [31:0]
Context ID value for comparison.
The value is compared against CONTEXTIDR_EL1 in the following cases:
• The PE is in Secure state.
• When ARMv8.1-VHE is not implemented.
• When ARMv8.1-VHE is implemented, HCR_EL2.E2H is 0 and the PE is in Non-secure EL0, EL1 or EL2.
• When ARMv8.1-VHE is implemented, HCR_EL2:{E2H, TGE} is {1, 0} and the PE is in Non-secure EL0 or EL1.

When ARMv8.1-VHE is implemented, HCR_EL2.E2H is 1, the value is compared against CONTEXTIDR_EL2 in the following cases:
• The PE is executing at EL2.
• HCR_EL2.TGE is 1 and the PE is in Non-secure EL0.
This field resets to a value that is architecturally UNKNOWN.

When DBGBCR<n>_EL1.BT==0b011x:

Bits [63:32]
Reserved, RES0.
ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR_EL1.

This field resets to a value that is architecturally UNKNOWN.

When DBGBCR<n>_EL1.BT==0b100x and EL2 implemented:

![Diagram of ContextID, bits [31:0]]

<table>
<thead>
<tr>
<th>63</th>
<th>48</th>
<th>47</th>
<th>40</th>
<th>39</th>
<th>32</th>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>VMID[15:8]</td>
<td>VMID[7:0]</td>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

In ARMv8.3, ARMv8.2 and ARMv8.1

Extension to VMID[7:0]. See VMID[7:0] for more details.

This field resets to a value that is architecturally UNKNOWN.

In ARMv8.0.

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits in the following cases.

- EL2 is using AArch32.
- ARMv8.1-VMID16 is not implemented.

When ARMv8.1-VMID16 is implemented and EL2 is using AArch64, it is IMPLEMENTATION DEFINED whether the VMID is 8 bits or 16 bits.

VMID[15:8] is RES0 if any of the following applies:

- The implementation has an 8-bit VMID.
- VTCR_EL2.VS has a value of 0.
- EL2 is using AArch32.

This field resets to a value that is architecturally UNKNOWN.

Bits [31:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT==0b101x and EL2 implemented:

![Diagram of ContextID, bits [31:0]]

<table>
<thead>
<tr>
<th>63</th>
<th>48</th>
<th>47</th>
<th>40</th>
<th>39</th>
<th>32</th>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>VMID[15:8]</td>
<td>VMID[7:0]</td>
<td>ContextID</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

In ARMv8.3, ARMv8.2 and ARMv8.1

Extension to VMID[7:0]. See VMID[7:0] for more details.
This field resets to a value that is architecturally **UNKNOWN**.

**In ARMv8.0.**

Reserved, RES0.

**VMID[7:0], bits [39:32]**

VMID value for comparison.

The VMID is 8 bits in the following cases:

- EL2 is using AArch32.
- **ARMv8.1-VMID16** is not implemented.

When **ARMv8.1-VMID16** is implemented and EL2 is using AArch64, it is **IMPLEMENTATION DEFINED** whether the VMID is 8 bits or 16 bits.

VMID[15:8] is **RES0** if any of the following applies:

- The implementation has an 8-bit VMID.
- VTCR_EL2.VS has a value of 0.
- EL2 is using AArch32.

This field resets to a value that is architecturally **UNKNOWN**.

**ContextID, bits [31:0]**

Context ID value for comparison against `CONTEXTIDR_EL1`.

This field resets to a value that is architecturally **UNKNOWN**.

When **DBGBCR<n>_EL1.BT==0b110x** and EL2 implemented:

<table>
<thead>
<tr>
<th>63</th>
<th>32</th>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="res0" alt="ContextID2" /></td>
<td><img src="res0" alt="RES0" /></td>
<td><img src="res0" alt="ContextID2" /></td>
<td><img src="res0" alt="RES0" /></td>
</tr>
</tbody>
</table>

**ContextID2, bits [63:32]**

Context ID value for comparison against `CONTEXTIDR_EL2`.

This field resets to a value that is architecturally **UNKNOWN**.

**Bits [31:0]**

Reserved, RES0.

When **DBGBCR<n>_EL1.BT==0b111x** and EL2 implemented:

<table>
<thead>
<tr>
<th>63</th>
<th>32</th>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="res0" alt="ContextID2" /></td>
<td><img src="res0" alt="ContextID" /></td>
<td><img src="res0" alt="ContextID" /></td>
<td><img src="res0" alt="RES0" /></td>
</tr>
</tbody>
</table>

**ContextID2, bits [63:32]**

Context ID value for comparison against `CONTEXTIDR_EL2`.

This field resets to a value that is architecturally **UNKNOWN**.

**ContextID, bits [31:0]**

Context ID value for comparison against `CONTEXTIDR_EL1`.

This field resets to a value that is architecturally **UNKNOWN**.
Accessing the DBGBVR<n>_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBGBVR&lt;n&gt;_EL1</td>
<td>10000000</td>
<td>n&lt;3:0&gt;</td>
<td>100</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- <CRm> is in the range 0 - 15.

Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TDA==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL3 is implemented and is using AArch64:
  - If MDCR_EL3.TDA==1, accesses to this register from EL1 and EL2 are trapped to EL3.

- If the register access does not generate an exception:
  - If EDSCR.TDA==1, and OSLSR_EL1.OSLK==0, and halting is allowed, accesses to this register from EL1, EL2, and EL3 generate a Software Access debug event.
D10.3.4 DBGCLAIMCLR_EL1, Debug Claim Tag Clear register

The DBGCLAIMCLR_EL1 characteristics are:

**Purpose**

Used by software to read the values of the CLAIM tag bits, and to clear these bits to 0. The architecture does not define any functionality for the CLAIM tag bits.

--- Note ---

CLAIM tags are typically used for communication between the debugger and target software. Used in conjunction with the DBGCLAIMSET_EL1 register.

**Configurations**

AArch64 System register DBGCLAIMCLR_EL1 is architecturally mapped to AArch32 System register DBGCLAIMCLR.

AArch64 System register DBGCLAIMCLR_EL1 is architecturally mapped to External register DBGCLAIMCLR_EL1.

An implementation must include 8 CLAIM tag bits.

This register is in the Cold reset domain. See the CLAIM field description for the effect of a Cold reset on the value returned by this register. This register is not affected by a Warm reset.

**Attributes**

DBGCLAIMCLR_EL1 is a 32-bit register.

**Field descriptions**

The DBGCLAIMCLR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Address</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-8</td>
<td>Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.</td>
</tr>
<tr>
<td>7-0</td>
<td>CLAIM, bits [7:0]</td>
</tr>
</tbody>
</table>

Reading this field returns the current value of the CLAIM tag bits. Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect. A cold reset clears the CLAIM tag bits to 0.

**Accessing the DBGCLAIMCLR_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>
This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBGCLAIMCLR_EL1</td>
<td>10</td>
<td>000</td>
<td>0111</td>
<td>1001</td>
<td>110</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>E2&lt;sup&gt;H&lt;/sup&gt;</th>
<th>TGE</th>
<th>NS</th>
<th>EL0</th>
<th>EL1</th>
<th>EL2</th>
<th>EL3</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>x</td>

<td>1</td>
<td>-</td>
<td>n/a</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TDA==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If MDCR_EL3.TDA==1, accesses to this register from EL1 and EL2 are trapped to EL3.
D10.3.5   DBGCLAIMSET_EL1, Debug Claim Tag Set register

The DBGCLAIMSET_EL1 characteristics are:

**Purpose**

Used by software to set the CLAIM tag bits to 1.

The architecture does not define any functionality for the CLAIM tag bits.

--- **Note** ---

CLAIM tags are typically used for communication between the debugger and target software.

---

CLAIM tags are typically used for communication between the debugger and target software. Used in conjunction with the DBGCLAIMCLR_EL1 register.

**Configurations**

AArch64 System register DBGCLAIMSET_EL1 is architecturally mapped to AArch32 System register DBGCLAIMSET.

AArch64 System register DBGCLAIMSET_EL1 is architecturally mapped to External register DBGCLAIMSET_EL1.

An implementation must include 8 CLAIM tag bits.

**Attributes**

DBGCLAIMSET_EL1 is a 32-bit register.

**Field descriptions**

The DBGCLAIMSET_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAZ/SBZ</td>
<td>CLAIM</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

**CLAIM, bits [7:0]**

Set CLAIM tag bits. RAO.

Writing a 1 to one of these bits sets the corresponding CLAIM tag bit to 1. This is an indirect write to the CLAIM tag bits. A single write operation can set multiple CLAIM tag bits to 1.

Writing 0 to one of these bits has no effect.

A cold reset clears the CLAIM tag bits to 0.

**Accessing the DBGCLAIMSET_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>
This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBGCLAIMSET_EL1</td>
<td>10</td>
<td>000</td>
<td>0111</td>
<td>1000</td>
<td>110</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE</td>
<td>EL0</td>
</tr>
<tr>
<td>x x</td>
<td>-</td>
</tr>
<tr>
<td>x 0</td>
<td>-</td>
</tr>
<tr>
<td>x 1</td>
<td>-</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TDA==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL3 is implemented and is using AArch64:
  - If MDCR_EL3.TDA==1, accesses to this register from EL1 and EL2 are trapped to EL3.
D10.3.6 DBGDTR_EL0, Debug Data Transfer Register, half-duplex

The DBGDTR_EL0 characteristics are:

**Purpose**

Transfers 64 bits of data between the PE and an external debugger. Can transfer both ways using only a single register.

**Configurations**

There are no configuration notes.

**Attributes**

DBGDTR_EL0 is a 64-bit register.

**Field descriptions**

The DBGDTR_EL0 bit assignments are:

```
      63  32  31  0

     HighWord  LowWord
```

**HighWord, bits [63:32]**

Writes to this register set DTRRX to the value in this field and do not change RXfull.

Reads from this register return the value of DTRTX and do not change TXfull.

**LowWord, bits [31:0]**

Writes to this register set DTRTX to the value in this field and set TXfull to 1.

Reads from this register return the value of DTRRX and clear RXfull to 0.

**Accessing the DBGDTR_EL0**

This register can be read using MRS with the following syntax:

\[ \text{MRS } <Xt>, <\text{systemreg}> \]

This register can be written using MSR (register) with the following syntax:

\[ \text{MSR } <\text{systemreg}>, <Xt> \]

This syntax is encoded with the following settings in the instruction encoding:

```
<systemreg> op0 op1 CRn CRm op2
DBGDTR_EL0 10 011 0000 0100 000
```
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0</td>
</tr>
<tr>
<td>x x 0</td>
<td>RW</td>
</tr>
<tr>
<td>x 0 1</td>
<td>RW</td>
</tr>
<tr>
<td>x 1 1</td>
<td>RW</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules, in Non-debug state:

- In both security states, and not dependent on other bits:
  - If MDSCR_EL1.TDCC==1, accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TDA==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If MDCR_EL3.TDA==1, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

**Note**

Read and write accesses to this register are not trapped in Debug state.
D10.3.7 DBGDTRRX_EL0, Debug Data Transfer Register, Receive

The DBGDTRRX_EL0 characteristics are:

Purpose

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. It is a component of the Debug Communications Channel.

Configurations

AArch64 System register DBGDTRRX_EL0 is architecturally mapped to AArch32 System register DBGDTRRXint.

AArch64 System register DBGDTRRX_EL0 is architecturally mapped to External register DBGDTRRX_EL0.

This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

Attributes

DBGDTRRX_EL0 is a 32-bit register.

Field descriptions

The DBGDTRRX_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [31:0]</th>
<th>Update DTRRX</th>
</tr>
</thead>
</table>

Update DTRRX.

If RXfull is set to 1, then reads of this register return the last value written to DTRRX and clear RXfull to 0.

For the full behavior of the Debug Communications Channel, see Chapter H4 The Debug Communication Channel and Instruction Transfer Register.

This field resets to a value that is architecturally UNKNOWN.

Accessing the DBGDTRRX_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBGDTRRX_EL0</td>
<td>10</td>
<td>011</td>
<td>0000</td>
<td>0101</td>
<td>000</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>x x 0</td>
<td>RO RO n/a RO</td>
</tr>
<tr>
<td>x 0 1</td>
<td>RO RO RO RO</td>
</tr>
<tr>
<td>x 1 1</td>
<td>RO n/a RO RO</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules, in Non-debug state:

- In both security states, and not dependent on other bits:
  - If MDSCR_EL1.TDCC==1, read accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TDA==1, Non-secure read accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If MDCR_EL3.TDA==1, read accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

**Note**

Read accesses to this register are not trapped in Debug state.
D10.3.8 DBGDTRTX_EL0, Debug Data Transfer Register, Transmit

The DBGDTRTX_EL0 characteristics are:

**Purpose**

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. It is a component of the Debug Communication Channel.

**Configurations**

AArch64 System register DBGDTRTX_EL0 is architecturally mapped to AArch32 System register DBGDTRTXint.

AArch64 System register DBGDTRTX_EL0 is architecturally mapped to External register DBGDTRTX_EL0.

This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

**Attributes**

DBGDTRTX_EL0 is a 32-bit register.

**Field descriptions**

The DBGDTRTX_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Bit Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>Return DTRTX</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Return DTRTX.

If TXfull is set to 0, then writes of this register update the value in DTRTX and set TXfull to 1.

For the full behavior of the Debug Communications Channel, see Chapter H4 The Debug Communication Channel and Instruction Transfer Register.

This field resets to a value that is architecturally UNKNOWN.

**Accessing the DBGDTRTX_EL0**

This register can be written using MSR (register) with the following syntax:

MSR `<systemreg>`, `<xt>`

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th><code>&lt;systemreg&gt;</code></th>
<th><code>op0</code></th>
<th><code>op1</code></th>
<th><code>CRn</code></th>
<th><code>CRm</code></th>
<th><code>op2</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>DBGDTRTX_EL0</td>
<td>10</td>
<td>011</td>
<td>0000</td>
<td>0101</td>
<td>000</td>
</tr>
</tbody>
</table>
**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>TGE</td>
<td>WO WO n/a WO</td>
</tr>
<tr>
<td>NS</td>
<td>WO WO WO WO</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules, in Non-debug state:

- In both security states, and not dependent on other bits:
  - If MDSCR_EL1.TDCC==1, write accesses to this register from EL0 are trapped to EL1.

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TDA==1, Non-secure write accesses to this register from EL0 and EL1 are trapped to EL2.

- When EL3 is implemented and is using AArch64:
  - If MDCR_EL3.TDA==1, write accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

**Note**

Write accesses to this register are not trapped in Debug state.
D10.3.9 DBGPRCR_EL1, Debug Power Control Register

The DBGPRCR_EL1 characteristics are:

**Purpose**
Controls behavior of the PE on powerdown request.

**Configurations**

AArch64 System register DBGPRCR_EL1 is architecturally mapped to AArch32 System register DBGPRCR.

Bit [0] of this register is mapped to EDPRCR.CORENPDRQ, bit [0] of the external view of this register.

The other bits in these registers are not mapped to each other.

This register is in the Cold reset domain. Some or all RW fields of this register have defined reset values. On a Cold reset these apply only if the PE resets into an Exception level that is using AArch64. Otherwise, on a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

**Attributes**

DBGPRCR_EL1 is a 32-bit register.

**Field descriptions**

The DBGPRCR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>1</td>
<td>Core no powerdown request. Requests emulation of powerdown. Possible values of this bit are:</td>
</tr>
<tr>
<td>0</td>
<td>If the system responds to a powerdown request, it powers down Core power domain.</td>
</tr>
<tr>
<td>1</td>
<td>If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.</td>
</tr>
</tbody>
</table>

Writes to this bit are permitted regardless of the state of the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request Core no powerdown regardless of whether invasive debug is permitted.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of EDPRCR.COREPURQ on exit from an IMPLEMENTATION DEFINED software-visible retention state.

When this register has an architecturally-defined reset value, this field resets to the value of EDPRCR.COREPURQ.

**Accessing the DBGPRCR_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

RES0

31 1 0

CORENPDRQ

Bits [31:1]  
Reserved, RES0.

CORENPDRQ, bit [0]  
Core no powerdown request. Requests emulation of powerdown. Possible values of this bit are:

0  
If the system responds to a powerdown request, it powers down Core power domain.

1  
If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

Writes to this bit are permitted regardless of the state of the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request Core no powerdown regardless of whether invasive debug is permitted.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of EDPRCR.COREPURQ on exit from an IMPLEMENTATION DEFINED software-visible retention state.

When this register has an architecturally-defined reset value, this field resets to the value of EDPRCR.COREPURQ.
MSR `<systemreg>, <Xt>`

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th><code>&lt;systemreg&gt;</code></th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBGPRC_EL1</td>
<td>10</td>
<td>000</td>
<td>001</td>
<td>0100</td>
<td>100</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>x x 0</td>
<td>- RW n/a RW</td>
</tr>
<tr>
<td>x 0 1</td>
<td>- RW RW RW</td>
</tr>
<tr>
<td>x 1 1</td>
<td>- n/a RW RW</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TDOSA==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If MDCR_EL3.TDOSA==1, accesses to this register from EL1 and EL2 are trapped to EL3.
D10.3.10  DBGVCR32_EL2, Debug Vector Catch Register

The DBGVCR32_EL2 characteristics are:

**Purpose**

Allows access to the AArch32 register DBGVC from AArch64 state only. Its value has no effect on execution in AArch64 state.

**Configurations**

AArch64 System register DBGVCR32_EL2 is architecturally mapped to AArch32 System register DBGVC.

If EL1 does not support AArch32, this register is UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

DBGVCR32_EL2 is a 32-bit register.

**Field descriptions**

The DBGVCR32_EL2 bit assignments are:

*When EL3 implemented and using AArch64:*

- NSF, bit [31]:
  FIQ vector catch enable in Non-secure state.
  The exception vector offset is 0x1C.
  This field resets to a value that is architecturally UNKNOWN.

- NSI, bit [30]:
  IRQ vector catch enable in Non-secure state.
  The exception vector offset is 0x18.
  This field resets to a value that is architecturally UNKNOWN.

- Bit [29]:
  Reserved, RES0.

- NSD, bit [28]:
  Data Abort vector catch enable in Non-secure state.
The exception vector offset is 0x10.
This field resets to a value that is architecturally UNKNOWN.

**NSP, bit [27]**
Prefetch Abort vector catch enable in Non-secure state.
The exception vector offset is 0x0C.
This field resets to a value that is architecturally UNKNOWN.

**NSS, bit [26]**
Supervisor Call (SVC) vector catch enable in Non-secure state.
The exception vector offset is 0x08.
This field resets to a value that is architecturally UNKNOWN.

**NSU, bit [25]**
Undefined Instruction vector catch enable in Non-secure state.
The exception vector offset is 0x04.
This field resets to a value that is architecturally UNKNOWN.

**Bits [24:8]**
Reserved, RES0.

**SF, bit [7]**
FIQ vector catch enable in Secure state.
The exception vector offset is 0x1C.
This field resets to a value that is architecturally UNKNOWN.

**SI, bit [6]**
IRQ vector catch enable in Secure state.
The exception vector offset is 0x18.
This field resets to a value that is architecturally UNKNOWN.

**Bit [5]**
Reserved, RES0.

**SD, bit [4]**
Data Abort vector catch enable in Secure state.
The exception vector offset is 0x10.
This field resets to a value that is architecturally UNKNOWN.

**SP, bit [3]**
Prefetch Abort vector catch enable in Secure state.
The exception vector offset is 0x0C.
This field resets to a value that is architecturally UNKNOWN.

**SS, bit [2]**
Supervisor Call (SVC) vector catch enable in Secure state.
The exception vector offset is 0x08.
This field resets to a value that is architecturally UNKNOWN.

**SU, bit [1]**
Undefined Instruction vector catch enable in Secure state.
The exception vector offset is 0x04.
This field resets to a value that is architecturally UNKNOWN.

**Bit [0]**

Reserved, RES0.

*When EL3 not implemented:*

F, bit [7]

FIQ vector catch enable.
The exception vector offset is 0x1C.
This field resets to a value that is architecturally UNKNOWN.

I, bit [6]

IRQ vector catch enable.
The exception vector offset is 0x18.
This field resets to a value that is architecturally UNKNOWN.

**Bit [5]**

Reserved, RES0.

D, bit [4]

Data Abort vector catch enable.
The exception vector offset is 0x10.
This field resets to a value that is architecturally UNKNOWN.

P, bit [3]

Prefetch Abort vector catch enable.
The exception vector offset 0x0C.
This field resets to a value that is architecturally UNKNOWN.

S, bit [2]

Supervisor Call (SVC) vector catch enable.
The exception vector offset 0x08.
This field resets to a value that is architecturally UNKNOWN.

U, bit [1]

Undefined Instruction vector catch enable.
The exception vector offset is 0x04.
This field resets to a value that is architecturally UNKNOWN.

**Bit [0]**

Reserved, RES0.
Accessing the DBGVCR32_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

```
<systemreg> op0 op1 CRn CRm op2
DBGVCR32_EL2 10 100 0000 0111 000
```

Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL3 is implemented and is using AArch64:
  - If MDCR_EL3.TDA==1, accesses to this register from EL2 are trapped to EL3.
D10.3.11  DBGWCR<n>_EL1, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n>_EL1 characteristics are:

**Purpose**

Holds control information for a watchpoint. Forms watchpoint n together with value register DBGWVR<n>_EL1.

**Configurations**

AArch64 System register DBGWCR<n>_EL1 is architecturally mapped to AArch32 System register DBGWCR<n>.

AArch64 System register DBGWCR<n>_EL1 is architecturally mapped to External register DBGWCR<n>_EL1.

If breakpoint n is not implemented then this register is unallocated.

This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

**Attributes**

DBGWCR<n>_EL1 is a 32-bit register.

**Field descriptions**

The DBGWCR<n>_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-29</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>28-24</td>
<td>Address mask. Only objects up to 2GB can be watched using a single mask.</td>
</tr>
<tr>
<td></td>
<td>00000: No mask.</td>
</tr>
<tr>
<td></td>
<td>00001: Reserved.</td>
</tr>
<tr>
<td></td>
<td>00010: Reserved.</td>
</tr>
<tr>
<td>23-21</td>
<td>If programmed with a reserved value, a watchpoint must behave as if either:</td>
</tr>
<tr>
<td></td>
<td>• MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn_EL1.</td>
</tr>
<tr>
<td></td>
<td>• The watchpoint is disabled.</td>
</tr>
<tr>
<td></td>
<td>Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.</td>
</tr>
<tr>
<td></td>
<td>Other values mask the corresponding number of address bits, from 0b00011 masking 3 address bits (0x000000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).</td>
</tr>
<tr>
<td>20-19</td>
<td>This field resets to a value that is architecturally UNKNOWN.</td>
</tr>
<tr>
<td>18-16</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>15-12</td>
<td></td>
</tr>
<tr>
<td>11-8</td>
<td></td>
</tr>
<tr>
<td>7-4</td>
<td></td>
</tr>
<tr>
<td>3-0</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:29]**

Reserved, RES0.

**MASK, bits [28:24]**

Address mask. Only objects up to 2GB can be watched using a single mask.

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>00000</td>
<td>No mask.</td>
</tr>
<tr>
<td>00001</td>
<td>Reserved.</td>
</tr>
<tr>
<td>00010</td>
<td>Reserved.</td>
</tr>
</tbody>
</table>

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn_EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from 0b00011 masking 3 address bits (0x000000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

This field resets to a value that is architecturally UNKNOWN.
WT, bit [20]
Watchpoint type. Possible values are:

0     Unlinked data address match.
1     Linked data address match.

This field resets to a value that is architecturally UNKNOWN.

LBN, bits [19:16]
Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

This field resets to a value that is architecturally UNKNOWN.

SSC, bits [15:14]
Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see Execution conditions for which a watchpoint generates Watchpoint exceptions on page D2-2019.

This field resets to a value that is architecturally UNKNOWN.

HMC, bit [13]
Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see Execution conditions for which a watchpoint generates Watchpoint exceptions on page D2-2019.

This field resets to a value that is architecturally UNKNOWN.

BAS, bits [12:5]
Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by DBGWVR<n>_EL1 is being watched.

<table>
<thead>
<tr>
<th>BAS</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x0xxxx Match byte at DBGWVR&lt;n&gt;_EL1 + 0</td>
<td></td>
</tr>
<tr>
<td>x00xxx Match byte at DBGWVR&lt;n&gt;_EL1 + 1</td>
<td></td>
</tr>
<tr>
<td>x00xx Match byte at DBGWVR&lt;n&gt;_EL1 + 2</td>
<td></td>
</tr>
<tr>
<td>x00x Match byte at DBGWVR&lt;n&gt;_EL1 + 3</td>
<td></td>
</tr>
</tbody>
</table>

In cases where DBGWVR<n>_EL1 addresses a double-word:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Description, if DBGWVR&lt;n&gt;_EL1[2] == 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>xxx1xxx Match byte at DBGWVR&lt;n&gt;_EL1 + 4</td>
<td></td>
</tr>
<tr>
<td>xx1xxxx Match byte at DBGWVR&lt;n&gt;_EL1 + 5</td>
<td></td>
</tr>
<tr>
<td>x1xxxxx Match byte at DBGWVR&lt;n&gt;_EL1 + 6</td>
<td></td>
</tr>
<tr>
<td>lxxxxxx Match byte at DBGWVR&lt;n&gt;_EL1 + 7</td>
<td></td>
</tr>
</tbody>
</table>

The valid values for BAS are non-zero binary numbers all of whose set bits are contiguous. All other values are reserved and must not be used by software. See Reserved DBGWCR<n>_EL1.BAS values on page D2-2027.

This field resets to a value that is architecturally UNKNOWN.

### LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

- **01** Match instructions that load from a watchpointed address.
- **10** Match instructions that store to a watchpointed address.
- **11** Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field resets to a value that is architecturally UNKNOWN.

### PAC, bits [2:1]

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and HMC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see Execution conditions for which a watchpoint generates Watchpoint exceptions on page D2-2019.

This field resets to a value that is architecturally UNKNOWN.

### E, bit [0]

Enable watchpoint n. Possible values are:

- **0** Watchpoint disabled.
- **1** Watchpoint enabled.

This field resets to a value that is architecturally UNKNOWN.

### Accessing the DBGWCR<n>_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBGWCR&lt;n&gt;_EL1</td>
<td>10</td>
<td>000</td>
<td>0000</td>
<td>n&lt;3:0&gt;</td>
<td>111</td>
</tr>
</tbody>
</table>

- <CRm> is in the range 0 - 15.
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TDA==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL3 is implemented and is using AArch64:
  - If MDCR_EL3.TDA==1, accesses to this register from EL1 and EL2 are trapped to EL3.

- If the register access does not generate an exception:
  - If ESCR.TDA==1, and OSLSR_EL1.OSLK==0, and halting is allowed, accesses to this register from EL1, EL2, and EL3 generate a Software Access debug event.
### D10.3.12 DBGWVR<n>_EL1, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n>_EL1 characteristics are:

**Purpose**

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register DBGWCR<n>_EL1.

**Configurations**

AArch64 System register DBGWVR<n>_EL1[31:0] is architecturally mapped to AArch32 System register DBGWVR<n>.

AArch64 System register DBGWVR<n>_EL1 is architecturally mapped to External register DBGWVR<n>_EL1.

If breakpoint n is not implemented then this register is unallocated.

This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

**Attributes**

DBGWVR<n>_EL1 is a 64-bit register.

**Field descriptions**

The DBGWVR<n>_EL1 bit assignments are:

![Hex Diagram]

#### RES[14:4], bits [63:53]

Reserved, Sign extended. Hardware and software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

#### VA[52:49], bits [52:49]

*In ARMv8.3 and ARMv8.2*

This field resets to a value that is architecturally UNKNOWN.

*In ARMv8.1 and ARMv8.0.*

#### VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

When ARMv8.2-LVA is implemented, and 52-bit addresses and a 64KB translation granule are in use, VA[52:49] forms the upper part of the address value. Otherwise, VA[52:49] are RESS.

This field resets to a value that is architecturally UNKNOWN.
Bits [1:0]
Reserved, RES0.

Accessing the DBGWVR<n>_EL1

This register can be read using MRS with the following syntax:
MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:
MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBGWVR&lt;n&gt;_EL1</td>
<td>10</td>
<td>000</td>
<td>0000</td>
<td>n&lt;3:0&gt;</td>
<td>110</td>
</tr>
</tbody>
</table>

- <CRm> is in the range 0 - 15.

Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>x x 0</td>
<td>- RW n/a RW</td>
</tr>
<tr>
<td>x 0 1</td>
<td>- RW RW RW</td>
</tr>
<tr>
<td>x 1 1</td>
<td>- n/a RW RW</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TDA==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL3 is implemented and is using AArch64:
  - If MDCR_EL3.TDA==1, accesses to this register from EL1 and EL2 are trapped to EL3.

- If the register access does not generate an exception then:
  - If EDSCR.TDA==1, and OSLSR_EL1.OSLK==0, and halting is allowed, accesses to this register from EL1, EL2, and EL3 generate a Software Access debug event.
D10.3.13 DLR_EL0, Debug Link Register

The DLR_EL0 characteristics are:

**Purpose**

In Debug state, holds the address to restart from.

**Configurations**

AArch64 System register DLR_EL0[31:0] is architecturally mapped to AArch32 System register DLR.

**Attributes**

DLR_EL0 is a 64-bit register.

**Field descriptions**

The DLR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Restart address</th>
</tr>
</thead>
</table>

Accessing the DLR_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>DLR_EL0</td>
<td>11</td>
<td>011</td>
<td>0100</td>
<td>0101</td>
<td>001</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>
</tr>
<tr>
<td>TGE</td>
<td>RW</td>
</tr>
<tr>
<td>NS</td>
<td>x</td>
</tr>
</tbody>
</table>

Access to this register is from Debug state only. During normal execution this register is unallocated.
D10.3.14  DSPSR_EL0, Debug Saved Program Status Register

The DSPSR_EL0 characteristics are:

**Purpose**
Holds the saved process state on entry to Debug state.

**Configurations**
AArch64 System register DSPSR_EL0 is architecturally mapped to AArch32 System register DSPSR.

**Attributes**
DSPSR_EL0 is a 32-bit register.

**Field descriptions**
The DSPSR_EL0 bit assignments are:

*When exiting Debug state to AArch32:*

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>16</th>
<th>15</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>N</td>
<td>Z</td>
<td>C</td>
<td>V</td>
<td>Q</td>
<td>J</td>
<td>SS</td>
<td>IL</td>
<td>GE</td>
<td>IT[7:2]</td>
<td>E</td>
<td>A</td>
<td>I</td>
<td>F</td>
<td>T</td>
<td>M[3:0]</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**N, bit [31]**
Copied to CPSR.N on exiting Debug state.

**Z, bit [30]**
Copied to CPSR.Z on exiting Debug state.

**C, bit [29]**
Copied to CPSR.C on exiting Debug state.

**V, bit [28]**
Copied to CPSR.V on exiting Debug state.

**Q, bit [27]**
Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.

**IT[1:0], bits [26:25]**
IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

**J, bit [24]**
RES0.
In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**Bit [23]**
Reserved, RES0.
PAN, bit [22]

In ARMv8.3, ARMv8.2 and ARMv8.1

When ARMv8.1-PAN is implemented, set to the value of CPSR.PAN on entering Debug state, and copied to CPSR.PAN on exiting Debug state.

When ARMv8.1-PAN is not implemented, this bit is RES0.

In ARMv8.0.

Reserved, RES0.

SS, bit [21]

Software step. Shows the value of PSTATE.SS immediately before Debug state was entered.

IL, bit [20]

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before Debug state was entered.

GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

IT[7:2], bits [15:10]

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

E, bit [9]

Endianness state bit. Controls the load and store endianness for data accesses:

0 Little-endian operation
1 Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

A, bit [8]

Serror interrupt mask bit. The possible values of this bit are:

0 Exception not masked.
1 Exception masked.

I, bit [7]

IRQ mask bit. The possible values of this bit are:

0 Exception not masked.
1 Exception masked.
F, bit [6]

FIQ mask bit. The possible values of this bit are:
0 Exception not masked.
1 Exception masked.

T, bit [5]

T32 Instruction set state bit. Determines the AArch32 instruction set state that the Debug state entry was taken from. Possible values of this bit are:
0 Taken from A32 state.
1 Taken from T32 state.

M[4], bit [4]

Execution state that Debug state was entered from. Possible values of this bit are:
1 Exception taken from AArch32.

M[3:0], bits [3:0]

AArch32 mode that Debug state was entered from. The possible values are:

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>User</td>
</tr>
<tr>
<td>0b0001</td>
<td>FIQ</td>
</tr>
<tr>
<td>0b0010</td>
<td>IRQ</td>
</tr>
<tr>
<td>0b0011</td>
<td>Supervisor</td>
</tr>
<tr>
<td>0b0100</td>
<td>Monitor</td>
</tr>
<tr>
<td>0b0101</td>
<td>Abort</td>
</tr>
<tr>
<td>0b1010</td>
<td>Hyp</td>
</tr>
<tr>
<td>0b1011</td>
<td>Undefined</td>
</tr>
<tr>
<td>0b1111</td>
<td>System</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in Reserved values in System and memory-mapped registers and translation table entries on page K1-6427.

When entering Debug state from AArch64 and exiting Debug state to AArch64:

N, bit [31]

Set to the value of the N condition flag on entering Debug state, and copied to the N condition flag on exiting Debug state.
Z, bit [30]
Set to the value of the Z condition flag on entering Debug state, and copied to the Z condition flag on exiting Debug state.

C, bit [29]
Set to the value of the C condition flag on entering Debug state, and copied to the C condition flag on exiting Debug state.

V, bit [28]
Set to the value of the V condition flag on entering Debug state, and copied to the V condition flag on exiting Debug state.

Bits [27:24]
Reserved, RES0.

UAO, bit [23]
In ARMv8.3 and ARMv8.2
When ARMv8.2-UAO is implemented, set to the value of PSTATE.UAO on entering Debug state, and copied to PSTATE.UAO on exiting Debug state.
When ARMv8.2-UAO is not implemented, this bit is RES0.

In ARMv8.1 and ARMv8.0.
Reserved, RES0.

PAN, bit [22]
In ARMv8.3, ARMv8.2 and ARMv8.1
When ARMv8.1-PAN is implemented, set to the value of PSTATE.PAN on entering Debug state, and copied to PSTATE.PAN on exiting Debug state.
When ARMv8.1-PAN is not implemented, this bit is RES0.

In ARMv8.0.
Reserved, RES0.

SS, bit [21]
Software step. Shows the value of PSTATE.SS immediately before Debug state was entered.

IL, bit [20]
Illegal Execution state bit. Shows the value of PSTATE.IL immediately before Debug state was entered.

Bits [19:10]
Reserved, RES0.

D, bit [9]
Process state D mask. The possible values of this bit are:
0  Watchpoint, Breakpoint, and Software Step exceptions targeted at the current Exception level are not masked.
1  Watchpoint, Breakpoint, and Software Step exceptions targeted at the current Exception level are masked.
When the target Exception level of the debug exception is higher than the current Exception level, the exception is not masked by this bit.

A, bit [8]
SError interrupt mask bit. The possible values of this bit are:
0  Exception not masked.
Exception masked.

I, bit [7]

IRQ mask bit. The possible values of this bit are:
0 Exception not masked.
1 Exception masked.

F, bit [6]

FIQ mask bit. The possible values of this bit are:
0 Exception not masked.
1 Exception masked.

Bit [5]

Reserved, RES0.

M[4], bit [4]

Execution state that Debug state was entered from. Possible values of this bit are:
0 Exception taken from AArch64.

M[3:0], bits [3:0]

AArch64 state (Exception level and selected SP) that Debug state was entered from. The possible values are:

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL0t</td>
</tr>
<tr>
<td>0b0100</td>
<td>EL1t</td>
</tr>
<tr>
<td>0b0101</td>
<td>EL1h</td>
</tr>
<tr>
<td>0b1000</td>
<td>EL2t</td>
</tr>
<tr>
<td>0b1001</td>
<td>EL2h</td>
</tr>
<tr>
<td>0b1100</td>
<td>EL3t</td>
</tr>
<tr>
<td>0b1101</td>
<td>EL3h</td>
</tr>
</tbody>
</table>

Other values are reserved, and returning to an Exception level that is using AArch64 with a reserved value in this field is treated as an illegal exception return.

The bits in this field are interpreted as follows:

- M[1] is unused and is RES0 for all non-reserved values.
- M[0] is used to select the SP:
  - 0 means the SP is always SP0.
  - 1 means the exception SP is determined by the EL.

Accessing the DSPSR_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>
This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSPSR_EL0</td>
<td>11</td>
<td>011</td>
<td>0100</td>
<td>0101</td>
<td>000</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>

</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

Access to this register is from Debug state only. During normal execution this register is unallocated.
D10.3.15   MDCCINT_EL1, Monitor DCC Interrupt Enable Register

The MDCCINT_EL1 characteristics are:

**Purpose**

Enables interrupt requests to be signaled based on the DCC status flags.

**Configurations**

AArch64 System register MDCCINT_EL1 is architecturally mapped to AArch32 System register
DBGDCCINT.

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset
values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is
using AArch64. Otherwise, on a Warm or Cold reset RW fields in this register reset to
architecturally UNKNOWN values.

**Attributes**

MDCCINT_EL1 is a 32-bit register.

**Field descriptions**

The MDCCINT_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RX</td>
</tr>
<tr>
<td>30</td>
<td>TX</td>

Bit [31]  
Reserved, RES0.

RX, bit [30]  
DCC interrupt request enable control for DTRRX. Enables a common COMMIRQ interrupt request
to be signaled based on the DCC status flags.

0  No interrupt request generated by DTRRX.

1  Interrupt request will be generated on RXfull == 1.

If legacy COMMRX and COMMTX signals are implemented, then these are not affected by the
value of this bit.

When this register has an architecturally-defined reset value, this field resets to 0.

TX, bit [29]  
DCC interrupt request enable control for DTRTX. Enables a common COMMIRQ interrupt request
to be signaled based on the DCC status flags.

0  No interrupt request generated by DTRTX.

1  Interrupt request will be generated on TXfull == 0.

If legacy COMMRX and COMMTX signals are implemented, then these are not affected by the
value of this bit.

When this register has an architecturally-defined reset value, this field resets to 0.

Bits [28:0]  
Reserved, RES0.
Accessing the MDCCINT_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>MDCCINT_EL1</td>
<td>1</td>
<td>000</td>
<td>000</td>
<td>010</td>
<td>000</td>
</tr>
</tbody>
</table>

Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>x x 0</td>
<td>- RW n/a RW</td>

<tr>
<td>x 0 1</td>
<td>- RW RW RW</td>
</tr>
<tr>
<td>x 1 1</td>
<td>- n/a RW RW</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TDA==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL3 is implemented and is using AArch64:
  - If MDCR_EL3.TDA==1, accesses to this register from EL1 and EL2 are trapped to EL3.
D10.3.16 MDCCSR_EL0, Monitor DCC Status Register

The MDCCSR_EL0 characteristics are:

**Purpose**
Main control register for the debug implementation, containing flow-control flags for the DCC. This is an internal, read-only view.

**Configurations**
There are no configuration notes.

**Attributes**
MDCCSR_EL0 is a 32-bit register.

**Field descriptions**
The MDCCSR_EL0 bit assignments are:

```
  31 30 29 28  19 18 15 14 13 12 11  6 5 2 1 0
RES0  RAZ/WI RES0  RAZ/WI
RES0  RXfull RES0  TXfull RES0
RES0  RAZ/WI RES0  RAZ/WI
RES0  RAZ/WI RES0  RAZ/WI
```

**Bit [31]**
Reserved, RES0.

**RXfull, bit [30]**
DTRRX full. Read-only view of the equivalent bit in the EDSCR.

**TXfull, bit [29]**
DTRTX full. Read-only view of the equivalent bit in the EDSCR.

**Bits [28:19]**
Reserved, RES0.

**Bits [18:15]**
RAZ/WI. Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.

**Bits [14:13]**
Reserved, RES0.

**Bit [12]**
RAZ/WI. Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.

**Bits [11:6]**
Reserved, RES0.

**Bits [5:2]**
RAZ/WI. Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.
Bits [1:0]

Reserved, RES0.

**Accessing the MDCCSR_EL0**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>MDCCSR_EL0</td>
<td>10</td>
<td>011</td>
<td>0000</td>
<td>0001</td>
<td>000</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>
</tr>
<tr>
<td>TGE</td>
<td>RO</td>
</tr>
<tr>
<td>NS</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If MDSCR_EL1.TDCC==1, read accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TDA==1, Non-secure read accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If MDCR_EL3.TDA==1, read accesses to this register from EL0, EL1, and EL2 are trapped to EL3.
**D10.3.17 MDCR_EL2, Monitor Debug Configuration Register (EL2)**

The MDCR_EL2 characteristics are:

**Purpose**

Provides EL2 configuration options for self-hosted debug and the Performance Monitors Extension.

**Configurations**

AArch64 System register MDCR_EL2 is architecturally mapped to AArch32 System register HDCR.

If EL2 is not implemented, this register is RES0 from EL3.

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch64. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

MDCR_EL2 is a 32-bit register.

**Field descriptions**

The MDCR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-18</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>17</td>
<td>HPMD, bit 17</td>
</tr>
<tr>
<td>16-5</td>
<td>E2PB</td>
</tr>
<tr>
<td>4</td>
<td>HPMN</td>
</tr>
</tbody>
</table>

**Bits [31:18]**

Reserved, RES0.

**HPMD, bit 17**

In ARMv8.3, ARMv8.2 and ARMv8.1

Guest Performance Monitors Disable. This control prohibits event counting at EL2. Permitted values are:

- 0: Event counting allowed at EL2.
- 1: Event counting prohibited at EL2.

In an ARMv8.1 implementation, event counting is prohibited unless enabled by the IMPLEMENTATION DEFINED authentication interface ExternalSecureNoninvasiveDebugEnabled().

This control applies only to:

- The event counters in the range [0..(HPMN-1)].
- If PMCR_EL0.DP is set to 1, PMCCNTR_EL0.

The other event counters are unaffected, and when PMCR_EL0.DP is set to 0, PMCCNTR_EL0 is unaffected.
When this register has an architecturally-defined reset value, this field resets to 0.

**In ARMv8.0.**

Reserved, RES0.

**Bits [16:15]**

Reserved, RES0.

**TPMS, bit [14]**

**In ARMv8.3 and ARMv8.2**

Trap Performance Monitor Sampling. When the Statistical Profiling Extension is implemented this field controls access to Statistical Profiling control registers from Non-secure EL1 and EL0. The possible values of this bit are:

0  Do not trap Statistical Profiling controls to EL2.
1  Accesses to Statistical Profiling controls at Non-secure EL1 generate a Trap exception to EL2.

If EL2 is not implemented, the PE behaves as if TPMS == 0, other than for a direct read of the register.

When the Statistical Profiling Extension is not implemented this field is reserved, RES0.

**In ARMv8.1 and ARMv8.0.**

Reserved, RES0.

**E2PB, bits [13:12]**

**In ARMv8.3 and ARMv8.2**

EL2 Profiling Buffer. When the Statistical Profiling Extension is implemented this field controls the owning translation regime and access to Profiling Buffer control registers from Non-secure EL1. The possible values of this field are:

00  Profiling Buffer uses the EL2 stage 1 translation regime. Accesses to Profiling Buffer controls at Non-secure EL1 generate a Trap exception to EL2.
10  Profiling Buffer uses the EL1&0 stage 1 translation regime. Accesses to Profiling Buffer controls at Non-secure EL1 generate a Trap exception to EL2.
11  Profiling Buffer uses the EL1&0 stage 1 translation regime. Accesses to Profiling Buffer controls at Non-secure EL1 are not trapped to EL2.

All other values are reserved. If this field is programmed with a reserved value, the PE behaves as if this field has a defined value, other than for a direct read of the register. Software must not rely on the behavior of reserved values, as they might change in a future version of the architecture.

If EL2 is not implemented, the PE behaves as if E2PB == 0b11, other than for a direct read of the register.

When the Statistical Profiling Extension is not implemented this field is reserved, RES0.

**In ARMv8.1 and ARMv8.0.**

Reserved, RES0.

**TDRA, bit [11]**

Trap Debug ROM Address register access. Traps Non-secure System register accesses to the Debug ROM registers to EL2. This trap is from:

- Non-secure EL0 using AArch32.
- Non-secure EL1, regardless of which Execution state it is using.

0  This control does not cause any instructions to be trapped.
1  Non-secure EL0 and EL1 System register accesses to the Debug ROM registers are trapped to EL2, unless it is trapped by DBGDSCRext.UDCCdis or MDSCR_EL1.TDCC.

The registers for which accesses are trapped are as follows:
AArch64: MDRAR_EL1.
AArch32: DBGDRAR, DBGDSAR.

If MDCR_EL2.TDE == 1 or HCR_EL2.TGE == 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

This field resets to a value that is architecturally UNKNOWN.

TDOSA, bit [10]
Trap debug OS-related register access. Traps Non-secure EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states:

0  This control does not cause any instructions to be trapped.
1  Non-secure EL1 System register accesses to the powerdown debug registers are trapped to EL2.

The registers for which accesses are trapped are as follows:
AArch64: OSLAR_EL1, OSLSR_EL1, OSDLR_EL1, and the DBGPRCR_EL1.
AArch32: DBGOSLSR, DBGOSLAR, DBGOSDLR, and the DBGPRCR.

AArch64 and AArch32: Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

Note These registers are not accessible at EL0.

If MDCR_EL2.TDE == 1 or HCR_EL2.TGE == 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

This field resets to a value that is architecturally UNKNOWN.

TDA, bit [9]
Trap Debug Access. Traps Non-secure EL0 and EL1 System register accesses to those debug System registers that are not trapped by either of the following:

• MDCR_EL2.TDRA.
• MDCR_EL2.TDOSA.

0  This control does not cause any instructions to be trapped.
1  Non-secure EL0 or EL1 System register accesses to the debug registers, other than the registers trapped by MDCR_EL2.TDRA and MDCR_EL2.TDOSA, are trapped to EL2, from both Execution states, unless it is trapped by DBGDSCRext.UDCCdis or MDSCR_EL1.TDCC.

Traps of AArch32 accesses to DBGDTRRXint and DBGDTRTXint are ignored in Debug state.
Traps of AArch64 accesses to DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0 are ignored in Debug state.

If MDCR_EL2.TDE == 1 or HCR_EL2.TGE == 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

This field resets to a value that is architecturally UNKNOWN.

TDE, bit [8]
Trap Debug exceptions. The possible values of this field are:

0  This control has no effect on the routing of debug exceptions, and has no effect on Non-secure accesses to debug registers.
1  In Non-secure state:

• Debug exceptions generated at EL1 or EL0 are routed to EL2.
• The MDCR_EL2.TDRA, TDOSA, TDA} fields are treated as being 1 for all purposes other than returning the result of a direct read of the register.

Note These registers are not accessible at EL0.
When HCR_EL2.TGE == 1, the PE behaves as if the value of this field is 1 for all purposes other than returning the value of a direct read of the register.

This field resets to a value that is architecturally UNKNOWN.

**HPME, bit [7]**

Hypervisor Performance Monitors Counters Enable. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>EL2 Performance Monitors counters disabled.</td>
</tr>
<tr>
<td>1</td>
<td>EL2 Performance Monitors counters enabled.</td>
</tr>
</tbody>
</table>

When the value of this bit is 1, the Performance Monitors counters that are reserved for use from EL2 or Secure state are enabled. For more information see the description of the HPMN field.

If the Performance Monitors Extension is not implemented, this field is RES0.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

**TPM, bit [6]**

Trap Performance Monitors accesses. Traps Non-secure EL0 and EL1 accesses to all Performance Monitors registers to EL2, from both Execution states:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>1</td>
<td>Non-secure EL0 and EL1 accesses to all Performance Monitors registers are trapped to EL2.</td>
</tr>
</tbody>
</table>

--- **Note** ---

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

---

If the Performance Monitors Extension is not implemented, this field is RES0.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

**TPMCR, bit [5]**

Trap PMCR_EL0 or PMCR accesses. Traps Non-secure EL0 and EL1 accesses to the PMCR_EL0 or PMCR to EL2.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>1</td>
<td>Non-secure EL0 and EL1 accesses to the PMCR_EL0 or PMCR are trapped to EL2, unless it is trapped by PMUSERENR.EN or PMUSERENR_EL0.EN.</td>
</tr>
</tbody>
</table>

--- **Note** ---

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

---

If the Performance Monitors Extension is not implemented, this field is RES0.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

**HPMN, bits [4:0]**

Defines the number of Performance Monitors counters that are accessible from Non-secure EL0 and EL1 modes.

If the Performance Monitors Extension is not implemented, this field is RES0.

In Non-secure state, HPMN divides the Performance Monitors counters as follows. For counter n in Non-secure state:

- If n is in the range 0<=n<HPMN, the counter is accessible from EL1 and EL2, and from EL0 if permitted by PMUSERENR_EL0. PMCR_EL0.E enables the operation of counters in this range.
- If n is in the range HPMN<=n<PMCR_EL0.N, the counter is accessible only from EL2 and from Secure state. MDCR_EL2.HPME enables the operation of counters in this range.
If this field is set to 0, or to a value larger than PMCR_EL0.N, then the following constrained unpredictable behavior applies:

- The value returned by a direct read of MDCR_EL2.HPMN is unknown.
- Either:
  - An unknown number of counters are reserved for EL2 use. That is, the PE behaves as if MDCR_EL2.HPMN is set to an unknown non-zero value less than PMCR_EL0.N.
  - All counters are reserved for EL2 use, meaning no counters are accessible from Non-secure EL1 and Non-secure EL0.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to the value of PMCR_EL0.N.

### Accessing the MDCR_EL2

This register can be read using MRS with the following syntax:

```plaintext
MRS <Xt>, <systemreg>
```

This register can be written using MSR (register) with the following syntax:

```plaintext
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>MDCR_EL2</td>
<td>11</td>
<td>100</td>
<td>001</td>
<td>001</td>
<td>001</td>
</tr>
</tbody>
</table>

### Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>
</tr>
<tr>
<td>TGE</td>
<td></td>
</tr>
<tr>

<td>1</td>
<td>-</td>
<td>n/a</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If MDCR_EL3.TDA==1, accesses to this register from EL2 are trapped to EL3.
D10.3.18 MDCR_EL3, Monitor Debug Configuration Register (EL3)

The MDCR_EL3 characteristics are:

Purpose

Provides EL3 configuration options for self-hosted debug and the Performance Monitors Extension.

Configurations

AArch64 System register MDCR_EL3 can be mapped to AArch32 System register SDCR, but this is not architecturally mandated.

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch64. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

MDCR_EL3 is a 32-bit register.

Field descriptions

The MDCR_EL3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>22</td>
<td>EPMAD, bit [21]</td>
</tr>
<tr>

<td>RES0</td>
</tr>
<tr>
<td>10</td>
<td>SPD32</td>
</tr>
</tbody>
</table>

Bits [31:22]

Reserved, RES0.

EPMAD, bit [21]

External debug interface Performance Monitors registers disable. This disables access to these registers by an external debugger:

0 Access to Performance Monitors registers from external debugger is permitted.
1 Access to Performance Monitors registers from external debugger is disabled, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If the Performance Monitors Extension is not implemented or does not support external debug interface accesses this bit is RES0.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to 0.

EDAD, bit [20]

External debug interface breakpoint and watchpoint register access disable. This disables access to these registers by an external debugger:

0 Access to breakpoint and watchpoint registers from external debugger is permitted.
1 Access to breakpoint and watchpoint registers from external debugger is disabled, unless overridden by the IMPLEMENTATION DEFINED authentication interface.
In ARMv8.0 and ARMv8.1 implementations, it is IMPLEMENTATION DEFINED whether this disable applies to the external register OSLAR_EL1.

From ARMv8.2, this disable is required to apply to the external register OSLAR_EL1.

When this register has an architecturally-defined reset value, this field resets to 0.

Bits [19:18]

Reserved, RES0.

SPME, bit [17]

Secure Performance Monitors enable. This allows event counting in Secure state:

0 Event counting prohibited in Secure state.

In an ARMv8.0 or ARMv8.1 implementation, event counting is prohibited unless ExternalSecureNoninvasiveDebugEnabled() is TRUE, meaning this control is overridden by the IMPLEMENTATION DEFINED authentication interface.

1 Event counting allowed in Secure state.

If the Performance Monitors Extension is not implemented, this field is RES0.

When this register has an architecturally-defined reset value, this field resets to 0.

SDD, bit [16]

AArch64 Secure self-hosted invasive debug disable. Disables Software debug exceptions in Secure state, other than Breakpoint Instruction exceptions.

0 Debug exceptions from Secure EL0 are enabled, and debug exceptions from Secure EL1 are enabled if the value of MDSCR_EL1.KDE is 1 and the value of PSTATE.D is 0.

1 Debug exceptions, other than Breakpoint Instruction exceptions, are disabled from all Exception levels in Secure state.

The SDD bit is ignored unless both of the following are true:

• The PE is in Secure state.
• Secure EL1 is using AArch64.

This field resets to a value that is architecturally UNKNOWN.

SPD32, bits [15:14]

AArch32 Secure self-hosted privileged invasive debug control. Enables or disables debug exceptions from Secure EL1 using AArch32, other than Breakpoint Instruction exceptions. Valid values for this field are:

00 Legacy mode. Debug exceptions from Secure EL1 are enabled by the IMPLEMENTATION DEFINED authentication interface.

10 Secure privileged debug disabled. Debug exceptions from Secure EL1 are disabled.

11 Secure privileged debug enabled. Debug exceptions from Secure EL1 are enabled.

Other values are reserved, and have the CONSTRAINED UNPREDICTABLE behavior that they must have the same behavior as 0b00. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field has no effect on Breakpoint Instruction exceptions. These are always enabled.

This field is:

• Ignored if either the PE is in Non-secure state or Secure EL1 is using AArch64.
• RES0 if the implementation does not support EL1 using AArch32.

If Secure EL1 is using AArch32 then:

• If debug exceptions from Secure EL1 are enabled, then debug exceptions from Secure EL0 are also enabled.
• Otherwise, debug exceptions from Secure EL0 are enabled only if the value of SDER32_EL3.SUIDEN is 1.
If this field is implemented as an RW field, it resets to a value that is architecturally **UNKNOWN**.

**NSPB, bits [13:12]**

*In ARMv8.3 and ARMv8.2*

Non-secure Profiling Buffer. When the Statistical Profiling Extension is implemented, this field controls the owning translation regime and accesses to Statistical Profiling and Profiling Buffer control registers. The possible values of this field are:

- **00** Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer controls at EL2 and EL1 in both security states generate Trap exceptions to EL3.
- **01** Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer controls in Non-secure state generate Trap exceptions to EL3.
- **10** Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer controls at EL2 and EL1 in both security states generate Trap exceptions to EL3.
- **11** Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer controls at Secure EL1 generate Trap exceptions to EL3.

If EL3 is not implemented and the PE executes in Non-secure state, the PE behaves as if NSPB == 0b11.

If EL3 is not implemented and the PE executes in Secure state, the PE behaves as if NSPB == 0b01.

When the Statistical Profiling Extension is not implemented this field is reserved, RES0.

*In ARMv8.1 and ARMv8.0.*

Reserved, RES0.

**Bit [11]**

Reserved, RES0.

**TDOSA, bit [10]**

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3:

- **0** This control does not cause any instructions to be trapped.
- **1** EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by HDCR.TDOSA or MDCR_EL2.TDOSA.

The registers for which accesses are trapped are as follows:

- AArch64: OSLAR_EL1, OSLSR_EL1, OSDLR_EL1, DBGPRCR_EL1.
- AArch32: DBGOSLAR, DBGOSLSR, DBGOSDLR, DBGPRCR.

AArch64 and AArch32: Any **IMPLEMENTATION DEFINED** register with similar functionality that the implementation specifies as trapped by this bit.

This field resets to a value that is architecturally **UNKNOWN**.

**TDA, bit [9]**

Trap Debug Access. Traps EL2, EL1, and EL0 System register accesses to those debug System registers that cannot be trapped using the MDCR_EL3.TDOSA field. When MDCR_EL3.TDA is:

- **0** This control does not cause any instructions to be trapped.
- **1** EL0, EL1, and EL2 accesses to the debug registers, other than the registers that can be trapped by MDCR_EL3.TDOSA, are trapped to EL3, from both Security states and both Execution states, unless it is trapped by DBGDSCRext.UDCCdis, MDSCR_EL1.TDCC, HDCR.TDA or MDCR_EL2.TDA.

Traps of AArch32 accesses to DBGDTRRXint and DBGDTRTXint are ignored in Debug state.
Traps of AArch64 accesses to DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0 are ignored in Debug state.

This field resets to a value that is architecturally UNKNOWN.

**Bits [8:7]**

Reserved, RES0.

**TPM, bit [6]**

Trap Performance Monitors accesses. Traps EL2, EL1, and EL0 accesses to all Performance Monitors registers to EL3, from both Security states and both Execution states.

0  This control does not cause any instructions to be trapped.

1  EL2, EL1, and EL0 System register accesses to all Performance Monitors registers are trapped to EL3, unless it is trapped by HDCR.TPM or MDCR_EL2.TPM.

If the Performance Monitors Extension is not implemented, this field is RES0.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

**Bits [5:0]**

Reserved, RES0.

**Accessing the MDCR_EL3**

This register can be read using MRS with the following syntax:

\[
\text{MRS } <\text{Xt}>, <\text{systemreg}>
\]

This register can be written using MSR (register) with the following syntax:

\[
\text{MSR } <\text{systemreg}>, <\text{Xt}>
\]

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>MDCR_EL3</td>
<td>11</td>
<td>110</td>
<td>0001</td>
<td>0011</td>
<td>001</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>x x 0</td>
<td>- - n/a RW</td>
</tr>
<tr>
<td>x 0 1</td>
<td>- - - RW</td>
</tr>
<tr>
<td>x 1 1</td>
<td>- n/a - RW</td>
</tr>
</tbody>
</table>
D10.3.19 MDRAR_EL1, Monitor Debug ROM Address Register

The MDRAR_EL1 characteristics are:

Purpose

Defines the base physical address of a 4KB-aligned memory-mapped debug component, usually a ROM table that locates and describes the memory-mapped debug components in the system. ARMv8 deprecates any use of this register.

Configurations

AArch64 System register MDRAR_EL1 is architecturally mapped to AArch32 System register DBGDRAR.

Attributes

MDRAR_EL1 is a 64-bit register.

Field descriptions

The MDRAR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:52</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>47:12</td>
<td>ROMADDR[47:12]</td>
</tr>
<tr>
<td>11:2</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>10</td>
<td>Valid</td>
</tr>
</tbody>
</table>

ROMADDR[51:48], bits [51:48]

In ARMv8.3 and ARMv8.2

In ARMv8.1 and ARMv8.0.

Reserved, RES0.

ROMADDR[47:12], bits [47:12]

Bits[47:12] of the ROM table physical address.

When ARMv8.2-LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, ROMADDR[52:49] forms the upper part of the address value. Otherwise, ROMADDR[52:49] is RES0.

If the physical address size in bits (PAsize) is less than 52 then the register bits corresponding to ROMADDR[51:PAsize] are RES0.

Bits [11:0] of the ROM table physical address are zero.

ARM strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

Bits [11:2]

Reserved, RES0.
Valid, bits [1:0]

This field indicates whether the ROM Table address is valid. The permitted values of this field are:

00 ROM Table address is not valid. Software must ignore ROMADDR.
11 ROM Table address is valid.

Other values are reserved.

Accessing the MDRAR_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>Crn</th>
<th>Crm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>MDRAR_EL1</td>
<td>10</td>
<td>000</td>
<td>001</td>
<td>000</td>
<td>000</td>
</tr>
</tbody>
</table>

Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>x x 0</td>
<td>- RO n/a RO</td>
</tr>
<tr>
<td>x 0 1</td>
<td>- RO RO RO</td>
</tr>
<tr>
<td>x 1 1</td>
<td>- n/a RO RO</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TDRA==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

- When EL3 is implemented and is using AArch64:
  - If MDCR_EL3.TDA==1, read accesses to this register from EL1 and EL2 are trapped to EL3.
D10.3.20 MDSCR_EL1, Monitor Debug System Control Register

The MDSCR_EL1 characteristics are:

**Purpose**

Main control register for the debug implementation.

**Configurations**

AArch64 System register MDSCR_EL1 is architecturally mapped to AArch32 System register DBGDSCRext.

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch64. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

MDSCR_EL1 is a 32-bit register.

**Field descriptions**

The MDSCR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>30</td>
<td>RXfull, bit</td>
</tr>
<tr>
<td>29</td>
<td>TXfull, bit</td>
</tr>
<tr>
<td>28</td>
<td>RES0</td>
</tr>
<tr>
<td>27</td>
<td>RXO</td>
</tr>
<tr>
<td>26</td>
<td>TXU</td>
</tr>
<tr>
<td>25</td>
<td>RES0</td>
</tr>
<tr>
<td>24</td>
<td>INTdis</td>
</tr>
<tr>
<td>23</td>
<td>TDA</td>
</tr>
<tr>
<td>22</td>
<td>RES0</td>
</tr>
<tr>
<td>21</td>
<td>RES0</td>
</tr>
<tr>
<td>20</td>
<td>RAZWI</td>
</tr>
</tbody>
</table>

**RXfull, bit [30]**

Used for save/restore of EDSCR.RXfull.

When OLSR_EL1.OSLK == 0 (the OS lock is unlocked), this bit is RO, and software must treat it as UNK/SBZP.

When OLSR_EL1.OSLK == 1 (the OS lock is locked), this bit is RW and holds the value of EDSCR.RXfull.

Reads and writes of this bit are indirect accesses to EDSCR.RXfull.

The architected behavior of this field determines the value it returns after a reset.

**TXfull, bit [29]**

Used for save/restore of EDSCR.TXfull.
When $\text{OSLSR\_EL1\_OSLK} == 0$ (the OS lock is unlocked), this bit is RO, and software must treat it as UNK/SBZP.

When $\text{OSLSR\_EL1\_OSLK} == 1$ (the OS lock is locked), this bit is RW and holds the value of $\text{EDSCR\_TXfull}$. Reads and writes of this bit are indirect accesses to $\text{EDSCR\_TXfull}$. The architected behavior of this field determines the value it returns after a reset.

**Bit [28]**

Reserved, RES0.

**RXO, bit [27]**

Used for save/restore of $\text{EDSCR\_RXO}$. Reads and writes of this bit are indirect accesses to $\text{EDSCR\_RXO}$. The architected behavior of this field determines the value it returns after a reset.

When $\text{OSLSR\_EL1\_OSLK} == 0$ (the OS lock is unlocked), this bit is RO, and software must treat it as UNK/SBZP.

When $\text{OSLSR\_EL1\_OSLK} == 1$ (the OS lock is locked), this bit is RW and holds the value of $\text{EDSCR\_RXO}$. The architected behavior of this field determines the value it returns after a reset.

**TXU, bit [26]**

Used for save/restore of $\text{EDSCR\_TXU}$. Reads and writes of this bit are indirect accesses to $\text{EDSCR\_TXU}$. The architected behavior of this field determines the value it returns after a reset.

When $\text{OSLSR\_EL1\_OSLK} == 0$ (the OS lock is unlocked), this bit is RO, and software must treat it as UNK/SBZP.

When $\text{OSLSR\_EL1\_OSLK} == 1$ (the OS lock is locked), this bit is RW and holds the value of $\text{EDSCR\_TXU}$. The architected behavior of this field determines the value it returns after a reset.

**Bits [25:24]**

Reserved, RES0.

**INTdis, bits [23:22]**

Used for save/restore of $\text{EDSCR\_INTdis}$. Reads and writes of this field are indirect accesses to $\text{EDSCR\_INTdis}$. The architected behavior of this field determines the value it returns after a reset.

When $\text{OSLSR\_EL1\_OSLK} == 0$ (the OS lock is unlocked), this field is RO, and software must treat it as UNK/SBZP.

When $\text{OSLSR\_EL1\_OSLK} == 1$ (the OS lock is locked), this field is RW and holds the value of $\text{EDSCR\_INTdis}$. The architected behavior of this field determines the value it returns after a reset.

**TDA, bit [21]**

Used for save/restore of $\text{EDSCR\_TDA}$. Reads and writes of this bit are indirect accesses to $\text{EDSCR\_TDA}$. The architected behavior of this field determines the value it returns after a reset.

When $\text{OSLSR\_EL1\_OSLK} == 0$ (the OS lock is unlocked), this bit is RO, and software must treat it as UNK/SBZP.

When $\text{OSLSR\_EL1\_OSLK} == 1$ (the OS lock is locked), this bit is RW and holds the value of $\text{EDSCR\_TDA}$. The architected behavior of this field determines the value it returns after a reset.

**Bit [20]**

Reserved, RES0.
SC2, bit [19]

_In ARMv8.1_

Used for save/restore of EDSCR.SC2.

When OSLSR_EL1.OSLK == 0 (the OS lock is unlocked), this bit is RO, and software must treat it as UNK/SBZP.

When OSLSR_EL1.OSLK == 1 (the OS lock is locked), this bit is RW and holds the value of EDSCR.SC2.

Reads and writes of this bit are indirect accesses to EDSCR.SC2.

If the PC Sample-based Profiling Extension is not implemented, then this field is RES0.

_Bits [18:16]_

RAZ/WI. Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.

MDE, bit [15]

Monitor debug events. Enable Breakpoint, Watchpoint, and Vector Catch exceptions.

0 Breakpoint, Watchpoint, and Vector Catch exceptions disabled.

1 Breakpoint, Watchpoint, and Vector Catch exceptions enabled.

This field resets to a value that is architecturally UNKNOWN.

HDE, bit [14]

Used for save/restore of EDSCR.HDE.

When OSLSR_EL1.OSLK == 0 (the OS lock is unlocked), this bit is RO, and software must treat it as UNK/SBZP.

When OSLSR_EL1.OSLK == 1 (the OS lock is locked), this bit is RW and holds the value of EDSCR.HDE.

Reads and writes of this bit are indirect accesses to EDSCR.HDE.

The architected behavior of this field determines the value it returns after a reset.

KDE, bit [13]

Local (kernel) debug enable. If EL_D is using AArch64, enable debug exceptions within EL_D.

Permitted values are:

0 Debug exceptions, other than Breakpoint Instruction exceptions, disabled within EL_D.

1 All debug exceptions enabled within EL_D.

RES0 if EL_D is using AArch32.

This field resets to a value that is architecturally UNKNOWN.

TDCC, bit [12]

Traps EL0 accesses to the DCC registers to EL1, from both Execution states:

0 This control does not cause any instructions to be trapped.

1 EL0 using AArch64: EL0 accesses to the MDCCSR_EL0, DBGDTRX_EL0, DBGDTRRX_EL0, and DBGDTRRX_EL0 registers are trapped to EL1.

EL0 using AArch32: EL0 accesses to the DBGDSCRint, DBGDTRRXint, DBGDTRTXint, DBGDIDR, DBGDSAR, and DBGDRAR registers are trapped to EL1.
___ Note ___

All accesses to these AArch32 registers are trapped, including LDC and STC accesses to 
DBGDTRTXint and DBGDTRRXint, and MRRC accesses to DBGDSAR and DBGDAR.

Traps of AArch32 accesses to the DBGDTRRXint and DBGDTRTXint are ignored in Debug state.  
Traps of AArch64 accesses to DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0 are ignored in Debug state.

This field resets to a value that is architecturally UNKNOWN.

Bits [11:7] 
Reserved, RES0.

ERR, bit [6]
Used for save/restore of EDSCR.ERR.
When OSLSR_EL1.OSLK == 0 (the OS lock is unlocked), this bit is RO, and software must treat 
it as UNK/SBZP.
When OSLSR_EL1.OSLK == 1 (the OS lock is locked), this bit is RW and holds the value of 
EDSCR.ERR.

Reads and writes of this bit are indirect accesses to EDSCR.ERR.
The architected behavior of this field determines the value it returns after a reset.

Bits [5:1] 
Reserved, RES0.

SS, bit [0]
Software step control bit. If EL_D is using AArch64, enable Software step. Permitted values are:
0 Software step disabled
1 Software step enabled.
RES0 if EL_D is using AArch32.

This field resets to a value that is architecturally UNKNOWN.

Accessing the MDSCR_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>MDSCR_EL1</td>
<td>10</td>
<td>000</td>
<td>0000</td>
<td>0010</td>
<td>010</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

Individual fields within this register might have restricted accessibility when OSLSR_EL1.OSLK == 0 (the OS lock is unlocked.) See the field descriptions for more detail.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TDA==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If MDCR_EL3.TDA==1, accesses to this register from EL1 and EL2 are trapped to EL3.
D10.3.21 OSDLR_EL1, OS Double Lock Register

The OSDLR_EL1 characteristics are:

**Purpose**

Used to control the OS Double Lock.

**Configurations**

AArch64 System register OSDLR_EL1 is architecturally mapped to AArch32 System register \( \text{DBGOSDLR} \).

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch64. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally \( \text{UNKNOWN} \) values.

**Attributes**

OSDLR_EL1 is a 32-bit register.

**Field descriptions**

The OSDLR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[31:1]</td>
<td>Reserved, ( \text{RES0} ).</td>
</tr>
<tr>
<td>[0]</td>
<td>DLK, OS Double Lock control bit. Possible values are:</td>
</tr>
<tr>
<td>0</td>
<td>OS Double Lock unlocked.</td>
</tr>
<tr>
<td>1</td>
<td>OS Double Lock locked, if ( \text{DBGPRCR_EL1.CORENPDREQ} ) (Core no powerdown request) bit is set to 0 and the PE is in Non-debug state. When this register has an architecturally-defined reset value, this field resets to 0.</td>
</tr>
</tbody>
</table>

**Accessing the OSDLR_EL1**

This register can be read using MRS with the following syntax:

\[ \text{MRS } \langle \text{Xt} \rangle, \langle \text{systemreg} \rangle \]

This register can be written using MSR (register) with the following syntax:

\[ \text{MSR } \langle \text{systemreg} \rangle, \langle \text{Xt} \rangle \]

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>(&lt;\text{systemreg}&gt; )</th>
<th>(\text{op0})</th>
<th>(\text{op1})</th>
<th>(\text{CRn})</th>
<th>(\text{CRm})</th>
<th>(\text{op2})</th>
</tr>
</thead>
<tbody>
<tr>
<td>OSDLR_EL1</td>
<td>10</td>
<td>000</td>
<td>001</td>
<td>0011</td>
<td>100</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see **Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895**. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TDOSA==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If MDCR_EL3.TDOSA==1, accesses to this register from EL1 and EL2 are trapped to EL3.
D10.3.22  OSDTRRX_EL1, OS Lock Data Transfer Register, Receive

The OSDTRRX_EL1 characteristics are:

**Purpose**

Used for save/restore of DBGDTRRX_EL0. It is a component of the Debug Communications Channel.

**Configurations**

AArch64 System register OSDTRRX_EL1 is architecturally mapped to AArch32 System register DBGDTRRXext.

**Attributes**

OSDTRRX_EL1 is a 32-bit register.

**Field descriptions**

The OSDTRRX_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Update DTRRX without side-effect</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Update DTRRX without side-effect.

Writes to this register update the value in DTRRX and do not change RXfull.

Reads of this register return the last value written to DTRRX and do not change RXfull.

For the full behavior of the Debug Communications Channel, see Chapter H4 The Debug Communication Channel and Instruction Transfer Register.

**Accessing the OSDTRRX_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>OSDTRRX_EL1</td>
<td>10</td>
<td>000</td>
<td>000</td>
<td>000</td>
<td>010</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

ARM deprecates reads and writes of OSDTRRX_EL1 when the OS lock is unlocked.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TDA==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If MDCR_EL3.TDA==1, accesses to this register from EL1 and EL2 are trapped to EL3.
D10.3.23   OSDTRTX_EL1, OS Lock Data Transfer Register, Transmit

The OSDTRTX_EL1 characteristics are:

**Purpose**

Used for save/restore of DBGDTRTX_EL0. It is a component of the Debug Communications Channel.

**Configurations**

AArch64 System register OSDTRTX_EL1 is architecturally mapped to AArch32 System register DBGDTRTXXext.

**Attributes**

OSDTRTX_EL1 is a 32-bit register.

**Field descriptions**

The OSDTRTX_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [31:0]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Return DTRTX without side-effect</td>
</tr>
</tbody>
</table>

Bits [31:0] 

Return DTRTX without side-effect. 
Reads of this register return the value in DTRTX and do not change TXfull. 
Writes of this register update the value in DTRTX and do not change TXfull. 
For the full behavior of the Debug Communications Channel, see Chapter H4 The Debug Communication Channel and Instruction Transfer Register.

**Accessing the OSDTRTX_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>OSDTRTX_EL1</td>
<td>10</td>
<td>000</td>
<td>0000</td>
<td>0011</td>
<td>010</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>
</tr>
<tr>
<td>TGE</td>
<td></td>
</tr>
<tr>
<td>NS</td>
<td></td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

ARM deprecates reads and writes of OSDTRTX_EL1 when the OS lock is unlocked.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TDA==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and using AArch64:
  - If MDCR_EL3.TDA==1, accesses to this register from EL1 and EL2 are trapped to EL3.
D10.3.24 OSECCR_EL1, OS Lock Exception Catch Control Register

The OSECCR_EL1 characteristics are:

**Purpose**

Provides a mechanism for an operating system to access the contents of EDECCR that are otherwise invisible to software, so it can save/restore the contents of EDECCR over powerdown on behalf of the external debugger.

**Configurations**

AArch64 System register OSECCR_EL1 is architecturally mapped to AArch32 System register DBGOSECCR.

AArch64 System register OSECCR_EL1 is architecturally mapped to External register EDECCR.

If OSLSR_EL1.OSLK == 0 then OSECCR_EL1 returns an UNKNOWN value on reads and ignores writes.

**Attributes**

OSECCR_EL1 is a 32-bit register.

**Field descriptions**

The OSECCR_EL1 bit assignments are:

*When OSLSR.OSLK==1:*

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EDECCR, bits [31:0]</td>
<td>Used for save/restore to EDECCR over powerdown.</td>
</tr>
<tr>
<td></td>
<td>Reads or writes to this field are indirect accesses to EDECCR.</td>
</tr>
</tbody>
</table>

**Accessing the OSECCR_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>OSECCR_EL1</td>
<td>10</td>
<td>000</td>
<td>0000</td>
<td>0110</td>
<td>010</td>
</tr>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TDA==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If MDCR_EL3.TDA==1, accesses to this register from EL1 and EL2 are trapped to EL3.
### D10.3.25 OSLAR_EL1, OS Lock Access Register

The OSLAR_EL1 characteristics are:

**Purpose**

Used to lock or unlock the OS lock.

**Configurations**

- AArch64 System register OSLAR_EL1 is architecturally mapped to AArch32 System register DBGOSLAR.
- AArch64 System register OSLAR_EL1 is architecturally mapped to External register OSLAR_EL1.

**Attributes**

OSLAR_EL1 is a 32-bit register.

**Field descriptions**

The OSLAR_EL1 bit assignments are:

```
<table>
<thead>
<tr>
<th>Bit assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits [31:1]</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>OSLK, bit [0]</td>
<td>On writes to OSLAR_EL1, bit[0] is copied to the OS lock. Use OSLSR_EL1.OSLK to check the current status of the lock.</td>
</tr>
</tbody>
</table>
```

**Accessing the OSLAR_EL1**

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>OSLAR_EL1</td>
<td>10</td>
<td>000</td>
<td>0001</td>
<td>0000</td>
<td>100</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td></td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TDOSA==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If MDCR_EL3.TDOSA==1, write accesses to this register from EL1 and EL2 are trapped to EL3.
D10.3.26 OSLSR_EL1, OS Lock Status Register

The OSLSR_EL1 characteristics are:

Purpose

Provides the status of the OS lock.

Configurations

AArch64 System register OSLSR_EL1 is architecturally mapped to AArch32 System register DBGOSLSR.

This register is in the Cold reset domain. Some or all RW fields of this register have defined reset values. On a Cold reset these apply only if the PE resets into an Exception level that is using AArch64. Otherwise, on a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

Attributes

OSLSR_EL1 is a 32-bit register.

Field descriptions

The OSLSR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>30</td>
<td>OSLM[0]</td>
</tr>
<tr>
<td>29</td>
<td>OSLK</td>
</tr>
<tr>
<td>28</td>
<td>nTT</td>
</tr>
<tr>
<td>27</td>
<td>OSLM[1]</td>
</tr>
</tbody>
</table>

Bits [31:4]

Reserved, RES0.

OSLM[1], bit [3]

See below for description of the OSLM field.

nTT, bit [2]

Not 32-bit access. This bit is always RAZ. It indicates that a 32-bit access is needed to write the key to the OS Lock Access Register.

OSLK, bit [1]

OS Lock Status. The possible values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>OS lock unlocked.</td>
</tr>
<tr>
<td>1</td>
<td>OS lock locked.</td>
</tr>
</tbody>
</table>

The OS lock is locked and unlocked by writing to the OS Lock Access Register. When this register has an architecturally-defined reset value, this field resets to 1.

OSLM[0], bit [0]

OS lock model implemented. Identifies the form of OS save and restore mechanism implemented. In ARMv8 these bits are as follows:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>OS lock implemented. DBGOSSRR not implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.
Accessing the OSLSR_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>OSLSR_EL1</td>
<td>100</td>
<td>000</td>
<td>0001</td>
<td>0001</td>
<td>100</td>
</tr>
</tbody>
</table>

Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>TGE</td>
<td>RO n/a RO RO</td>
</tr>
<tr>
<td>NS</td>
<td>RO RO RO RO</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TDOSA==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If MDCR_EL3.TDOSA==1, read accesses to this register from EL1 and EL2 are trapped to EL3.
D10.3.27  SDER32_EL3, AArch32 Secure Debug Enable Register

The SDER32_EL3 characteristics are:

Purpose

Allows access to the AArch32 register SDER from AArch64 state only. Its value has no effect on execution in AArch64 state.

Configurations

AArch64 System register SDER32_EL3 is architecturally mapped to AArch32 System register SDER.

If EL1 is AArch64 only, this register is UNDEFINED.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

SDER32_EL3 is a 32-bit register.

Field descriptions

The SDER32_EL3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>2</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>1</td>
<td>SUNIDEN (Secure User Non-Invasive Debug Enable):</td>
</tr>
<tr>
<td>0</td>
<td>Performance Monitors event counting prohibited in Secure EL0 unless allowed by MDCR_EL3.SPME or the IMPLEMENTATION DEFINED authentication interface ExternalSecureNoninvasiveDebugEnabled().</td>
</tr>
<tr>
<td>1</td>
<td>Performance Monitors event counting allowed in Secure EL0.</td>
</tr>
<tr>
<td>0</td>
<td>SUIDEN (Secure User Invasive Debug Enable):</td>
</tr>
<tr>
<td>0</td>
<td>Debug exceptions other than Breakpoint Instruction exceptions from Secure EL0 are disabled, unless enabled by MDCR_EL3.SPD32.</td>
</tr>
<tr>
<td>1</td>
<td>Debug exceptions from Secure EL0 are enabled.</td>
</tr>
</tbody>
</table>

This field resets to a value that is architecturally UNKNOWN.

Accessing the SDER32_EL3

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:
MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>SDER_EL3</td>
<td>11</td>
<td>110</td>
<td>0001</td>
<td>0001</td>
<td>001</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>CL0</td>
</tr>
<tr>
<td>x x 0</td>
<td>-</td>
</tr>
<tr>
<td>x 0 1</td>
<td>-</td>
</tr>
<tr>
<td>x 1 1</td>
<td>-</td>
</tr>
</tbody>
</table>
D10.4 Performance Monitors registers

This section lists the Performance Monitoring registers in AArch64.
D10.4.1 PMCCFILTR_EL0, Performance Monitors Cycle Count Filter Register

The PMCCFILTR_EL0 characteristics are:

**Purpose**

Determines the modes in which the Cycle Counter, PMCCNTR_EL0, increments.

**Configurations**

AArch64 System register PMCCFILTR_EL0 is architecturally mapped to AArch32 System register PMCCFILTR.

AArch64 System register PMCCFILTR_EL0 is architecturally mapped to External register PMCCFILTR_EL0.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMCCFILTR_EL0 is a 32-bit register.

**Field descriptions**

The PMCCFILTR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>P, Privileged filtering bit. Controls counting in EL1. If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the NSK bit. The possible values of this bit are: 0 Count cycles in EL1. 1 Do not count cycles in EL1.</td>
</tr>
<tr>
<td>30</td>
<td>U, User filtering bit. Controls counting in EL0. If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the NSU bit. The possible values of this bit are: 0 Count cycles in EL0. 1 Do not count cycles in EL0.</td>
</tr>
<tr>
<td>29</td>
<td>NSK, Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1. If EL3 is not implemented, this bit is RES0. If the value of this bit is equal to the value of P, cycles in Non-secure EL1 are counted. Otherwise, cycles in Non-secure EL1 are not counted.</td>
</tr>
<tr>
<td>28</td>
<td>NSU, Non-secure EL0 (Unprivileged) filtering. Controls counting in Non-secure EL0. If EL3 is not implemented, this bit is RES0. If the value of this bit is equal to the value of U, cycles in Non-secure EL0 are counted. Otherwise, cycles in Non-secure EL0 are not counted.</td>
</tr>
</tbody>
</table>

RES0
NSH, bit [27]

Non-secure EL2 (Hypervisor) filtering bit. Controls counting in Non-secure EL2. If EL2 is not implemented, this bit is RES0.

0  Do not count cycles in EL2.
1  Count cycles in EL2.

M, bit [26]

Secure EL3 filtering bit. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of P, cycles in Secure EL3 are counted.
Otherwise, cycles in Secure EL3 are not counted.

Most applications can ignore this field and set its value to 0.

--- Note ---

This field is not visible in the AArch32 PMCCFILTR System register.

Bits [25:0]

Reserved, RES0.

Accessing the PMCCFILTR_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMCCFILTR_EL0</td>
<td>11</td>
<td>011</td>
<td>110</td>
<td>1111</td>
<td>111</td>
</tr>
</tbody>
</table>

PMCCFILTR_EL0 can also be accessed by using PMXEVTYPER_EL0 with PMSELR_EL0.SEL set to 0b11111.

Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>

<td>RW n/a RW RW</td>
</tr>
</tbody>
</table>

---
Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If `PMUSERENR_EL0.EN==0`, accesses to this register from EL0 are trapped to EL1.

- When EL2 is implemented and is using AArch64 and `SCR_EL3.NS == 1`:
  - If `MDCR_EL2.TPM==1`, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.

- When EL3 is implemented and is using AArch64:
  - If `MDCR_EL3.TPM==1`, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.
### D10.4.2 PMCCNTR_EL0, Performance Monitors Cycle Count Register

The PMCCNTR_EL0 characteristics are:

**Purpose**

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See *Time as measured by the Performance Monitors cycle counter on page D5-2227* for more information. PMCCFILTR_EL0 determines the modes and states in which the PMCCNTR_EL0 can increment.

**Configurations**

AArch64 System register PMCCNTR_EL0 is architecturally mapped to AArch32 System register PMCCNTR.

AArch64 System register PMCCNTR_EL0 is architecturally mapped to External register PMCCNTR_EL0.

All counters are subject to any changes in clock frequency, including clock stopping caused by the WFI and WFE instructions. This means that it is CONSTRAINED UNPREDICTABLE whether or not PMCCNTR_EL0 continues to increment when clocks are stopped by WFI and WFE instructions.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMCCNTR_EL0 is a 64-bit register.

**Field descriptions**

The PMCCNTR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>CCNT, bits [63:0]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cycle count. Depending on the values of PMCR_EL0.{LC,D}, this field increments in one of the following ways:</td>
</tr>
<tr>
<td>• Every processor clock cycle.</td>
</tr>
<tr>
<td>• Every 64th processor clock cycle.</td>
</tr>
<tr>
<td>Writing 1 to PMCR_EL0.C sets this field to 0.</td>
</tr>
</tbody>
</table>

**Accessing the PMCCNTR_EL0**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMCCNTR_EL0</td>
<td>11</td>
<td>011</td>
<td>1001</td>
<td>1101</td>
<td>000</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>x x 0</td>
<td>RW RW n/a RW</td>
</tr>
<tr>
<td>x 0 1</td>
<td>RW RW RW RW</td>
</tr>
<tr>
<td>x 1 1</td>
<td>RW n/a RW RW</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

• In both security states, and not dependent on other bits:
  — If PMUSERENR_EL0.CR==0, and PMUSERENR_EL0.EN==0, read accesses to this register from EL0 are trapped to EL1.
  — If PMUSERENR_EL0.EN==0, write accesses to this register from EL0 are trapped to EL1.

• When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  — If MDCR_EL2.TPM==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.

• When EL3 is implemented and is using AArch64:
  — If MDCR_EL3.TPM==1, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.
D10.4.3 PMCEID0_EL0, Performance Monitors Common Event Identification register 0

The PMCEID0_EL0 characteristics are:

**Purpose**

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the ranges 0x0000 to 0x001F and 0x4000 to 0x401F.

When the value of a bit in the register is 1 the corresponding common event is implemented or counted.

______ Note ________

ARM recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

For more information about the common events and the use of the PMCEIDn_EL0 registers see *The PMU event number space and common events* on page D5-2244.

**Configurations**

AArch64 System register PMCEID0_EL0[31:0] is architecturally mapped to AArch32 System register PMCEID0.

AArch64 System register PMCEID0_EL0[63:32] is architecturally mapped to AArch32 System register PMCEID2.

AArch64 System register PMCEID0_EL0[31:0] is architecturally mapped to External register PMCEID0.

AArch64 System register PMCEID0_EL0[63:32] is architecturally mapped to External register PMCEID2.

**Attributes**

PMCEID0_EL0 is a 64-bit register.

**Field descriptions**

The PMCEID0_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>32</th>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>IDhi[31:0]</td>
<td>ID[31:0]</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**IDhi[31:0], bits [63:32]**

_**In ARMv8.3, ARMv8.2 and ARMv8.1**_

IDhi[n] corresponds to common event (0x4000 + n).

For each bit:

<table>
<thead>
<tr>
<th>0</th>
<th>1</th>
</tr>
</thead>
<tbody>
<tr>
<td>The common event is not implemented, or not counted.</td>
<td>The common event is implemented.</td>
</tr>
</tbody>
</table>

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

______ Note ________

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.
**In ARMv8.0.**
Reserved, RES0.

**ID[31:0], bits [31:0]**
ID[n] corresponds to common event n.
For each bit:
0  The common event is not implemented, or not counted.
1  The common event is implemented.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

--- Note ---
Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

**Accessing the PMCEID0_EL0**
This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMCEID0_EL0</td>
<td>11</td>
<td>011</td>
<td>1001</td>
<td>1100</td>
<td>110</td>
</tr>
</tbody>
</table>

**Accessibility**
The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS EL0 EL1 EL2 EL3</td>
<td></td>
</tr>
<tr>
<td>x x 0</td>
<td>RO RO n/a RO</td>
</tr>
<tr>
<td>x 0 1</td>
<td>RO RO RO RO</td>
</tr>
<tr>
<td>x 1 1</td>
<td>RO n/a RO RO</td>
</tr>
</tbody>
</table>

**Traps and Enables**
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If PMUSERENR_EL0.EN==0, read accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TPM==1, Non-secure read accesses to this register from EL0 and EL1 are trapped to EL2.
• When EL3 is implemented and is using AArch64:
  — If MDCR_EL3.TPM==1, read accesses to this register from EL0, EL1, and EL2 are trapped to EL3.
D10.4.4 PMCEID1_EL0, Performance Monitors Common Event Identification register 1

The PMCEID1_EL0 characteristics are:

**Purpose**

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the ranges 0x0020 to 0x003F and 0x4020 to 0x403F. When the value of a bit in the register is 1 the corresponding common event is implemented or counted.

___ Note ___

ARM recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

___ For more information about the common events and the use of the PMCEIDn_EL0 registers see The PMU event number space and common events on page D5-2244. ___

**Configurations**

AArch64 System register PMCEID1_EL0[31:0] is architecturally mapped to AArch32 System register PMCEID1.

AArch64 System register PMCEID1_EL0[63:32] is architecturally mapped to AArch32 System register PMCEID3.

AArch64 System register PMCEID1_EL0[31:0] is architecturally mapped to External register PMCEID1.

AArch64 System register PMCEID1_EL0[63:32] is architecturally mapped to External register PMCEID3.

**Attributes**

PMCEID1_EL0 is a 64-bit register.

**Field descriptions**

The PMCEID1_EL0 bit assignments are:

```
63 32 31 0

IDh[63:32], bits [63:32]

In ARMv8.3, ARMv8.2 and ARMv8.1

IDh[n] corresponds to common event (0x4000 + n).

For each bit:

0  The common event is not implemented, or not counted.
1  The common event is implemented.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

___ Note ___

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.
**In ARMv8.0.**

Reserved, RES0.

**ID[63:32], bits [31:0]**

ID[n] corresponds to common event n.

For each bit:

0    The common event is not implemented, or not counted.
1    The common event is implemented.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

---  

**Note**

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

---

**Accessing the PMCEID1_EL0**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMCEID1_EL0</td>
<td>11</td>
<td>011</td>
<td>1000</td>
<td>1100</td>
<td>111</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>
</tr>
<tr>
<td>TGE</td>
<td>RO</td>

<tr>
<td>x</td>
<td>RO</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If PMUSERENR_EL0.EN==0, read accesses to this register from EL0 are trapped to EL1.

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TPM==1, Non-secure read accesses to this register from EL0 and EL1 are trapped to EL2.
• When EL3 is implemented and is using AArch64:
  — If `MDCR_EL3.TPM==1`, read accesses to this register from EL0, EL1, and EL2 are trapped to EL3.
D10.4.5 PMCNTENCLR_EL0, Performance Monitors Count Enable Clear register

The PMCNTENCLR_EL0 characteristics are:

**Purpose**

Disables the Cycle Count Register, PMCCNTR_EL0, and any implemented event counters PMEVCNTR<n>. Reading this register shows which counters are enabled.

**Configurations**

AArch64 System register PMCNTENCLR_EL0 is architecturally mapped to AArch32 System register PMCNTENCLR.

AArch64 System register PMCNTENCLR_EL0 is architecturally mapped to External register PMCNTENCLR_EL0.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMCNTENCLR_EL0 is a 32-bit register.

**Field descriptions**

The PMCNTENCLR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>P&lt;n&gt;, bit [n]</td>
<td></td>
</tr>
</tbody>
</table>

- **C, bit [31]**
  - PMCCNTR_EL0 disable bit. Disables the cycle counter register. Possible values are:
    - 0: When read, means the cycle counter is disabled. When written, has no effect.
    - 1: When read, means the cycle counter is enabled. When written, disables the cycle counter.

- **P<n>, bit [n], for n = 0 to 30**
  - Event counter disable bit for PMEVCNTR<n>_EL0.
  - Bits [30:N] are RAZ/WI. When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in MDCR_EL2.HPMN. Otherwise, N is the value in PMCR_EL0.N.
  - Possible values of each bit are:
    - 0: When read, means that PMEVCNTR<n>_EL0 is disabled. When written, has no effect.
    - 1: When read, means that PMEVCNTR<n>_EL0 is enabled. When written, disables PMEVCNTR<n>_EL0.

**Accessing the PMCNTENCLR_EL0**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>
This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMCNTENCLR_EL0</td>
<td>11</td>
<td>011</td>
<td>1001</td>
<td>1100</td>
<td>010</td>
</tr>
</tbody>
</table>

### Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>x x 0</td>
<td>RW RW n/a RW</td>
</tr>
<tr>
<td>x 0 1</td>
<td>RW RW RW RW</td>
</tr>
<tr>
<td>x 1 1</td>
<td>RW n/a RW RW</td>
</tr>
</tbody>
</table>

### Traps and Enables

For a description of the prioritization of any generated exceptions, see Synonymous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If PMUSERENR_EL0.EN==0, accesses to this register from EL0 are trapped to EL1.

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TPM==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.

- When EL3 is implemented and is using AArch64:
  - If MDCR_EL3.TPM==1, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.
D10.4.6 PMCNTENSET_EL0, Performance Monitors Count Enable Set register

The PMCNTENSET_EL0 characteristics are:

**Purpose**

Enables the Cycle Count Register, PMCCNTR_EL0, and any implemented event counters PMEVCNTR<\text{n}>. Reading this register shows which counters are enabled.

**Configurations**

AArch64 System register PMCNTENSET_EL0 is architecturally mapped to AArch32 System register PMCNTENSET.

AArch64 System register PMCNTENSET_EL0 is architecturally mapped to External register PMCNTENSET_EL0.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMCNTENSET_EL0 is a 32-bit register.

**Field descriptions**

The PMCNTENSET_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit 31</th>
<th>Bit [30:0]</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>P&lt;\text{n}&gt;, bit [n]</td>
</tr>
</tbody>
</table>

- **C**, bit [31]
  - **PMCCNTR_EL0** enable bit. Enables the cycle counter register. Possible values are:
    - 0: When read, means the cycle counter is disabled. When written, has no effect.
    - 1: When read, means the cycle counter is enabled. When written, enables the cycle counter.

- **P<\text{n}>, bit [n]**, for \text{n} = 0 to 30
  - Event counter enable bit for PMEVCNTR<\text{n}>_EL0.
  - Bits [30:N] are RAZ/WI. When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in MDCR_EL2.HPMN. Otherwise, N is the value in PMCR_EL0.N.
  - Possible values of each bit are:
    - 0: When read, means that PMEVCNTR<\text{n}>_EL0 is disabled. When written, has no effect.
    - 1: When read, means that PMEVCNTR<\text{n}>_EL0 event counter is enabled. When written, enables PMEVCNTR<\text{n}>_EL0.

**Accessing the PMCNTENSET_EL0**

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```
This syntax is encoded with the following settings in the instruction encoding:

```
<systemreg>   op0   op1  CRn  CRm  op2
PMCNTENSET_EL0  11   011  1001  1100  001
```

**Accessibility**

The register is accessible in software as follows:

```
Control   Accessibility
E2H  TGE  NS  EL0  EL1  EL2  EL3
x   x   0   RW  RW  n/a  RW
x   0   1   RW  RW  RW  RW
x   1   1   RW  n/a  RW  RW
```

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If PMUSERENR_EL0.EN==0, accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TPM==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If MDCR_EL3.TPM==1, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.
D10.4.7 PMCR_EL0, Performance Monitors Control Register

The PMCR_EL0 characteristics are:

**Purpose**
Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

**Configurations**
AArch64 System register PMCR_EL0 is architecturally mapped to AArch32 System register PMCR.
AArch64 System register PMCR_EL0[6:0] is architecturally mapped to External register PMCR_EL0[6:0].

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch64. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**
PMCR_EL0 is a 32-bit register.

**Field descriptions**
The PMCR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>24</th>
<th>23</th>
<th>16</th>
<th>15</th>
<th>10</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMP</td>
<td>IDCODE</td>
<td>N</td>
<td>RES0</td>
<td>LC</td>
<td>D</td>
<td>C</td>
<td>P</td>
<td>E</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**IMP, bits [31:24]**
Implementer code. This field is RO with an IMPLEMENTATION DEFINED value.
The implementer codes are allocated by ARM. Values have the same interpretation as bits [31:24] of the MIDR.

**IDCODE, bits [23:16]**
Identification code. This field is RO with an IMPLEMENTATION DEFINED value.
Each implementer must maintain a list of identification codes that is specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.

**N, bits [15:11]**
Number of event counters. A RO field that indicates the number counters implemented. A value of 000000 in this field indicates that only the Cycle Count Register PMCCNTR_EL0 is implemented.
The value of this field is the number of event counters implemented. This value is in the range of 000000, in which case only the PMCCNTR_EL0 is implemented, to 111111, which indicates that the PMCCNTR_EL0 and 31 event counters are implemented.
In an implementation that includes EL2, reads of this field from Non-secure EL1 and Non-secure EL0 return the value of MDCR_EL2.HPMN.

**Bits [10:7]**
Reserved, RES0.
**LC, bit [6]**

Long cycle counter enable. Determines which PMCCNTR_EL0 bit generates an overflow recorded by PMOVSR[31].

- **0**: Cycle counter overflow on increment that changes PMCCNTR_EL0[31] from 1 to 0.
- **1**: Cycle counter overflow on increment that changes PMCCNTR_EL0[63] from 1 to 0.

ARM deprecates use of PMCR_EL0.LC = 0.

In an AArch64-only implementation, this field is **RES1**.

If this field is implemented as an RW field, it resets to a value that is architecturally **UNKNOWN**.

**DP, bit [5]**

Disable cycle counter when event counting is prohibited. The possible values of this bit are:

- **0**: PMCCNTR_EL0, if enabled, counts when event counting is prohibited.
- **1**: PMCCNTR_EL0 does not count when event counting is prohibited.

Counting events is never prohibited in Non-secure state. However, there are some restrictions on counting events in Secure state. For more information about the interaction between the Performance Monitors and EL3, see Interaction with EL3 on page D5-2233.

When EL3 is not implemented, this field is **RES0**:

- When ARMv8.1-PMU is not implemented.
- When ARMv8.1-PMU is implemented, only if EL2 is not implemented.

Otherwise this field is RW.

If this field is implemented as an RW field, it resets to a value that is architecturally **UNKNOWN**.

**X, bit [4]**

Enable export of events in an IMPLEMENTATION DEFINED event stream. The possible values of this bit are:

- **0**: Do not export events.
- **1**: Export events where not prohibited.

This field enables the exporting of events over an event bus to another device, for example to an OPTIONAL trace macrocell. If the implementation does not include such an event bus then this field is RAZ/WI, otherwise it is an RW field.

In an implementation that includes an event bus, no events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

If this field is implemented as an RW field, it resets to a value that is architecturally **UNKNOWN**.

**D, bit [3]**

Clock divider. The possible values of this bit are:

- **0**: When enabled, PMCCNTR_EL0 counts every clock cycle.
- **1**: When enabled, PMCCNTR_EL0 counts once every 64 clock cycles.

In an AArch64-only implementation this field is **RES0**, otherwise it is an RW field. If PMCR_EL0.LC = 1, this bit is ignored and the cycle counter counts every clock cycle.

ARM deprecates use of PMCR_EL0.D = 1.

If this field is implemented as an RW field, it resets to a value that is architecturally **UNKNOWN**.

**C, bit [2]**

Cycle counter reset. This bit is WO. The effects of writing to this bit are:

- **0**: No action.
- **1**: Reset PMCCNTR_EL0 to zero.

This bit is always RAZ.
Resetting PMCCNTR_EL0 does not clear the PMCCNTR_EL0 overflow bit to 0.

**P, bit [1]**

Event counter reset. This bit is WO. The effects of writing to this bit are:

- 0: No action.
- 1: Reset all event counters accessible in the current EL, not including PMCCNTR_EL0, to zero.

This bit is always RAZ.

In Non-secure EL0 and EL1, if EL2 is implemented, a write of 1 to this bit does not reset event counters that MDCR_EL2.HPMN reserves for EL2 use.

In EL2 and EL3, a write of 1 to this bit resets all the event counters.

Resetting the event counters does not clear any overflow bits to 0.

**E, bit [0]**

Enable. The possible values of this bit are:

- 0: All counters that are accessible at Non-secure EL1, including PMCCNTR_EL0, are disabled.
- 1: All counters that are accessible at Non-secure EL1 are enabled by PMCNTENSET_EL0.

This bit is RW.

If EL2 is implemented, this bit does not affect the operation of event counters that MDCR_EL2.HPMN reserves for EL2 use.

When this register has an architecturally-defined reset value, this field resets to 0.

**Accessing the PMCR_EL0**

This register can be read using MRS with the following syntax:

```c
MRS <Xt>, <systemreg>
```

This register can be written using MSR (register) with the following syntax:

```c
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMCR_EL0</td>
<td>11</td>
<td>011</td>
<td>1001</td>
<td>1100</td>
<td>000</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>
</tr>
<tr>
<td>TGE</td>
<td>RW</td>
</tr>
<tr>
<td>NS</td>
<td>RW</td>
</tr>
<tr>
<td>EL0</td>
<td>RW</td>
</tr>
<tr>
<td>EL1</td>
<td>RW</td>
</tr>
<tr>
<td>EL2</td>
<td>RW</td>
</tr>
<tr>
<td>EL3</td>
<td>RW</td>
</tr>
</tbody>
</table>
Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If `PMUSERENR_EL0.EN==0`, accesses to this register from EL0 are trapped to EL1.

- When EL2 is implemented and is using AArch64 and `SCR_EL3.NS == 1`:
  - If `MDCR_EL2.TPM==1`, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
  - If `MDCR_EL2.TPMCR==1`, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.

- When EL3 is implemented and is using AArch64:
  - If `MDCR_EL3.TPM==1`, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.
D10.4.8 PMEVCNTR<n>_EL0, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n>_EL0 characteristics are:

**Purpose**

Holds event counter n, which counts events, where n is 0 to 30.

**Configurations**

AArch64 System register PMEVCNTR<n>_EL0 is architecturally mapped to AArch32 System register PMEVCNTR<n>.

AArch64 System register PMEVCNTR<n>_EL0 is architecturally mapped to External register PMEVCNTR<n>_EL0.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMEVCNTR<n>_EL0 is a 32-bit register.

**Field descriptions**

The PMEVCNTR<n>_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Event counter n</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

**Accessing the PMEVCNTR<n>_EL0**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMEVCNTR&lt;n&gt;_EL0</td>
<td>11</td>
<td>011</td>
<td>1110</td>
<td>10:n&lt;4:3&gt;</td>
<td>n&lt;2:0&gt;</td>
</tr>
</tbody>
</table>

- <CRm> is in the range 8 - 11.
- <op2> is in the range 0 - 7.

PMEVCNTR<n>_EL0 can also be accessed by using PMXEVCNTR_EL0 with PMSELR_EL0.SEL set to the value of <n>.
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>E2H</th>
<th>TGE</th>
<th>NS</th>
<th>EL0</th>
<th>EL1</th>
<th>EL2</th>
<th>EL3</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>x</td>
<td>0</td>
<td>RW</td>
<td>RW</td>
<td>n/a</td>
<td>RW</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
<td>1</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
<td>1</td>
<td>RW</td>
<td>n/a</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If \(<n>\) is greater than or equal to the number of accessible counters, reads and writes of PMEVCNTR<\(<n>\)> EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- For an access from Non-secure EL1, or an access from Non-secure EL0 when the value of PMUSERENR_EL0.EN is 1, if PMSELR_EL0.SEL is greater than or equal to the number of accessible counters but is less than the number of implemented counters, the register access is trapped to EL2.

--- Note ---

In an implementation that includes EL2, in Non-secure state at EL0 and EL1, MDCR_EL2.HPMN identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of implemented counters.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If PMUSERENR_EL0.EN==0, and PMUSERENR_EL0.ER==0, read accesses to this register from EL0 are trapped to EL1.
  - If PMUSERENR_EL0.EN==0, write accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TPM==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If MDCR_EL3.TPM==1, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.
D10.4.9 PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>_EL0 characteristics are:

**Purpose**

Confirms event counter n, where n is 0 to 30.

**Configurations**

AArch64 System register PMEVTYPER<n>_EL0 is architecturally mapped to AArch32 System register PMEVTYPER<n>.

AArch64 System register PMEVTYPER<n>_EL0 is architecturally mapped to External register PMEVTYPER<n>_EL0.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMEVTYPER<n>_EL0 is a 32-bit register.

**Field descriptions**

The PMEVTYPER<n>_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>16</th>
<th>15</th>
<th>10</th>
<th>9</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>P</td>
<td>U</td>
<td>M</td>
<td>RES0</td>
<td>evtCount[15:10]</td>
<td>evtCount[9:0]</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**P, bit [31]**

Privileged filtering bit. Controls counting in EL1. If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the NSK bit. The possible values of this bit are:

- 0: Count events in EL1.
- 1: Do not count events in EL1.

**U, bit [30]**

User filtering bit. Controls counting in EL0. If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the NSU bit. The possible values of this bit are:

- 0: Count events in EL0.
- 1: Do not count events in EL0.

**NSK, bit [29]**

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of P, events in Non-secure EL1 are counted. Otherwise, events in Non-secure EL1 are not counted.

**NSU, bit [28]**

Non-secure EL0 (Unprivileged) filtering. Controls counting in Non-secure EL0. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of U, events in Non-secure EL0 are counted.
Otherwise, events in Non-secure EL0 are not counted.

NSH, bit [27]
Non-secure EL2 (Hypervisor) filtering. Controls counting in Non-secure EL2. If EL2 is not implemented, this bit is RES0.
- 0: Do not count events in EL2.
- 1: Count events in EL2.

M, bit [26]
Secure EL3 filtering bit. If EL3 is not implemented, this bit is RES0.
- If the value of this bit is equal to the value of P, cycles in Secure EL3 are counted.
- Otherwise, cycles in Secure EL3 are not counted.
- Most applications can ignore this field and set its value to 0.

Note
This field is not visible in the AArch32 PMEVTYPER System register.

MT, bit [25]
Multithreading. When the implementation is multi-threaded, the valid values for this bit are:
- 0: Count events only on controlling PE.
- 1: Count events from any PE with the same affinity at level 1 and above as this PE.
When the implementation is not multi-threaded, this bit is RES0.

Note
- An implementation is described as multi-threaded when the lowest level of affinity consists of logical PEs that are implemented using a multi-threading type approach. That is, the performance of PEs at the lowest affinity level is highly interdependent. On such an implementation, the value of MPIDR_EL1.MT, when read at the highest implemented Exception level, is 1.
- Events from a different thread of a multithreaded implementation are not Attributable to the thread counting the event.

Bits [24:16]
Reserved, RES0.

evtCount[15:10], bits [15:10]

In ARMv8.3, ARMv8.2 and ARMv8.1
Extension to evtCount[9:0]. See evtCount[9:0] for more details.

In ARMv8.0.
Reserved, RES0.

evtCount[9:0], bits [9:0]
Event to count. The event number of the event that is counted by event counter PMEVCNTR<n>_EL0.
Software must program this field with an event that is supported by the PE being programmed.
There are three types of event:
- Common architectural and microarchitectural events.
- ARM recommended common architectural and microarchitectural events.
- IMPLEMENTATION DEFINED events.
The ranges of event numbers allocated to each type of event are shown in Allocation of the PMU event number space on page D5-2244.
If evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the event type:

- For the range 0x000 to 0x03F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED events, it is UNPREDICTABLE what event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

**Note**

UNPREDICTABLE means the event must not expose privileged information.

ARM recommends that the behavior across a family of implementations is defined such that if a given implementation does not include an event from a set of common IMPLEMENTATION DEFINED events, then no event is counted and the value read back on evtCount is the value written.

**Accessing the PMEVTYPER<n>_EL0**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMEVTYPER&lt;n&gt;_EL0</td>
<td>11</td>
<td>011</td>
<td>1110</td>
<td>11:n&lt;4:3&gt;</td>
<td>n&lt;2:0&gt;</td>
</tr>
</tbody>
</table>

- <CRm> is in the range 12 - 15.
- <op2> is in the range 0 - 7.

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>x x 0</td>
<td>RW RW n/a RW</td>
</tr>
<tr>
<td>x 0 1</td>
<td>RW RW RW RW</td>
</tr>
<tr>
<td>x 1 1</td>
<td>RW n/a RW RW</td>
</tr>
</tbody>
</table>

PMEVTYPER<n>_EL0 can also be accessed by using PMXEVTYPER_EL0 with PMSELR_EL0.SEL set to n.

If <n> is greater than or equal to the number of accessible counters, reads and writes of PMEVTYPER<n>_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
• For an access from Non-secure EL1, or an access from Non-secure EL0 when the value of PMUSERENR_EL0.EN is 1, if PMSELR_EL0.SEL is greater than or equal to the number of accessible counters but is less than the number of implemented counters, the register access is trapped to EL2.

Note
In an implementation that includes EL2, in Non-secure state at EL0 and EL1, MDCR_EL2.HPMN identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of implemented counters.

Traps and Enables
For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

• In both security states, and not dependent on other bits:
  — If PMUSERENR_EL0.EN==0, accesses to this register from EL0 are trapped to EL1.

• When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  — If MDCR_EL2.TPM==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.

• When EL3 is implemented and is using AArch64:
  — If MDCR_EL3.TPM==1, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.
D10.4.10 PMINTENCLR_EL1, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR_EL1 characteristics are:

**Purpose**

Disables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR_EL0, and the event counters PMEVCNTR<n>_EL0. Reading the register shows which overflow interrupt requests are enabled.

**Configurations**

AArch64 System register PMINTENCLR_EL1 is architecturally mapped to AArch32 System register PMINTENCLR.

AArch64 System register PMINTENCLR_EL1 is architecturally mapped to External register PMINTENCLR_EL1.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMINTENCLR_EL1 is a 32-bit register.

**Field descriptions**

The PMINTENCLR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>P&lt;n&gt;, bit [n]</td>
<td></td>
</tr>
</tbody>
</table>

**C, bit [31]**

PMCCNTR_EL0 overflow interrupt request disable bit. Possible values are:

0 When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.

1 When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.

**P<n>, bit [n], for n = 0 to 30**

Event counter overflow interrupt request disable bit for PMEVCNTR<n>_EL0.

When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in MDCR_EL2.HPMN. Otherwise, N is the value in PMCR_EL0.N.

Bits [30:N] are RAZ/WI.

Possible values are:

0 When read, means that the PMEVCNTR<n>_EL0 event counter interrupt request is disabled. When written, has no effect.

1 When read, means that the PMEVCNTR<n>_EL0 event counter interrupt request is enabled. When written, disables the PMEVCNTR<n>_EL0 interrupt request.

**Accessing the PMINTENCLR_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:
MSR `<systemreg>, <Xt>`

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMINTENCLR_EL1</td>
<td>11</td>
<td>000</td>
<td>1001</td>
<td>1110</td>
<td>010</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TPM==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If MDCR_EL3.TPM==1, accesses to this register from EL1 and EL2 are trapped to EL3.
**D10.4.11 PMINTENSET_EL1, Performance Monitors Interrupt Enable Set register**

The PMINTENSET_EL1 characteristics are:

**Purpose**

Enables the generation of interrupt requests on overflows from the Cycle Count Register, \texttt{PMCCNTR\_EL0}, and the event counters \texttt{PMEVCNTR\_<n>\_EL0}. Reading the register shows which overflow interrupt requests are enabled.

**Configurations**

AArch64 System register \texttt{PMINTENSET\_EL1} is architecturally mapped to AArch32 System register \texttt{PMINTENSET}.

AArch64 System register \texttt{PMINTENSET\_EL1} is architecturally mapped to External register \texttt{PMINTENSET\_EL1}.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally \texttt{UNKNOWN} values.

**Attributes**

\texttt{PMINTENSET\_EL1} is a 32-bit register.

**Field descriptions**

The \texttt{PMINTENSET\_EL1} bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>0</th>
<th>C</th>
<th>(\text{P&lt;n&gt;, bit [n]})</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

\(C\), bit [31]

\texttt{PMCCNTR\_EL0} overflow interrupt request enable bit. Possible values are:

| 0   | When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect. |
| 1   | When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request. |

\(P<n>\), bit [n], for \(n = 0\) to \(30\)

Event counter overflow interrupt request enable bit for \texttt{PMEVCNTR\_<n>\_EL0}.

When EL2 is implemented, in Non-secure EL1 and EL0, \(N\) is the value in \texttt{MDCR\_EL2.HPMN}. Otherwise, \(N\) is the value in \texttt{PMCR\_EL0.N}.

Bits [30:N] are RAZ/WI.

Possible values are:

| 0   | When read, means that the \texttt{PMEVCNTR\_<n>\_EL0} event counter interrupt request is disabled. When written, has no effect. |
| 1   | When read, means that the \texttt{PMEVCNTR\_<n>\_EL0} event counter interrupt request is enabled. When written, enables the \texttt{PMEVCNTR\_<n>\_EL0} interrupt request. |

**Accessing the PMINTENSET\_EL1**

This register can be read using MRS with the following syntax:

\texttt{MRS <Xt>, <systemreg>}

This register can be written using MSR (register) with the following syntax:
MSR `<systemreg>, <Xt>`

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMINTENSET_EL1</td>
<td>11</td>
<td>000</td>
<td>1001</td>
<td>1110</td>
<td>001</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>n/a RW RW</td>
</tr>
<tr>
<td>1</td>
<td>n/a RW RW</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TPM==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If MDCR_EL3.TPM==1, accesses to this register from EL1 and EL2 are trapped to EL3.
D10.4.12  PMOVSCLR_EL0, Performance Monitors Overflow Flag Status Clear Register

The PMOVSCLR_EL0 characteristics are:

**Purpose**

Contains the state of the overflow bit for the Cycle Count Register, PMCCNTR_EL0, and each of the implemented event counters PMEVCNTR<\text{n}>. Writing to this register clears these bits.

**Configurations**

AArch64 System register PMOVSCLR_EL0 is architecturally mapped to AArch32 System register PMOVSR.

AArch64 System register PMOVSCLR_EL0 is architecturally mapped to External register PMOVSCLR_EL0.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMOVSCLR_EL0 is a 32-bit register.

**Field descriptions**

The PMOVSCLR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>C, bit [31]</td>
</tr>
<tr>
<td>30</td>
<td>P&lt;\text{n}&gt;, bit [n]</td>
</tr>
</tbody>
</table>

C, bit [31]

PMCCNTR_EL0 overflow bit. Possible values are:

0  When read, means the cycle counter has not overflowed. When written, has no effect.
1  When read, means the cycle counter has overflowed. When written, clears the overflow bit to 0.

PMCR_EL0.LC controls whether an overflow is detected from PMCCNTR_EL0[31] or from PMCCNTR_EL0.

P<\text{n}>, bit [n], for n = 0 to 30

Event counter overflow clear bit for PMEVCNTR<\text{n}>_EL0.

Bits [30:N] are RAZ/WI.

When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in MDCR_EL2.HPMN. Otherwise, N is the value in PMCR_EL0.N.

Possible values of each bit are:

0  When read, means that PMEVCNTR<\text{n}>_EL0 has not overflowed. When written, has no effect.
1  When read, means that PMEVCNTR<\text{n}>_EL0 has overflowed. When written, clears the PMEVCNTR<\text{n}>_EL0 overflow bit to 0.

**Accessing the PMOVSCLR_EL0**

This register can be read using MRS with the following syntax:

MRS <\text{x}t>, <systemreg>

This register can be written using MSR (register) with the following syntax:
MSR `<systemreg>, <Xt>`

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th><code>&lt;systemreg&gt;</code></th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMOVSCLR_EL0</td>
<td>11</td>
<td>011</td>
<td>1001</td>
<td>1100</td>
<td>011</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If `PMUSERENR_EL0.EN==0`, accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If `MDCR_EL2.TPM==1`, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If `MDCR_EL3.TPM==1`, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.
D10.4.13 PMOVSSET_EL0, Performance Monitors Overflow Flag Status Set register

The PMOVSSET_EL0 characteristics are:

**Purpose**
Sets the state of the overflow bit for the Cycle Count Register, PMCCNTR_EL0, and each of the implemented event counters PMEVCNTR<n>.

**Configurations**
AArch64 System register PMOVSSET_EL0 is architecturally mapped to AArch32 System register PMOVSSET.
AArch64 System register PMOVSSET_EL0 is architecturally mapped to External register PMOVSSET_EL0.
This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**
PMOVSSET_EL0 is a 32-bit register.

**Field descriptions**
The PMOVSSET_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>P&lt;n&gt;, bit [n]</td>
<td></td>
</tr>
</tbody>
</table>

C, bit [31]  
PMCCNTR_EL0 overflow bit. Possible values are:
0 When read, means the cycle counter has not overflowed. When written, has no effect.
1 When read, means the cycle counter has overflowed. When written, sets the overflow bit to 1.

P<n>, bit [n], for n = 0 to 30  
Event counter overflow set bit for PMEVCNTR<n>_EL0.
Bits [30:N] are RAZ/WI.
When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in MDCR_EL2.HPMN. Otherwise, N is the value in PMCR_EL0.N.
Possible values are:
0 When read, means that PMEVCNTR<n>_EL0 has not overflowed. When written, has no effect.
1 When read, means that PMEVCNTR<n>_EL0 has overflowed. When written, sets the PMEVCNTR<n>_EL0 overflow bit to 1.

**Accessing the PMOVSSET_EL0**
This register can be read using MRS with the following syntax:
MRS <Xt>, <systemreg>
This register can be written using MSR (register) with the following syntax:
MSR <systemreg>, <Xt>
This syntax is encoded with the following settings in the instruction encoding:

```
<systemreg> op0 op1 CRn CRm op2
PMOVSET_EL0 11 011 1001 1110 011
```

### Accessibility
The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

### Traps and Enables
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If `PMUSERENR_EL0.EN==0`, accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and `SCR_EL3.NS == 1`:
  - If `MDCR_EL2.TPM==1`, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If `MDCR_EL3.TPM==1`, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.
D10.4.14 PMSELR_EL0, Performance Monitors Event Counter Selection Register

The PMSELR_EL0 characteristics are:

Purpose

Selects the current event counter PMEVCNTR<\(n\)> or the cycle counter, CCNT.

PMSELR_EL0 is used in conjunction with PMXEVTPER_EL0 to determine the event that increments a selected event counter, and the modes and states in which the selected counter increments.

It is also used in conjunction with PMXEVCNTR_EL0, to determine the value of a selected event counter.

Configurations

AArch64 System register PMSELR_EL0 is architecturally mapped to AArch32 System register PMSELR.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMSELR_EL0 is a 32-bit register.

Field descriptions

The PMSELR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>5-0</td>
<td>SEL</td>
</tr>
</tbody>
</table>

Bits [31:5]

Reserved, RES0.

SEL, bits [4:0]

Selects event counter, PMEVCNTR<\(n\)>, where \(n\) is the value held in this field. This value identifies which event counter is accessed when a subsequent access to PMXEVTPER_EL0 or PMXEVCNTR_EL0 occurs.

This field can take any value from 0 (\(0b00000\)) to \((\text{PMCR.N})-1\), or 31 (\(0b11111\)).

When PMSELR_EL0.SEL is \(0b11111\), it selects the cycle counter and:

- A read of the PMXEVTPER_EL0 returns the value of PMCCFILTR_EL0.
- A write of the PMXEVTPER_EL0 writes to PMCCFILTR_EL0.
- A read or write of PMXEVCNTR_EL0 has CONSTRAINED UNPREDICTABLE effects, that can be one of the following:
  - Access to PMXEVCNTR_EL0 is UNDEFINED.
  - Access to PMXEVCNTR_EL0 behaves as a NOP.
  - Access to PMXEVCNTR_EL0 behaves as if the register is RAZ/WI.
  - Access to PMXEVCNTR_EL0 behaves as if the PMSELR_EL0.SEL field contains an UNKNOWN value.

If this field is set to a value greater than or equal to the number of implemented counters, but not equal to 31:
- Direct reads of this field return an UNKNOWN value.
The results of access to `PMXEVTYPE_EL0` or `PMXEVCNTR_EL0` are CONstrained UNpredicT able, and can be one of the following:

- Access to `PMXEVTYPE_EL0` or `PMXEVCNTR_EL0` is UNDEFINED.
- Access to `PMXEVTYPE_EL0` or `PMXEVCNTR_EL0` behaves as a NOP.
- Access to `PMXEVTYPE_EL0` or `PMXEVCNTR_EL0` behaves as if the register is RAZ/WI.
- Access to `PMXEVTYPE_EL0` or `PMXEVCNTR_EL0` behaves as if the PMSELR_EL0.SEL field contains an UNKNOWN value.
- Access to `PMXEVTYPE_EL0` or `PMXEVCNTR_EL0` behaves as if the PMSELR_EL0.SEL field contains 0b11111.

### Accessing the PMSELR_EL0

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMSELR_EL0</td>
<td>11</td>
<td>011</td>
<td>1001</td>
<td>1100</td>
<td>101</td>
</tr>
</tbody>
</table>

### Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If `PMUSERN_E0.EN==0`, and `PMUSERN_E0.ER==0`, accesses to this register from EL0 are trapped to EL1.

- When EL2 is implemented and is using AArch64 and `SCR_E3.NS == 1`:
  - If `MDCR_EL2.TPM==1`, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.

- When EL3 is implemented and is using AArch64:
  - If `MDCR_EL3.TPM==1`, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.
D10.4.15 PMSWINC_EL0, Performance Monitors Software Increment register

The PMSWINC_EL0 characteristics are:

**Purpose**

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see SW_INCR.

**Configurations**

AArch64 System register PMSWINC_EL0 is architecturally mapped to AArch32 System register PMSWINC.

AArch64 System register PMSWINC_EL0 is architecturally mapped to External register PMSWINC_EL0.

**Attributes**

PMSWINC_EL0 is a 32-bit register.

**Field descriptions**

The PMSWINC_EL0 bit assignments are:

```
<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>P&lt;n&gt;, bit [n], for n = 0 to 30</td>
<td>0</td>
</tr>
<tr>
<td>30</td>
<td>Reserved, RES0</td>
<td></td>
</tr>
</tbody>
</table>

P<n>, bit [n], for n = 0 to 30

Event counter software increment bit for PMEVCNTR<n>_EL0.

Bits [30:N] are WI.

When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in MDCR_EL2.HPMN. Otherwise, N is the value in PMCR.N.

The effects of writing to this bit are:

0  No action. The write to this bit is ignored.
1  If PMEVCNTR<n>_EL0 is enabled and configured to count the software increment event, increments PMEVCNTR<n>_EL0 by 1. If PMEVCNTR<n>_EL0 is disabled, or not configured to count the software increment event, the write to this bit is ignored.

Accessing the PMSWINC_EL0

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMSWINC_EL0</td>
<td>11</td>
<td>011</td>
<td>1001</td>
<td>1100</td>
<td>100</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>E2H</th>
<th>TGE</th>
<th>NS</th>
<th>EL0</th>
<th>EL1</th>
<th>EL2</th>
<th>EL3</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>x</td>
<td>0</td>
<td>WO</td>
<td>WO</td>
<td>n/a</td>
<td>WO</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
<td>1</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
<td>1</td>
<td>WO</td>
<td>n/a</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If PMUSERENR_EL0.EN==0, and PMUSERENR_EL0.SW==0, write accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TPM==1, Non-secure write accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If MDCR_EL3.TPM==1, write accesses to this register from EL0, EL1, and EL2 are trapped to EL3.
## PMUSERENR_EL0, Performance Monitors User Enable Register

The PMUSERENR_EL0 characteristics are:

### Purpose
Enables or disables EL0 access to the Performance Monitors.

### Configurations
AArch64 System register PMUSERENR_EL0 is architecturally mapped to AArch32 System register PMUSERENR.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

### Attributes
PMUSERENR_EL0 is a 32-bit register.

### Field descriptions
The PMUSERENR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:4</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>3</td>
<td>Event counter read trap control:</td>
</tr>
<tr>
<td>0</td>
<td>EL0 using AArch64: EL0 reads of the PMXEVCNTR_EL0 and PMEVCNTR&lt;_n&gt;_EL0, and EL0 read/write accesses to the PMSELR_EL0, are trapped to EL1 if PMUSERENR_EL0.EN is also 0. EL0 using AArch32: EL0 reads of the PMXEVCNTR and PMEVCNTR&lt;_n&gt;, and EL0 read/write accesses to the PMSELR, are trapped to EL1 if PMUSERENR_EL0.EN is also 0.</td>
</tr>
<tr>
<td>1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>2</td>
<td>Cycle counter read trap control:</td>
</tr>
<tr>
<td>0</td>
<td>EL0 using AArch64: EL0 read accesses to the PMCCNTR_EL0 are trapped to EL1 if PMUSERENR_EL0.EN is also 0. EL0 using AArch32: EL0 read accesses to the PMCCNTR are trapped to EL1 if PMUSERENR_EL0.EN is also 0.</td>
</tr>
<tr>
<td>1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>1</td>
<td>Software Increment write trap control:</td>
</tr>
<tr>
<td>0</td>
<td>EL0 using AArch64: EL0 writes to the PMSWINC_EL0 are trapped to EL1 if PMUSERENR_EL0.EN is also 0.</td>
</tr>
</tbody>
</table>
EL0 using AArch32: EL0 writes to the PMSWINC are trapped to EL1 if PMUSERENR_EL0.EN is also 0.

1  This control does not cause any instructions to be trapped.

**EN, bit [0]**

Traps EL0 accesses to the Performance Monitors registers to EL1, from both Execution states:

0  EL0 accesses to the Performance Monitors registers are trapped to EL1, unless enabled by one of PMUSERENR_EL0.{ER, CR, SW}.

1  This control does not cause any instructions to be trapped. Software can access all PMU registers at EL0.

--- **Note** ---

- The PMUSERENR_EL0 and PMUSERENR registers are always RO at EL0 and not trapped by this bit.
- EL0 cannot read or write PMINTENSET_EL1 and PMINTENCLR_EL1, or PMINTENSET and PMINTENCLR.

### Accessing the PMUSERENR_EL0

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMUSERENR_EL0</td>
<td>11</td>
<td>011</td>
<td>1001</td>
<td>1110</td>
<td>000</td>
</tr>
</tbody>
</table>

### Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0</td>
</tr>
<tr>
<td>x x 0</td>
<td>RO</td>
</tr>
<tr>
<td>x 0 1</td>
<td>RO</td>
</tr>
<tr>
<td>x 1 1</td>
<td>RO</td>
</tr>
</tbody>
</table>

### Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TPM==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
• When EL3 is implemented and is using AArch64:
  — If MDCR_EL3.TPM==1, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.
PMXEV CNTR_EL0, Performance Monitors Selected Event Count Register

The PMXEV CNTR_EL0 characteristics are:

**Purpose**

Reads or writes the value of the selected event counter, PMEVCNTR<n>_EL0. PMSELR_EL0.SEL determines which event counter is selected.

**Configurations**

AArch64 System register PMXEV CNTR_EL0 is architecturally mapped to AArch32 System register PMXEV CNTR.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMXEV CNTR_EL0 is a 32-bit register.

**Field descriptions**

The PMXEV CNTR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>PMEVCNTR&lt;n&gt;</th>
<th>0</th>
</tr>
</thead>
</table>

PMEVCNTR<n>, bits [31:0]

Value of the selected event counter, PMEVCNTR<n>_EL0, where n is the value stored in PMSELR_EL0.SEL.

**Accessing the PMXEV CNTR_EL0**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMXEV CNTR_EL0</td>
<td>11</td>
<td>011</td>
<td>1001</td>
<td>1101</td>
<td>010</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>USER</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

If PMSELR_EL0.SEL is greater than or equal to the number of accessible counters then reads and writes of PMXEVCTR_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if PMSELR_EL0.SEL has an UNKNOWN value less than the number of counters accessible at the current Exception level and Security state.
- Accesses to the register behave as if PMSELR_EL0.SEL is 31.
- For an access from Non-secure EL1, or an access from Non-secure EL0 when the value of PMUSERENR_EL0.EN is 1, if PMSELR_EL0.SEL is greater than or equal to the number of accessible counters but is less than the number of implemented counters, the register access is trapped to EL2.

--- Note ---

In an implementation that includes EL2, in Non-secure state at EL0 and EL1, MDCR_EL2.HPMN identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of implemented counters.

---

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If PMUSERENR_EL0.EN==0, and PMUSERENR_EL0.ER==0, read accesses to this register from EL0 are trapped to EL1.
  - If PMUSERENR_EL0.EN==0, write accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TPM==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If MDCR_EL3.TPM==1, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.
D10.4.18 PMXEVTYPER_EL0, Performance Monitors Selected Event Type Register

The PMXEVTYPER_EL0 characteristics are:

**Purpose**

When PMSEL_EL0.SEL selects an event counter, this accesses a PMEVTYPER<\text{n}>_EL0 register. When PMSEL_EL0.SEL selects the cycle counter, this accesses PMCCFILTR_EL0.

**Configurations**

AArch64 System register PMXEVTYPER_EL0 is architecturally mapped to AArch32 System register PMXEVTYPER.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMXEVTYPER_EL0 is a 32-bit register.

**Field descriptions**

The PMXEVTYPER_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Event type register or PMCCFILTR_EL0</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Event type register or PMCCFILTR_EL0.

When PMSEL_EL0.SEL == 31, this register accesses PMCCFILTR_EL0.

Otherwise, this register accesses PMEVTYPER<\text{n}>_EL0 where \text{n} is the value in PMSEL_EL0.SEL.

**Accessing the PMXEVTYPER_EL0**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMXEVTYPER_EL0</td>
<td>11</td>
<td>011</td>
<td>1101</td>
<td>1101</td>
<td>001</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

If PMSEL_EL0.SEL is greater than or equal to the number of accessible counters then reads and writes of PMXEVTYPER_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if PMSEL_EL0.SEL has an UNKNOWN value less than the number of counters accessible at the current Exception level and Security state.
- Accesses to the register behave as if PMSEL_EL0.SEL is 31.
- For an access from Non-secure EL1, or an access from Non-secure EL0 when the value of PMUSERENR_EL0.EN is 1, if PMSEL_EL0.SEL is greater than or equal to the number of accessible counters but is less than the number of implemented counters, the register access is trapped to EL2.

Note

In an implementation that includes EL2, in Non-secure state at EL0 and EL1, MDCR_EL2.HPMN identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of implemented counters.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If PMUSERENR_EL0.EN==0, accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If MDCR_EL2.TPM==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If MDCR_EL3.TPM==1, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.
D10.5 Statistical Profiling Extension registers

This section lists the Statistical Profiling Extension registers in AArch64.
D10.5.1 PMBIDR_EL1, Profiling Buffer ID Register

The PMBIDR_EL1 characteristics are:

Purpose

Provides information to software as to whether the buffer can be programmed at the current Exception level.

Configurations

Present only if the Statistical Profiling Extension is implemented. Direct reads of PMBIDR_EL1 are UNDEFINED at EL0.

Attributes

PMBIDR_EL1 is a 64-bit register.

Field descriptions

The PMBIDR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit(s)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:6</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>5</td>
<td>F, Flag Updates. Defines whether the address translation performed by the Profiling Buffer manages the Access Flag and Dirty Bit</td>
</tr>
<tr>
<td>0</td>
<td>0b0: Accesses to pages not marked with Access Flag and not with Dirty Bit set will generate an Unsupported Access fault if hardware management of those flags is enabled</td>
</tr>
<tr>
<td>1</td>
<td>0b1: Profiling Buffer address translation manages the Access Flag and Dirty Bit in the same way as the MMU on this PE</td>
</tr>
<tr>
<td>4</td>
<td>P, Prohibited. The Profiling Buffer is owned by the current or a lower Exception level in the current security state</td>
</tr>
<tr>
<td>0</td>
<td>0b0: Profiling Buffer is owned by the current or a lower Exception level in the current security state. This does not mean an access will not be trapped to a higher Exception level</td>
</tr>
<tr>
<td></td>
<td>0b1: Profiling Buffer is owned by a higher Exception level or the other security state</td>
</tr>
<tr>
<td>3:0</td>
<td>Align, defines the minimum alignment constraint for PMBPTR_EL1. If this field is non-zero, then the PE must pad every record up to a multiple of this size</td>
</tr>
<tr>
<td></td>
<td>0b0000: Byte</td>
</tr>
</tbody>
</table>
0b0001  Halfword. PMBPTR_EL1[0] is RES0
0b0010  Word. PMBPTR_EL1[1:0] is RES0
0b0011  Doubleword. PMBPTR_EL1[2:0] is RES0
0b0100  16 Bytes. PMBPTR_EL1[3:0] is RES0
0b0101  32 Bytes. PMBPTR_EL1[4:0] is RES0
0b0110  64 Bytes. PMBPTR_EL1[5:0] is RES0
0b0111  128 Bytes. PMBPTR_EL1[6:0] is RES0
0b1000  256 Bytes. PMBPTR_EL1[7:0] is RES0
0b1001  512 Bytes. PMBPTR_EL1[8:0] is RES0
0b1010  1KB. PMBPTR_EL1[9:0] is RES0
0b1011  2KB. PMBPTR_EL1[10:0] is RES0

All other values are reserved. Reserved values might be defined in a future version of the architecture.

Accessing the PMBIDR_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>CRn</th>
<th>op0</th>
<th>op1</th>
<th>op2</th>
<th>CRm</th>

<td>- n/a RO RO</td>
</tr>
</tbody>
</table>
D10.5.2 PMBLIMITR_EL1, Profiling Buffer Limit Address Register

The PMBLIMITR_EL1 characteristics are:

**Purpose**
Defines the upper limit for the profiling buffer, and enables the profiling buffer

**Configurations**
Present only if the Statistical Profiling Extension is implemented. Direct reads and writes of PMBLIMITR_EL1 are UNDEFINED at EL0.

**Attributes**
PMBLIMITR_EL1 is a 64-bit register.

**Field descriptions**
The PMBLIMITR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LIMIT, bits [63:12]</td>
<td>Limit address, plus one. Read/write. Defines the limit of the buffer. If the smallest implemented translation granule is not 4KB, then bits [N-1:12] are RES0, where N is the IMPLEMENTATION DEFINED value, Log2(smallest implemented translation granule).</td>
</tr>
<tr>
<td>FM, bits [2:1]</td>
<td>Fill mode</td>
</tr>
<tr>
<td>00</td>
<td>Stop collection and raise maintenance interrupt on buffer fill</td>
</tr>
<tr>
<td>All other values</td>
<td>Reserved. If this field is programmed with a reserved value, the PE behaves as if this field has a defined value, other than for a direct read of the register. Software must not rely on the behavior of reserved values, as they might change in a future version of the architecture.</td>
</tr>
<tr>
<td>E, bit [0]</td>
<td>Profiling Buffer enable</td>
</tr>
<tr>
<td>0</td>
<td>All output is discarded</td>
</tr>
<tr>
<td>1</td>
<td>Enabled</td>
</tr>
<tr>
<td>When this register has an architecturally-defined reset value, this field resets to 0.</td>
<td></td>
</tr>
</tbody>
</table>

**Accessing the PMBLIMITR_EL1**

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>
This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>CRn</th>
<th>op0</th>
<th>op1</th>
<th>op2</th>
<th>CRm</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMBLIMITR_EL1</td>
<td>1001</td>
<td>11</td>
<td>000</td>
<td>000</td>
<td>1010</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- If (AArch64-MDCR_EL2.E2PB != 0b00 || AArch64-MDCR_EL2.E2PB != 0b10) && AArch64-SCR_EL3.NS == 0b1, then access from EL1 traps to EL2
- If AArch64-MDCR_EL3.NSPB != 0b01 && AArch64-SCR_EL3.NS == 0b0, then access from EL1 traps to EL3
- If AArch64-MDCR_EL3.NSPB != 0b11 && AArch64-SCR_EL3.NS == 0b1, then access from EL2 or EL1 traps to EL3
D10.5.3 PMBPTR_EL1, Profiling Buffer Write Pointer Register

The PMBPTR_EL1 characteristics are:

**Purpose**

Defines the current write pointer for the profiling buffer.

**Configurations**

Present only if the Statistical Profiling Extension is implemented. Direct reads and writes of PMBPTR_EL1 are UNDEFINED otherwise.

**Attributes**

PMBPTR_EL1 is a 64-bit register.

**Field descriptions**

The PMBPTR_EL1 bit assignments are:

```
  63  62  61  60  59  58  57  56  55  54  53  52  51  50  49  48  47  46  45  44  43  42  41  40  39  38  37  36  35  34  33  32  31  30  29  28  27  26  25  24  23  22  21  20  19  18  17  16  15  14  13  12  11  10  9  8  7  6  5  4  3  2  1  0
```

**PTR, bits [63:0]**

Current write address. Defines the virtual address of the next entry to be written to the buffer.

The architecture places restrictions on the values that software can write to the pointer. For more information, see *Restrictions on the current write pointer* on page D6-2286.

--- Note ---

As a result, an implementation might treat some of bits[M:0], where M is defined by PMBIDR_EL1.Align, as RES0.

---

On a management interrupt, PMBPTR_EL1 is frozen

**Accessing the PMBPTR_EL1**

This register can be written using MSR (register) with the following syntax:

MSR `<systemreg>`, `<Xt>`

This register can be read using MRS with the following syntax:

MRS `<Xt>`, `<systemreg>`

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th><code>&lt;systemreg&gt;</code></th>
<th>CRn</th>
<th>op0</th>
<th>op1</th>
<th>op2</th>
<th>CRm</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMBPTR_EL1</td>
<td>1001</td>
<td>11</td>
<td>000</td>
<td>001</td>
<td>1010</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>E2H</th>
<th>TGE</th>
<th>NS</th>
<th>EL0</th>
<th>EL1</th>
<th>EL2</th>
<th>EL3</th>
</tr>
</thead>
<tbody>
<tr>

<td>0</td>
<td>1</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
<td>1</td>
<td>-</td>
<td>n/a</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

— If \((\text{AArch64-MDCR\_EL2.E2PB} \neq 0b00 \text{ || AArch64-MDCR\_EL2.E2PB} \neq 0b10) \&\& \text{AArch64-SCR\_EL3.NS} = 0b1\), then access from EL1 traps to EL2

— If \((\text{AArch64-MDCR\_EL3.NSPB} \neq 0b01 \&\& \text{AArch64-SCR\_EL3.NS} = 0b0\), then access from EL1 traps to EL3

— If \((\text{AArch64-MDCR\_EL3.NSPB} \neq 0b11 \&\& \text{AArch64-SCR\_EL3.NS} = 0b1\), then access from EL2 or EL1 traps to EL3
D10.5.4 PMBSR_EL1, Profiling Buffer Status/syndrome Register

The PMBSR_EL1 characteristics are:

**Purpose**
Provides syndrome information to software when the buffer is disabled because the management interrupt has been raised.

**Configurations**
Present only if the Statistical Profiling Extension is implemented. Direct reads and writes of PMBSR_EL1 are UNDEFINED otherwise.

**Attributes**
PMBSR_EL1 is a 64-bit register.

**Field descriptions**
The PMBSR_EL1 bit assignments are:

Bits [63:32]  
Reserved, RES0.

Bits [25:20]  
Reserved, RES0.

EC, bits [31:26]  
Exception class  
Top-level description of the cause of the buffer management event  
- 0b100100 Stage 1 Data Abort on write to Profiling Buffer  
- 0b100101 Stage 2 Data Abort on write to Profiling Buffer  
- 0b000000 Other buffer management event. All buffer management events other than those described by other defined Exception class codes.  
  
All other values are reserved. Reserved values might be defined in a future version of the architecture.

DL, bit [19]  
Partial record lost  
Following a buffer management event other than an asynchronous external abort, indicates whether the last record written to the Profiling Buffer is complete  
- 0b0 PMBPTR_EL1 points to the first byte after the last complete record written to the Profiling Buffer  
- 0b1 Part of a record was lost because of a buffer management event or synchronous external abort. PMBPTR_EL1 might not point to the first byte after the last complete record written to the buffer, and so restarting collection might result in a data record stream that software cannot parse. All records prior to the last record have been written to the buffer.
When the buffer management event was because of an asynchronous external abort, this bit is set to 1 and software must not assume that any valid data has been written to the Profiling Buffer.

**EA, bit [18]**

External abort
- 0b0: An external abort has not been asserted
- 0b1: An external abort has been asserted and detected by the Statistical Profiling Extension

This bit is RES0 if the PE never sets this bit as the result of an external abort.

**S, bit [17]**

Service
- 0b0: PMBIRQ is not asserted
- 0b1: PMBIRQ is asserted. All profiling data has either been written to the buffer or discarded

**COLL, bit [16]**

Collision detected
- 0b0: No collision events detected
- 0b1: At least one collision event was recorded

**MSS, bits [15:0]**

Management Event Specific Syndrome
Contains syndrome specific to the management event
The syndrome contents for each management event are described in the following sections.

**MSS encoding for other buffer management event (EC == 0b0000000)**

The MSS encoding for other buffer management event (EC = 0b0000000) bit assignments are:

<table>
<thead>
<tr>
<th>Bit [15:6]</th>
<th>15</th>
<th>6</th>
<th>5</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits</td>
<td>RES0</td>
<td>BSC</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Reserved. This field is RES0.

**BSC, bits [5:0]**

Buffer status code.
- 0b000000: Buffer not filled.
- 0b000001: Buffer filled.

All other values are reserved. Reserved values might be defined in a future version of the architecture.

**MSS encoding for data abort or stage 2 data abort on write to buffer (EC == 0b10010x)**

The MSS encoding for data abort or stage 2 data abort on write to buffer (EC == 0b10010x) bit assignments are:

<table>
<thead>
<tr>
<th>Bit [15:6]</th>
<th>15</th>
<th>6</th>
<th>5</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits</td>
<td>RES0</td>
<td>FSC</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Reserved. This field is RES0.

**FSC, bits [5:0]**
Fault status code
0b0000xx  Address Size fault. Bits [1:0] encode the level.
0b0001xx  Translation fault. Bits [1:0] encode the level.
0b0010xx  Access Flag fault. Bits [1:0] encode the level.
0b0011xx  Permission fault. Bits [1:0] encode the level.
0b010000  Synchronous external abort on write.
0b0101xx  Synchronous external abort on translation table walk or hardware update of translation table. Bits [1:0] encode the level.
0b010001  Asynchronous external abort on write.
0b100001  Alignment fault.
0b110000  TLB Conflict fault.
0b110101  Unsupported Access fault.
All other values are reserved. Reserved values might be defined in a future version of the architecture.

Accessing the PMBSR_EL1

This register can be written using MSR (register) with the following syntax:
MSR <systemreg>, <Xt>
This register can be read using MRS with the following syntax:
MRS <Xt>, <systemreg>
This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>CRn</th>
<th>op0</th>
<th>op1</th>
<th>op2</th>
<th>CRm</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMBSR_EL1</td>
<td>1001</td>
<td>11</td>
<td>000</td>
<td>011</td>
<td>1010</td>
</tr>
</tbody>
</table>

Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0</td>
</tr>
<tr>
<td>x x 0</td>
<td>-</td>
</tr>
<tr>
<td>x 0 1</td>
<td>-</td>
</tr>
<tr>
<td>x 1 1</td>
<td>-</td>
</tr>
</tbody>
</table>
Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

— If (AArch64-MDCR_EL2.E2PB == 0b00 || AArch64-MDCR_EL2.E2PB == 0b10) && AArch64-SCR_EL3.NS == 0b1, then access from EL1 traps to EL2

— If AArch64-MDCR_EL3.NSPB != 0b01 && AArch64-SCR_EL3.NS == 0b0, then access from EL1 traps to EL3

— If AArch64-MDCR_EL3.NSPB != 0b11 && AArch64-SCR_EL3.NS == 0b1, then access from EL2 or EL1 traps to EL3
**D10.5.5 PMSCR_EL1, Statistical Profiling Control Register (EL1)**

The PMSCR_EL1 characteristics are:

**Purpose**

Provides EL1 controls for Statistical Profiling

**Configurations**

Present only if the Statistical Profiling Extension is implemented. Direct reads and writes of PMSCR_EL1 are UNDEFINED otherwise

**Attributes**

PMSCR_EL1 is a 64-bit register.

**Field descriptions**

The PMSCR_EL1 bit assignments are:

<table>

</tbody>
</table>
0b1  Physical addresses are collected
If MDCR_EL2.E2PB != 0b00 and the PE is in Non-secure state, this bit is combined with
PMSCR_EL2.PA to determine which address is collected
This bit is ignored by the PE when in Non-secure state and MDCR_EL2.E2PB == 0b00.

CX, bit [3]
CONTEXTIDR_EL1 Sample Enable
0b0  CONTEXTIDR_EL1 is not collected
0b1  CONTEXTIDR_EL1 is collected
This bit is ignored by the PE when any of the following are true:
  • At EL2.
  • In Non-secure state and HCR_EL2.TGE == 1.

E1SPE, bit [1]
EL1 Statistical Profiling Enable
0b0  Sampling disabled at EL1
0b1  Sampling enabled at EL1
This bit is ignored by the PE when in Non-secure state and HCR_EL2.TGE == 1.

E0SPE, bit [0]
EL0 Statistical Profiling Enable
0b0  Sampling disabled at EL0
0b1  Sampling enabled at EL0
This bit is ignored by the PE when in Non-secure state and HCR_EL2.TGE == 1.

Accessing the PMSCR_EL1
This register can be written using MSR (register) with the following syntax:
MSR <systemreg>, <Xt>
This register can be read using MRS with the following syntax:
MRS <Xt>, <systemreg>
This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>CRn</th>
<th>op0</th>
<th>op1</th>
<th>op2</th>
<th>CRm</th>
</tr>

</tbody>
</table>

This table applies to all instructions that can access this register.

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- If AArch64-MDCR_EL2.TPMS == 0b1 && AArch64-SCR_EL3.NS == 0b1, then access from EL1 traps to EL2
- If AArch64-MDCR_EL3.NSPB != 0b01 && AArch64-SCR_EL3.NS == 0b0, then access from EL1 traps to EL3
- If AArch64-MDCR_EL3.NSPB != 0b11 && AArch64-SCR_EL3.NS == 0b1, then access from EL2 or EL1 traps to EL3.
### D10.5.6 PMSCR_EL2, Statistical Profiling Control Register (EL2)

The PMSCR_EL2 characteristics are:

**Purpose**

Provides EL2 controls for Statistical Profiling

**Configurations**

Present only if the Statistical Profiling Extension is implemented. Direct reads and writes of PMSCR_EL2 are UNDEFINED otherwise

**Attributes**

PMSCR_EL2 is a 64-bit register.

**Field descriptions**

The PMSCR_EL2 bit assignments are:

![PMSCR_EL2 Diagram]

**Bits [63:7]**

Reserved, RES0.

**Bit [2]**

Reserved, RES0.

**PCT, bit [6]**

Physical Timestamp

If timestamp sampling is enabled, determines which counter is collected

| 00 | Virtual counter, CNTVCT_EL0, is collected |
| 01 | Physical counter, CNTPCT_EL0, is collected |

If MDCR_EL2.E2PB != 0b00, this bit is combined with PMSCR_EL1.PCT to determine which counter is collected.

This bit is ignored by the PE when in Secure state. If EL2 is not implemented, the PE behaves as if this bit is set to 1, other than for a direct read of the register.

**TS, bit [5]**

Timestamp Enable

| 00 | Timestamp sampling disabled |
| 01 | Timestamp sampling enabled |

This bit is ignored by the PE when in Non-secure state and MDCR_EL2.E2PB != 0b00, or in Secure state.
PA, bit [4]
Physical Address Sample Enable
0b0  Physical addresses are not collected
0b1  Physical addresses are collected
If MDCR_EL2.E2PB != 0b00, this bit is combined with PMSCR_EL1.PA to determine which address is collected.
This bit is ignored by the PE when in Secure state. If EL2 is not implemented, the PE behaves as if this bit is set to 1, other than a direct read of the register.

CX, bit [3]
CONTEXTIDR_EL2 Sample Enable
0b0  CONTEXTIDR_EL2 is not collected
0b1  CONTEXTIDR_EL2 is collected
This bit is ignored by the PE when in Secure state.

E2SPE, bit [1]
EL2 Statistical Profiling Enable
0b0  Sampling disabled at EL2
0b1  Sampling enabled at EL2
This bit is RES0 if MDCR_EL2.E2PB != 0b00. This bit is ignored by the PE when in Secure state.

E0HSPE, bit [0]
EL0 Statistical Profiling Enable
0b0  Sampling disabled at EL0
0b1  Sampling enabled at EL0
This bit is RES0 if MDCR_EL2.E2PB != 0b00. This bit is ignored by the PE when in Non-secure state and HCR_EL2.TGE == 0, or in Secure state.

Accessing the PMSCR_EL2
This register can be written using MSR (register) with the following syntax:
MSR <systemreg>, <Xt>
This register can be read using MRS with the following syntax:
MRS <Xt>, <systemreg>
This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>CRn</th>
<th>op0</th>
<th>op1</th>

This table applies to all instructions that can access this register.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

— If AArch64-MDCR_EL3.NSPB != 0b11, then access from EL2 traps to EL3
D10.5.7 PMSEVFR_EL1, Sampling Event Filter Register

The PMSEVFR_EL1 characteristics are:

**Purpose**

Controls sample filtering by events. The overall filter is the logical AND of these filters. For example, if $E[3]$ and $E[5]$ are both set to 1, only samples that have both event 3 (Level 1 unified or data cache refill) and event 5 set (TLB walk) are recorded.

**Configurations**

Present only if the Statistical Profiling Extension is implemented. Direct reads and writes of PMSEVFR_EL1 are UNDEFINED otherwise.

**Attributes**

PMSEVFR_EL1 is a 64-bit register.

**Field descriptions**

The PMSEVFR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-48</td>
<td>$E[n]$ is the event filter for event $n$. If event $n$ is not implemented, or filtering on event $n$ is not supported, the corresponding bit is RES0.</td>
</tr>
<tr>
<td></td>
<td>0b0 Event $n$ is ignored.</td>
</tr>
<tr>
<td></td>
<td>0b1 Do not record samples that have event $n == 0$</td>
</tr>
<tr>
<td></td>
<td>An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.</td>
</tr>
<tr>
<td></td>
<td>This field is ignored by the PE when PMSFCR_EL1.FE == 0b0</td>
</tr>
<tr>
<td>31-24</td>
<td>$E[n]$ is the event filter for event $n$. If event $n$ is not implemented, or filtering on event $n$ is not supported, the corresponding bit is RES0.</td>
</tr>
<tr>
<td></td>
<td>0b0 Event $n$ is ignored.</td>
</tr>
<tr>
<td></td>
<td>0b1 Do not record samples that have event $n == 0$</td>
</tr>
<tr>
<td></td>
<td>An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.</td>
</tr>
<tr>
<td></td>
<td>This field is ignored by the PE when PMSFCR_EL1.FE == 0b0</td>
</tr>
</tbody>
</table>
E, bits [15:12]

E[n] is the event filter for event n. If event n is not implemented, or filtering on event n is not supported, the corresponding bit is RES0.

- 0b0: Event n is ignored.
- 0b1: Do not record samples that have event n == 0

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0b0

Bits [47:32]
Reserved, RES0.

Bits [23:16]
Reserved, RES0.

Bits [11:8]
Reserved, RES0.

Bit [6]
Reserved, RES0.

Bit [4]
Reserved, RES0.

Bit [2]
Reserved, RES0.

Bit [0]
Reserved, RES0.

E[7], bit [7]
Mispredicted
- 0b0: Mispredicted event is ignored.
- 0b1: Do not record samples that have event 7 (Mispredicted) == 0

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

E[5], bit [5]
TLB walk
- 0b0: TLB walk event is ignored.
- 0b1: Do not record samples that have event 5 (TLB walk) == 0

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

E[3], bit [3]
Level 1 data or unified cache refill
- 0b0: Level 1 data or unified cache refill event is ignored.
- 0b1: Do not record samples that have event 3 (Level 1 data or unified cache refill) == 0

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

E[1], bit [1]
Architecturally retired
- 0b0: Architecturally retired event is ignored.
- 0b1: Do not record samples that have event 1 (Architecturally retired) == 0
This bit is ignored by the PE when PMSFCR_EL1.FE == 0.
If the PE does not support sampling of speculative instructions this bit is RES1.

**Accessing the PMSEVFR_EL1**

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>CRn</th>
<th>op0</th>
<th>op1</th>
<th>op2</th>
<th>CRm</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMSEVFR_EL1</td>
<td>1001</td>
<td>11</td>
<td>000</td>
<td>101</td>
<td>1001</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>x x 0</td>
<td>- RW n/a RW</td>
</tr>
<tr>
<td>x 0 1</td>
<td>- RW RW RW</td>
</tr>
<tr>
<td>x 1 1</td>
<td>- n/a RW RW</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- If AArch64-MDCR_EL2.TPMS == 0b1 && AArch64-SCR_EL3.NS == 0b1, then access from EL1 traps to EL2
- If AArch64-MDCR_EL2.NSPB != 0b01 && AArch64-SCR_EL3.NS == 0b0, then access from EL1 traps to EL3
- If AArch64-MDCR_EL2.NSPB != 0b11 && AArch64-SCR_EL3.NS == 0b1, then access from EL2 or EL1 traps to EL3
D10.5.8 PMSFCR_EL1, Sampling Filter Control Register

The PMSFCR_EL1 characteristics are:

**Purpose**

Controls sample filtering. The filter is the logical AND of the FL, FT and FE bits. For example, if FE == 1 and FT == 1 only samples including the selected operation types and the selected events will be recorded.

**Configurations**

Present only if the Statistical Profiling Extension is implemented. Direct reads and writes of PMSFCR_EL1 are UNDEFINED otherwise.

**Attributes**

PMSFCR_EL1 is a 64-bit register.

**Field descriptions**

The PMSFCR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignments</th>
<th>Field Descriptions</th>
</tr>
</thead>
<tbody>
<tr>

<td>2</td>
<td>FL, bit [2]</td>
</tr>
<tr>
<td></td>
<td>Filter by latency</td>
</tr>
<tr>
<td>00</td>
<td>Latency filtering disabled</td>
</tr>
</tbody>
</table>
Latency filtering enabled. Samples with a total latency less than PMSLATFR_EL1.MINLAT will not be recorded

If this field is set to 1 and PMSLATFR_EL1.MINLAT is set to zero, it is CONSTRAINED UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FL is set to 0

FT, bit [1]
Filter by operation type. The filter is the logical OR of the ST, LD and B bits. For example, if LD and ST are both set, both load and store operations are recorded

0b0  Type filtering disabled
0b1  Type filtering enabled. Samples not one of the selected operation types will not be recorded

If this field is set to 1 and the PMSFCR_EL1.{ST, LD, B} bits are all set to zero, it is CONSTRAINED UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FT is set to 0

FE, bit [0]
Filter by event

0b0  Event filtering disabled
0b1  Event filtering enabled. Samples not including the events selected by PMSEVFR_EL1 will not be recorded

If this field is set to 1 and PMSEVFR_EL1 is set to zero, it is CONSTRAINED UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FE is set to 0

Accessing the PMSFCR_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>CRn</th>
<th>op0</th>
<th>op1</th>
<th>op2</th>
<th>CRm</th>

<tr>
<td>x 1 1</td>
<td>- n/a RW RW</td>
</tr>
</tbody>
</table>
Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

— If `AArch64-MDCR_EL2.TPMS == 0b1 && AArch64-SCR_EL3.NS == 0b1`, then access from EL1 traps to EL2

— If `AArch64-MDCR_EL3.NSPB != 0b01 && AArch64-SCR_EL3.NS == 0b0`, then access from EL1 traps to EL3

— If `AArch64-MDCR_EL3.NSPB != 0b11 && AArch64-SCR_EL3.NS == 0b1`, then access from EL2 or EL1 traps to EL3
### D10.5.9 PMSICR_EL1, Sampling Interval Counter Register

The PMSICR_EL1 characteristics are:

**Purpose**
Software must write zero to PMSICR_EL1 before enabling sample profiling for a sampling session. Software must then treat PMSICR_EL1 as an opaque, 64-bit, read/write register used for context switches only.

**Configurations**
Present only if the Statistical Profiling Extension is implemented. Direct reads and writes of PMSICR_EL1 are UNDEFINED otherwise.

**Attributes**
The value of PMSICR_EL1 does not change whilst profiling is disabled.

**Field descriptions**
The PMSICR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit assignments</th>
<th>Field descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>63–56</td>
<td>ECOUNT, Secondary sample interval counter</td>
</tr>
<tr>
<td>55–32</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>31–0</td>
<td>COUNT, Primary sample interval counter</td>
</tr>
</tbody>
</table>

**ECOUNT, bits [63:56]**
Secondary sample interval counter
Provides the secondary counter used after the primary counter reaches zero. Whilst the secondary counter is nonzero and profiling is enabled, the secondary counter decrements by 1 for each member of the sample population. The primary counter also continues to decrement since it is also nonzero. When the secondary counter reaches zero, a member of the sampling population is selected for sampling.
If PMSIDR_EL1.ERnd == 0b0 this bit is RES1.

**Bits [55:32]**
Reserved, RES0.

**COUNT, bits [31:0]**
Primary sample interval counter
Provides the primary counter used for sampling.
The primary counter is reloaded when the value of this register is zero and the PE moves from a state or Exception level where profiling is disabled to a state or Exception level where profiling is enabled
Whilst the primary counter is nonzero and sampling is enabled, the primary counter decrements by 1 for each member of the sample population
When the counter reaches zero, the behavior depends on the values of PMSIDR_EL1.ERnd and PMSIRR_EL1.RND
  • If PMSIRR_EL1.RND == 0 or PMSIDR_EL1.ERnd == 0:
    — A member of the sampling population is selected for sampling
    — The primary counter is reloaded
  • If PMSIRR_EL1.RND == 1 and PMSIDR_EL1.ERnd == 1:
    — The secondary counter is set to a random or pseudorandom value in the range 0x00 to 0xFF
— The primary counter is reloaded

**Accessing the PMSICR_EL1**

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

— If AArch64-MDCR_EL2.TPMS == 0b1 && AArch64-SCR_EL3.NS == 0b1, then access from EL1 traps to EL2
— If AArch64-MDCR_EL3.NSPB != 0b01 && AArch64-SCR_EL3.NS == 0b0, then access from EL1 traps to EL3
— If AArch64-MDCR_EL3.NSPB != 0b11 && AArch64-SCR_EL3.NS == 0b1, then access from EL2 or EL1 traps to EL3
D10.5.10  **PMSIDR_EL1, Sampling Profiling ID Register**

The PMSIDR_EL1 characteristics are:

**Purpose**

Describes the Statistical Profiling implementation to software

**Configurations**

Present only if the Statistical Profiling Extension is implemented. Direct reads of PMSIDR_EL1 are UNDEFINED otherwise.

**Attributes**

PMSIDR_EL1 is a 64-bit register.

**Field descriptions**

The PMSIDR_EL1 bit assignments are:

![Diagram of the PMSIDR_EL1 register]

**Bits [63:20]**

Reserved, RES0.

**Bits [7:6]**

Reserved, RES0.

**CountSize, bits [19:16]**

Defines the size of the counters

- `0b0010` 12-bit saturating counters

All other values are reserved. Reserved values might be defined in a future version of the architecture.

**MaxSize, bits [15:12]**

Defines the largest size for a single record, rounded up to a power-of-two. If this is the same as the minimum alignment (PMBIDR_EL1.Align), then each record is exactly this size

- `0b0100` 16 bytes
- `0b0101` 32 bytes
- `0b0110` 64 bytes
- `0b0111` 128 bytes
- `0b1000` 256 bytes
- `0b1001` 512 bytes
- `0b1010` 1024 bytes
- `0b1011` 2KB
All other values are reserved. Reserved values might be defined in a future version of the architecture.

**Interval, bits [11:8]**

Recommended minimum sampling interval. This provides guidance from the implementer to the smallest minimum sampling interval, N.

<table>
<thead>
<tr>
<th>Value</th>
<th>Interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>256</td>
</tr>
<tr>
<td>0010</td>
<td>512</td>
</tr>
<tr>
<td>0011</td>
<td>768</td>
</tr>
<tr>
<td>0100</td>
<td>1,024</td>
</tr>
<tr>
<td>0101</td>
<td>1,536</td>
</tr>
<tr>
<td>0110</td>
<td>2,048</td>
</tr>
<tr>
<td>0111</td>
<td>3,072</td>
</tr>
<tr>
<td>1000</td>
<td>4,096</td>
</tr>
</tbody>
</table>

All other values are reserved. Reserved values might be defined in a future version of the architecture.

**ERnd, bit [5]**

Defines how the random number generator is used in determining the interval between samples, when enabled by PMSIRR_EL1.RND.

- **0**: The random number is added at the start of the interval, and the sample is taken and a new interval started when the combined interval expires.
- **1**: The random number is added and the new interval started after the interval programmed in PMSIRR_EL1.INTERVAL expires, and the sample is taken when the random interval expires.

**LDS, bit [4]**

Data source indicator for sampled load instructions

- **0**: Loaded data source not implemented
- **1**: Loaded data source implemented

**ArchInst, bit [3]**

Architectural instruction profiling

- **0**: Micro-op sampling implemented
- **1**: Architecture instruction sampling implemented

**FL, bit [2]**

Filtering by latency. This bit is RAO.

**FT, bit [1]**

Filtering by operation type. This bit is RAO.

**FE, bit [0]**

Filtering by events. This bit is RAO.

**Accessing the PMSIDR_EL1**

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```
This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>CRn</th>
<th>op0</th>
<th>op1</th>
<th>op2</th>
<th>CRm</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMSIDR_EL1</td>
<td>1001</td>
<td>11</td>
<td>000</td>
<td>111</td>
<td>1001</td>
</tr>
</tbody>
</table>

### Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- If AArch64-MDCR_EL2.TPMS == 0b1 && AArch64-SCR_EL3.NS == 0b1, then access from EL1 traps to EL2
- If AArch64-MDCR_EL3.NSPB != 0b01 && AArch64-SCR_EL3.NS == 0b0, then access from EL1 traps to EL3
- If AArch64-MDCR_EL3.NSPB != 0b11 && AArch64-SCR_EL3.NS == 0b1, then access from EL2 or EL1 traps to EL3
D10.5.11 PMSIRR_EL1, Sampling Interval Reload Register

The PMSIRR_EL1 characteristics are:

**Purpose**

Defines the interval between samples

**Configurations**

Present only if the Statistical Profiling Extension is implemented. Direct reads and writes of PMSIRR_EL1 are UNDEFINED otherwise.

**Attributes**

PMSIRR_EL1 is a 64-bit register.

**Field descriptions**

The PMSIRR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Positions</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-32</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>31-8</td>
<td>INTERVAL</td>
</tr>
<tr>
<td>7-1</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>0</td>
<td>RND</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**Bits [7:1]**

Reserved, RES0.

**INTERVAL, bits [31:8]**

Bits [31:8] of the PMSICR_EL1 interval counter reload value. Software must set this to a non-zero value. If software sets this to zero, an UNKNOWN sampling interval is used. Software should set this to a value greater than the minimum indicated by PMSIDR_EL1.Interval

**RND, bit [0]**

Controls randomization of the sampling interval

- **0b0**: Disable randomization of sampling interval
- **0b1**: Add (pseudo-)random jitter to sampling interval

The random number generator is not architected.

**Accessing the PMSIRR_EL1**

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>CRn</th>
<th>op0</th>
<th>op1</th>
<th>op2</th>
<th>CRm</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMSIRR_EL1</td>
<td>1001</td>
<td>11</td>
<td>000</td>
<td>000</td>
<td>1010</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

— If AArch64-MDCR_EL2.TPMS == 0b1 && AArch64-SCR_EL3.NS == 0b1, then access from EL1 traps to EL2
— If AArch64-MDCR_EL3.NSPB != 0b01 && AArch64-SCR_EL3.NS == 0b0, then access from EL1 traps to EL3
— If AArch64-MDCR_EL3.NSPB != 0b11 && AArch64-SCR_EL3.NS == 0b1, then access from EL2 or EL1 traps to EL3
D10.5.12  **PMSLATFR_EL1, Sampling Latency Filter Register**

The PMSLATFR_EL1 characteristics are:

**Purpose**

Controls sample filtering by latency

**Configurations**

Present only if the Statistical Profiling Extension is implemented. Direct reads and writes of PMSLATFR_EL1 are UNDEFINED otherwise.

**Attributes**

PMSLATFR_EL1 is a 64-bit register.

**Field descriptions**

The PMSLATFR_EL1 bit assignments are:

- Bits [63:12]: Reserved, RES0.
- **MINLAT**, bits [11:0]: Minimum latency. When PMSFCR_EL1.FL == 1, defines the minimum total latency for filtered operations. Samples with a total latency less than MINLAT will not be recorded. This field is ignored by the PE when PMSFCR_EL1.FL == 0.

**Accessing the PMSLATFR_EL1**

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>CRn</th>
<th>op0</th>
<th>op1</th>
<th>op2</th>
<th>CRm</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMSLATFR_EL1</td>
<td>1001</td>
<td>11</td>
<td>000</td>
<td>110</td>
<td>1001</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

```
<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>
</tr>
<tr>
<td>TGE</td>
<td></td>

<tr>
<td>NS</td>
<td></td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>
```

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

— If AArch64-MDCR_EL2.TPMS == 0b1 && AArch64-SCR_EL3.NS == 0b1, then access from EL1 traps to EL2
— If AArch64-MDCR_EL3.NSPB != 0b01 && AArch64-SCR_EL3.NS == 0b0, then access from EL1 traps to EL3
— If AArch64-MDCR_EL3.NSPB != 0b11 && AArch64-SCR_EL3.NS == 0b1, then access from EL2 or EL1 traps to EL3
D10.6  Generic Timer registers

This section lists the Generic Timer registers in AArch64.
D10.6.1 CNTFRQ_EL0, Counter-timer Frequency register

The CNTFRQ_EL0 characteristics are:

Purpose

This register is provided so that software can discover the frequency of the system counter. It must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

Configurations

AArch64 System register CNTFRQ_EL0 is architecturally mapped to AArch32 System register CNTFRQ.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTFRQ_EL0 is a 32-bit register.

Field descriptions

The CNTFRQ_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:0</td>
<td>Clock frequency</td>
</tr>
</tbody>
</table>

Bits [31:0]

Clock frequency. Indicates the system counter clock frequency, in Hz.

Accessing the CNTFRQ_EL0

This register can be read using MRS with the following syntax:

\[
\text{MRS} \ <Xt>, \ <\text{systemreg}>
\]

This register can be written using MSR (register) with the following syntax:

\[
\text{MSR} \ <\text{systemreg}>, \ <Xt>
\]

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CNTFRQ_EL0</td>
<td>11</td>
<td>01</td>
<td>1110</td>
<td>0000</td>
<td>000</td>
</tr>
</tbody>
</table>
### Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>EL1 is the highest implemented Exception level.</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>EL2 is the highest implemented Exception level.</td>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>EL2 is the highest implemented Exception level.</td>
<td>x</td>
<td>1</td>
</tr>
<tr>
<td>EL3 is the highest implemented Exception level.</td>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>EL3 is the highest implemented Exception level.</td>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895](#). Subject to the prioritization rules:

- When HCR_EL2.E2H == 0:
  - If CNTKCTL_EL1.EL0PCTEN==0, and CNTKCTL_EL1.EL0VCTEN==0, read accesses to this register from EL0 are trapped to EL1.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If CNTKCTL_EL1.EL0PCTEN==0, and CNTKCTL_EL1.EL0VCTEN==0, Non-secure read accesses to this register from EL0 are trapped to EL1.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 1):
  - If CNTKCTL_EL1.EL0PCTEN==0, and CNTKCTL_EL1.EL0VCTEN==0, Non-secure read accesses to this register from EL0 are trapped to EL2.
D10.6.2 CNTHCTL_EL2, Counter-timer Hypervisor Control register

The CNTHCTL_EL2 characteristics are:

**Purpose**

Controls the generation of an event stream from the physical counter, and access from Non-secure EL1 to the physical counter and the Non-secure EL1 physical timer.

**Configurations**

AArch64 System register CNTHCTL_EL2 is architecturally mapped to AArch32 System register CNTHCTL.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTHCTL_EL2 is a 32-bit register.

**Field descriptions**

The CNTHCTL_EL2 bit assignments are:

When HCR_EL2.E2H == 0:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>8-7</td>
<td>EVNTI, selects which bit (0 to 15) of the counter register CNTPCT_EL0 is the trigger for the event stream generated from that counter, when that stream is enabled.</td>
</tr>
<tr>
<td>4-3</td>
<td>EVNTDIR, controls which transition of the counter register CNTPCT_EL0 trigger bit, defined by EVNTI, generates an event when the event stream is enabled:</td>
</tr>
<tr>
<td>0</td>
<td>A 0 to 1 transition of the trigger bit triggers an event.</td>
</tr>
<tr>
<td>1</td>
<td>A 1 to 0 transition of the trigger bit triggers an event.</td>
</tr>
<tr>
<td>2</td>
<td>EVNTEN, enables the generation of an event stream from the counter register CNTPCT_EL0:</td>
</tr>
<tr>
<td>0</td>
<td>Disables the event stream.</td>
</tr>
<tr>
<td>1</td>
<td>Enables the event stream.</td>
</tr>
</tbody>
</table>

This format applies in all ARMv8.0 implementations, and it also contains a description of the behavior when EL3 is implemented and EL2 is not implemented.
EL1PCEN, bit [1]
Traps Non-secure EL0 and EL1 accesses to the physical timer registers to EL2.

0 From AArch64 state: Non-secure EL0 and EL1 accesses to the CNTP_CTL_EL0, CNTP_CVAL_EL0, and CNTP_TVAL_EL0 are trapped to EL2, unless it is trapped by CNTKCTL_EL1.EL0PTEN.
From AArch32 state: Non-secure EL0 and EL1 accesses to the CNTP_CTL, CNTP_CVAL, and CNTP_TVAL are trapped to EL2, unless it is trapped by CNTKCTL_EL1.EL0PTEN or CNTKCTL.PL0PTEN.

1 This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

EL1PCTEN, bit [0]
Traps Non-secure EL0 and EL1 accesses to the physical counter register to EL2.

0 From AArch64 state: Non-secure EL0 and EL1 accesses to the CNTPCT_EL0 are trapped to EL2, unless it is trapped by CNTKCTL_EL1.EL0PCTEN.
From AArch32 state: Non-secure EL0 and EL1 accesses to the CNTPCT are trapped to EL2, unless it is trapped by CNTKCTL_EL1.EL0PCTEN or CNTKCTL.PL0PCTEN.

1 This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

When HCR_EL2.E2H == 1:

```
31 12 11 10 9 8 7 4 3 2 1 0
| RES0 | EVNTI | EL0PCTEN | EL0VCTEN | EVNTEN | EVNTDIR | EL0VTEN | EL0PTEN | EL1PCTEN | EL1PTEN |
```

Bits [31:12]
Reserved, RES0.

EL1PTEN, bit [11]
When HCR_EL2.TGE is 0, traps Non-secure EL0 and EL1 accesses to the physical timer registers to EL2.

0 From AArch64 state: Non-secure EL0 and EL1 accesses to the CNTP_CTL_EL0, CNTP_CVAL_EL0, and CNTP_TVAL_EL0 are trapped to EL2, unless it is trapped by CNTKCTL_EL1.EL0PTEN.
From AArch32 state: Non-secure EL0 and EL1 accesses to the CNTP_CTL, CNTP_CVAL, and CNTP_TVAL are trapped to EL2, unless it is trapped by CNTKCTL_EL1.EL0PTEN or CNTKCTL.PL0PTEN.

1 This control does not cause any instructions to be trapped.

When HCR_EL2.TGE is 1, this control does not cause any instructions to be trapped.
EL1PCTEN, bit [10]

When HCR_EL2.TGE is 0, traps Non-secure EL0 and EL1 accesses to the physical counter register to EL2.

0  From AArch64 state: Non-secure EL0 and EL1 accesses to the CNTPCT_EL0 are trapped to EL2, unless it is trapped by CNTKCTL_EL1.EL0PCTEN.
   From AArch32 state: Non-secure EL0 and EL1 accesses to the CNTPCT are trapped to EL2, unless it is trapped by CNTKCTL_EL1.EL0PCTEN or CNTKCTL.PL0PCTEN.

1  This control does not cause any instructions to be trapped.

When HCR_EL2.TGE is 1, this control does not cause any instructions to be trapped.

EL0PTEN, bit [9]

When HCR_EL2.TGE is 0, this control does not cause any instructions to be trapped.

When HCR_EL2.TGE is 1, traps EL0 accesses to the physical timer registers to EL2.

0  EL0 using AArch64: EL0 accesses to the CNTP_CTL_EL0, CNTP_CVAL_EL0, and CNTP_TVAL_EL0 registers are trapped to EL2.
   EL0 using AArch32: EL0 accesses to the CNTP_CTL, CNTP_CVAL, and CNTP_TVAL registers are trapped to EL2.

1  This control does not cause any instructions to be trapped.

EL0VTEN, bit [8]

When HCR_EL2.TGE is 0, this control does not cause any instructions to be trapped.

When HCR_EL2.TGE is 1, traps EL0 accesses to the virtual timer registers to EL2.

0  EL0 using AArch64: EL0 accesses to the CNTV_CTL_EL0, CNTV_CVAL_EL0, and CNTV_TVAL_EL0 registers are trapped to EL2.
   EL0 using AArch32: EL0 accesses to the CNTV_CTL, CNTV_CVAL, and CNTV_TVAL registers are trapped to EL2.

1  This control does not cause any instructions to be trapped.

EVNTI, bits [7:4]

Selects which bit (0 to 15) of the counter register CNTPCT_EL0 is the trigger for the event stream generated from that counter, when that stream is enabled.

EVNTDIR, bit [3]

Controls which transition of the counter register CNTPCT_EL0 trigger bit, defined by EVNTI, generates an event when the event stream is enabled:

0  A 0 to 1 transition of the trigger bit triggers an event.

1  A 1 to 0 transition of the trigger bit triggers an event.

EVNTEN, bit [2]

Enables the generation of an event stream from the counter register CNTPCT_EL0:

0  Disables the event stream.

1  Enables the event stream.

EL0VCTEN, bit [1]

When HCR_EL2.TGE is 0, this control does not cause any instructions to be trapped.

When HCR_EL2.TGE is 1, traps EL0 accesses to the frequency register and virtual counter register to EL2.

0  EL0 using AArch64: EL0 accesses to the CNTVCT_EL0 are trapped to EL2.
   EL0 using AArch64: EL0 accesses to the CNTFRQ_EL0 register are trapped to EL2, if CNTHCTL_EL2.EL0PCTEN is also 0.
   EL0 using AArch32: EL0 accesses to the CNTVCT are trapped to EL2.

1  EL0 using AArch32: EL0 accesses to the CNTVCT are trapped to EL2.
EL0 using AArch32: EL0 accesses to the CNTFRQ register are trapped to EL2, if CNTHCTL_EL2.EL0VCTEN is also 0.

1  This control does not cause any instructions to be trapped.

EL0PCTEN, bit [0]

When HCR_EL2.TGE is 0, this control does not cause any instructions to be trapped.

When HCR_EL2.TGE is 1, traps EL0 accesses to the frequency register and physical counter register to EL2.

0  EL0 using AArch64: EL0 accesses to the CNTPTCT_EL0 are trapped to EL2.

EL0 using AArch64: EL0 accesses to the CNTFRQ_EL0 register are trapped to EL2, if CNTHCTL_EL2.EL0VCTEN is also 0.

EL0 using AArch32: EL0 accesses to the CNTPTCT are trapped to EL2.

EL0 using AArch32: EL0 accesses to the CNTFRQ and register are trapped to EL2, if CNTHCTL_EL2.EL0VCTEN is also 0.

1  This control does not cause any instructions to be trapped.

Accessing the CNTHCTL_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CNTHCTL_EL2</td>
<td>11</td>
<td>100</td>
<td>1110</td>
<td>0001</td>
<td>000</td>
</tr>
<tr>
<td>CNTKCTL_EL1</td>
<td>11</td>
<td>000</td>
<td>1110</td>
<td>0001</td>
<td>000</td>
</tr>
</tbody>
</table>

Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0 EL1</td>
<td>EL2 EL3</td>
</tr>
<tr>
<td>CNTHCTL_EL2</td>
<td>x x 0</td>
<td>n/a RW</td>
</tr>
<tr>
<td>CNTHCTL_EL2</td>
<td>0 0 1</td>
<td>RW RW</td>
</tr>
<tr>
<td>CNTHCTL_EL2</td>
<td>0 1 1</td>

<td>CNTKCTL_EL1 n/a</td>
</tr>
<tr>
<td>CNTKCTL_EL1</td>
<td>0 0 1</td>
<td>CNTKCTL_EL1 CNTKCTL_EL1</td>
</tr>
</tbody>
</table>
This table applies to all instructions that can access this register.

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic
CNTKCTL_EL2 or CNTKCTL_EL1 are not guaranteed to be ordered with respect to accesses using the other
mnemonic.

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) &&
  (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.

D10.6.3 CNTHP_CTL_EL2, Counter-timer Hypervisor Physical Timer Control register

The CNTHP_CTL_EL2 characteristics are:

**Purpose**

Control register for the EL2 physical timer.

**Configurations**

AArch64 System register CNTHP_CTL_EL2 is architecturally mapped to AArch32 System register CNTHP_CTL.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTHP_CTL_EL2 is a 32-bit register.

**Field descriptions**

The CNTHP_CTL_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Permitted values</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>ISTATUS</td>
<td>0: not met, 1: met</td>
</tr>
<tr>
<td>2</td>
<td>IMASK</td>
<td>0: not masked, 1: masked</td>
</tr>
<tr>
<td>1</td>
<td>ENABLE</td>
<td>0: disabled, 1: enabled</td>
</tr>
</tbody>
</table>

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

0 Timer condition is not met.
1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see *Operation of the CompareValue views of the timers* on page D8-2329 and *Operation of the TimerValue views of the timers* on page D8-2330.

This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

0 Timer interrupt is not masked by the IMASK bit.
1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

0 Timer disabled.
Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHP_TVAL_EL2 continues to count down.

--- Note ---
Disabling the output signal might be a power-saving option.

### Accessing the CNTHP_CTL_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CNTHP_CTL_EL2</td>
<td>11</td>
<td>100</td>
<td>1110</td>
<td>0010</td>
<td>001</td>
</tr>
<tr>
<td>CNTP_CTL_EL0</td>
<td>11</td>
<td>011</td>
<td>1110</td>
<td>0010</td>
<td>001</td>
</tr>
</tbody>
</table>

### Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>CNTHP_CTL_EL2</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>CNTHP_CTL_EL2</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>CNTHP_CTL_EL2</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>CNTHP_CTL_EL2</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>CNTHP_CTL_EL2</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>CNTP_CTL_EL0</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>CNTP_CTL_EL0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>CNTP_CTL_EL0</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>CNTP_CTL_EL0</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>CNTP_CTL_EL0</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

This table applies to all instructions that can access this register.

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHP_CTL_EL2 or CNTP_CTL_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.
Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 1):
  - If CNTHCTL_EL2.EL0PTEN==0, Non-secure accesses to this register from EL0 are trapped to EL2.
D10.6.4  **CNTHP_CVAL_EL2, Counter-timer Hypervisor Physical Timer CompareValue register**

The CNTHP_CVAL_EL2 characteristics are:

**Purpose**

Holds the compare value for the EL2 physical timer.

**Configurations**

AArch64 System register CNTHP_CVAL_EL2 is architecturally mapped to AArch32 System register CNTHP_CVAL.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTHP_CVAL_EL2 is a 64-bit register.

**Field descriptions**

The CNTHP_CVAL_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>CompareValue</td>
</tr>
</tbody>
</table>

**CompareValue, bits [63:0]**

Holds the EL2 physical timer CompareValue.

When CNTHP_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHP_CTL_EL2.ISTATUS is set to 1.
- If CNTHP_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHP_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count.

**Accessing the CNTHP_CVAL_EL2**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CNTHP_CVAL_EL2</td>
<td>11</td>

<td>010</td>
</tr>
<tr>
<td>CNTP_CVAL_EL0</td>
<td>11</td>
<td>011</td>
<td>1110</td>
<td>0010</td>
<td>010</td>
</tr>
</tbody>
</table>
### Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>CNTHP_CVAL_EL2</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>CNTHP_CVAL_EL2</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>CNTHP_CVAL_EL2</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>CNTHP_CVAL_EL2</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>CNTHP_CVAL_EL2</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>CNTP_CVAL_EL0</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>CNTP_CVAL_EL0</td>
<td>0</td>
<td>0</td>

</tr>
<tr>
<td>CNTP_CVAL_EL0</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>CNTP_CVAL_EL0</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

This table applies to all instructions that can access this register.

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHP_CVAL_EL2 or CNTP_CVAL_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 1):
  - If CNTHCTL_EL2.EL0PTEN==0, Non-secure accesses to this register from EL0 are trapped to EL2.
D10.6.5  CNTHP_TVAL_EL2, Counter-timer Hypervisor Physical Timer TimerValue register

The CNTHP_TVAL_EL2 characteristics are:

**Purpose**

Holds the timer value for the EL2 physical timer.

**Configurations**

AArch64 System register CNTHP_TVAL_EL2 is architecturally mapped to AArch32 System register CNTHP_TVAL.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturallyUNKNOWNvalues.

**Attributes**

CNTHP_TVAL_EL2 is a 32-bit register.

**Field descriptions**

The CNTHP_TVAL_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>TimerValue</td>
<td>The TimerValue view of the EL2 physical timer.</td>
</tr>
</tbody>
</table>

On a read of this register:

- If CNTHP_CTL_EL2.ENABLE is 0, the value returned isUNKNOWN.
- If CNTHP_CTL_EL2.ENABLE is 1, the value returned is (CNTHP_CVAL_EL2 - CNTPCT_EL0).

On a write of this register, CNTHP_CVAL_EL2 is set to (CNTPCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHP_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CNTHP_CVAL_EL2) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHP_CTL_EL2.ISTATUS is set to 1.
- If CNTHP_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHP_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

**Accessing the CNTHP_TVAL_EL2**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>
This syntax is encoded with the following settings in the instruction encoding:

\[
\begin{array}{|c|c|c|c|c|c|}
\hline
<\text{systemreg}> & \text{op0} & \text{op1} & \text{CRn} & \text{CRm} & \text{op2} \\
\hline
\text{CNTHP\_TVAL\_EL2} & 11 & 100 & 1110 & 0010 & 000 \\
\text{CNTP\_TVAL\_EL0} & 11 & 011 & 1110 & 0010 & 000 \\
\hline
\end{array}
\]

### Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>&lt;\text{systemreg}&gt;</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>CNTHP_TVAL_EL2</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>CNTHP_TVAL_EL2</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>CNTHP_TVAL_EL2</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>CNTHP_TVAL_EL2</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>CNTHP_TVAL_EL2</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>CNTP_TVAL_EL0</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>CNTP_TVAL_EL0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>CNTP_TVAL_EL0</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>CNTP_TVAL_EL0</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>CNTP_TVAL_EL0</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

This table applies to all instructions that can access this register.

When HCR\_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHP\_TVAL\_EL2 or CNTP\_TVAL\_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
• When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 1):
  — If CNTHCTL_EL2.EL0PTEN==0, Non-secure accesses to this register from EL0 are trapped to EL2.
D10.6.6 CNTHV_CTL_EL2, Counter-timer Virtual Timer Control register (EL2)

The CNTHV_CTL_EL2 characteristics are:

**Purpose**
Control register for the EL2 virtual timer.

**Configurations**
AArch64 System register CNTHV_CTL_EL2 is architecturally mapped to AArch32 System register CNTHV_CTL.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

**Attributes**
CNTHV_CTL_EL2 is a 32-bit register.

**Field descriptions**
The CNTHV_CTL_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>3</td>
<td>ISTATUS</td>
</tr>
<tr>
<td>2</td>
<td>IMASK</td>
</tr>
<tr>
<td>1</td>
<td>ENABLE</td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:3]**
Reserved, RES0.

**ISTATUS, bit [2]**
The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Timer condition not met.</td>
</tr>
<tr>
<td>1</td>
<td>Timer condition met.</td>
</tr>
</tbody>
</table>

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met.

ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see Operation of the CompareValue views of the timers on page D8-2329 and Operation of the TimerValue views of the timers on page D8-2330.

This bit is read-only.

**IMASK, bit [1]**
Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>

For more information, see the description of the ISTATUS bit.
ENABLE, bit [0]

Enables the timer. Permitted values are:

0  Timer disabled.
1  Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHV_TV_AL_EL2 continues to count down.

Note

Disabling the output signal might be a power-saving option.

Accessing the CNTHV_CTL_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CNTHV_CTL_EL2</td>
<td>11</td>
<td>00</td>
<td>110</td>
<td>001</td>
<td>01</td>
</tr>
<tr>
<td>CNTV_CTL_EL0</td>
<td>11</td>
<td>01</td>
<td>110</td>
<td>001</td>
<td>01</td>
</tr>
</tbody>
</table>

Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>CNTHV_CTL_EL2</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>CNTHV_CTL_EL2</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>CNTHV_CTL_EL0</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>CNTHV_CTL_EL2</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>CNTHV_CTL_EL2</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>CNTV_CTL_EL0</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>CNTV_CTL_EL0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>CNTV_CTL_EL0</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>CNTV_CTL_EL0</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>CNTV_CTL_EL0</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

This table applies to all instructions that can access this register.
When `HCR_EL2.E2H` is 1, without explicit synchronization, access from EL2 using the mnemonic `CNTHV_CTL_EL2` or `CNTV_CTL_EL0` are not guaranteed to be ordered with respect to accesses using the other mnemonic.

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and `(SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0)`:  
  — If `HCR_EL2.NV==1`, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and `(SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0)`:  
  — If `HCR_EL2.NV==1`, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and `(SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 1)`:  
  — If `CNTHCTL_EL2.EL0VTEN==0`, Non-secure accesses to this register from EL0 are trapped to EL2.
D10.6.7  CNTHV_CVAL_EL2, Counter-timer Virtual Timer CompareValue register (EL2)

The CNTHV_CVAL_EL2 characteristics are:

**Purpose**

Holds the compare value for the EL2 virtual timer.

**Configurations**

AArch64 System register CNTHV_CVAL_EL2 is architecturally mapped to AArch32 System register CNTHV_CVAL.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

**Attributes**

CNTHV_CVAL_EL2 is a 64-bit register.

**Field descriptions**

The CNTHV_CVAL_EL2 bit assignments are:

```
+----------------+----------------+
<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:0</td>
<td>CompareValue</td>
</tr>
</tbody>
</table>

CompareValue, bits [63:0]

Holds the EL2 virtual timer CompareValue.

When CNTHV_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTVCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHV_CTL_EL2.ISTATUS is set to 1.
- If CNTHV_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHV_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count.

**Accessing the CNTHV_CVAL_EL2**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th></th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CNTHV_CVAL_EL2</td>
<td>11</td>
<td>100</td>
<td>1110</td>
<td>0011</td>
<td>010</td>
</tr>
<tr>
<td>CNTV_CVAL_EL0</td>
<td>11</td>
<td>011</td>
<td>1110</td>
<td>0011</td>
<td>010</td>
</tr>
</tbody>
</table>
### Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>CNTHV_CVAL_EL2</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>CNTHV_CVAL_EL2</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>CNTHV_CVAL_EL2</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>CNTHV_CVAL_EL2</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>CNTHV_CVAL_EL2</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>CNTV_CVAL_EL0</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>CNTV_CVAL_EL0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>CNTV_CVAL_EL0</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>CNTV_CVAL_EL0</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>CNTV_CVAL_EL0</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

This table applies to all instructions that can access this register.

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHV_CVAL_EL2 or CNTV_CVAL_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 1):
  - If CNTHCTL_EL2.EL0VTEN==0, Non-secure accesses to this register from EL0 are trapped to EL2.
D10.6.8  CNTHV_TVAL_EL2, Counter-timer Virtual Timer TimerValue register (EL2)

The CNTHV_TVAL_EL2 characteristics are:

Purpose

Holds the timer value for the EL2 virtual timer.

Configurations

AArch64 System register CNTHV_TVAL_EL2 is architecturally mapped to AArch32 System register CNTHV_TVAL.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

Attributes

CNTHV_TVAL_EL2 is a 32-bit register.

Field descriptions

The CNTHV_TVAL_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>TimerValue</td>
<td></td>
</tr>
</tbody>
</table>

TimerValue, bits [31:0]

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If CNTHV_CTL_EL2.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHV_CTL_EL2.ENABLE is 1, the value returned is (CNTHV_CVAL_EL2 - CNTVCT_EL0).

On a write of this register, CNTHV_CVAL_EL2 is set to (CNTVCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHV_CTL_EL2.ENABLE is 1, the timer condition is met when ((CNTVCT_EL0 - CNTHV_CVAL_EL2) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHV_CTL_EL2.ISTATUS is set to 1.
- If CNTHV_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHV_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

Accessing the CNTHV_TVAL_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>
This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CNTHV_TVAL_EL2</td>
<td>11</td>
<td>100</td>
<td>1110</td>
<td>0011</td>
<td>000</td>
</tr>
<tr>
<td>CNTV_TVAL_EL0</td>
<td>11</td>
<td>011</td>
<td>1110</td>
<td>0011</td>
<td>000</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>E2H</td>
<td>TGE</td>

<td>0</td>
</tr>
<tr>
<td>CNTV_TVAL_EL0</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

This table applies to all instructions that can access this register.

When \texttt{HCR\_EL2.E2H} is 1, without explicit synchronization, access from EL2 using the mnemonic \texttt{CNTHV\_VAL\_EL2} or \texttt{CNTV\_VAL\_EL0} are not guaranteed to be ordered with respect to accesses using the other mnemonic.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see \textit{Synchronous exception prioritization for exceptions taken to AArch64} on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (\texttt{SCR\_EL3.NS} == 1) && (\texttt{HCR\_EL2.E2H} == 0):
  - If \texttt{HCR\_EL2.NV}==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (\texttt{SCR\_EL3.NS} == 1) && (\texttt{HCR\_EL2.E2H} == 1) && (\texttt{HCR\_EL2.TGE} == 0):
  - If \texttt{HCR\_EL2.NV}==1, Non-secure accesses to this register from EL1 are trapped to EL2.
• When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 1):
  — If CNTHCTL_EL2.EL0VTEN==0, Non-secure accesses to this register from EL0 are trapped to EL2.
D10.6.9 CNTKCTL_EL1, Counter-timer Kernel Control register

The CNTKCTL_EL1 characteristics are:

**Purpose**

When ARMv8.1-VHE is not implemented, or when HCR_EL2.{E2H, TGE} is not \{1, 1\}, this register controls the generation of an event stream from the virtual counter, and access from EL0 to the physical counter, virtual counter, EL1 physical timers, and the virtual timer.

When ARMv8.1-VHE is implemented and HCR_EL2.{E2H, TGE} is \{1, 1\}, this register does not cause any event stream from the virtual counter to be generated, and does not control access to the counters and timers. The access to counters and timers at EL0 is controlled by CNTHCTL_EL2.

**Configurations**

AArch64 System register CNTKCTL_EL1 is architecturally mapped to AArch32 System register CNTKCTL.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTKCTL_EL1 is a 32-bit register.

**Field descriptions**

The CNTKCTL_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>10:8</td>
<td>EVNTI</td>
</tr>
<tr>
<td>9</td>
<td>EL0PTEN</td>
</tr>
<tr>
<td>8</td>
<td>EL0VCTEN</td>
</tr>
<tr>
<td>7</td>
<td>EVNTEN</td>
</tr>
<tr>
<td>6</td>
<td>EVNTDIR</td>
</tr>
<tr>
<td>5</td>
<td>EL0VTEN</td>
</tr>
<tr>
<td>4</td>
<td>EL0PTEN</td>
</tr>
</tbody>
</table>

**Bits [31:10]**

Reserved, RES0.

**EL0PTEN, bit [9]**

When ARMv8.1-VHE is not implemented, or when HCR_EL2.{E2H, TGE} is not \{1, 1\}, traps EL0 accesses to the physical timer registers to EL1.

0 EL0 using AArch64: EL0 accesses to the CNTP_CTL_EL0, CNTP_CVAL_EL0, and CNTP_TVAL_EL0 registers are trapped to EL1.

EL0 using AArch32: EL0 accesses to the CNTP_CTL, CNTP_CVAL, and CNTP_TVAL registers are trapped to EL1.

When HCR_EL2.TGE is 1, this trap is routed to EL2.

1 This control does not cause any instructions to be trapped.

When ARMv8.1-VHE is implemented and HCR_EL2.{E2H, TGE} is \{1, 1\}, this control does not cause any instructions to be trapped.
EL0VTEN, bit [8]

When ARMv8.1-VHE is not implemented, or when HCR_EL2.{E2H, TGE} is not {1, 1}, traps EL0 accesses to the virtual timer registers to EL1.

0  EL0 using AArch64: EL0 accesses to the CNTV_CTL_EL0, CNTV_CVAL_EL0, and CNTV_TVAL_EL0 registers are trapped to EL1.
    EL0 using AArch32: EL0 accesses to the CNTV_CTL, CNTV_CVAL, and CNTV_TVAL registers are trapped to EL1.
    When HCR_EL2.TGE is 1, this trap is routed to EL2.

1  This control does not cause any instructions to be trapped.

When ARMv8.1-VHE is implemented and HCR_EL2.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

EVNTI, bits [7:4]

Selects which bit (0 to 15) of the counter register CNTVCT_EL0 is the trigger for the event stream generated from that counter, when that stream is enabled.

EVNTDIR, bit [3]

Controls which transition of the counter register CNTVCT_EL0 trigger bit, defined by EVNTI, generates an event when the event stream is enabled:

0  A 0 to 1 transition of the trigger bit triggers an event.

1  A 1 to 0 transition of the trigger bit triggers an event.

EVNTEN, bit [2]

When ARMv8.1-VHE is not implemented, or when HCR_EL2.{E2H, TGE} is not {1, 1}, enables the generation of an event stream from the counter register CNTVCT_EL0:

0  Disables the event stream.

1  Enables the event stream.

When ARMv8.1-VHE is implemented and HCR_EL2.{E2H, TGE} is {1, 1}, this control does not enable the event stream.

EL0VCTEN, bit [1]

When ARMv8.1-VHE is not implemented, or when HCR_EL2.{E2H, TGE} is not {1, 1}, traps EL0 accesses to the frequency register and virtual counter register to EL1.

0  EL0 using AArch64: EL0 accesses to the CNTVCT_EL0 are trapped to EL1.
    EL0 using AArch64: EL0 accesses to the CNTFRQ_EL0 register are trapped to EL1, if CNTKCTL_EL1.EL0PCTEN is also 0.
    EL0 using AArch32: EL0 accesses to the CNTVCT are trapped to EL1.
    EL0 using AArch32: EL0 accesses to the CNTFRQ and register are trapped to EL1, if CNTKCTL_EL1.EL0VCTEN is also 0.
    When HCR_EL2.TGE is 1, this trap is routed to EL2.

1  This control does not cause any instructions to be trapped.

When ARMv8.1-VHE is implemented and HCR_EL2.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

EL0PCTEN, bit [0]

When ARMv8.1-VHE is not implemented, or when HCR_EL2.{E2H, TGE} is not {1, 1}, traps EL0 accesses to the frequency register and physical counter register to EL1.

0  EL0 using AArch64: EL0 accesses to the CNTPCT_EL0 are trapped to EL1.
    EL0 using AArch64: EL0 accesses to the CNTFRQ_EL0 register are trapped to EL1, if CNTKCTL_EL1.EL0PCTEN is also 0.
    EL0 using AArch32: EL0 accesses to the CNTPCT are trapped to EL1.
    EL0 using AArch32: EL0 accesses to the CNTFRQ and register are trapped to EL1, if CNTKCTL_EL1.EL0VCTEN is also 0.

1  This control does not cause any instructions to be trapped.

When ARMv8.1-VHE is implemented and HCR_EL2.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.
When HCR_EL2.TGE is 1, this trap is routed to EL2.

This control does not cause any instructions to be trapped.

When ARMv8.1-VHE is implemented and HCR_EL2.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

### Accessing the CNTKCTL_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td>CNTKCTL_EL12</td>
<td>0 1 1</td>
<td>n/a - -</td>
</tr>
<tr>
<td>CNTKCTL_EL12</td>
<td>1 0 1</td>
<td>EL1 - - RW RW</td>
</tr>
<tr>
<td>CNTKCTL_EL12</td>
<td>1 1 1</td>
<td>n/a EL2 RW</td>
</tr>
</tbody>
</table>

This table applies to all instructions that can access this register.

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTKCTL_EL1 or CNTKCTL_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.
Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor CNTKCTL_EL12 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor CNTKCTL_EL12 are trapped to EL2.
D10.6.10 CNTP_CTL_EL0, Counter-timer Physical Timer Control register

The CNTP_CTL_EL0 characteristics are:

Purpose
Control register for the EL1 physical timer.

Configurations
AArch64 System register CNTP_CTL_EL0 is architecturally mapped to AArch32 System register CNTP_CTL.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes
CNTP_CTL_EL0 is a 32-bit register.

Field descriptions
The CNTP_CTL_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>3</td>
<td>ISTATUS</td>
<td>The status of the timer. This bit indicates whether the timer condition is met:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0: Timer condition is not met.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1: Timer condition is met.</td>
</tr>
<tr>
<td>2</td>
<td>IMASK</td>
<td>Timer interrupt mask bit. Permitted values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0: Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1: Timer interrupt is masked by the IMASK bit.</td>
</tr>
<tr>
<td>1</td>
<td>ENABLE</td>
<td>Enables the timer. Permitted values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0: Timer disabled.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1: Timer enabled.</td>
</tr>
</tbody>
</table>

For more information see Operation of the CompareValue views of the timers on page D8-2329 and Operation of the TimerValue views of the timers on page D8-2330.
Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTP_TVAL_EL0 continues to count down.

**Note**
Disabling the output signal might be a power-saving option.

### Accessing the CNTP_CTL_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CNTP_CTL_EL0</td>
<td>11</td>
<td>011</td>
<td>1110</td>
<td>0010</td>
<td>001</td>
</tr>
<tr>
<td>CNTP_CTL_EL02</td>
<td>11</td>
<td>101</td>
<td>1110</td>
<td>0010</td>
<td>001</td>
</tr>
</tbody>
</table>

### Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>E2H</td>
<td>EL0</td>
</tr>
<tr>
<td>CNTP_CTL_EL0</td>
<td>x x 0</td>
<td>RW</td>
</tr>
<tr>
<td>CNTP_CTL_EL0</td>
<td>0 0 1</td>
<td>RW</td>
</tr>
<tr>
<td>CNTP_CTL_EL0</td>
<td>0 1 1</td>
<td>RW</td>
</tr>
<tr>
<td>CNTP_CTL_EL0</td>
<td>1 0 1</td>
<td>RW</td>
</tr>
<tr>
<td>CNTP_CTL_EL0</td>
<td>1 1 1</td>
<td>CNTHP_CTL_EL2</td>
</tr>
<tr>
<td>CNTP_CTL_EL02</td>

</tr>
<tr>
<td>CNTP_CTL_EL02</td>
<td>0 1 1</td>
<td>-</td>
</tr>
<tr>
<td>CNTP_CTL_EL02</td>
<td>1 0 1</td>
<td>-</td>
</tr>
<tr>
<td>CNTP_CTL_EL02</td>
<td>1 1 1</td>
<td>-</td>
</tr>
</tbody>
</table>

This table applies to all instructions that can access this register.

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTP_CTL_EL0 or CNTP_CTL_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.
Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When HCR_EL2.E2H == 0:
  - If CNTKCTL_EL1.EL0PTEN==0, accesses to this register from EL0 are trapped to EL1.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If CNTHCTL_EL2.EL1PCEN==0, Non-secure accesses to this register from EL1 are trapped to EL2.
  - If CNTHCTL_EL2.EL1PCEN==0, and CNTKCTL_EL1.EL0PTEN==1, Non-secure accesses to this register from EL0 are trapped to EL2.
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor CNTP_CTL_EL02 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If CNTHCTL_EL2.EL1PTEN==0, Non-secure accesses to this register from EL1 are trapped to EL2.
  - If CNTHCTL_EL2.EL1PTEN==0, and CNTKCTL_EL1.EL0PTEN==1, Non-secure accesses to this register from EL0 are trapped to EL2.
  - If CNTKCTL_EL1.EL0PTEN==0, Non-secure accesses to this register from EL0 are trapped to EL1.
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor CNTP_CTL_EL02 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 1):
  - If CNTHCTL_EL2.EL0PTEN==0, Non-secure accesses to this register from EL0 are trapped to EL2.
D10.6.11  CNTP_CVAL_EL0, Counter-timer Physical Timer CompareValue register

The CNTP_CVAL_EL0 characteristics are:

**Purpose**
Holds the compare value for the EL1 physical timer.

**Configurations**
AArch64 System register CNTP_CVAL_EL0 is architecturally mapped to AArch32 System register CNTP_CVAL.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**
CNTP_CVAL_EL0 is a 64-bit register.

**Field descriptions**
The CNTP_CVAL_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Positions</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-0</td>
<td>CompareValue</td>
<td>Holds the EL1 physical timer CompareValue.</td>
</tr>
</tbody>
</table>

- **CompareValue, bits [63:0]**
  Holds the EL1 physical timer CompareValue.
  - When CNTP_CTL_EL0.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:
    - CNTP_CTL_EL0.ISTATUS is set to 1.
    - If CNTP_CTL_EL0.IMASK is 0, an interrupt is generated.
  - When CNTP_CTL_EL0.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count.

**Accessing the CNTP_CVAL_EL0**
This register can be read using MRS with the following syntax:
MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:
MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CNTP_CVAL_EL0</td>
<td>11</td>
<td>011</td>
<td>1110</td>
<td>0010</td>
<td>010</td>
</tr>
<tr>
<td>CNTP_CVAL_EL02</td>
<td>11</td>
<td>101</td>
<td>1110</td>
<td>0010</td>
<td>010</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>CNTP_CV_AL_EL0</td>
<td>x</td>
<td>x</td>
</tr>

<td>1</td>
<td>0</td>
</tr>
<tr>
<td>CNTP_CV_AL_EL02</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

This table applies to all instructions that can access this register.

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTP_CV_AL_EL0 or CNTP_CV_AL_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When HCR_EL2.E2H == 0:
  - If CNTKCTL_EL1.ELOPTEN==0, accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If CNTHCTL_EL2.EL1PCEN==0, Non-secure accesses to this register from EL1 are trapped to EL2.
  - If CNTHCTL_EL2.EL1PCEN==0, and CNTKCTL_EL1.ELOPTEN==1, Non-secure accesses to this register from EL0 are trapped to EL2.
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor CNTP_CV_AL_EL02 are trapped to EL2.
- When EL2 is implemented and using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If CNTHCTL_EL2.EL1PTEN==0, Non-secure accesses to this register from EL1 are trapped to EL2.
  - If CNTHCTL_EL2.EL1PTEN==0, and CNTKCTL_EL1.ELOPTEN==1, Non-secure accesses to this register from EL0 are trapped to EL2.
  - If CNTHCTL_EL1.ELOPTEN==0, Non-secure accesses to this register from EL0 are trapped to EL1.
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor CNTP_CV_AL_EL02 are trapped to EL2.
When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 1):

- If CNTHCTL_EL2.EL0PTEN==0, Non-secure accesses to this register from EL0 are trapped to EL2.
D10.6.12  CNTP_TV_ALL_EL0, Counter-timer Physical Timer TimerValue register

The CNTP_TV_ALL_EL0 characteristics are:

Purpose

Holds the timer value for the EL1 physical timer.

Configurations

AArch64 System register CNTP_TV_ALL_EL0 is architecturally mapped to AArch32 System register CNTP_TV_ALL.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTP_TV_ALL_EL0 is a 32-bit register.

Field descriptions

The CNTP_TV_ALL_EL0 bit assignments are:

31 0

TimerValue

TimerValue, bits [31:0]

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If CNTP_CTL_EL0.ENABLE is 0, the value returned is UNKNOWN.
- If CNTP_CTL_EL0.ENABLE is 1, the value returned is (CNTP_CV_ALL_EL0 - CNTPCT_EL0).

On a write of this register, CNTP_CV_ALL_EL0 is set to (CNTPCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTP_CTL_EL0.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CNTP_CV_ALL_EL0) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTP_CTL_EL0.ISTATUS is set to 1.
- If CNTP_CTL_EL0.IMASK is 0, an interrupt is generated.

When CNTP_CTL_EL0.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

Accessing the CNTP_TV_ALL_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>
This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CNTP_TVAL_EL0</td>
<td>11</td>
<td>011</td>
<td>1110</td>
<td>0010</td>
<td>000</td>
</tr>
<tr>
<td>CNTP_TVAL_EL02</td>
<td>11</td>
<td>101</td>
<td>1110</td>
<td>0010</td>
<td>000</td>
</tr>
</tbody>
</table>

### Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>CNTP_TVAL_EL0</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>CNTP_TVAL_EL0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>CNTP_TVAL_EL0</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>CNTP_TVAL_EL0</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>CNTP_TVAL_EL0</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>CNTP_TVAL_EL02</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>CNTP_TVAL_EL02</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>CNTP_TVAL_EL02</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>CNTP_TVAL_EL02</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>CNTP_TVAL_EL02</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

This table applies to all instructions that can access this register.

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTP_TVAL_EL0 or CNTP_TVAL_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

### Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When HCR_EL2.E2H == 0:
  - If CNTKCTL_EL1.EL0PTEN==0, accesses to this register from EL0 are trapped to EL1.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If CNTHCTL_EL2.EL1PCEN==0, Non-secure accesses to this register from EL1 are trapped to EL2.
  - If CNTHCTL_EL2.EL1PCEN==0, and CNTKCTL_EL1.EL0PTEN==1, Non-secure accesses to this register from EL0 are trapped to EL2.
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor CNTP_TVAL_EL02 are trapped to EL2.
• When EL2 is implemented and is using AArch64 and \((\text{SCR\_EL3.NS} = 1) \&\& (\text{HCR\_EL2.E2H} = 1) \&\& (\text{HCR\_EL2.TGE} = 0)\):
  — If \(\text{CNTHCTL\_EL2.EL1PTEN} = 0\), Non-secure accesses to this register from EL1 are trapped to EL2.
  — If \(\text{CNTHCTL\_EL2.EL1PTEN} = 0\), and \(\text{CNTKCTL\_EL1.EL0PTEN} = 1\), Non-secure accesses to this register from EL0 are trapped to EL2.
  — If \(\text{CNTKCTL\_EL1.EL0PTEN} = 0\), Non-secure accesses to this register from EL0 are trapped to EL1.
  — If \(\text{HCR\_EL2.NV} = 1\), Non-secure accesses to this register from EL1 using accessor CNTP_TV\_AL\_EL02 are trapped to EL2.

• When EL2 is implemented and is using AArch64 and \((\text{SCR\_EL3.NS} = 1) \&\& (\text{HCR\_EL2.E2H} = 1) \&\& (\text{HCR\_EL2.TGE} = 1)\):
  — If \(\text{CNTHCTL\_EL2.EL0PTEN} = 0\), Non-secure accesses to this register from EL0 are trapped to EL2.
D10.6.13   CNTPCT_EL0, Counter-timer Physical Count register

The CNTPCT_EL0 characteristics are:

**Purpose**

Holds the 64-bit physical count value.

**Configurations**

AArch64 System register CNTPCT_EL0 is architecturally mapped to AArch32 System register CNTPCT.

**Attributes**

CNTPCT_EL0 is a 64-bit register.

**Field descriptions**

The CNTPCT_EL0 bit assignments are:

![Physical count value](image)

**Bits [63:0]**

Physical count value.

**Accessing the CNTPCT_EL0**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CNTPCT_EL0</td>
<td>11</td>
<td>011</td>
<td>1110</td>
<td>0000</td>
<td>001</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>x x 0</td>
<td>RO RO n/a RO</td>
</tr>
<tr>
<td>x 0 1</td>
<td>RO RO RO RO</td>
</tr>
<tr>
<td>x 1 1</td>
<td>RO n/a RO RO</td>
</tr>
</tbody>
</table>
Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When HCR_EL2.E2H == 0:
  - If CNTKCTL_EL1.EL0PCTEN==0, read accesses to this register from EL0 are trapped to EL1.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If CNTHCTL_EL2.EL1PCTEN==0, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If CNTHCTL_EL2.EL1PCTEN==0, and CNTKCTL_EL1.EL0PCTEN==1, Non-secure read accesses to this register from EL0 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If CNTHCTL_EL2.EL1PCTEN==0, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If CNTHCTL_EL2.EL1PCTEN==0, and CNTKCTL_EL1.EL0PCTEN==1, Non-secure read accesses to this register from EL0 are trapped to EL2.
  - If CNTKCTL_EL1.EL0PCTEN==0, Non-secure read accesses to this register from EL0 are trapped to EL1.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 1):
  - If CNTHCTL_EL2.EL0PCTEN==0, Non-secure read accesses to this register from EL0 are trapped to EL2.
D10.6.14  CNTPS_CTL_EL1, Counter-timer Physical Secure Timer Control register

The CNTPS_CTL_EL1 characteristics are:

**Purpose**
Control register for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

**Configurations**
RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**
CNTPS_CTL_EL1 is a 32-bit register.

**Field descriptions**
The CNTPS_CTL_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>3</td>
<td>ISTATUS</td>
</tr>
<tr>
<td>2</td>
<td>IMASK</td>
</tr>
<tr>
<td>1</td>
<td>ENABLE</td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:3]**
Reserved, RES0.

**ISTATUS, bit [2]**
The status of the timer. This bit indicates whether the timer condition is met:
- 0 Timer condition is not met.
- 1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.
For more information see Operation of the CompareValue views of the timers on page D8-2329 and Operation of the TimerValue views of the timers on page D8-2330.

This bit is read-only.

**IMASK, bit [1]**
Timer interrupt mask bit. Permitted values are:
- 0 Timer interrupt is not masked by the IMASK bit.
- 1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

**ENABLE, bit [0]**
Enables the timer. Permitted values are:
- 0 Timer disabled.
- 1 Timer enabled.
Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTPS_TVAL_EL1 continues to count down.

--- Note ---
Disabling the output signal might be a power-saving option.

**Accessing the CNTPS_CTL_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CNTPS_CTL_EL1</td>
<td>11</td>
<td>111</td>
<td>110</td>
<td>0010</td>
<td>001</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS EL0 EL1 EL2 EL3</td>
<td>n/a RW RW</td>
</tr>
<tr>
<td>0 0 1</td>
<td>- - - RW</td>
</tr>
<tr>
<td>0 1 1</td>
<td>- n/a - RW</td>
</tr>
<tr>
<td>1 0 1</td>
<td>- - - RW</td>
</tr>
<tr>
<td>1 1 1</td>
<td>- n/a - RW</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL3 is implemented and is using AArch64 and SCR_EL3.NS == 0:
  - If SCR_EL3.ST==0, Secure accesses to this register from EL1 are trapped to EL3.
### D10.6.15 CNTPS_CVAL_EL1, Counter-timer Physical Secure Timer CompareValue register

The CNTPS_CVAL_EL1 characteristics are:

**Purpose**

Holds the compare value for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

**Configurations**

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTPS_CVAL_EL1 is a 64-bit register.

**Field descriptions**

The CNTPS_CVAL_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-0</td>
<td>CompareValue</td>
</tr>
</tbody>
</table>

**CompareValue, bits [63:0]**

Holds the secure physical timer CompareValue.

When CNTPS_CTL_EL1.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTPS_CTL_EL1.ISTATUS is set to 1.
- If CNTPS_CTL_EL1.IMASK is 0, an interrupt is generated.

When CNTPS_CTL_EL1.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count.

**Accessing the CNTPS_CVAL_EL1**

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CNTPS_CVAL_EL1</td>
<td>11</td>
<td>111</td>
<td>1110</td>
<td>0010</td>
<td>010</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS EL0 EL1 EL2 EL3</td>
<td>RW n/a RW</td>
</tr>
<tr>
<td>x x 0</td>
<td>RW n/a RW</td>
</tr>
<tr>
<td>0 0 1</td>
<td>RW</td>
</tr>
<tr>
<td>0 1 1</td>
<td>RW</td>
</tr>
<tr>
<td>1 0 1</td>
<td>RW</td>
</tr>
<tr>
<td>1 1 1</td>
<td>RW</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

• When EL3 is implemented and is using AArch64 and SCR_EL3.NS == 0:
  — If SCR_EL3.ST==0, Secure accesses to this register from EL1 are trapped to EL3.
The CNTPS_TVAL_EL1 characteristics are:

**Purpose**
Holds the timer value for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

**Configurations**
RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**
CNTPS_TVAL_EL1 is a 32-bit register.

**Field descriptions**
The CNTPS_TVAL_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TimerValue</td>
<td>31:0</td>
</tr>
</tbody>
</table>

**TimerValue, bits [31:0]**
The TimerValue view of the secure physical timer.

On a read of this register:
- If CNTPS_CTL_EL1.ENABLE is 0, the value returned is UNKNOWN.
- If CNTPS_CTL_EL1.ENABLE is 1, the value returned is (CNTPS_CVAL_EL1 - CNTPCT_EL0).

On a write of this register, CNTPS_CVAL_EL1 is set to (CNTPCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTPS_CTL_EL1.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CNTPS_CVAL_EL1) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:
- CNTPS_CTL_EL1.ISTATUS is set to 1.
- If CNTPS_CTL_EL1.IMASK is 0, an interrupt is generated.

When CNTPS_CTL_EL1.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

**Accessing the CNTPS_TVAL_EL1**
This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CNTPS_TVAL_EL1</td>
<td>11</td>
<td>111</td>
<td>1110</td>
<td>0010</td>
<td>000</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>
</tr>
<tr>
<td>TGE</td>
<td></td>
</tr>
<tr>
<td>NS</td>
<td></td>
</tr>
<tr>
<td>x</td>
<td>-</td>
</tr>
<tr>
<td>x</td>
<td>-</td>
</tr>
<tr>
<td>0</td>
<td>-</td>
</tr>
<tr>
<td>0</td>
<td>-</td>
</tr>
<tr>
<td>1</td>
<td>-</td>
</tr>
<tr>
<td>1</td>
<td>-</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL3 is implemented and is using AArch64 and SCR_EL3.NS == 0:
  - If SCR_EL3.ST==0, Secure accesses to this register from EL1 are trapped to EL3.
D10.6.17 CNTV_CTL_EL0, Counter-timer Virtual Timer Control register

The CNTV_CTL_EL0 characteristics are:

Purpose
Control register for the virtual timer.

Configurations
AArch64 System register CNTV_CTL_EL0 is architecturally mapped to AArch32 System register CNTV_CTL.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes
CNTV_CTL_EL0 is a 32-bit register.

Field descriptions
The CNTV_CTL_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:3</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>2</td>
<td>ISTATUS</td>
</tr>
<tr>
<td>1</td>
<td>IMASK</td>
</tr>
<tr>
<td>0</td>
<td>ENABLE</td>
</tr>
</tbody>
</table>

Bits [31:3]
Reserved, RES0.

ISTATUS, bit [2]
The status of the timer. This bit indicates whether the timer condition is met:
0 Timer condition is not met.
1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see Operation of the CompareValue views of the timers on page D8-2329 and Operation of the TimerValue views of the timers on page D8-2330.

This bit is read-only.

IMASK, bit [1]
Timer interrupt mask bit. Permitted values are:
0 Timer interrupt is not masked by the IMASK bit.
1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

ENABLE, bit [0]
Enables the timer. Permitted values are:
0 Timer disabled.
1 Timer enabled.
Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTV_TVAL_EL0 continues to count down.

--- Note ---
Disabling the output signal might be a power-saving option.

**Accessing the CNTV_CTL_EL0**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

This table applies to all instructions that can access this register.

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTV_CTL_EL0 or CNTV_CTL_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.
Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When HCR_EL2.E2H == 0:
  — If CNTKCTL_EL1.EL0VTEN==0, accesses to this register from EL0 are trapped to EL1.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  — If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor CNTV_CTL_EL02 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  — If CNTKCTL_EL1.EL0VTEN==0, Non-secure accesses to this register from EL0 are trapped to EL1.
  — If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor CNTV_CTL_EL02 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 1):
  — If CNTTHCTL_EL2.EL0VTEN==0, Non-secure accesses to this register from EL0 are trapped to EL2.
D10.6.18  CNTV_CVAL_EL0, Counter-timer Virtual Timer CompareValue register

The CNTV_CVAL_EL0 characteristics are:

**Purpose**

Holds the compare value for the virtual timer.

**Configurations**

AArch64 System register CNTV_CVAL_EL0 is architecturally mapped to AArch32 System register CNTV_CVAL.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTV_CVAL_EL0 is a 64-bit register.

**Field descriptions**

The CNTV_CVAL_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Width</th>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-0</td>
<td>CompareValue</td>
<td>EL1 virtual timer CompareValue.</td>
</tr>
</tbody>
</table>

When CNTV_CTL_EL0.ENABLE is 1, the timer condition is met when \((\text{CNTVCT_EL0} - \text{CompareValue})\) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTV_CTL_EL0.ISTATUS is set to 1.
- If CNTV_CTL_EL0.IMASK is 0, an interrupt is generated.

When CNTV_CTL_EL0.ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count.

**Accessing the CNTV_CVAL_EL0**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>

This table applies to all instructions that can access this register.

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTV_CV_AL_EL0 or CNTV_CV_AL_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When HCR_EL2.E2H == 0:
  - If CNTKCTL_EL1.EL0VTEN==0, accesses to this register from EL0 are trapped to EL1.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor CNTV_CVAL_EL02 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If CNTKCTL_EL1.EL0VTEN==0, Non-secure accesses to this register from EL0 are trapped to EL1.
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor CNTV_CVAL_EL02 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 1):
  - If CNTHCTRL_EL2.EL0VTEN==0, Non-secure accesses to this register from EL0 are trapped to EL2.
D10.6.19 CNTV_TVAL_EL0, Counter-timer Virtual Timer TimerValue register

The CNTV_TVAL_EL0 characteristics are:

**Purpose**

Holds the timer value for the EL1 virtual timer.

**Configurations**

AArch64 System register CNTV_TVAL_EL0 is architecturally mapped to AArch32 System register CNTV_TVAL.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTV_TVAL_EL0 is a 32-bit register.

**Field descriptions**

The CNTV_TVAL_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:0</td>
<td>TimerValue</td>
<td>The TimerValue view of the EL1 virtual timer.</td>
</tr>
</tbody>
</table>

On a read of this register:

- If CNTV_CTL_EL0.ENABLE is 0, the value returned is UNKNOWN.
- If CNTV_CTL_EL0.ENABLE is 1, the value returned is (CNTV_CVVAL_EL0 - CNTVCT_EL0).

On a write of this register, CNTV_CVVAL_EL0 is set to (CNTVCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTV_CTL_EL0.ENABLE is 1, the timer condition is met when (CNTVCT_EL0 - CNTV_CVVAL_EL0) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTV_CTL_EL0.ISTATUS is set to 1.
- If CNTV_CTL_EL0.IMASK is 0, an interrupt is generated.

When CNTV_CTL_EL0.ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

**Accessing the CNTV_TVAL_EL0**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>
This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CNTV_TVAL_EL0</td>
<td>11</td>
<td>011</td>
<td>1110</td>
<td>0011</td>
<td>000</td>
</tr>
<tr>
<td>CNTV_TVAL_EL02</td>
<td>11</td>
<td>101</td>
<td>1110</td>
<td>0011</td>
<td>000</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>CNTV_TVAL_EL0</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>CNTV_TVAL_EL0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>CNTV_TVAL_EL0</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>CNTV_TVAL_EL0</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>CNTV_TVAL_EL0</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>CNTV_TVAL_EL02</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>CNTV_TVAL_EL02</td>
<td>0</td>
<td>0</td>

<td>1</td>
<td>0</td>
</tr>
<tr>
<td>CNTV_TVAL_EL02</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

This table applies to all instructions that can access this register.

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTV_TVAL_EL0 or CNTV_TVAL_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When HCR_EL2.E2H == 0:
  - If CNTKCTL_EL1.EL0VTEN==0, accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor CNTV_TVAL_EL02 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If CNTKCTL_EL1.EL0VTEN==0, Non-secure accesses to this register from EL0 are trapped to EL1.
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor CNTV_TVAL_EL02 are trapped to EL2.
• When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) &&
  (HCR_EL2.TGE == 1):
  — If CNTHCTL_EL2.EL0VTEN==0, Non-secure accesses to this register from EL0 are trapped to EL2.
D10.6.20 CNTVCT_EL0, Counter-timer Virtual Count register

The CNTVCT_EL0 characteristics are:

**Purpose**
Holds the 64-bit virtual count value. The virtual count value is equal to the physical count value visible in CNTPCT_EL0 minus the virtual offset visible in CNTVOFF_EL2.

**Configurations**
AArch64 System register CNTVCT_EL0 is architecturally mapped to AArch32 System register CNTPCT.

The value of this register is the same as the value of CNTPCT_EL0 in the following conditions:
- When EL2 is not implemented.
- When EL2 is implemented, HCR_EL2.E2H is 1, and this register is read from EL2.
- When EL2 is implemented, HCR_EL2.{E2H, TGE} is {1, 1}, and this register is read from Non-secure EL0 or EL2.

**Attributes**
CNTVCT_EL0 is a 64-bit register.

**Field descriptions**
The CNTVCT_EL0 bit assignments are:

```
<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Virtual count value</td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>
```

**Accessing the CNTVCT_EL0**
This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CNTVCT_EL0</td>
<td>11</td>
<td>011</td>
<td>1110</td>
<td>0000</td>
<td>010</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0</td>
</tr>
<tr>
<td>x x 0</td>
<td>RO</td>
</tr>
<tr>
<td>x 0 1</td>
<td>RO</td>
</tr>
<tr>
<td>x 1 1</td>
<td>RO</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When HCR_EL2.E2H == 0:
  - If CNTKCTL_EL1.EL0VCTEN==0, read accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If CNTKCTL_EL1.EL0VCTEN==0, Non-secure read accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 1):
  - If CNTHCTL_EL2.EL0PCTEN==0, Non-secure read accesses to this register from EL0 are trapped to EL2.
D10.6.21  CNTVOFF_EL2, Counter-timer Virtual Offset register

The CNTVOFF_EL2 characteristics are:

**Purpose**

Holds the 64-bit virtual offset. This is the offset between the physical count value visible in CNTPCT_EL0 and the virtual count value visible in CNTVCT_EL0.

**Configurations**

AArch64 System register CNTVOFF_EL2 is architecturally mapped to AArch32 System register CNTVOFF.

If EL2 is not implemented, this register is RES0 from EL3 and the virtual counter uses a fixed virtual offset of zero.

--- Note ---

When EL2 is implemented and is using AArch64, the virtual counter uses a fixed virtual offset of zero in the following situations:

- HCR_EL2.E2H is 1, and CNTVCT_EL0 is read from EL2.
- HCR_EL2.{E2H, TGE} is {1, 1}, and either:
  - CNTVCT_EL0 is read from Non-secure EL0 or EL2.
  - CNTVCT is read from Non-secure EL0.

RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTVOFF_EL2 is a 64-bit register.

**Field descriptions**

The CNTVOFF_EL2 bit assignments are:

![Bit assignments diagram]

**Bits [63:0]**

Virtual offset.

**Accessing the CNTVOFF_EL2**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
Part E
The AArch32 Application Level Architecture
Chapter E1
The AArch32 Application Level Programmers’ Model

This chapter gives an Application level description of the programmers’ model for software executing in AArch32 state. This means it describes execution in EL0 when EL0 is using AArch32. It contains the following sections:

- *About the Application level programmers’ model* on page E1-2978.
- *The Application level programmers’ model in AArch32 state* on page E1-2979.
- *Advanced SIMD and floating-point instructions* on page E1-2990.
- *About the AArch32 System register interface* on page E1-3001.
- *Exceptions* on page E1-3002.
E1.1 About the Application level programmers’ model

This chapter contains the programmers’ model information required for the development of applications that will execute in AArch32 state.

The information in this chapter is distinct from the system information required to service and support application execution under an operating system, or higher level of system software. However, some knowledge of that system information is needed to put the Application level programmers' model into context.

Depending on the implementation, the architecture supports multiple levels of execution privilege. These privilege levels are indicated by different Exception levels that number upwards from EL0, where EL0 corresponds to the lowest privilege level and is often described as unprivileged. The Application level programmers’ model is the programmers’ model for software executing at EL0. For more information see ARMv8 architectural concepts on page A1-36.

System software determines the Exception level, and therefore the level of privilege, at which application software runs. When an operating system supports execution at both EL1 and EL0, an application usually runs unprivileged. This has the following effects:

- It means that the operating system can allocate system resources to an application in a unique or shared manner.
- It provides a degree of protection from other processes, and so helps protect the operating system from malfunctioning software.

This chapter indicates where some System level understanding is helpful, and if appropriate it gives a reference to the System level description.

When included in an implementation:

- EL3 provides two Security states, Secure and Non-secure. Secure state provides additional hardware features that support the development of secure applications.
- EL2 provides virtualization of operation in Non-secure state.

However, application level software is generally unaware of its Security state, and of any virtualization. For more information, see The ARMv8-A security model on page G1-4597 and The effect of implementing EL2 on the Exception model on page G1-4602.

--- Note ---

- When an implementation includes EL3, application and operating system software normally executes in Non-secure state.
- EL2, that provides the virtualization features, is implemented only in Non-secure state.
- Older documentation, describing implementations or architecture versions that support only two privilege levels, often refers to execution at EL1 as privileged execution.
- In this manual, the terms CONSTRAINED UNPREDICTABLE, IMPLEMENTATION DEFINED, OPTIONAL, RES0, RES1, UNDEFINED, UNKNOWN, and UNPREDICTABLE have ARM-specific meanings, as defined in the Glossary. In body text, these terms are shown in SMALL CAPS, for example IMPLEMENTATION DEFINED.
The following sections give more information about the Application level programmers’ model in AArch32 state:

- Instruction sets, arithmetic operations, and register files.
- Core data types and arithmetic in AArch32 state.
- The general-purpose registers, and the PC, in AArch32 state on page E1-2981.
- Process state, PSTATE on page E1-2984.
- Jazelle support on page E1-2989.

### E1.2.1 Instruction sets, arithmetic operations, and register files

The A32 and T32 instruction sets both provide a wide range of integer arithmetic and logical operations, that operate on a register file of sixteen 32-bit registers, that are comprised of the AArch32 general-purpose registers and the PC. As described in The general-purpose registers, and the PC, in AArch32 state on page E1-2981, these registers include the registers SP (R13) and LR (R14), which have specialized uses. Core data types and arithmetic in AArch32 state gives more information about these operations.

In addition, an implementation that implements the T32 and A32 instruction sets includes both:

- Scalar floating-point instructions.
- The Advanced SIMD vector instructions.

Floating-point and vector instructions operate on a separate common register file, described in The SIMD and floating-point register file on page E1-2990. Advanced SIMD and floating-point instructions on page E1-2990 gives more information about these instructions.

### E1.2.2 Core data types and arithmetic in AArch32 state

When executing in AArch32 state, a PE supports the following data types in memory:

- **Byte** 8 bits.
- **Halfword** 16 bits.
- **Word** 32 bits.
- **Doubleword** 64 bits.

PE registers are 32 bits in size. The instruction sets provide instructions that use the following data types for data held in registers:

- 32-bit pointers.
- Unsigned or signed 32-bit integers.
- Unsigned 16-bit or 8-bit integers, held in zero-extended form.
- Signed 16-bit or 8-bit integers, held in sign-extended form.
- Two 16-bit integers packed into a register.
- Four 8-bit integers packed into a register.
- Unsigned or signed 64-bit integers held in two registers.

Load and store operations can transfer bytes, halfwords, or words to and from memory. Loads of bytes or halfwords zero-extend or sign-extend the data as it is loaded, as specified in the appropriate load instruction.

The instruction sets include load and store operations that transfer two or more words to and from memory. Software can load and store doublewords using these instructions.

___ Note ___

For information about the atomicity of memory accesses see Atomicity in the ARM architecture on page E2-3006.

When any of the data types is described as *unsigned*, the N-bit data value represents a non-negative integer in the range 0 to \(2^{N-1}\), using normal binary format.

When any of these types is described as *signed*, the N-bit data value represents an integer in the range \(-2^{(N-1)}\) to \(+2^{(N-1)-1}\), using two's complement format.
The instructions that operate on packed halfwords or bytes include some multiply instructions that use only one of two halfwords, and SIMD instructions that perform parallel addition or subtraction on all of the halfwords or bytes.

Note

These SIMD instructions operate on values held in the general-purpose registers, and must not be confused with the Advanced SIMD instructions that operate on a separate register file that provides registers of up 128 bits.

Direct instruction support for 64-bit integers is limited, and most 64-bit operations require sequences of two or more instructions to synthesize them.

Integer arithmetic

The instruction set provides a wide range of operations on the values in registers, including bitwise logical operations, shifts, additions, subtractions, multiplications, and divisions. The pseudocode described in Appendix K12 ARM Pseudocode Definition defines these operations, usually in one of three ways:

- By direct use of the pseudocode operators and built-in functions defined in Operators on page K12-6572.
- By use of pseudocode helper functions defined in the main text. See Appendix K12 Pseudocode Index.
- By a sequence of the form:
  1. Use of the SInt(), UInt(), and Int() built-in functions defined in Converting bitstrings to integers on page K12-6584 to convert the bitstring contents of the instruction operands to the unbounded integers that they represent as two's complement or unsigned integers.
  2. Use of mathematical operators, built-in functions and helper functions on those unbounded integers to calculate other such integers.
  3. Use of either the bitstring extraction operator defined in Bitstring concatenation and slicing on page K12-6573 or of the saturation helper functions described in Pseudocode description of saturation on page E1-2981 to convert an unbounded integer result into a bitstring result that can be written to a register.

Shift and rotate operations

The following types of shift and rotate operations are used in instructions:

Logical Shift Left

The LSL() pseudocode function moves each bit of a bitstring left by a specified number of bits. Zeros are shifted in at the right end of the bitstring. Bits that are shifted off the left end of the bitstring are discarded, except that the last such bit can be produced as a carry output.

Logical Shift Right

The LSR() pseudocode function moves each bit of a bitstring right by a specified number of bits. Zeros are shifted in at the left end of the bitstring. Bits that are shifted off the right end of the bitstring are discarded, except that the last such bit can be produced as a carry output.

Arithmetic Shift Right

The ASR() pseudocode function moves each bit of a bitstring right by a specified number of bits. Copies of the leftmost bit are shifted in at the left end of the bitstring. Bits that are shifted off the right end of the bitstring are discarded, except that the last such bit can be produced as a carry output.

Rotate Right

The ROR() pseudocode function moves each bit of a bitstring right by a specified number of bits. Each bit that is shifted off the right end of the bitstring is re-introduced at the left end. The last bit shifted off the right end of the bitstring can be produced as a carry output.

Rotate Right with Extend

The RRX() pseudocode function moves each bit of a bitstring right by one bit. A carry input is shifted in at the left end of the bitstring. The bit shifted off the right end of the bitstring can be produced as a carry output.
**Pseudocode description of addition and subtraction**

In pseudocode, addition and subtraction can be performed on any combination of unbounded integers and bitstrings, provided that if they are performed on two bitstrings, the bitstrings must be identical in length. The result is another unbounded integer if both operands are unbounded integers, and a bitstring of the same length as the bitstring operand or operands otherwise. For the definition of these operations, see *Addition and subtraction* on page K12-6574.

The main addition and subtraction instructions can produce status information about both unsigned carry and signed overflow conditions. When necessary, multi-word additions and subtractions can be synthesized from this status information. In pseudocode the `AddWithCarry()` function provides an addition with a carry input and a set of output Condition flags including carry output and overflow:

An important property of the `AddWithCarry()` function is that if:

\[
\text{result, nzcv} = \text{AddWithCarry}(x, \text{NOT}(y), \text{carry\_in})
\]

Then:

- If `carry\_in` == ‘1’, then result == x-y with:
  - `nzcv<0>` == ‘1’ if signed overflow occurred during the subtraction.
  - `nzcv<1>` == ‘1’ if unsigned borrow did not occur during the subtraction, that is, if \(x \geq y\).
- If `carry\_in` == ‘0’, then result == x-y-1 with:
  - `nzcv<0>` == ‘1’ if signed overflow occurred during the subtraction.
  - `nzcv<1>` == ‘1’ if unsigned borrow did not occur during the subtraction, that is, if \(x \geq y\).

Taken together, this means that the `carry\_in` and `nzcv<1>` output in `AddWithCarry()` calls can act as NOT borrow flags for subtractions as well as carry flags for additions.

**Pseudocode description of saturation**

Some instructions perform *saturating arithmetic*, that is, if the result of the arithmetic overflows the destination signed or unsigned N-bit integer range, the result produced is the largest or smallest value in that range, rather than wrapping around modulo \(2^N\). This is supported in pseudocode by:

- The `SignedSatQ()` and `UnsignedSatQ()` functions when an operation requires, in addition to the saturated result, a Boolean argument that indicates whether saturation occurred.
- The `SignedSat()` and `UnsignedSat()` functions when only the saturated result is required.

`Sat(i, N, unsigned)` returns either `UnsignedSatQ(i, N)` or `SignedSatQ(i, N)` depending on the value of its third argument, and `Sat(i, N, unsigned)` returns either `UnsignedSat(i, N)` or `SignedSat(i, N)` depending on the value of its third argument.

### E1.2.3 The general-purpose registers, and the PC, in AArch32 state

In the AArch32 Application level view, a PE has:

- Fifteen general-purpose 32-bit registers, R0 to R14, of which R13 and R14 have alternative names reflecting how they are, or can be, used:
  - R13 is usually identified as SP.
  - R14 is usually identified as LR.
- The PC (program counter), that can be described as R15.
The specialized uses of the SP (R13), LR (R14), and PC (R15) are:

**SP, the stack pointer**

The PE uses SP as a pointer to the active stack.

In the T32 instruction set, some instructions cannot access SP. Instructions that can access SP can use SP as a general-purpose register.

The A32 instruction set provides more general access to SP, and it can be used as a general-purpose register.

--- Note ---

Using SP for any purpose other than as a stack pointer might break the requirements of operating systems, debuggers, and other software systems, causing them to malfunction.

Software can refer to SP as R13.

**LR, the link register**

The link register can be used to hold return link information, and some cases described in this manual require this use of the LR. When software does not require the LR for linking, it can use it for other purposes. Software can refer to LR as R14.

**PC, the program counter**

- When executing an A32 instruction, PC reads as the address of the current instruction plus 8.
- When executing a T32 instruction, PC reads as the address of the current instruction plus 4.
- Writing an address to PC causes a branch to that address.

Most T32 instructions cannot access PC.

The A32 instruction set provides more general access to the PC, and many A32 instructions can use the PC as a general-purpose register. However, ARM deprecates the use of PC for any purpose other than as the program counter. See **Writing to the PC** for more information.

Software can refer to PC as R15.

See **AArch32 general-purpose registers, the PC, and the Special-purpose registers** on page G1-4609 for the system level view of these registers.

--- Note ---

In general, ARM strongly recommends using the names SP, LR and PC instead of R13, R14 and R15. However, sometimes it is simpler to use the R13-R15 names when referring to a group of registers. For example, it is simpler to refer to registers R8 to R15, rather than to registers R8 to R12, the SP, LR and PC. These two descriptions of the group of registers have exactly the same meaning.

**Writing to the PC**

In the A32 and T32 instruction sets, many data-processing instructions can write to the PC. Writes to the PC are handled as follows:

- In T32 state, the following 16-bit T32 instruction encodings branch to the value written to the PC:
  - Encoding T2 of **ADD, ADDS (register)** on page F5-3271.
  - Encoding T1 of **MOV, MOVS (register)** on page F5-3514.

The value written to the PC is forced to be halfword-aligned by ignoring its least significant bit, treating that bit as being 0.

- The **B, BL, CBNZ, CBZ, CHKA, HR, HBL, HBLP, HBP, TBB, and TBH** instructions remain in the same instruction set state and branch to the value written to the PC.

The definition of each of these instructions ensures that the value written to the PC is correctly aligned for the current instruction set state.
• The BLX (immediate) instruction switches between A32 and T32 states and branches to the value written to the PC. Its definition ensures that the value written to the PC is correctly aligned for the new instruction set state.

• The following instructions write a value to the PC, treating that value as an interworking address to branch to, with low-order bits that determine the new instruction set state:
  — BLX (register), BX, and BXJ.
  — LDR instructions with <rt> equal to the PC.
  — POP and all forms of LDM except LDM (exception return), when the register list includes the PC.
  — In A32 state only, ADC, ADD, ADR, AND, ASR (immediate), BIC, EOR, LSL (immediate), LSR (immediate), MOV, MVN, ORR, ROR (immediate), RX, RSB, RSC, SBC, and SUB instructions with <rd> equal to the PC and without flag-setting specified.

For details of how an interworking address specifies the new instruction set state and instruction address, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC.

— Note —
The register-shifted register instructions, that are available only in the A32 instruction set and are summarized in Data-processing register (register shift) on page F4-3209, are CONSTRAINED UNPREDICTABLE if they attempt to write to the PC, see Using R15 on page K1-6391.

• Some instructions are treated as exception return instructions, and write both the PC and the CPSR. For more information, including which instructions are exception return instructions, see Exception return to an Exception level using AArch32 on page G1-4645.

• Some instructions cause an exception, and the exception handler address is written to the PC as part of the exception entry.

Pseudocode description of operations on the AArch32 general-purpose registers and the PC

In pseudocode, the uses of the $R[n]$ function, with an index parameter $n$, are:
• Reading or writing R0-R12, SP, and LR, using $n = 0-12$, 13, and 14 respectively.
• Reading the PC, using $n = 15$.

Pseudocode description of general-purpose register and PC operations on page G1-4611 describes accesses to these registers.

Descriptions of A32 store instructions that store the PC value use the PCStoreValue() pseudocode function to specify the PC value stored by the instruction.

Writing an address to the PC causes either a simple branch to that address or an interworking branch that also selects the instruction set to execute after the branch. A simple branch is performed by the BranchWritePC() function.

An interworking branch is performed by the BXWritePC() function.

The LoadWritePC() and ALUWritePC() functions are used for two cases where the behavior was systematically modified between architecture versions.
E1.2.4 Process state, PSTATE

Process state or PSTATE is an abstraction of process state information. All of the instruction sets provide instructions that operate on elements of PSTATE.

Note

In this chapter, references to PSTATE link to the more appropriate of:
• The Application-level view of PSTATE given in this section.
• The System-level description in Process state, PSTATE on page G1-4614.

The following PSTATE information is accessible at EL0:

The Condition flags

Flag-setting instructions set these. They are:

N  Negative Condition flag. If the result of the instruction is regarded as a two's complement signed integer, the PE sets this to:
• 1 if the result is negative.
• 0 if the result is positive or zero.

Z  Zero Condition flag. Set to:
• 1 if the result of the instruction is zero.
• 0 otherwise.
A result of zero often indicates an equal result from a comparison.

C  Carry Condition flag. Set to:
• 1 if the instruction results in a carry condition, for example an unsigned overflow that is the result of an addition.
• 0 otherwise.

V  Overflow Condition flag. Set to:
• 1 if the instruction results in an overflow condition, for example a signed overflow that is the result of an addition.
• 0 otherwise.

Conditional instructions test the N, Z, C, and V Condition flags, combining them with the Condition code for the instruction, to determine whether the instruction must be executed. In this way, execution of the instruction is conditional on the result of a previous operation. For more information about conditional execution, see Conditional execution on page F2-3101.

The overflow or saturation flag

Q  Some instructions can set this. For those instructions that can, the PE:
• Sets it to 1 if the instruction indicates overflow or saturation.
• Leaves it unchanged otherwise.
For more information, see Pseudocode description of saturation on page E1-2981.

The greater than or equal flags

GE[3:0]  The instructions described in Parallel addition and subtraction instructions on page F1-3068 update these to indicate the results from individual bytes or halfwords of the operation. These flags can control a later SEL instruction. For more information, see SEL on page F5-3663.
**PSTATE** also contains **PE state controls**. There is no direct access to these from application level instructions, but they can be changed by side-effects of application level instructions. They are:

**Instruction set state**

**J, T** The current instruction set state, as shown in Table E1-1. In ARMv8, the J bit is RES0, see the Note in this section.

<table>
<thead>
<tr>
<th>J</th>
<th>T</th>
<th>Instruction set state</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>A32</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
<td>T32</td>
</tr>
</tbody>
</table>

**A32** The PE is executing the A32 instruction set, summarized in Chapter F4 **A32 Instruction Set Encoding**.

**T32** The PE is executing the T32 instruction set, summarized in Chapter F3 **T32 Instruction Set Encoding**.

**Note**

**Encoding with J==1 before ARMv8, Jazelle and T32EE states**

In previous versions of the ARM architecture, the encoding {1, 0} selected Jazelle state, and encoding {1, 1} selected T32EE state. ARMv8 does not support either of these states, and these are encodings for unimplemented instruction set states, see **Unimplemented instruction sets** on page G1-4620. ARMv8 AArch32 state requires a Trivial Jazelle implementation, see **Trivial implementation of the Jazelle extension** on page G1-4620.

**The IT block state**

**IT[7:0]** The If-Then controls for the T32 IT instruction, that applies to the **IT block** of instructions that immediately follow the IT instruction. See **IT** on page F5-3380 for a description of the IT instruction and its associated IT block.

For more information about the use of **PSTATE.IT** see **Use of PSTATE.IT** on page E1-2987.

**Endianness mapping**

**E** For data accesses, controls the endianness:

<table>
<thead>
<tr>
<th>E</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Little-endian.</td>
</tr>
<tr>
<td>1</td>
<td>Big-endian.</td>
</tr>
</tbody>
</table>

If an implementation does not provide:

- Big-endian support for data accesses, this bit is RES0.
- Little-endian support for data accesses, this bit is RES1.

Instruction fetches are always little-endian, and ignore **PSTATE.E**.
Accessing PSTATE fields at EL0

The following sections describe which PSTATE fields can be directly accessed at EL0, and how they can be accessed:

- The Application Program Status Register, APSR.
- The SETEND instruction.

The Application Program Status Register, APSR

At EL0, some PSTATE fields can be accessed using the Special-purpose Application Program Status Register (APSR). The APSR can be directly read using the MRS instruction, and directly written using the MSR (register) and MSR (immediate) instructions.

The APSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>N, Z, C, V</td>
<td>PSTATE Condition flags.</td>
</tr>
<tr>
<td>Q</td>
<td>PSTATE overflow or saturation flag.</td>
</tr>
<tr>
<td>Bits[26:24]</td>
<td>Reserved, RAZ/SBZP. Software can use MSR instructions that write the top byte of the APSR without using a read-modify-write sequence. If it does this, it must write zeros to bits[26:24].</td>
</tr>
<tr>
<td>Bits[23:20, 15:0]</td>
<td>Reserved bits that are allocated to system features, or are available for future expansion. Unprivileged execution ignores writes to fields that are accessible only at EL1 or higher. However, application level software that writes to the APSR must treat reserved bits as Do-Not-Modify (DNM) bits. For more information about the reserved bits, see The Current Program Status Register, CPSR on page G1-4616.</td>
</tr>
<tr>
<td>GE[3:0]</td>
<td>The PSTATE greater than or equal flags.</td>
</tr>
</tbody>
</table>

The other PSTATE fields cannot be accessed by using the APSR.

The system level alias for the APSR is the CPSR. The CPSR is a superset of the APSR. See The Current Program Status Register, CPSR on page G1-4616.

Writes to the PSTATE fields have side-effects on various aspects of PE operation. All of these side-effects, except side-effects on memory accesses associated with fetching instructions, are synchronous to the APSR write. This means they are guaranteed:

- Not to be visible to earlier instructions in the execution stream.
- To be visible to later instructions in the execution stream.

The SETEND instruction

The A32 and T32 instruction sets both include an instruction to manipulate PSTATE.E:

- **SETEND BE** Sets PSTATE.E to 1, for big-endian operation.
- **SETEND LE** Sets PSTATE.E to 0, for little-endian operation.

The SETEND instruction is unconditional. For more information, see SETEND on page F5-3665. ARM deprecates use of the SETEND instruction.
Use of PSTATE.IT

PSTATE.IT provides the If-Then controls for the T32 IT instruction, that applies to the IT block of instructions that immediately follow the IT instruction.

PSTATE.IT divides into two subfields:

**IT[7:5]** Holds the base condition for the current IT block. The base condition is the top three bits of the Condition code specified by the <firstcond> field of the IT instruction.

**IT[4:0]** Encodes:

- Implicitly, the size of the IT block. This is the number of instructions that are to be conditionally executed. The size of the block is indicated by the position of the least significant 1 in this field, as shown in Table E1-2.
- For each instruction in the IT block, the least significant bit of the Condition code. This is encoded in the IT block entries that Table E1-2 shows as Nx.

Note: Changing the least significant bit of a Condition code from 0 to 1 has the effect of inverting the Condition code.

Both subfields are all zeros when no IT block is active.

When an IT instruction is executed, PSTATE.IT is set according to the <firstcond> field of the instruction and the Then and Else (T and E) parameters in the instruction, see IT on page F5-3380. This means that, on executing an IT instruction, the initial state of PSTATE.IT depends on the number of instructions in the IT block, as Table E1-2 shows:

<table>
<thead>
<tr>
<th>Number of instructions in IT block</th>
<th>PSTATE.IT bits</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>1</td>
<td>cond_base</td>
<td>N1</td>
</tr>
<tr>
<td>Not executing an IT instruction</td>
<td>000</td>
<td>0</td>
</tr>
</tbody>
</table>

Table E1-2 Initial state of PSTATE.IT on executing an IT instruction

In Table E1-2, N1 refers to the first instruction in the IT block, and N2, N3, and N4 refer to the second, third, and fourth instructions in the IT block if they are present.

When permitted, an instruction in an IT block is conditional, see Conditional instructions on page F1-3059 and Conditional execution on page F2-3101. The Condition code used is the current value of IT[7:4]. When an instruction in an IT block completes its execution normally, PSTATE.IT[4:0] is left-shifted by one bit, so that PSTATE.IT[4] always relates to the next instruction to be executed. Table E1-3 on page E1-2988 shows how PSTATE.IT during the execution of an IT instruction with four instructions in the IT block.
A few instructions, for example BKPT, cannot be conditional and therefore are always executed ignoring the current value of PSTATE.IT.

For details of what happens if an instruction in an IT block takes an exception, see Overview of exception entry on page G1-4630.

An instruction that might complete its normal execution by branching is only permitted in an IT block as the last instruction in the block. This means that normal execution of the instruction always results in PSTATE.IT advancing to execution where no IT block is active.

For performance reasons, ARMv8 deprecates the use of IT other than with a single 16-bit T32 instruction from a specified subset of the 16-bit T32 instructions, see Partial deprecation of IT on page F1-3076. In addition, implementations can provide a set of ITD control fields, SCTLR.ITD, SCTLR_EL1.ITD, and HSCTLR.ITD, to disable these deprecated uses, making them UNDEFINED. When an implementation includes ITD control fields, Changes to an ITD control by an instruction in an IT block describes the permitted CONSTRAINED UNPREDICTABLE behaviors if an instruction in an IT block changes the value of an ITD control to disable the use of the IT instruction.

On a branch or an exception return, if PSTATE.IT is set to a value that is not consistent with the instruction stream being branched to or returned to, then instruction execution is CONSTRAINED UNPREDICTABLE.

PSTATE.IT affects instruction execution only in T32 state. In A32 state, PSTATE.IT must be 0b00000000, otherwise the behavior is CONSTRAINED UNPREDICTABLE.

For more information see CONSTRAINED UNPREDICTABLE behavior associated with IT instructions and PSTATE.IT on page K1-6392.

Changes to an ITD control by an instruction in an IT block

In an implementation that includes SCTLR.ITD, SCTLR_EL1.ITD, and HSCTLR.ITD controls, if an instruction in an IT block changes an ITD control so that the IT instruction using the IT block would be disabled, then one of the following behaviors applies:

- The change to the ITD field, once synchronized, has no effect on the execution of instructions in the current IT block, but applies only to any subsequent execution of an IT instruction to which the control applies.
- Synchronizing the change to the ITD field guarantees that all bits of PSTATE.IT are cleared to 0.

In addition, after the change to the ITD field has been synchronized, any remaining instructions in the IT block that would be made UNDEFINED by the new value of ITD are either:

- Executed normally.
- Treated as UNDEFINED.

The choice between the options described in this section is determined by the implementation, and any choice can vary between different changes to an ITD control by an instruction in an IT block.

### Table E1-3 Updates to PSTATE.IT when executing an IT instruction with a four-instruction IT block

<table>
<thead>
<tr>
<th>IT block instruction being executed</th>
<th>PSTATE.IT bits</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>First</td>
<td>cond_base N1 N2 N3 N4 1 -</td>
<td></td>
</tr>
<tr>
<td>Second</td>
<td>cond_base N2 N3 N4 1 0 0 -</td>
<td></td>
</tr>
<tr>
<td>Third</td>
<td>cond_base N3 N4 1 0 0 0 -</td>

</tr>
<tr>
<td>Fourth</td>
<td>cond_base N4 1 0 0 0 0 -</td>
<td></td>
</tr>
<tr>
<td>Not executing an IT instruction</td>
<td>000 0 0 0 0 0</td>
<td>No IT block is active</td>
</tr>
</tbody>
</table>

A few instructions, for example BKPT, cannot be conditional and therefore are always executed ignoring the current value of PSTATE.IT.
**Pseudocode description of PSTATE PE state fields**

The pseudocode function `CurrentInstrSet()` returns the current instruction set. The pseudocode function `SelectInstrSet()` selects a new instruction set.

PSTATE.IT advances after normal execution of an IT block instruction. This is described by the `AArch32.ITAdvance()` pseudocode function.

The pseudocode function `InITBlock()` tests whether the current instruction is in an IT block. The pseudocode function `LastInITBlock()` tests whether the current instruction is the last instruction in an IT block.

The `BigEndian()` pseudocode function tests whether big-endian data memory accesses are currently selected.

**E1.2.5 Jazelle support**

ARMv8 requires AArch32 state to include a trivial implementation of the Jazelle extension, as described in *Trivial implementation of the Jazelle extension* on page G1-4620.
E1.3 Advanced SIMD and floating-point instructions

In general, ARMv8 requires implementation of Advanced SIMD and floating-point instructions in the T32 and A32 instruction sets, but see Implications of not including Advanced SIMD and floating-point support on page E1-2996.

The Advanced SIMD instructions perform packed Single Instruction Multiple Data (SIMD) operations, either integer or single-precision floating-point. The floating-point instructions perform single-precision or double-precision scalar floating-point operations. When ARMv8.2-FP16 is implemented, half-precision floating-point can also be used for data processing.

These instructions permit floating-point exceptions, such as Overflow or Divide by Zero, to be handled without trapping. When handled in this way, a floating-point exception causes a cumulative status register bit to be set to 1 and a default result to be produced by the operation. ARMv8 also optionally supports the trapping of floating-point exceptions, see Floating-point exceptions and exception traps on page G1-4700. For more information about floating-point exceptions see Floating-point exceptions and exception traps on page E1-2993.

The Advanced SIMD and floating-point instructions also provide the following conversion functions:

- Between half-precision floating-point and single-precision floating point, in both directions.
- From double-precision, floating point to a signed single precision integer.

Some Advanced SIMD instructions support polynomial arithmetic over \{0, 1\}, as described in Polynomial arithmetic over \{0, 1\} on page A1-49.

For system level information about the Advanced SIMD and Floating-point implementation see Advanced SIMD and floating-point support on page G1-4696.

The following sections give more information about the Advanced SIMD and floating-point instructions:

- The SIMD and floating-point register file.
- Data types supported by the Advanced SIMD implementation on page E1-2992.
- Advanced SIMD and floating-point System registers on page E1-2992.
- Floating-point data types and arithmetic on page E1-2992.
- Floating-point exceptions and exception traps on page E1-2993.
- Controls of Advanced SIMD operation that do not apply to floating-point operation on page E1-2996.
- Implications of not including Advanced SIMD and floating-point support on page E1-2996.
- Pseudocode description of floating-point operations on page E1-2997.

E1.3.1 The SIMD and floating-point register file

The Advanced SIMD and floating-point instructions use the same register file, that comprises 32 registers. This is distinct from the register file that holds the general-purpose registers and the PC.

The Advanced SIMD and floating-point views of the register file are different. The following sections describe these different views. Figure E1-1 on page E1-2991 shows the views of the register file, and the way the word, doubleword, and quadword registers overlap.

Advanced SIMD views of the register file

Advanced SIMD can view this register file as:

- Sixteen 128-bit quadword registers, Q0-Q15.
- Thirty-two 64-bit doubleword registers, D0-D31.

These views can be used simultaneously. For example, a program might hold 64-bit vectors in D0 and D1 and a 128-bit vector in Q1.
Floating-point views of the register file

The Advanced SIMD and floating-point register file consists of thirty-two doubleword registers, that can be viewed as:

- Thirty-two 64-bit doubleword registers, D0-D31. This view is also available to Advanced SIMD instructions.
- Thirty-two 32-bit single word registers, S0-S31. Only half of the set is accessible in this view.

**Note**

In AArch32 state, half-precision floating point values are always represented using the bottom 16 bits of a single word register, S0-S31. When a half-precision value is written to a single word register, the top 16 bits of that register are set to 0.

The two views can be used simultaneously.

SIMD and Floating-point register file mapping onto registers

Figure E1-1 shows the different views of the SIMD and floating-point register file, and the relationship between them.

<table>
<thead>
<tr>
<th>S0-S31</th>
<th>D0-D31</th>
<th>Q0-Q15</th>
</tr>
</thead>
<tbody>
<tr>
<td>Floating-point only</td>
<td>Floating-point or Advanced SIMD</td>
<td>Advanced SIMD only</td>
</tr>
<tr>
<td>S0</td>
<td>D0</td>
<td>Q0</td>
</tr>
<tr>
<td>S1</td>
<td>D1</td>
<td></td>
</tr>
<tr>
<td>S2</td>
<td>D2</td>
<td>Q1</td>
</tr>
<tr>
<td>S3</td>
<td>D3</td>
<td></td>
</tr>
<tr>
<td>S4</td>
<td></td>
<td></td>
</tr>
<tr>
<td>S5</td>
<td></td>
<td></td>
</tr>
<tr>
<td>S6</td>
<td></td>
<td></td>

<td>D15</td>
<td>Q7</td>
</tr>
<tr>
<td>S30</td>
<td></td>
<td></td>
</tr>
<tr>
<td>S31</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The mapping between the registers is as follows:

- $S_{2n}$ maps to the least significant half of $D_{2n}$.
- $S_{2n+1}$ maps to the most significant half of $D_{2n}$.
- $D_{2n}$ maps to the least significant half of $Q_{n}$.
- $D_{2n+1}$ maps to the most significant half of $Q_{n}$.
For example, software can access the least significant half of the elements of a vector in Q6 by referring to D12, and the most significant half of the elements by referring to D13.

**Pseudocode description of the SIMD and Floating-point register file**

The functions _Dclone, S[], and D[] provide the S0-S31, D0-D31, and Q0-Q15 views of the Advanced SIMD and floating-point registers:

The Din[] function returns a Doubleword register from the _Dclone[] copy of the SIMD and Floating-point register file, and the Qin[] function returns a Quadword register from that register file.

---

**E1.3.2 Data types supported by the Advanced SIMD implementation**

Advanced SIMD instructions can operate on integer and floating-point data, and the implementation defines a set of data types that support the required data formats. Vector formats in AArch32 state on page A1-42 describes these formats.

**Advanced SIMD vectors**

In an implementation that includes support for Advanced SIMD operation, a register can hold one or more packed elements, all of the same size and type. The combination of a register and a data type describes a vector of elements. The vector is considered to be an array of elements of the data type specified in the instruction. The number of elements in the vector is implied by the size of the data elements and the size of the register.

Vector indices are in the range 0 to (number of elements – 1). An index of 0 refers to the least significant end of the vector. In Vector formats in AArch32 state on page A1-42, Figure A1-3 on page A1-44 shows the Advanced SIMD vector formats.

**Pseudocode description of Advanced SIMD vectors**

The pseudocode function Elem[] accesses the element of a specified index and size in a vector.

**E1.3.3 Advanced SIMD and floating-point System registers**

The Advanced SIMD and floating-point instructions have a shared register space for System registers. The only register in this space that is accessible at the Application level is the FPSCR.

Writes to the FPSCR can have side-effects on various aspects of PE operation. All of these side-effects are synchronous to the FPSCR write. This means they are guaranteed not to be visible to earlier instructions in the execution stream, and they are guaranteed to be visible to later instructions in the execution stream.

See Advanced SIMD and floating-point System registers on page G1-4699 for the system level view of the registers.

These registers can be described as the SIMD and floating-point System registers.

**E1.3.4 Floating-point data types and arithmetic**

The T32 and A32 floating-point instructions support single-precision (32-bit) and double-precision (64-bit) data types and arithmetic as defined by the IEEE 754 floating-point standard. They also support the half-precision (16-bit) floating-point data type for data storage, by supporting conversions between single-precision and half-precision data types. When ARMv8.2-FP16 is implemented, it also supports the half-precision floating-point data type for data processing operations.
ARM standard floating-point arithmetic means IEEE 754 floating-point arithmetic with the restrictions described in Advanced SIMD and floating-point support on page A1-50, including supporting only the input and output values described in ARM standard floating-point input and output values on page A1-52.

The AArch32 Advanced SIMD instructions support only single-precision and, when ARMv8.2-FP16 is implemented, half-precision ARM standard floating-point arithmetic.

The following sections describe the Advanced SIMD and floating-point formats:
- Half-precision floating-point formats on page A1-44.
- Double-precision floating-point format on page A1-47.

The following sections describe features of Advanced SIMD and floating-point processing:
- NaN handling and the Default NaN on page A1-54.

## Floating-point exceptions and exception traps

ARM Advanced SIMD and floating-point instructions record the following floating-point exceptions in the FPSCR cumulative bits, unless the floating-point exception is trapped and generates an exception:

- **FPSCR.IOC** Invalid Operation. The bit is set to 1 if the result of an operation has no mathematical value or cannot be represented. Cases include, for example:
  - \((\text{infinity}) \times 0\).
  - \((+\text{infinity}) + (-\text{infinity})\).

  These tests are made after flush-to-zero processing. For example, if flush-to-zero mode is selected, multiplying a denormalized number and an infinity is treated as \((0 \times \text{infinity})\), and causes an Invalid Operation floating-point exception.

  IOC is also set on any floating-point operation with one or more signaling NaNs as operands, except for negation and absolute value, as described in Floating-point negation and absolute value on page E1-2997.

- **FPSCR.DZC** Divide by Zero. The bit is set to 1 if a divide operation has a zero divisor and a dividend that is not zero, an infinity or a NaN. These tests are made after flush-to-zero processing, so if flush-to-zero processing is selected, a denormalized dividend is treated as zero and prevents Divide by Zero from occurring, and a denormalized divisor is treated as zero and causes Divide by Zero to occur if the dividend is a normalized number.

  For the reciprocal and reciprocal square root estimate functions the dividend is assumed to be +1.0. This means that a zero or denormalized operand to these functions sets the DZC bit.

- **FPSCR.OFC** Overflow. The bit is set to 1 if the absolute value of the result of an operation, produced after rounding, is greater than the maximum positive normalized number for the destination precision.

- **FPSCR.UFC** Underflow. The bit is set to 1 if the absolute value of the result of an operation, produced before rounding, is less than the minimum positive normalized number for the destination precision, and the rounded result is inexact.

  The criteria for the Underflow floating-point exception to occur are different in Flush-to-zero mode. For details, see Flush-to-zero on page A1-53.

- **FPSCR.IXC** Inexact. The bit is set to 1 if the result of an operation is not equivalent to the value that would be produced if the operation were performed with unbounded precision and exponent range.

  The criteria for the Inexact floating-point exception to occur are different in Flush-to-zero mode. For details, see Flush-to-zero on page A1-53.

- **FPSCR.IDC** Input Denormal. The bit is set to 1 if a denormalized input operand is replaced in the computation by a zero, as described in Flush-to-zero on page A1-53.
For Advanced SIMD instructions, and for floating-point instructions when floating-point exception trapping is not supported, these are non-trapping exceptions and the data-processing instructions do not generate any trapped exceptions.

For floating-point instructions when floating-point exception trapping is supported:

- The floating-point exceptions can be trapped, by setting trap enable bits in the FPSCR, see Floating-point exceptions and exception traps on page G1-4700, and:
  - When a trap is not enabled the corresponding floating-point exception updates the corresponding FPSCR cumulative bit does not generate an exception.
  - When a trap is enabled the corresponding floating-point exception does not update the FPSCR, but generates an exception. In this case, bits in the FPEXC indicate which floating-point exceptions have occurred.

- The definition of the Underflow floating-point exception is different in the trapped and cumulative exception cases. In the trapped case the definition is:
  - The trapped Underflow floating-point exception occurs if the absolute value of the result of an operation, produced before rounding, is less than the minimum positive normalized number for the destination precision, regardless of whether the rounded result is inexact.

- As with cumulative exceptions, higher priority trapped exceptions can prevent lower priority exceptions from occurring, as described in Combinations of floating-point exceptions on page E1-2995.

- For Invalid Operation floating-point exceptions, for details of which quiet NaN is produced as the default result see NaN handling and the Default NaN on page A1-54.

- For Overflow floating-point exceptions, the sign bit of the default result is determined normally for the overflowing operation.

- For Divide by Zero floating-point exceptions, the sign bit of the default result is determined normally for a division. This means it is the exclusive OR of the sign bits of the two operands.

Table E1-4 shows the results of untrapped floating-point exceptions. That table uses the following abbreviations:

| MaxNorm | The maximum normalized number of the destination precision. |
| RM      | Round towards Minus Infinity mode, as defined in the IEEE 754 standard. |
| RN      | Round to Nearest mode, as defined in the IEEE 754 standard. |
| RP      | Round towards Plus Infinity mode, as defined in the IEEE 754 standard. |
| RZ      | Round towards Zero mode, as defined in the IEEE 754 standard. |

For more information about the IEEE 754 descriptions of the rounding modes see Floating-point standards, and terminology on page A1-52.

Combinations of floating-point exceptions

Many pseudocode functions perform floating-point operations, including FixedToFP(), FPAdd(), FPCompare(), FPCompareEQ(), FPCompareGE(), FPCompareGT(), FPDiv(), FPMAX(), FMIN(), FMUL(), FMULAdd(), FPREcipEstimate(), FPREcipStep(), FPRSqrtEstimate(), FPRSqrtStep(), FPSqrt(), FPSub(), and FPToFixed(). All of these operations can generate floating-point exceptions.

--- Note ---

FPAbs() and FPNeg() are not classified as floating-point operations because:

- They cannot generate floating-point exceptions.
- The floating-point operation behavior described in the following sections does not apply to them:
  - NaN handling and the Default NaN on page A1-54.

More than one exception can occur on the same operation. The only combinations of floating-point exceptions that can occur are:

- Overflow with Inexact.
- Underflow with Inexact.
- Input Denormal with other floating-point exceptions.

The priority order of these floating-point exceptions is that the Inexact exception is treated as lowest priority, and the Input Denormal exception is treated as highest priority.

When none of the floating-point exceptions caused by an operation is trapped, any floating-point exception that occurs causes the associated cumulative bit in the FPSCR to be set.

When one or more floating-point exceptions caused by an operation is trapped, the behavior of the instruction depends on the priority of the exceptions:

- If the higher priority floating-point exception is trapped, its trap handler is called. It is IMPLEMENTATION DEFINED whether any information about the lower priority floating-point exception is provided.

--- Note ---

Information about the lower priority floating-point exception might be provided in:

- The FPEXC, if the exception generated by the trap is taken to an Exception level that is using AArch32.
- The ESR_ELx.ISS field, if the exception generated by the trap is taken to an Exception level that is using AArch64.

However, information might be provided in another IMPLEMENTATION DEFINED way, for example using an IMPLEMENTATION DEFINED register.

Apart from this, the lower priority floating-point exception is ignored in this case.

- If the higher priority floating-point exception is untrapped, its cumulative bit is set to 1 and its default result is evaluated. Then the lower priority floating-point exception is handled normally, using this default result.

Some floating-point instructions specify more than one floating-point operation, as indicated by the pseudocode descriptions of the instruction. In such cases, a floating-point exception on one operation is treated as higher priority than a floating-point exception on another operation if the occurrence of the second floating-point exception depends on the result of the first operation. Otherwise, it is CONSTRAINED UNPREDICTABLE which floating-point exception is treated as higher priority.

For example, a VMLA.F32 instruction specifies a floating-point multiplication followed by a floating-point addition. The addition can generate Overflow, Underflow and Inexact floating-point exceptions, all of which depend on both operands to the addition and so are treated as lower priority than any floating-point exception on the multiplication. The same applies to Invalid Operation floating-point exceptions on the addition caused by adding opposite-signed infinities. The addition can also generate an Input Denormal floating-point exception, caused by the addend being a denormalized number while in Flush-to-zero mode. It is CONSTRAINED UNPREDICTABLE which of an Input Denormal floating-point exception on the addition and a floating-point exception on the multiplication is treated as higher priority.
higher priority, because the occurrence of the Input Denormal floating-point exception does not depend on the result of the multiplication. The same applies to an Invalid Operation floating-point exception on the addition caused by the addend being a signaling NaN.

Note

The `VFMA` instruction performs a vector addition and a vector multiplication as a single operation. The `VFMS` instruction performs a vector subtraction and a vector multiplication as a single operation.

### E1.3.6 Controls of Advanced SIMD operation that do not apply to floating-point operation

ARMv7 permitted implementation of either, both, or neither of the Advanced SIMD and floating-point additions to the base instruction set, and provided some controls that applied to the Advanced SIMD functionality but not to the floating-point functionality. In ARMv8, Advanced SIMD functionality cannot be separated from floating-point functionality, but in AArch32 state these controls function as they did in ARMv7. This means they apply only to the following instructions and instruction encodings:

- All instructions with encodings defined in:
  - Advanced SIMD data-processing on page F3-3155, for the T32 instruction set.
  - Advanced SIMD data-processing on page F4-3240, for the A32 instruction set.

- All instructions with encodings defined in:
  - Advanced SIMD element or structure load/store on page F3-3178, for the T32 instruction set.
  - Advanced SIMD element or structure load/store on page F4-3252, for the A32 instruction set.

- The form of the `VDUP` instruction described in VDUP (general-purpose register) on page F6-4113.

- The byte and halfword forms of the VMOV instructions described in each of:
  - VMOV (general-purpose register to scalar) on page F6-4276.
  - VMOV (scalar to general-purpose register) on page F6-4280.

The controls of this functionality are:

- The CPACR.ASEDIS field.
- The HCPTR.TASE field.

In an implementation that supports Advanced SIMD functionality, support for each of these controls is optional:

- If the CPACR.ASEDIS control is not supported then the CPACR.ASEDIS field is RAZ/WI. This is equivalent to the control permitting the execution of Advanced SIMD instructions at EL1 and EL0.

- If the HCPTR.TASE control is not supported then the HCPTR.TASE field is RAZ/WI. This means the HCPTR does not provide a control that can trap Non-secure execution of Advanced SIMD instructions to Hyp mode.

### E1.3.7 Implications of not including Advanced SIMD and floating-point support

In general, ARMv8 requires the inclusion of the Advanced SIMD and floating-point instructions in all instruction sets. Exceptionally, for implementation targeting specialized markets, ARM might produce or license an ARMv8-A implementation that does not provide any support for Advanced SIMD and floating-point instructions. In such an implementation, in AArch32 state:

- Each of the CPACR.{cp10, cp11} fields is RES0.
- The CPACR.ASEDIS bit is RES0.
- Each of the HCPTR.{TASE, TCP10, TCP11} fields is RES1.
- Each of the NSACR.{NSASEDIS, cp10, cp11} fields is RES0.
- The FPEXC register is UNDEFINED.
E1.3.8 Pseudocode description of floating-point operations

The following subsections contain pseudocode definitions of the floating-point functionality supported by the ARMv8 architecture:

- Generation of specific floating-point values.
- Floating-point negation and absolute value.
- Floating-point value unpacking.
- Floating-point exception and NaN handling.
- Floating-point rounding on page E1-2998.
- Selection of ARM standard floating-point arithmetic on page E1-2998.
- Floating-point comparisons on page E1-2998.
- Floating-point maximum and minimum on page E1-2998.
- Floating-point addition and subtraction on page E1-2998.
- Floating-point multiplication and division on page E1-2998.
- Floating-point fused multiply-add on page E1-2998.
- Floating-point reciprocal estimate and step on page E1-2999.
- Floating-point square root on page E1-2999.
- Floating-point reciprocal square root estimate and step on page E1-2999.
- Floating-point conversions on page E1-3000.

Generation of specific floating-point values

The following pseudocode functions generate specific floating-point values. The sign argument is '0' for the positive version and '1' for the negative version:

- FPInfinity().
- FPMaxNormal().
- FPZero().
- FTPwo().
- FPTwo().
- FPTThree().
- FPDefaultNaN().

Floating-point negation and absolute value

The floating-point negation and absolute value operations only affect the sign bit. They do not treat NaN operands specially, nor denormalized number operands when flush-to-zero is selected.

The floating-point negation operation is described by the pseudocode function FPNeg(). The floating-point absolute value operation is described by the pseudocode function FPAbs().

Floating-point value unpacking

The FPUnpack() function determines the type of a floating-point number, defined by FPType{}, and its numerical value. It also does flush-to-zero processing on input operands.

Floating-point exception and NaN handling

The FPProcessException() procedure checks whether a floating-point exception is trapped, and handles it accordingly. The floating-point exception types are defined by FPExc{}.

The FPProcessNaN() function processes a NaN operand, producing the correct result value and generating an Invalid Operation floating-point exception if necessary. The FPProcessNaNs() function performs the standard NaN processing for a two-operand operation. The FPProcessNaNs3() function performs the standard NaN processing for a three-operand operation.
Floating-point rounding

The `FPRound()` function rounds and encodes a floating-point result to a specified destination format. This includes processing Overflow, Underflow and Inexact floating-point exceptions and performing flush-to-zero processing on result values.

Selection of ARM standard floating-point arithmetic

The `StandardFPSCRValue()` function returns the FPSCR value that selects ARM standard floating-point arithmetic. Most of the arithmetic functions have a Boolean `fpscr_controlled` argument that is `TRUE` for Floating-point operations and `FALSE` for Advanced SIMD operations, and that selects between using the real FPSCR value and this value.

Floating-point comparisons

The `FPCompare()` function compares two floating-point numbers, producing a \{N, Z, C, V\} Condition flags result as shown in Table E1-5:

<table>
<thead>
<tr>
<th>Comparison result</th>
<th>N</th>
<th>Z</th>
<th>C</th>
<th>V</th>
</tr>
</thead>
<tbody>
<tr>
<td>Equal</td>
<td>0</td>
<td>1</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>Less than</td>
<td>1</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Greater than</td>
<td>0</td>
<td>0</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>Unordered</td>
<td>0</td>
<td>0</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

This result defines the operation of the `VCMP` floating-point instruction. The `VCMP` instruction writes these flag values in the FPSCR. After using a `VMRS` instruction to transfer them to the APSR, they can control conditional execution as shown in Table F2-1 on page F2-3101.

The `FPCompareEQ()`, `FPCompareGE()`, and `FPCompareGT()` functions describe the operation of Advanced SIMD instructions that perform floating-point comparisons.

Floating-point maximum and minimum

The `FPMax()` function returns the maximum of two floating-point numbers. The `FPMin()` function returns the minimum of two floating-point numbers.

Floating-point addition and subtraction

The `FPAdd()` function adds two floating-point numbers. The `FPSub()` function subtracts one floating-point number from another floating-point number.

Floating-point multiplication and division

The `FPMul()` function multiplies two floating-point numbers. The `FPDiv()` function divides one floating-point number by another floating-point number.

Floating-point fused multiply-add

The `FPMulAdd()` function performs a floating-point fused multiply-add.
Floating-point reciprocal estimate and step

The Advanced SIMD implementation includes instructions that support Newton-Raphson calculation of the reciprocal of a number.

The VRECPE instruction produces the initial estimate of the reciprocal. It uses the pseudocode functions:

- FPRecipEstimate().
- UnsignedRecipEstimate().

Table E1-6 shows the results where input values are out of range.

### Table E1-6 VRECPE results for out of range inputs

<table>
<thead>
<tr>
<th>Number type</th>
<th>Input Vm[i]</th>
<th>Result Vd[i]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Integer</td>
<td>&lt;= 0x7FFFFFFF</td>
<td>0xFFFFFFFF</td>
</tr>
<tr>
<td>Floating-point</td>
<td>NaN</td>
<td>Default NaN</td>
</tr>
<tr>
<td>Floating-point</td>
<td>±0 or denormalized number</td>
<td>±infinity a</td>
</tr>
<tr>
<td>Floating-point</td>
<td>±infinity</td>
<td>±0</td>
</tr>
<tr>
<td>Floating-point</td>
<td>Absolute value &gt;= 2^{126}</td>
<td>±0</td>
</tr>
</tbody>
</table>

a. FPSCR.DZC is set to 1

The Newton-Raphson iteration:

\[ x_{n+1} = x_n (2 - dx_n) \]

converges to \((1/d)\) if \(x_0\) is the result of VRECPE applied to \(d\).

The VRECPS instruction performs a \((2 - op1 \times op2)\) calculation and can be used with a multiplication to perform a step of this iteration. The functionality of this instruction is defined by the FPRecipStep() pseudocode function.

Table E1-7 shows the results where input values are out of range.

### Table E1-7 VRECPS results for out of range inputs

<table>
<thead>
<tr>
<th>Input Vn[i]</th>
<th>Input Vm[i]</th>
<th>Result Vd[i]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any NaN</td>
<td>-</td>
<td>Default NaN</td>
</tr>
<tr>
<td>-</td>
<td>Any NaN</td>
<td>Default NaN</td>
</tr>
<tr>
<td>±0.0 or denormalized number</td>
<td>±infinity</td>
<td>2.0</td>
</tr>
<tr>
<td>±infinity</td>
<td>±0.0 or denormalized number</td>
<td>2.0</td>
</tr>
</tbody>
</table>

Floating-point square root

The FPSqrt() function returns the square root of a floating-point number.

Floating-point reciprocal square root estimate and step

The Advanced SIMD implementation includes instructions that support Newton-Raphson calculation of the reciprocal of the square root of a number.

The VRSQRTE instruction produces the initial estimate of the reciprocal of the square root. It uses the pseudocode functions:

- FPSqrtEstimate().
- UnsignedSqrtEstimate().
Table E1-8 shows the results where input values are out of range.

**Table E1-8 VRSQRTE results for out of range inputs**

<table>
<thead>
<tr>
<th>Number type</th>
<th>Input Vm[i]</th>
<th>Result Vd[i]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Integer</td>
<td>&lt;= 0xFFFFFFF</td>
<td>0xFFFFFFF</td>
</tr>
<tr>
<td>Floating-point</td>
<td>NaN, –(normalized number), –infinity</td>
<td>Default NaN</td>
</tr>
<tr>
<td>Floating-point</td>
<td>–0 or –(denormalized number)</td>
<td>– infinity a</td>
</tr>
<tr>
<td>Floating-point</td>
<td>+0 or +(denormalized number)</td>
<td>+infinity a</td>
</tr>
<tr>
<td>Floating-point</td>
<td>+infinity</td>
<td>+0</td>
</tr>
</tbody>
</table>

a. FPSCR.DZC is set to 1.

The Newton-Raphson iteration:

\[ x_{n+1} = x_n \frac{3 - dx_n^2}{2} \]

converges to \( \frac{1}{\sqrt{d}} \) if \( x_0 \) is the result of VRSQRTE applied to \( d \).

The VRSQRTS instruction performs a \( (3 – \text{op1} \times \text{op2})/2 \) calculation and can be used with two multiplications to perform a step of this iteration. The functionality of this instruction is defined by the FPRSqrtStep() pseudocode function.

Table E1-9 shows the results where input values are out of range.

**Table E1-9 VRSQRTS results for out of range inputs**

<table>
<thead>
<tr>
<th>Input Vn[i]</th>
<th>Input Vm[i]</th>
<th>Result Vd[i]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any NaN</td>
<td>-</td>
<td>Default NaN</td>
</tr>
<tr>
<td>-</td>
<td>Any NaN</td>
<td>Default NaN</td>
</tr>
<tr>
<td>±0.0 or denormalized number</td>
<td>±infinity</td>
<td>1.5</td>
</tr>
<tr>
<td>±infinity</td>
<td>±0.0 or denormalized number</td>
<td>1.5</td>
</tr>
</tbody>
</table>

FPRSqrtStep() calls the FPHalvedSub() pseudocode function.

**Floating-point conversions**

The FConvert() pseudocode function performs conversions between half-precision, single-precision, and double-precision floating-point numbers.

The FPToFixed() and FixedToFP() functions perform conversions between floating-point numbers and integers or fixed-point numbers.
E1.4 About the AArch32 System register interface

AArch32 state provides a System register encoding space, that is indexed by the parameter set \{coproc, opc1, Crn, Crm, opc2\}, and a set of System register access instructions. This encoding space is used for:

- System registers.
- System instructions, for:
  - Cache and branch predictor maintenance.
  - Address translation.
  - TLB maintenance.

In ARMv8, this encoding space uses only the coproc values 0b111x.

--- Note ---

The encoding space with coproc values 0b101x is redefined to provide Advanced SIMD and floating-point functionality.

---

In ARMv8:

- The (coproc==0b1111) encodings provide system control functionality, by providing access to System registers and System instructions. This includes architecture and feature identification, as well as control, status information and configuration support.
  
  The following sections give a general description of these encodings:
  - About the System registers for VMSAv8-32 on page G4-4972.
  - VMSAv8-32 organization of registers in the (coproc==0b1111) encoding space on page G6-4996.
  - Functional grouping of VMSAv8-32 System registers on page G4-4977.

  These encodings also provide the Performance monitor registers, see Chapter D5 The Performance Monitors Extension.

- The (coproc==0b1110) encodings provide access to additional registers, that support:
  - Debug, see Chapter G2 AArch32 Self-hosted Debug.
  - The Jazelle identification registers, see Jazelle support on page E1-2989.

UNPREDICTABLE, CONSTRAINED UNPREDICTABLE, and UNDEFINED behavior for AArch32 System register accesses on page G7-5013 gives information more information about permitted accesses to the System registers in AArch32 state.

Most functionality in the (coproc==0b111x) encoding space cannot be accessed by software executing at EL0. This manual clearly identifies those functions that can be accessed at EL0.

For more information:

- About this encoding space, including the naming of the parameters that index the space, see The AArch32 System register interface on page G1-4693.
- About the System interface access instructions, see System register access instructions on page F1-3079.
E1.5 Exceptions

The ARM architecture uses the following terms to describe various types of exceptional condition:

Exceptions

In the ARM architecture, an exception causes entry to EL1, EL2, or EL3. If the Exception level that is entered is using AArch32, it also causes entry to the PE mode in which the exception must be taken. A software handler for the exception is then executed.

Note

The term floating-point exception does not use this meaning of exception. This term is described later in this list.

Exceptions include:
- Reset.
- Interrupts.
- Memory system aborts.
- Undefined instructions.
- Supervisor calls (SVCs), Secure Monitor calls (SMCs), and hypervisor calls (HVCs).
- Debug exceptions.

Most details of exception handling are not visible to application level software, and are described in Handling exceptions that are taken to an Exception level using AArch32 on page G1-4622. In an ARMv8 implementation that includes all the Exception levels, aspects that are visible to application level software are:

- The SVC instruction causes a Supervisor Call exception. This provides a mechanism for unprivileged software to make a call to the operating system, or other system component that is accessible only at EL1.
- The SMC instruction causes a Secure Monitor Call exception, but only if software execution is at EL1 or higher. Unprivileged software can only cause a Secure Monitor Call exception by methods defined by the operating system, or by another component of the software system that executes at EL1 or higher.
- The HVC instruction causes a Hypervisor Call exception, but only if software execution is at EL1 or higher. Unprivileged software can only cause a Hypervisor Call exception by methods defined by the hypervisor, or by another component of the software system that executes at EL1 or higher.
- The BKPT instruction causes a Breakpoint Instruction exception, that is taken as a Prefetch Abort exception. This provides a mechanism for a debugger to insert breakpoints into unprivileged software, or for unprivileged software to make a call into a debugger that is accessible at EL1.
- The WFI (Wait for Interrupt) instruction provides a hint that nothing needs to be done until an interrupt or another WFI wake-up event occurs, see Wait For Interrupt on page G1-4691. This means the hardware might enter a low-power state until the wake-up event occurs.
- The WFE (Wait for Event) instruction provides a hint that nothing needs to be done until either an SEV instruction generates an event, or another WFE wake-up event occurs, see Wait For Event and Send Event on page G1-4688. This means the hardware might enter a low-power state until the wake-up event occurs.

Floating-point exceptions

These relate to exceptional conditions encountered during floating-point arithmetic, such as Divide by Zero or Overflow. For more information see:
- Floating-point exceptions and exception traps on page E1-2993.
- The FPEXC and FPSCR register descriptions.
Chapter E2
The AArch32 Application Level Memory Model

This chapter gives an application level description of the memory model for software executing in AArch32 state. This means it describes the memory model for execution in EL0 when EL0 is using AArch32 in the following sections:

- *About the ARM memory model* on page E2-3004.
- *Atomicity in the ARM architecture* on page E2-3006.
- *Definition of the ARMv8 memory model* on page E2-3011.
- *Caches and memory hierarchy* on page E2-3022.
- *Alignment support* on page E2-3027.
- *Endian support* on page E2-3029.
- *Memory types and attributes* on page E2-3032.
- *Mismatched memory attributes* on page E2-3042.
- *Synchronization and semaphores* on page E2-3045

Note

In this chapter, System register names usually link to the description of the register in *Chapter G7 AArch32 System Register Descriptions*, for example SCTLR.
E2.1 About the ARM memory model

The ARM architecture is a weakly ordered memory architecture that permits the observation and completion of memory accesses in a different order from the program order. The following sections of this chapter provide the complete definition of the ARMv8 memory model, this introduction is not intended to contradict the definition found in those sections. In general, the basic principles of the ARMv8 memory model are:

- To provide a memory model that has similar weaknesses to those found in the memory models used by high-level programming languages such as C or Java. For example, by permitting independent memory accesses to be re-ordered as seen by other observers.
- To avoid the requirement for multi-copy atomicity in the majority of memory types.
- The provision of instructions and memory barriers to compensate for the lack of multi-copy atomicity in the cases where it would be needed.
- The use of address, data, and control dependencies in the creation of order so as to avoid having excessive numbers of barriers or other explicit instructions in common situations where some order is required by the programmer or the compiler.

This section contains:
- Address space.
- Memory type overview on page E2-3005.

E2.1.1 Address space

Address calculations are performed using 32-bit registers. Supervisory software determines the valid address range. Attempting to access an address that is not valid generates an MMU fault.

Address calculations are performed modulo $2^{32}$.

The result of an address calculation is UNKNOWN if it overflows or underflows the 32-bit address range $A[31:0]$.

Memory accesses use the $\text{MemA}[\cdot]$, $\text{MemO}[\cdot]$, $\text{MemU}[\cdot]$, and $\text{MemU}_\text{unpriv}[\cdot]$ pseudocode functions:
- The $\text{MemA}[\cdot]$ function makes an aligned access of the required type.
- The $\text{MemO}[\cdot]$ function makes an ordered access of the required type.
- The $\text{MemU}[\cdot]$ function makes an unaligned access of the required type
- The $\text{MemU}_\text{unpriv}[\cdot]$ function makes an unaligned, unprivileged access of the required type

Each of these functions calls $\text{Mem}_{\text{with_type}}[\cdot]$ function, that specifies the required access. This calls $\text{AArch32.MemSingle}[\cdot]$, which performs an atomic, little-endian read of size bytes.

The $\text{AccType}$ enumeration defines the different access types.

--- Note ---

- Chapter G3 The AArch32 System Level Memory Model and Chapter G4 The AArch32 Virtual Memory System Architecture include descriptions of memory system features that are transparent to the application, including memory access, address translation, memory maintenance instructions, and alignment checking and the associated fault handling. These chapters also reference pseudocode descriptions of these operations.
- For references to the pseudocode that relates to memory accesses, see Basic memory access on page G3-4838, Unaligned memory access on page G3-4839, and Aligned memory access on page G3-4839.
E2.1.2 Memory type overview

ARMv8 provides the following mutually-exclusive memory types:

**Normal**
This is generally used for bulk memory operations, both read-write and read-only operations.

**Device**
The ARM architecture forbids speculative reads of any type of Device memory. This means Device memory types are suitable attributes for read-sensitive locations.

Locations of the memory map that are assigned to peripherals are usually assigned the Device memory attribute.

Device memory has additional attributes that have the following effects:
- They prevent aggregation of reads and writes, maintaining the number and size of the specified memory accesses. See **Gathering** on page E2-3038.
- They preserve the access order and synchronization requirements, both for accesses to a single peripheral and where there is a synchronization requirement on the observability of one or more memory write and read accesses. See **Reordering** on page E2-3039.
- They indicate whether a write can be acknowledged other than at the end point. See **Early Write Acknowledgement** on page E2-3040.

For more information on Normal memory and Device memory, see **Memory types and attributes** on page E2-3032.

--- Note ---

Earlier versions of the ARM architecture defined a single Device memory type and a Strongly-Ordered memory type. A Note in **Device memory** on page E2-3036 describes how these memory types map onto the ARMv8 memory types.
E2.2 Atomicity in the ARM architecture

Atomicity is a feature of memory accesses, described as atomic accesses. The ARM architecture description refers to two types of atomicity, single-copy atomicity and multi-copy atomicity. In the ARMv8 architecture, the atomicity requirements for memory accesses depend on the memory type, and whether the access is explicit or implicit. For more information see:

- Requirements for single-copy atomicity.
- Properties of single-copy atomic accesses on page E2-3007.
- Multi-copy atomicity on page E2-3008.
- Requirements for multi-copy atomicity on page E2-3008.
- Concurrent modification and execution of instructions on page E2-3008.

For more information about the memory types, see Memory type overview on page E2-3005.

E2.2.1 Requirements for single-copy atomicity

In AArch32 state, the single-copy atomic PE accesses are:

- All byte accesses.
- All halfword accesses to halfword-aligned locations.
- All word accesses to word-aligned locations.
- Memory accesses caused by LDREXD and STREXD instructions to doubleword-aligned locations.

LDM, LDC, LDRD, STM, STC, STRD, PUSHR, POP, RFE, SRS, VLDM, VLDR, VSTM, and VSTR instructions are executed as a sequence of word-aligned word accesses. Each 32-bit word access is guaranteed to be single-copy atomic. The architecture does not require subsequences of two or more word accesses from the sequence to be single-copy atomic.

LDRD and STRD accesses to 64-bit aligned locations are 64-bit single-copy atomic as seen by translation table walks and accesses to translation tables.

--- Note ---

This requirement has been added to avoid the need for complex measures to avoid atomicity issues when changing translation table entries, without creating a requirement that all locations in the memory system are 64-bit single-copy atomic. This addition means:

- The system designer must ensure that all writable memory locations that might be used to hold translations, such as bulk SDRAM, can be accessed with 64-bit single-copy atomicity.
- Software must ensure that translation tables are not held in memory locations that cannot meet this atomicity requirement, such as peripherals that are typically accessed using a narrow bus.

This requirement places no burden on read-only memory locations for which reads have no side effects, since it is impossible to detect the size of memory accesses to such locations.

Advanced SIMD element and structure loads and stores are executed as a sequence of accesses of the element or structure size. The architecture requires the element accesses to be single-copy atomic if and only if both:

- The element size is 32 bits, or smaller.
- The elements are naturally aligned.

Accesses to 64-bit elements or structures that are 32-bit aligned are executed as a sequence of 32-bit accesses, each of which is single-copy atomic. The architecture does not require subsequences of two or more 32-bit accesses from the sequence to be single-copy atomic.

When an access is not single-copy atomic by the rules described in this section, it is executed as a sequence of one or more accesses that aggregate to the size of the original access. Each of the accesses in this sequence is single-copy atomic, at least at the byte level.
Note

In this section, the terms before the write operation and after the write operation mean before or after the write operation has had its effect on the coherence order of the bytes of the memory location accessed by the write operation.

If, according to these rules, an instruction is executed as a sequence of accesses, a synchronous Data Abort exception or Debug state entry can be taken during that sequence. This causes execution of the instruction to be abandoned. See Data Abort exception on page G1-4672 and, when ARMv8.2-LSMAOC is implemented, Taking an interrupt or other exception during a multiple-register load or store on page G1-4660.

If the synchronous Data Abort exception is returned from using the preferred return address, the instruction that generated the sequence of accesses is re-executed and so any access that was performed before the exception was taken is repeated. This also applies to an exit from Debug state.

Note

The exception behavior for these multiple access instructions means they are not suitable for use for writes to memory for the purpose of software synchronization.

For implicit accesses:

- Cache linefills and evictions have no effect on the single-copy atomicity of explicit transactions or instruction fetches.
- Instruction fetches are single-copy atomic:
  - At 32-bit granularity in A32 state.
  - At 16-bit granularity in T32 state.
- Concurrent modification and execution of instructions on page E2-3008 describes additional constraints on the behavior of instruction fetches.
- Translation table walks are performed using accesses that are single-copy atomic:
  - At 32-bit granularity when using Short-descriptor format translation tables.
  - At 64-bit granularity when using Long-descriptor format translation tables.

### E2.2.2 Properties of single-copy atomic accesses

A memory access instruction that is single-copy atomic has the following properties:

1. For a pair of overlapping single-copy atomic store instructions, all of the overlapping writes generated by one of the stores are Coherence-after the corresponding overlapping writes generated by the other store.

2. For a single-copy atomic load instruction \( L_1 \) that overlaps a single-copy atomic store instruction \( S_2 \), if one of the overlapping reads generated by \( L_1 \) Reads-from one of the overlapping writes generated by \( S_2 \), then none of the overlapping writes generated by \( S_2 \) are Coherence-after the corresponding overlapping reads generated by \( L_1 \).

For more information, see Definition of the ARMv8 memory model on page E2-3011.
E2.2.3 Multi-copy atomicity

In a multiprocessing system, writes to a memory location are **multi-copy atomic** if the following conditions are both true:

- All writes to the same location are **serialized**, meaning they are observed in the same order by all observers, although some observers might not observe all of the writes.
- A read of a location does not return the value of a write until all observers observe that write.

**Note**

 Writes that are not coherent are not multi-copy atomic.

E2.2.4 Requirements for multi-copy atomicity

For Normal memory, writes are not required to be multi-copy atomic.

For Device memory, writes are not required to be multi-copy atomic.

The ARMv8 memory model is **Other-multi-copy atomic**. For more information, see *Ordering constraints on page E2-3015*.

E2.2.5 Concurrent modification and execution of instructions

The ARMv8 architecture limits the set of instructions that can be executed by one thread of execution as they are being modified by another thread of execution without requiring explicit synchronization.

Concurrent modification and execution of instructions can lead to the resulting instruction performing any behavior that can be achieved by executing any sequence of instructions that can be executed from the same Exception level, except where the instruction before modification and the instruction after modification are:

- When executing the A32 instruction set, a B, BKPT, BL, HVC, ISB, NOP, SMC, or SVC instruction.
- When executing the T32 instruction set. a 16-bit B, BKPT, BLX, BX, NOP, or SVC instruction.

In addition, for the 32-bit T32 instructions, for which *Instruction encodings on page F2-3096* describes the meaning of \{hw1, hw2\}:

- hw1 of a 32-bit BL (immediate) instruction can be concurrently modified to hw1 of another BL (immediate) instruction:
  - This means that some of the most significant bits of the immediate value can be modified.
- hw1 of a 32-bit BLX (immediate) instruction can be concurrently modified to hw1 of another BLX immediate instruction:
  - This means that some of the most significant bits of the immediate value can be modified.
- hw1 of a 32-bit BL (immediate) or BLX (immediate) instruction can be concurrently modified to a T32 16-bit B, BX, BLX, BKPT, or SVC instruction. This modification also works in reverse.
- hw2 of a 32-bit BL (immediate) instruction can be concurrently modified to hw2 of another BL (immediate) instruction with a different immediate:
  - This means that some bits of the immediate value, including the least significant bits, can be modified.
- hw2 of a 32-bit BLX (immediate) instruction can be concurrently modified to hw2 of another BLX (immediate) instruction with a different immediate:
  - This means that some bits of the immediate value, including the least significant bits, can be modified.
- hw2 of a 32-bit B (immediate) instruction with a condition field can be concurrently modified to hw2 of another 32-bit B (immediate) instruction with a condition field with a different immediate:
  - This means that some bits of the immediate value, including the least significant bits, can be modified.
• hw2 of a 32-bit B (immediate) instruction without a condition field can be concurrently modified to hw2 of another 32-bit B (immediate) instruction without a condition field:
  — This means that some bits of the immediate value, including the least significant bits, can be modified.

--- Note ---
• In the T32 instruction set:
  — The only encodings of BKPT and SVC are 16-bit.
  — The only encoding of BL is 32-bit.
• The ISB instruction can be concurrently modified and executed in the A32 and A64 instruction sets, but not in the T32 instruction set.

For the instructions explicitly identified in this section, the architecture guarantees that, after modification of the instruction, behavior is consistent with execution of either:
• The instruction originally fetched.
• A fetch of the modified instruction.

The instructions to which this applies are the B, BL, NOP, BKPT, SVC, HVC, and SMC instructions.

For both instruction sets, if one thread of execution changes a conditional branch instruction to another conditional branch instruction, and the change affects both the condition field and the branch target, execution of the changed instruction by another thread of execution before the change is synchronized can lead to either:
• The old condition being associated with the new target address.
• The new condition being associated with the old target address.

These possibilities apply regardless of whether the condition, either before or after the change to the branch instruction, is the always condition.

For all other instructions, to avoid UNPREDICTABLE or CONSTRAINED UNPREDICTABLE behavior, instruction modifications must be explicitly synchronized before they are executed. The required synchronization is as follows:

1. No PE must be executing an instruction when another PE is modifying that instruction.

2. To ensure that the modified instructions are observable, a PE that is writing the instructions must issue the following sequence of instructions and operations:
   ; Coherency example for self-modifying code
   ; Enter this code with <Rt> containing a new 32-bit instruction,
   ; to be held in Cacheable space at a location pointed to by Rn. Use STRH in the first
   ; line instead of STR for a 16-bit instruction.
   STR <Rt>, [Rn]
   DCOMVAU Rn ; Clean data cache by MVA to point of unification (PoU)
   DSB ; Ensure visibility of the data stored
   ICIMVAU Rn ; Invalidate instruction cache by VA to PoU
   BPIMVA Rn ; Invalidate branch predictor by MVA to PoU
   DSB ; Ensure completion of the invalidations

--- Note ---
• The D COMVAU operation is not required if the area of memory is either Non-cacheable or Write-Through Cacheable.
• If the contents of physical memory differ between the mappings, changing the mapping of VAs to PAs can cause the instructions to be concurrently modified by one PE and executed by another PE. If the modifications affect instructions other than those listed as being acceptable for modification, synchronization must be used to avoid UNPREDICTABLE or CONSTRAINED UNPREDICTABLE behavior.

3. In a multiprocessor system, the ICIMVAU and BPIMVA are broadcast to all PEs within the Inner Shareable domain of the PE running this sequence. However, once the modified instructions are observable, each PE that is executing the modified instructions must issue the following instruction to ensure execution of the modified instructions:
   ISB ; Synchronize fetched instruction stream
For more information about the required synchronization operation, see Synchronization and coherency issues between data and instruction accesses on page E2-3024.

—— Note ————

For information about memory accesses caused by instruction fetches, see Ordering constraints on page E2-3015.
E2.3 Definition of the ARMv8 memory model

This section describes observation and ordering in the ARMv8 memory model. It contains the following subsections:

• Locations
• Ordering and observability on page E2-3012.
• Ordering constraints on page E2-3015.
• Completion and endpoint ordering on page E2-3016.
• Memory barriers on page E2-3017.

For more information on endpoint ordering of memory accesses, see Reordering on page E2-3039.

In the ARMv8 memory model, the Shareability memory attribute indicates the degree to which hardware must ensure memory coherency between a set of observers, see Memory types and attributes on page E2-3032.

The ARMv8 architecture defines additional memory attributes and associated behaviors, which are defined in the system level section of this manual. See:

• Chapter G3 The AArch32 System Level Memory Model.
• Chapter G4 The AArch32 Virtual Memory System Architecture.

See also Mismatched memory attributes on page E2-3042.

E2.3.1 Locations

The ARMv8 memory model provides a set of definitions that are used to construct conditions on the permitted sequences of accesses to memory. The ARMv8 memory model defines:

• The ordering of observation of memory accesses between different observers.
• The ordering of arrival of memory accesses arriving at an endpoint.
• The mechanisms to control the ordering of observation of memory accesses and the arrival of memory accesses at an endpoint.

Locations, Memory effects, and Observers

The ARMv8 memory model provides the following definition of a Location in memory:

Location

A Location refers to a single byte in memory.

As part of its execution an instruction might generate a Memory effect. Observers in the system might observe the Memory effects of that instruction on a Location. The ARMv8 memory model provides the following definitions of a Memory effect and an Observer:

Memory effect

The Memory effects of an instruction are the read, write, or barrier effects of that instruction. For an instruction that accesses memory:

• A read effect is generated for each Location that is read by the instruction.
• A write effect is generated for each Location that is written by the instruction.

An instruction can generate both read and write effects.

The memory effects of an instruction I₁ are said to appear in program order before the Memory effects of instruction I₂ if and only if I₁ occurs before I₂ in program order.

For the purposes of describing the ARMv8 memory model, all read and write effects access only Normal memory locations in a Common Shareability Domain. Where this section refers to a read, write, or memory barrier without any qualification, then it is referring to the corresponding Memory effect.
Observer
An Observer refers to either a processing element, or some other memory accessing agent that can generate reads from or writes to memory.

Common Shareability Domain
A Common Shareability Domain for a program is the smallest Shareability domain that contains all of the active Observers of the Memory effects generated by a program.

E2.3.2 Ordering and observability

The ARMv8 memory model permits reordering of memory accesses. This section defines the permitted reordering of memory accesses using the following:

- Register value dependencies to establish order between instructions on a PE.
- Ordering constraints to establish order between accesses to a Location.

Register value dependencies

The ARMv8 memory model defines the following dependencies between instructions:

Register dependency
A Register dependency from a first data value V₁ to a second data value V₂ exists within a PE if and only if either:

- The register, excluding the AArch64 zero register (XZR or WZR), that is used to hold V₁ is used in the calculation of V₂.
- There is a Register dependency from V₁ to a third data value V₃ and there is a register dependency from V₃ to V₂.

Register data dependency
A Register data dependency from a first data value V₁ to a second data value V₂ exists within a PE if and only if either:

- The register, excluding the AArch64 zero register (XZR or WZR) and the AArch32 PC, that is used to hold V₁ and is used in the calculation of V₂, and the calculation between V₁ and the V₂ does not consist of either:
  - A conditional branch whose condition is determined by V₁.
  - A conditional selection, move, or computation whose condition is determined by V₁, where the input data values for the selection, move, or computation do not have a data dependency on V₁.
- There is a Register data dependency from V₁ to a third data value V₃, and there is a Register dependency from V₃ to V₂.

Address dependency
An Address dependency from a read R₁ to a subsequent read R₂ exists if and only if there is a Register data dependency from the data value that is returned by R₁ to the address used by R₂.

Data dependency
A Data dependency from a read R₁ to a subsequent write W₂ exists if and only if there is a Register dependency from the data value returned by R₁ to the data value written by W₂.
Control dependency

A Control dependency from a read \( R_1 \) to a subsequent instruction \( I_2 \) exists if and only if there is a Register dependency from the data value returned by \( R_1 \) to the data value used in the evaluation of a conditional branch or the determination of a synchronous exception on an instruction and \( I_2 \) is only executed as a result of one of the possible outcomes of that conditional branch or synchronous exception.

Ordering and observability at a Location

Memory effects on a Location are related by the following relations:

Reads-from

A Reads-from relation that couples reads and writes to the same Location such that each read is paired with a single write in the program. If a read \( R_2 \) of a Location Reads-from a write \( W_1 \) to the same Location if and only if \( R_2 \) takes its data from \( W_1 \).

\[ \text{Note} \]
The Reads-from relation represents a read being satisfied by a write and then returning the written data.

Coherence order

A Coherence order relation for each Location in the program that provides a total order on all writes from all coherent Observers to that Location, starting with a notional write of the initial value.

\[ \text{Note} \]
The Coherence order of a Location represents the order in which writes to the Location arrive at memory.

Coherence-after

A write \( W_2 \) to a Location is Coherence-after another write \( W_1 \) to the same Location if and only if \( W_2 \) is sequenced after \( W_1 \) in the Coherence order of the Location.

A write \( W_2 \) to a Location is Coherence-after a read \( R_1 \) of the same location if and only if \( R_1 \) Reads-from a write \( W_3 \) to the same Location and \( W_2 \) is Coherence-after \( W_3 \).

Overlapping accesses

Two Memory effect overlap if and only if they access the same Location. Two instructions overlap if and only if one or more of their generated Memory effects overlap.

Observed-by

A read or a write \( RW_1 \) from an Observer is Observed-by a write \( W_2 \) from a different Observer if and only if \( W_2 \) is coherence-after \( RW_1 \).

A write \( W_1 \) from an Observer is Observed-by a read \( R_2 \) from a different Observer if and only if \( R_2 \) Reads-from \( W_1 \).

\[ \text{Note} \]
The Observed-by relation only relates accesses generated by different Observers.

DMB FULL

A DMB FULL is a DMB with neither the LD or the ST qualifier.

Where this section refers to DMB without any qualification, then it is referring to all types of DMB. Unless a specific shareability domain is defined, a DMB applies to the Common Shareability Domain.

All properties that apply to DMB also apply to the corresponding DSB.
Ordering relations

In addition to the ordering relations that describe order at a location, the ARMv8 memory model also provides ordering relations to describe the ordering of instructions. These are as follows:

Dependency-ordered-before

A dependency creates externally-visible order between a read and another Memory effect generated by the same Observer. A read R₁ is Dependency-ordered-before a read or write RW₂ from the same Observer if and only if R₁ appears in program order before RW₂ and any of the following cases apply:

- There is an Address dependency or a Data dependency from R₁ to RW₂.
- RW₂ is a write W₂ and there is a Control dependency from R₁ to W₂.
- RW₂ is a read R₂ generated by an instruction appearing in program order after an instruction I₃ that generates a Context synchronization event, and there is a Control dependency from R₁ to I₃.
- RW₂ is a write W₂ appearing in program order after a read or a write RW₃ and there is an Address dependency from R₁ to RW₃.
- RW₂ is a write W₂ that is Coherence-after a write W₃ and there is a Control dependency or a Data dependency from R₁ to W₃.
- RW₂ is a read R₂ that Reads-from a write W₃ and there is an Address dependency or a Data dependency from R₁ to W₃.

Atomic-ordered-before

Load-Exclusive and Store-Exclusive instructions provide some ordering guarantees, even in the absence of dependencies. A read or a write RW₁ is Atomic-ordered-before a read or a write RW₂ from the same Observer if and only if RW₁ appears in program order before RW₂ and either of the following cases apply:

- RW₁ is a read R₁ and RW₂ is a write W₂ such that R₁ and W₂ are generated by an atomic instruction or a successful Load-Exclusive/Store-Exclusive instruction pair to the same Location.
- RW₁ is a write W₁ generated by an atomic instruction or a successful Store-Exclusive instruction and RW₂ is a read R₂ generated by an instruction with Acquire semantics such that R₂ Reads-from W₁.

For more information, see Synchronization and semaphores on page E2-3045.

Barrier-ordered-before

Barrier instructions order prior Memory effects before subsequent Memory effects generated by the same Observer. A read or a write RW₁ is Barrier-ordered-before a read or a write RW₂ from the same Observer if and only if RW₁ appears in program order before RW₂ and any of the following cases apply:

- RW₁ appears in program order before a DMB FULL that appears in program order before RW₂.
- RW₁ is a write W₁ generated by an instruction with Release semantics and RW₂ is a read R₂ generated by an instruction with Acquire semantics.
- RW₁ is a read R₁ and either:
  - R₁ appears in program order before a DMB LD that appears in program order before RW₂.
  - R₁ is generated by an instruction with Acquire semantics.
- RW₂ is a write W₂ and either:
  - RW₁ is a write W₁ appearing in program order before a DMB ST that appears in program order before W₂.
  - W₂ is generated by an instruction with Release semantics.
  - RW₁ appears in program order before a write W₃ generated by an instruction with Release semantics and W₂ is Coherence-after W₃.
Ordered-before

An arbitrary pair of Memory effects is ordered if it can be linked by a chain of ordered accesses consistent with external observation. A read or a write RW₁ is Ordered-before a read or a write RW₂ if and only if any of the following cases apply:

- RW₁ is Observed-by RW₂.
- RW₁ is Dependency-ordered-before RW₂.
- RW₁ is Atomic-ordered-before RW₂.
- RW₁ is Barrier-ordered-before RW₂.
- RW₁ is Ordered-before a read or a write that is Ordered-before RW₂.

E2.3.3 Ordering constraints

The ARMv8 memory model is described as being Other-multi-copy atomic. The definition of Other-multi-copy atomic is as follows:

Other-multi-copy atomic

In an Other-multi-copy atomic system, it is required that a write from an Observer, if observed by a different Observer, is then observed by all other Observers that access the Location coherently. It is, however, permitted for an Observer to observe its own writes prior to making them visible to other observers in the system.

The Other-multi-copy atomic property of the ARMv8 memory model is enforced by placing constraints on the possible executions of a program. Those executions that meet the constraints given by the ordering model are said to be architecturally well-formed. An implementation that is executing a program is only permitted to exhibit behavior consistent with an architecturally well-formed execution.

Architecturally well-formed

An architecturally well-formed execution must satisfy both of the following requirements:

Internal visibility requirement

For a read or a write RW₁ that appears in program order before a read or a write RW₂ to the same Location, the internal visibility requirement requires that exactly one of the following statements is true:

- RW₂ is a write W₂ that is Coherence-after RW₁.
- RW₁ is a write W₁ and RW₂ is a read R₂ such that either:
  - R₂ Reads-from W₁.
  - R₂ Reads-from another write that is Coherence-after W₁.
- RW₁ and RW₂ are both reads R₁ and R₂ such that R₁ Reads-from a write W₃ and either:
  - R₂ Reads-from W₃.
  - R₂ Reads-from another write that is Coherence-after W₃.

Note

Informally, if a Memory effect M₁ from an Observer appears in program order before a Memory effect M₂ from the same Observer, then M₁ will be seen to occur before M₂ by that Observer.

External visibility requirement

For a read or a write RW₁ from an Observer that is Ordered-before a read or a write RW₂ from a different Observer, the external visibility constraint requires that RW₂ is not Observed-by RW₁. This means that an Architecturally well-formed execution must not exhibit a cycle in the Ordered-before relation.
E2.3 Definition of the ARMv8 memory model

E2.3.4 Completion and endpoint ordering

Interaction between Observers in a system is not restricted to communication via shared variables in coherent memory. For example, an Observer could configure an interrupt controller to raise an interrupt on another Observer as a form of message passing. These interactions typically involve an additional agent, which defines the instruction sequence that is required to establish communication links between different Observers. When these forms of interaction are used in conjunction with shared variables, a DSB instruction can be used to enforce ordering between them.

For all memory, the completion rules are defined as:

- A read $R_1$ to a Location is complete for a shareability domain when all of the following are true:
  - Any write to the same Location by an Observer within the shareability domain will be Coherence-after $R_1$.
  - Any translation table walks associated with $R_1$ are complete for that shareability domain.

- A write $W_1$ to a Location is complete for a shareability domain when all of the following are true:
  - Any write to the same Location by an Observer within the shareability domain will be Coherence-after $W_1$.
  - Any read to the same Location by an Observer within the shareability domain will either Reads-from $W_1$ or Reads-from a write that is Coherence-after $W_1$.
  - Any translation table walks associated with the write are complete for that shareability domain.

- A translation table walk is complete for a shareability domain when the memory accesses, including the updates to translation table entries, associated with the translation table walk are complete for that shareability domain, and the TLB is updated.

- A cache or branch predictor maintenance instruction is complete for a shareability domain when the memory effects of the instruction are complete for that shareability domain, and any translation table walks that arise from the instruction are complete for that shareability domain.

- A TLB invalidate instruction is complete when all memory accesses using the TLB entries that have been invalidated are complete.

The completion of any cache, branch predictor, or TLB maintenance instruction includes its completion on all PEs that are affected by both the instruction and the DSB operation that is required to guarantee visibility of the maintenance instruction.

Note

These completion rules mean that, for example, a cache maintenance instruction that operates by VA to the PoC completes only after memory at the PoC has been updated.

Additionally, for Device-nGnRnE memory, a read or write of a Location in a Memory-mapped peripheral that exhibits side-effects is complete only when the read or write both:

- Can begin to affect the state of the Memory-mapped peripheral.
- Can trigger all associated side-effects, whether they affect other peripheral devices, PEs, or memory.

Note

This requirement for Device-nGnRnE memory is consistent with the memory access having reached the peripheral endpoint.
Peripherals

This section defines a Memory-mapped peripheral and the total order of reads and writes to a peripheral which is defined as the Peripheral coherence order:

Memory-mapped peripheral

A Memory-mapped peripheral occupies a memory region of IMPLEMENTATION DEFINED size and can be accessed using load and store instructions. Memory effects to a Memory-mapped peripheral can have side-effects, such as causing the peripheral to perform an action. Values that are read from addresses within a Memory-mapped peripheral might not correspond to the last data value written to those addresses. As such, Memory effects to a Memory-mapped peripheral might not appear in the Reads-from or Coherence order relations.

Peripheral coherence order

The Peripheral coherence order of a Memory-mapped peripheral is a total order on all reads and writes to that peripheral.

Note

The Peripheral coherence order for a Memory-mapped peripheral signifies the order in which accesses arrive at the endpoint.

For a read or a write RW1 and a read or a write RW2 to the same peripheral, then RW1 will appear in the Peripheral coherence order for the peripheral before RW2 if either of the following cases apply:

- RW1 and RW2 are accesses using Non-cacheable or Device attributes and RW1 is Ordered-before RW2.
- RW1 and RW2 are accesses using Device-nGnRE or Device-nGnRnE attributes and RW1 appears in program order before RW2.

Out-of-band-ordered-before

A read or a write RW1 is Out-of-band-ordered-before a read or a write RW2 if and only if either of the following cases apply:

- RW1 appears in program order before a DSB instruction that begins an IMPLEMENTATION DEFINED instruction sequence indirectly leading to the generation of RW2.
- RW1 is Ordered-before a read or a write RW3 and RW3 is Out-of-band-ordered-before RW2.

If a Memory effect M1 is Out-of-band-ordered-before a read or a write M2, then M1 is seen to occur before M2 by all Observers.

E2.3.5 Memory barriers

The ARM architecture is a weakly ordered memory architecture that supports out of order completion. Memory barrier is the general term applied to an instruction, or sequence of instructions, that forces synchronization events by a PE with respect to retiring Load/Store instructions. The memory barriers defined by the ARMv8 architecture provide a range of functionality, including:

- Ordering of Load/Store instructions.
- Completion of Load/Store instructions.
- Context synchronization.

The following subsections describe the ARMv8 memory barrier instructions:

- Instruction Synchronization Barrier (ISB) on page E2-3018.
- Data Memory Barrier (DMB) on page E2-3018.
- Data Synchronization Barrier (DSB) on page E2-3019.
- Shareability and access limitations on the data barrier operations on page E2-3019.
Note

Depending on the required synchronization, a program might use memory barriers on their own, or it might use them in conjunction with cache maintenance and memory management instructions that in general are only available when software execution is at EL1 or higher.

The DMB and DSB memory barriers affect reads and writes to the memory system generated by Load/Store instructions and data or unified cache maintenance instructions being executed by the PE. Instruction fetches or accesses caused by a hardware translation table access are not explicit accesses.

AArch32 state also supports the legacy barrier instructions CP15DMB, CP15DSB, and CP15ISB. These instructions are executed as MCRs using the appropriate encoding, and are accessible from EL0. However, for performance reasons ARM deprecates any use of these operations, and strongly recommends that software uses the DMB, DSB, and ISB instructions described in this section instead. Optionally, an implementation can support a CP15BEN control that supervisory software can use to disable use of these instructions, meaning the corresponding MCR encodings are UNDEFINED. When the CP15BEN control is supported, setting one of the following CP15BEN fields to 0 makes execution of CP15DMB, CP15DSB, and CP15ISB UNDEFINED:

- SCTLR_EL1.CP15BEN, for execution of these instructions at EL0 using AArch32 when EL1 is using AArch64.
- SCTLR.CP15BEN, for execution of these instructions at EL0 or EL1 when EL1 is using AArch32.
- HSCTLR.CP15BEN, for execution of these instructions at EL2 when EL2 is using AArch32.

Instruction Synchronization Barrier (ISB)

An ISB instruction ensures that all instructions that come after the ISB instruction in program order are fetched from the cache or memory after the ISB instruction has completed. Using an ISB ensures that the effects of context-changing operations executed before the ISB are visible to the instructions fetched after the ISB instruction. Examples of context-changing operations that require the insertion of an ISB instruction to ensure the effects of the operation are visible to instructions fetched after the ISB instruction are:

- Completed cache and TLB maintenance instructions.
- Changes to System registers.

Any context-changing operations appearing in program order after the ISB instruction only take effect after the ISB has been executed.

The pseudocode function for the operation of an ISB is InstructionSynchronizationBarrier().

See also Memory barriers on page G3-4840.

Data Memory Barrier (DMB)

The DMB instruction is a memory barrier instruction that ensures the relative order of memory accesses before the barrier with memory accesses after the barrier. The DMB instruction does not ensure the completion of any of the memory accesses for which it ensures relative order.

The full definition of the DMB is covered formally in the Definition of the ARMv8 memory model on page E2-3011 and this introduction to the DMB instruction is not intended to contradict that section.

The basic principle of a DMB instruction is to introduce order between memory accesses that are specified to be affected by the DMB options supplied as arguments to the DMB instruction. The DMB instruction ensures that all affected memory accesses by the PE executing the DMB that appear in program order before the DMB and those which originate from a different PE, to the extent required by the DMB options, which have been Observed-by the PE before the DMB is executed, are Observed-by each PE, to the extent required by the DMB options, before any affected memory accesses that appear in program order after the DMB are Observed-by that PE.

The use of a DMB creates order between the Memory effects of instructions as described in the definition of Barrier-ordered-before.

The pseudocode function for the operation of a DMB is DataMemoryBarrier().
Data Synchronization Barrier (DSB)

A DSB is a memory barrier that ensures that memory accesses that occur before the DSB have completed before the completion of the DSB instruction. In doing this, it acts as a stronger barrier than a DMB and all ordering that is created by a DMB with specific options is also generated by a DSB with the same options.

Execution of a DSB at EL2 ensures that any memory accesses caused by speculative translation table walks from the Non-secure PL1&0 translation regime have been observed.

For more information, see Use of out-of-context translation regimes on page G4-4848.

A DSB completes when all of the following apply:

• All explicit memory accesses that are observed by PEe before the DSB is executed and are of the required access types, and are from observers in the same required shareability domain as PEe, are complete for the set of observers in the required shareability domain.

• If the required access types of the DSB is reads and writes, then all cache and branch predictor maintenance instructions and all TLB maintenance instructions issued by PEe before the DSB are complete for the required shareability domain.

In addition, no instruction that appears in program order after the DSB instruction can alter any state of the system or perform any part of its functionality other than:

• Being fetched from memory and decoded.

• Reading the general-purpose, SIMD and floating-point, Special-purpose, or System registers that are directly or indirectly read without causing side-effects until the DSB completes.

The pseudocode function for the operation of a DSB is DataSynchronizationBarrier().

See also Memory barrier instructions on page G3-4837 and Memory barriers on page G3-4840.

Shareability and access limitations on the data barrier operations

The DMB and DSB instructions can each take an optional limitation argument that specifies:

• The shareability domain over which the instruction must operate. This is one of:
  — Full system.
  — Outer Shareable.
  — Inner Shareable.
  — Non-shareable.

• The accesses for which the instruction operates. This is one of:
  — Read and write accesses, both before and after the barrier instruction.
  — Write accesses only, before and after the barrier instruction.
  — Read accesses before the barrier instruction, and read and write accesses after the barrier instruction.

——— Note ————

This form of a DMB or DSB instruction can be described as a Load-Load/Store barrier.

For more information on whether an access is before or after a barrier instruction, see Data Memory Barrier (DMB) on page E2-3018 or Data Synchronization Barrier (DSB).
Table E2-1 shows how these options are encoded in the <option> field of the instruction.

<table>
<thead>
<tr>
<th>Accesses</th>
<th>Shareability domain</th>
<th>Before the barrier</th>
<th>After the barrier</th>
<th>Full system</th>
<th>Outer Shareable</th>
<th>Inner Shareable</th>
<th>Non-shareable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reads and writes</td>
<td>SY</td>
<td>SY</td>
<td>0SH</td>
<td>ISH</td>
<td>NSH</td>

<td></td>
</tr>
</tbody>
</table>

If no <option> is specified then the instruction operates for read and write accesses, over the full system, meaning the operation is the same as for the SY option. See the instruction descriptions for more information:

- **DMB** on page F5-3357.
- **DSB** on page F5-3360.

--- **Note** ---

ISH also supports an optional limitation argument that can only contain one value that corresponds to full system operation, see **ISB** on page F5-3379.

---

**Load-Acquire, Store-Release**

ARMv8 provides a set of instructions with Acquire semantics for loads, and Release semantics for stores.

The full definition of the Load-Acquire instruction is covered formally in the **Definition of the ARMv8 memory model** on page E2-3011 and this introduction to the Load-Acquire instruction is not intended to contradict that section.

The basic principle of a Load-Acquire instruction is to introduce order between the memory access generated by the Load-Acquire instruction and the memory accesses appearing in program order after the Load-Acquire instruction, such that the memory access generated by the Load-Acquire instruction is Observed-by each PE, to the extent that that PE is required to observe the access coherently, before any of the memory accesses appearing in program order after the Load-Acquire instruction are Observed-by that PE, to the extent that the PE is required to observe the accesses coherently.

The use of a Load-Acquire instruction creates order between the Memory effects of instructions as described in the definition of **Barrier-ordered-before**.

The full definition of the Store-Release instruction is covered formally in the **Definition of the ARMv8 memory model** on page E2-3011 and this introduction to the Store-Release instruction is not intended to contradict that section.

The basic principle of a Store-Release instruction is to introduce order between the memory accesses generated by the PE executing the Store-Release instruction, together with those which originate from a different PE, to the extent that the PE is required to observe them coherently, Observed-by the PE before executing the Store-release.

The use of a Store-Release instruction creates order between the Memory effects of instructions as described in the definition of **Barrier-ordered-before**.

In addition, the use of a Load-Acquire or a Store-Release instruction on accesses to a Memory-mapped peripheral introduces order between the Memory effects of the instructions that access that peripheral, as described in the definition of **Peripheral coherence order**.

Load-Acquire and Store-Release, other than **LDAEXD** and **STLEXD**, access only a single data element. This access is single-copy atomic. The address of the data object must be aligned to the size of the data element being accessed, otherwise the access generates an Alignment fault.
LDAEXD and STLEXD access two data elements. The address supplied to the instructions must be doubleword aligned, otherwise the access generates an Alignment fault.

A Store-Release Exclusive instruction only has the release semantics if the store is successful.

---

**Note**

- Each Load-Acquire Exclusive and Store-Release Exclusive instruction is essentially a variant of the equivalent Load-Exclusive or Store-Exclusive instruction. All usage restrictions and single-copy atomicity properties:
  - That apply to the Load-Exclusive instructions also apply to the Load-Acquire Exclusive instructions.
  - That apply to the Store-Exclusive instructions also apply to the Store-Release Exclusive instructions.

- The Load-Acquire/Store-Release instructions can remove the requirement to use the explicit DMB memory barrier instruction.

---

Table E2-2 summarizes the Load-Acquire/Store-release instructions.

**E2.4 Caches and memory hierarchy**

The implementation of a memory system depends heavily on the microarchitecture and therefore many details of the memory system are IMPLEMENTATION DEFINED. ARMv8 defines the application level interface to the memory system, including a hierarchical memory system with multiple levels of cache. This section describes an application level view of this system. It contains the subsections:

- Introduction to caches.
- Memory hierarchy.
- Implication of caches for the application programmer on page E2-3024.
- Preloading caches on page E2-3025.

**E2.4.1 Introduction to caches**

A cache is a block of high-speed memory that contains a number of entries, each consisting of:

- Main memory address information, commonly known as a tag.
- The associated data.

Caches increase the average speed of a memory access and take account of two principles of locality:

**Spatial locality**

An access to one location is likely to be followed by accesses to adjacent locations. Examples of this principle are:
- Sequential instruction execution.
- Accessing a data structure.

**Temporal locality**

An access to an area of memory is likely to be repeated in a short time period. An example of this principle is the execution of a software loop.

To minimize the quantity of control information stored, the spatial locality property groups several locations together under the same tag. This logical block is commonly known as a cache line. When data is loaded into a cache, access times for subsequent loads and stores are reduced, resulting in overall performance benefits. An access to information already in a cache is known as a cache hit, and other accesses are called cache misses.

Normally, caches are self-managing, with the updates occurring automatically. Whenever the PE accesses a cacheable memory location, the cache is checked. If the access is a cache hit, the access occurs in the cache. Otherwise, the access is made to memory. Typically, when making this access, a cache location is allocated and the cache line loaded from memory. ARMv8 permits different cache topologies and access policies, provided they comply with the memory coherency model described in this manual.

Caches introduce a number of potential problems, mainly because:
- Memory accesses can occur at times other than when the programmer would expect them.
- A data item can be held in multiple physical locations.

**E2.4.2 Memory hierarchy**

Typically memory close to a PE has very low latency, but is limited in size and expensive to implement. Further from the PE it is common to implement larger blocks of memory but these have increased latency. To optimize overall performance, an ARMv8 memory system can include multiple levels of cache in a hierarchical memory system that exploits this trade-off between size and latency. Figure E2-1 on page E2-3023 shows an example of such a system in an ARMv8-A system that supports virtual addressing.
Note

In this manual, in a hierarchical memory system, Level 1 refers to the level closest to the PE, as shown in Figure E2-1.

Instructions and data can be held in separate caches or in a unified cache. A cache hierarchy can have one or more levels of separate instruction and data caches, with one or more unified caches located at the levels closest to the main memory. Memory coherency for cache topologies can be defined using the conceptual points Point of Unification (PoU) and Point of Coherency (PoC). For more information, including the definitions of PoU and PoC, see About cache maintenance in AArch32 state on page G3-4816.

Note

ARMv8 ARMv8.2-DCPoP adds architectural support for an additional conceptual point, Point of Persistence, but this support is provided only in AArch64 state. For more information see About cache maintenance in AArch64 state on page D3-2058.

The Cacheability and Shareability memory attributes

Cacheability and Shareability are two attributes that describe the memory hierarchy in a multiprocessing system:

**Cacheability**  This term defines whether memory locations are allowed to be allocated into a cache or not. Cacheability is defined independently for Inner and Outer Cacheability locations.

**Shareability**  This term defines whether memory locations are shareable between different agents in a system. Marking a memory location as shareable for a particular domain requires hardware to ensure that the location is coherent for all agents in that domain. Shareability is defined independently for Inner and Outer Shareability domains.

For more information about the Cacheability and Shareability attributes see Memory types and attributes on page E2-3032.
Implication of caches for the application programmer

In normal operation, the caches are largely invisible to the application programmer. However they can become visible when there is a breakdown in the coherency of the caches. Such a breakdown can occur:

- When memory locations are updated by other agents in the system that do not use hardware management of coherency.
- When memory updates made from the application software must be made visible to other agents in the system, without the use of hardware management of coherency.

For example:

- In the absence of hardware management of coherency of DMA accesses, in a system with a DMA controller that reads memory locations that are held in the data cache of a PE, a breakdown of coherency occurs when the PE has written new data in the data cache, but the DMA controller reads the old data held in memory.
- In a Harvard cache implementation, where there are separate instruction and data caches, a breakdown of coherency occurs when new instruction data has been written into the data cache, but the instruction cache still contains the old instruction data.

Data coherency issues

Software can ensure the data coherency of caches in the following ways:

- By not using the caches in situations where coherency issues can arise. This can be achieved by:
  - Using Non-cacheable or, in some cases, Write-Through Cacheable memory.
  - Not enabling caches in the system.
- By using system calls to functions using cache maintenance instructions that execute at a higher Exception level.
- By using hardware coherency mechanisms to ensure the coherency of data accesses to memory for cacheable locations by observers within the different shareability domains, see Non-shareable Normal memory on page E2-3034 and Shareable, Inner Shareable, and Outer Shareable Normal memory on page E2-3033.

Note

The performance of these hardware coherency mechanisms is highly implementation-specific. In some implementations the mechanism suppresses the ability to cache shareable locations. In other implementations, cache coherency hardware can hold data in caches while managing coherency between observers within the shareability domains.

Synchronization and coherency issues between data and instruction accesses

How far ahead of the current point of execution instructions are fetched from is IMPLEMENTATION DEFINED. Such prefetching can be either a fixed or a dynamically varying number of instructions, and can follow any or all possible future execution paths. For all types of memory:

- The PE might have fetched the instructions from memory at any time since the last Context synchronization event on that PE.
- Any instructions fetched in this way might be executed multiple times, if this is required by the execution of the program, without being re-fetched from memory.

The ARM architecture does not require the hardware to ensure coherency between instruction caches and memory, even for locations of shared memory.

If software requires coherency between instruction execution and memory, it must manage this coherency using Context synchronization events and cache maintenance instructions. These can only be accessed from an Exception level that is higher than EL0, and therefore require a system call, see Exception-generating and exception-handling instructions on page F1-3077. The following code sequence can be used for this purpose:

; Coherency example for data and instruction accesses within the same Inner Shareable domain.
Enter this code with <Rt> containing a new 32-bit instruction, to be held in Cacheable space at a location pointed to by Rn. Use STRH in the first line instead of STR for a 16-bit instruction.

```
STR Rt, [Rn]
DCOMAU Rn    ; Clean data cache by MVA to point of unification (PoU)
DSB          ; Ensure visibility of the data cleaned from cache
ICIMAU Rn    ; Invalidate instruction cache by MVA to PoU
BPIMVA Rn    ; Invalidate branch predictor by MVA to PoU
DSB          ; Ensure completion of the invalidations
ISB          ; Synchronize the fetched instruction stream
```

--- Note ---

- For accesses that are Non-cacheable or Write-Through, the clean data cache instruction is not required. For accesses that are Non-cacheable, the invalidate instruction cache is not required, because in AArch32 state these accesses are not permitted to be held in an instruction cache.

- This code can be used when the thread of execution modifying the code is the same thread of execution that is executing the code. The ARMv8 architecture limits the set of instructions that can be executed by one thread of execution as they are being modified by another thread of execution without requiring explicit synchronization. See Concurrent modification and execution of instructions on page E2-3008.

--- E2.4.4 Preloading caches ---

The ARM architecture provides the memory system hints PLD (Preload Data), PLDW (Preload Data With Intent To Write) and PLI (Preload Instruction) that software can use to communicate the expected use of memory locations to the hardware. The memory system can respond by taking actions that are expected to speed up the memory accesses if they occur. The effect of these memory system hints is IMPLEMENTATION DEFINED. Typically, implementations use this information to bring data or instruction locations into caches.

The Preload instructions are hints, and so implementations can treat them as NOPs without affecting the functional behavior of the device. The instructions cannot generate synchronous Data Abort exceptions, but the resulting memory system operations might, under exceptional circumstances, generate an asynchronous External abort, which is reported using an SError interrupt and taken using an asynchronous Data Abort exception. For more information, see Data Abort exception on page G1-4672.

A PLD, PLDW, or PLI instruction can only cause allocation to software-visible caching structures such as caches or TLBs for memory locations that can be accessed, according to the permissions defined by the current translation regime or a translation regime for a higher Exception level in the current Security state, by any of:

- Reads.
- Writes.
- Instruction fetches.

A PLD, PLDW, or PLI instruction can access any memory location in Normal memory that can be accessed, according to the permissions defined by the current translation regime or a translation regime for a higher Exception level in the current Security state, by any of:

- Reads.
- Writes.
- Instruction fetches.

--- Note ---

In each case, the entire list applies to each of PLD, PLDW, and PLI.

---

A PLD, PLDW, or PLI instruction is guaranteed not to access any type of Device memory.

A PLI instruction must not perform any access that cannot be performed by a speculative instruction fetch by the processor. Therefore in a VMSA implementation, if all associated MMUs are disabled, a PLI instruction cannot access any memory location that cannot be accessed by instruction fetches.
The pseudocode enumeration `PrefetchHint` defines the prefetch hint types.

The `Hint_Prefetch()` pseudocode function signals to the memory system that memory accesses of the type hint to or from the specified address are likely to occur in the near future. The memory system might take some action to speed up the memory accesses when they do occur, such as preloading the specified address into one or more caches as indicated by the innermost cache level target and non-temporal hint stream.

For more information on PLD, PLI, and PLDW, see:

- PLD, PLDW (immediate) on page F5-3568.
- PLD (literal) on page F5-3570.
- PLD, PLDW (register) on page F5-3572.
- PLI (immediate, literal) on page F5-3574.
- PLI (register) on page F5-3577.
E2.5 Alignment support

This section describes alignment support. It contains the following subsections:

- Instruction alignment.
- Unaligned data access.
- Cases where unaligned accesses are CONSTRAINED UNPREDICTABLE on page E2-3028.
- Unaligned data access restrictions on page E2-3028.
- Generation of Alignment faults by Load/store multiple accesses to Device memory on page E2-3028.

For more information about Alignment faults see Alignment faults on page G4-4940.

E2.5.1 Instruction alignment

A32 instructions are word-aligned.

T32 instructions are halfword-aligned.

E2.5.2 Unaligned data access

An ARMv8 implementation must support unaligned data accesses to Normal memory by some load and store instructions. As Table E2-3 shows, software can control whether a misaligned access to Normal memory by one of these instructions causes an Alignment fault Data Abort exception:

- By setting SCTLR.A, for unaligned accesses from any mode other than Hyp mode.
- By setting HSCTLRA, for unaligned accesses from Hyp mode.

Table E2-3 Alignment requirements of load/store instructions

</tr>
<tr>
<td>VLD1, VLD2, VLD3, VLD4, VST1, VST2, VST3, VST4, all with :&lt;align&gt; specified⁴</td>
<td>As specified by :&lt;align&gt;</td>
<td>Alignment fault</td>
</tr>
</tbody>
</table>

a. Previous versions of this manual used @<align> to specify alignment. Both forms are supported, see Chapter F6 T32 and A32 Advanced SIMD and Floating-point Instruction Descriptions for more information.
--- Note ---

Any unaligned access to any type of Device memory generates an Alignment fault, see Alignment faults on page G4-4940.

---

**E2.5.3** Cases where unaligned accesses are CONSTRAINED UNPREDICTABLE

Any load instruction that is not faulted by the alignment restrictions shown in Table E2-3 on page E2-3027 and that loads the PC has CONSTRAINED UNPREDICTABLE behavior if the address it loads from is not word-aligned, see Loads and Stores to unaligned locations on page K1-6392. This overrules any permitted Load/Store behavior shown in Table E2-3 on page E2-3027.

**E2.5.4** Unaligned data access restrictions

The following points apply to unaligned data accesses in ARMv8:

- Accesses are not guaranteed to be single-copy atomic except at the byte access level, see Atomicity in the ARM architecture on page E2-3006.
- Unaligned accesses typically take a number of additional cycles to complete compared to a naturally-aligned access.
- An operation that performs an unaligned access can abort on any memory access that it makes, and can abort on more than one access. This means that an unaligned access that occurs across a page boundary can generate an abort on either side of the boundary.

**E2.5.5** Generation of Alignment faults by Load/store multiple accesses to Device memory

When ARMv8.2-LSMAOC is implemented and the value of the applicable nTLSMD field is 0, any memory access by an AArch32 Load Multiple or Store Multiple instruction to an address that the stage 1 translation assigns as Device-nGRE, Device-nGnRE, or Device-nGnRnE generates an Alignment fault.

The applicable nTLSMD field is the field in the SCTLR_EL1, SCTLR_EL2, HSCTLR, or SCTLR register that applies to the Exception level and Security state at which the LDM or STM instruction is executed.
E2.6 Endian support

*General description of endianness in the ARM architecture* describes the relationship between endianness and memory addressing in the ARM architecture.

The following subsections then describe the endianness schemes supported by the architecture:

- Instruction endianness.
- Data endianness on page E2-3030.
- Endianness of memory-mapped peripherals on page E2-3031.

E2.6.1 General description of endianness in the ARM architecture

This section only describes memory addressing and the effects of endianness for data elements up to doubleword of 64 bits. However, this description can be extended to apply to larger data elements.

For an address A, Figure E2-2 shows, for big-endian and little-endian memory systems, the relationship between:

- The doubleword at address A.
- The words at addresses A and A+4.
- The halfwords at addresses A, A+2, A+4, and A+6.
- The bytes at addresses A, A+1, A+2, A+3, A+4, A+5, A+6, and A+7.

The terms in Figure E2-2 have the following definitions:

- **MSByte**: Most-significant byte.
- **LSByte**: Least-significant byte.

In this figure, *Byte, A+1* is an abbreviation for *Byte at address A+1*.

**Figure E2-2 Endianness relationships in AArch32 state**

E2.6.2 Instruction endianness

In ARMv8-A, the mapping of instruction memory is always little-endian.

### E2.6.3 Data endianness

The size of the data value that is loaded or stored is the size that is used for the purpose of endian conversion for floating-point, Advanced SIMD, and general-purpose register loads and stores.

Table E2-4 shows the element sizes of all the load/store instructions, for all instruction sets.

<table>
<thead>
<tr>
<th>Instructions</th>
<th>Element size</th>
</tr>
</thead>
<tbody>
<tr>
<td>LDRB, LDREXB, LDRBT, LDRSB, LDRSBT, STRB, STREXB, STRBT, TBB</td>
<td>Byte</td>
</tr>
<tr>
<td>LDRH, LDREXH, LDRHT, LDRSH, LDRSHT, STRH, STREXH, STRHT, TBB</td>
<td>Halfword</td>
</tr>
<tr>
<td>LDR, LDRT, LDREX, STR, STRT, STREX</td>
<td>Word</td>
</tr>
<tr>
<td>LDRD, LDREXD, STRD, STREXD</td>
<td>Word</td>
</tr>
<tr>
<td>All forms of LDM, PUSH, POP, RFE, SRS, all forms of STM</td>
<td>Word</td>
</tr>
<tr>
<td>LDC, STC</td>
<td>Word</td>
</tr>
<tr>
<td>Forms of VLDM, VLDR, VPPOP, VPUSH, VSTM, VSTR that transfer 32-bit Si registers</td>
<td>Word</td>
</tr>
<tr>
<td>Forms of VLDM, VLDR, VPPOP, VPUSH, VSTM, VSTR that transfer 64-bit Di registers</td>
<td>Doubleword</td>
</tr>
<tr>
<td>VLD1, VLD2, VLD3, VLD4, VST1, VST2, VST3, VST4</td>
<td>Element size of the Advanced SIMD access</td>
</tr>
</tbody>
</table>

CPSR.E determines the data endianness.

The data size used for endianness conversions:

- Is the size of the data value that is loaded or stored for Advanced SIMD and floating-point register and general-purpose register loads and stores.
- Is the size of the data element that is loaded or stored for Advanced SIMD element and data structure loads and stores. For more information see Endianness in Advanced SIMD on page E2-3031.

### Instructions to reverse bytes in registers

An application or device driver might have to interface to memory-mapped peripheral registers or shared memory structures that are not the same endianness as the internal data structures. Similarly, the endianness of the operating system might not match that of the peripheral registers or shared memory. In these cases, the PE requires an efficient method to transform explicitly the endianness of the data.

Table E2-5 shows the instructions that provide this functionality in the A32 and T32 instruction sets.

<table>
<thead>
<tr>
<th>Function</th>
<th>T32 / A32 Instruction</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reverse bytes in whole register</td>

</tr>
<tr>
<td>Reverse elements in halfwords, vector</td>
<td>VREV16</td>
<td>For use with registers in the SIMD and floating-point register file</td>
</tr>
</tbody>
</table>
Endianness in Advanced SIMD

Advanced SIMD element Load/Store instructions transfer vectors of elements between memory and the SIMD and floating-point register file. An instruction specifies both the length of the transfer and the size of the data elements being transferred. This information is used by the PE to load and store data correctly in both big-endian and little-endian systems.

Consider, for example, the A32 or T32 instruction:

\[
\text{VLD1.16} \{D0\}, [R1]
\]

This loads a 64-bit register with four 16-bit values. The four elements appear in the register in array order, with the lowest indexed element fetched from the lowest address. The order of bytes in the elements depends on the endianness configuration, as shown in Figure E2-3. Therefore, the order of the elements in the registers is the same regardless of the endianness configuration.

For information about the alignment of Advanced SIMD instructions see Alignment support on page E2-3027.

The \texttt{BigEndian()} pseudocode function determines the current endianness of the data.

The \texttt{BigEndianReverse()} pseudocode function reverses the endianness of a bitstring.

The \texttt{BigEndian()} and \texttt{BigEndianReverse()} functions are defined in Chapter J1 ARMv8 Pseudocode.

E2.6.4 Endianness of memory-mapped peripherals

All memory-mapped peripherals defined in the ARM architecture must be little-endian.

Peripherals to which this requirement applies include:

- Memory-mapped register interfaces to a debugger, or to a cross-trigger interface, see Chapter H8 About the External Debug Registers.
- The memory-mapped register interface to the system level implementation of the Generic Timer, see Chapter I2 System Level Implementation of the Generic Timer.
- A memory-mapped register interface to the Performance Monitors, see Chapter I3 Recommended External Interface to the Performance Monitors.
- Memory-mapped register interfaces to an ARM Generic Interface Controller, see the ARM Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0.
- The memory-mapped register interface to an ARM trace component. See, for example, the ARM Embedded Trace Macrocell Architecture Specification, ETMv4.
**E2.7 Memory types and attributes**

In ARMv8 the ordering of accesses for addresses in memory, referred to as the memory order model, is defined by the memory attributes. The following sections describe this model:

- **Normal memory**.
- **Device memory** on page E2-3036.
- **Memory access restrictions** on page E2-3041.

**E2.7.1 Normal memory**

The Normal memory type attribute applies to most memory in a system. It indicates that the hardware is permitted by the architecture to perform speculative data read accesses to these locations, regardless of the access permissions for these locations.

The Normal memory type has the following properties:

- A write to a memory location with the Normal attribute completes in finite time. This means that it is globally observed for the shareability domain of the memory location in finite time. For a Non-cacheable location, the location is observed by all observers in finite time.

- A completed write to a memory location with the Normal attribute is globally observed for the shareability domain of the memory location in finite time without the need for explicit cache maintenance instructions or barriers. For a Non-cacheable location, the completed write is globally observed for all observers in finite time without the need for explicit cache maintenance instructions or barriers.

- Writes to a memory location with the Normal memory attribute that is Non-cacheable must reach the endpoint for that location in the memory system in finite time.

- Unaligned memory accesses can access Normal memory if the system is configured to generate such accesses.

- There is no requirement for the memory system beyond the PE to be able to identify the elements accessed by multi-register Load/Store instructions. See [Multi-register loads and stores that access Normal memory](#) on page E2-3036.

**Note**

- The Normal memory attribute is appropriate for locations of memory that are idempotent, meaning that they exhibit all of the following properties:
  - Read accesses can be repeated with no side-effects.
  - Repeated read accesses return the last value written to the resource being read.
  - Read accesses can fetch additional memory locations with no side-effects.
  - Write accesses can be repeated with no side-effects if the contents of the location accessed are unchanged between the repeated writes or as the result of an exception, as described in this section.
  - Unaligned accesses can be supported.
  - Accesses can be merged before accessing the target memory system.

- An instruction that generates a sequence of accesses as described in [Atomicity in the ARM architecture](#) on page E2-3006 might be abandoned as a result of an exception being taken during the sequence of accesses. On return from the exception the instruction is restarted, and therefore one or more of the memory locations might be accessed multiple times. This can result in repeated write accesses to a location that has been changed between the write accesses.

The following sections describe the other attributes for Normal memory:

- **Shareable Normal memory** on page E2-3033.
- **Non-shareable Normal memory** on page E2-3034.
- **Cacheability attributes for Normal memory** on page E2-3034.
See also:

- Multi-register loads and stores that access Normal memory on page E2-3036.
- Atomicity in the ARM architecture on page E2-3006.
- Memory barriers on page E2-3017. For accesses to Normal memory, a DMB instruction is required to ensure the required ordering.
- Concurrent modification and execution of instructions on page E2-3008.

Shareable Normal memory

A Normal memory location has a Shareability attribute that is defined as one of:

- Inner Shareable.
- Outer Shareable.
- Non-shareable.

The shareability attributes define the data coherency requirements of the location, that hardware must enforce. They do not affect the coherency requirements of instruction fetches, see Synchronization and coherency issues between data and instruction accesses on page E2-3024.

---

**Note**

- System designers can use the Shareability attribute to specify the locations in Normal memory for which coherency must be maintained. However, software developers must not assume that specifying a memory location as Non-shareable permits software to make assumptions about the incoherency of the location between different PEs in a shared memory system. Such assumptions are not portable between different multiprocessing implementations that might use the Shareability attribute. Any multiprocessing implementation might implement caches that are shared, inherently, between different PEs.

- This architecture assumes that all PEs that use the same operating system or hypervisor are in the same Inner Shareable shareability domain.

---

**Shareable, Inner Shareable, and Outer Shareable Normal memory**

The ARM architecture abstracts the system as a series of Inner and Outer Shareability domains.

Each Inner Shareability domain contains a set of observers that are data coherent for each member of that set for data accesses with the Inner Shareable attribute made by any member of that set.

Each Outer Shareability domain contains a set of observers that are data coherent for each member of that set for data accesses with the Outer Shareable attribute made by any member of that set.

The following properties also hold:

- Each observer is only a member of a single Inner Shareability domain.
- Each observer is only a member of a single Outer Shareability domain.
- All observers in an Inner Shareability domain are always members of the same Outer Shareability domain. This means that an Inner Shareability domain is a subset of an Outer Shareability domain, although it is not required to be a proper subset.

---

**Note**

- Because all data accesses to Non-cacheable locations are data coherent to all observers, Non-cacheable locations are always treated as Outer Shareable.

- The Inner Shareable domain is expected to be the set of PEs controlled by a single hypervisor or operating system.
The details of the use of the Shareability attributes are system-specific. Example E2-1 shows how they might be used.

Example E2-1 Use of shareability attributes

In an implementation, a particular subsystem with two clusters of PEs has the requirement that:

• In each cluster, the data caches or unified caches of the PEs in the cluster are transparent for all data accesses to memory locations with the Inner Shareable attribute.

• However, between the two clusters, the caches:
  — Are not required to be coherent for data accesses that have only the Inner Shareable attribute.
  — Are coherent for data accesses that have the Outer Shareable attribute.

In this system, each cluster is in a different Shareability domain for the Inner Shareable attribute, but all components of the subsystem are in the same Shareability domain for the Outer Shareable attribute.

A system might implement two such subsystems. If the data caches or unified caches of one subsystem are not transparent to the accesses from the other subsystem, this system has two Outer Shareable Shareability domains.

Having two levels of shareability means system designers can reduce the performance and power overhead for shared memory locations that do not need to be part of the Outer Shareable Shareability domain.

For Shareable Normal memory, the Load-Exclusive and Store-Exclusive synchronization primitives take account of the possibility of accesses by more than one observer in the same Shareability domain.

Non-shareable Normal memory

For Normal memory locations, the Non-shareable attribute identifies Normal memory that is likely to be accessed only by a single PE.

A location in Normal memory with the Non-shareable attribute does not require the hardware to make data accesses by different observers coherent, unless the memory is Non-cacheable. For a Non-shareable location, if other observers share the memory system, software must use cache maintenance instructions, if the presence of caches might lead to coherency issues when communicating between the observers. This cache maintenance requirement is in addition to the barrier operations that are required to ensure memory ordering.

For Non-shareable Normal memory, it is IMPLEMENTATION DEFINED whether the Load-Exclusive and Store-Exclusive synchronization primitives take account of the possibility of accesses by more than one observer.

Cacheability attributes for Normal memory

In addition to being Outer Shareable, Inner Shareable or Non-shareable, each region of Normal memory is assigned a Cacheability attribute that is one of:

• Write-Through Cacheable.
• Write-Back Cacheable.
• Non-cacheable.

Also, for Write-Through Cacheable and Write-Back Cacheable Normal memory regions:

• A region might be assigned cache allocation hints for read and write accesses.
• It is IMPLEMENTATION DEFINED whether the cache allocation hints can have an additional attribute of Transient or Non-transient.

For more information see Cacheability, cache allocation hints, and cache transient hints on page G3-4812.
A memory location can be marked as having different cacheability attributes, for example when using aliases in a VA to PA mapping:

- If the attributes differ only in the cache allocation hint this does not affect the behavior of accesses to that location.
- For other cases see Mismatched memory attributes on page E2-3042.

The cacheability attributes provide a mechanism of coherency control with observers that lie outside the Shareability domain of a region of memory. In some cases, the use of Write-Through Cacheable or Non-cacheable regions of memory might provide a better mechanism for controlling coherency than the use of hardware coherency mechanisms or the use of cache maintenance routines. To this end, the architecture requires the following properties for Non-cacheable or Write-Through Cacheable memory:

- A completed write to a memory location that is Non-cacheable or Write-Through Cacheable for a level of cache made by an observer accessing the memory system inside the level of cache is visible to all observers accessing the memory system outside the level of cache without the need of explicit cache maintenance.
- A completed write to a memory location that is Non-cacheable for a level of cache made by an observer accessing the memory system outside the level of cache is visible to all observers accessing the memory system inside the level of cache without the need of explicit cache maintenance.

**Note**

Implementations can use the cache allocation hints to indicate a probable performance benefit of caching. For example, a programmer might know that a piece of memory is not going to be accessed again and would be better treated as Non-cacheable. The distinction between memory regions with attributes that differ only in the cache allocation hints exists only as a hint for performance.

For Normal memory, the ARM architecture provides cacheability attributes that are defined independently for each of two conceptual levels of cache, the *inner* and the *outer* cache. The relationship between these conceptual levels of cache and the implemented physical levels of cache is IMPLEMENTATION DEFINED, and can differ from the boundaries between the Inner and Outer Shareability domains. However:

- Inner refers to the innermost caches, meaning the caches that are closest to the PE, and always includes the lowest level of cache.
- No cache that is controlled by the Inner cacheability attributes can lie outside a cache that is controlled by the Outer cacheability attributes.
- An implementation might not have any outer cache.

Example E2-2, Example E2-3 on page E2-3036, and Example E2-4 on page E2-3036 describe the possible ways of implementing a system with three levels of cache, *level 1* (L1) to *level 3* (L3).

**Note**

- L1 cache is the level closest to the PE, see Memory hierarchy on page E2-3022.
- When managing coherency, system designs must consider both the inner and outer cacheability attributes, as well as the Shareability attributes. This is because hardware might have to manage the coherency of caches at one conceptual level, even when another conceptual level has the Non-cacheable attribute.

**Example E2-2 Implementation with two inner and one outer cache levels**

Implement the three levels of cache in the system, L1 to L3, with:

- The Inner cacheability attribute applied to L1 and L2 cache.
- The Outer cacheability attribute applied to L3 cache.
Example E2-3 Implementation with three inner and no outer cache levels

Implement the three levels of cache in the system, L1 to L3, with the Inner cacheability attribute applied to L1, L2, and L3 cache. Do not use the Outer cacheability attribute.

Example E2-4 Implementation with one inner and two outer cache levels

Implement the three levels of cache in the system, L1 to L3, with:
- The Inner cacheability attribute applied to L1 cache.
- The Outer cacheability attribute applied to L2 and L3 cache.

Multi-register loads and stores that access Normal memory

For all instructions that load or store more than one general-purpose register from an Exception level there is no requirement for the memory system beyond the PE to be able to identify the size of the elements accessed by these load or store instructions.

For all instructions that load or store more than one general-purpose register from an Exception level the order in which the registers are accessed is not defined by the architecture.

For all instructions that load or store one or more registers from the SIMD and floating-point register file from an Exception level there is no requirement for the memory system beyond the PE to be able to identify the size of the element accessed by these load or store instructions.

E2.7.2 Device memory

The Device memory type attributes define memory locations where an access to the location can cause side-effects, or where the value returned for a load can vary depending on the number of loads performed. Typically, the Device memory attributes are used for memory-mapped peripherals and similar locations.

The attributes for ARMv8 Device memory are:

- **Gathering**
  - Identified as G or nG, see Gathering on page E2-3038.

- **Reordering**
  - Identified as R or nR, see Reordering on page E2-3039.

- **Early Write Acknowledgement**
  - Identified as E or nE, see Early Write Acknowledgement on page E2-3040.

The ARMv8 Device memory types are:

- **Device-nGnRnE**
  - Device non-Gathering, non-Reordering, No Early write acknowledgement.
  - Equivalent to the Strongly-ordered memory type in earlier versions of the architecture.

- **Device-nGnRE**
  - Device non-Gathering, non-Reordering, Early Write Acknowledgement.
  - Equivalent to the Device memory type in earlier versions of the architecture.

- **Device-nGRE**
  - Device non-Gathering, Reordering, Early Write Acknowledgement.
  - ARMv8 adds this memory type to the translation table formats found in earlier versions of the architecture. The use of barriers is required to order accesses to Device-nGRE memory.
  - The Device-nGRE memory type is introduced into the AArch32 translation table formats when the PE is using the Long Descriptor Translation Table format.

- **Device-GRE**
  - Device Gathering, Reordering, Early Write Acknowledgement.
ARMv8 adds this memory type to the translation table formats found in earlier versions of the architecture. Device-GRE memory has the fewest constraints. It behaves similar to Normal memory, with the restriction that speculative accesses to Device-GRE memory is forbidden.

The Device-GRE memory type is introduced into the AArch32 translation table formats when the PE is using the Long Descriptor Translation Table format.

Collectively these are referred to as any Device memory type. Going down the list, the memory types are described as getting weaker; conversely the going up the list the memory types are described as getting stronger.

--- Note ---

• As the list of types shows, these additional attributes are hierarchical. For example, a memory location that permits Gathering must also permit Reordering and Early Write Acknowledgement.

• The architecture does not require an implementation to distinguish between each of these memory types and ARM recognizes that not all implementations will do so. The subsection that describes each of the attributes, describes the implementation rules for the attribute.

• Earlier versions of the ARM architecture defined the following memory types:
  — Strongly-ordered memory. This is the equivalent of the Device-nGnRnE memory type.
  — Device memory. This is the equivalent of the Device-nGnRE memory type.

All of these memory types have the following properties:

• Speculative data accesses are not permitted to any memory location with any Device memory attribute. This means that each memory access to any Device memory type must be one that would be generated by a simple sequential execution of the program.
  
  An exception to this applies:
    — Reads generated by the Advanced SIMD and floating-point instructions can access bytes that are not explicitly accessed by the instruction if the bytes accessed are in a 16-byte window, aligned to 16-bytes, that contains at least one byte that is explicitly accessed by the instruction.

—— Note ——

• An instruction that generates a sequence of accesses as described in Atomicity in the ARM architecture on page E2-3006 might be abandoned as a result of an exception being taken during the sequence of accesses. On return from the exception the instruction is restarted, and therefore one or more of the memory locations might be accessed multiple times. This can result in repeated accesses to a location where the program only defines a single access. For this reason, ARM strongly recommends that no accesses to Device memory are performed from a single instruction that spans the boundary of a translation granule or which in some other way could lead to some of the accesses being aborted.
    — Write speculation that is visible to other observers is prohibited for all memory types.

• A write to a memory location with any Device memory attribute completes in finite time. This means that it is globally observed for all observers in the system in finite time.

• If a location with any Device memory attribute changes without an explicit write by an observer, this change must also be globally observed for all observers in the system in finite time. Such a change might occur in a peripheral location that holds status information.

• A completed write to a memory location with any Device memory attribute is globally observed for all observers in finite time without the need for explicit maintenance.

• Data accesses to memory locations are coherent for all observers in the system, and correspondingly are treated as being Outer Shareable.

• A memory location with any Device memory attribute cannot be allocated into a cache.

• Writes to a memory location with any Device memory attribute must reach the endpoint for that address in the memory system in finite time. Typically, the endpoint is a peripheral or some physical memory.
• All accesses to memory with any Device memory attribute must be aligned. Any unaligned access generates an Alignment fault at the first stage of translation that defined the location as being Device.

--- Note ---
In the Non-secure PL1&0 translation regime in systems where HCR.TGE==1 and HCR.DC==0, any Alignment fault that results from the fact that all locations are treated as Device is a fault at the first stage of translation. This causes the value of HSR.ISS.[24] to be 0.

--- Note ---
Hardware does not prevent speculative instruction fetches from a memory location with any of the Device memory attributes unless the memory location is also marked as Execute-never for all Exception levels.

--- Note ---
This means that to prevent speculative instruction fetches from memory locations with Device memory attributes, any location that is assigned any Device memory type must also be marked as Execute-never for all Exception levels. Failure to mark a memory location with any Device memory attribute as Execute-never for all Exception levels is a programming error.

See also Memory access restrictions on page E2-3041.

The memory types for Translation table walks cannot be defined as any Device memory type within the TCR. For the Non-secure EL1&0 translation regime, the memory accesses made during a stage 1 translation table walk are subject to a stage 2 translation, and as a result of this second stage of translation, the accesses from the first stage translation table walk might be made to memory locations with any Device memory type. These accesses might be made speculatively. When the value of the HCR.PTW bit is 1, a stage 2 permission fault is generated if a first stage translation table walk is made to any Device memory type.

For instruction fetches, if branches cause the program counter to point to an area of memory with the Device attribute which is not marked as Execute-never for the current Exception level, an implementation can either:
• Treat the instruction fetch as if it were to a memory location with the Normal Non-cacheable attribute.
• Take a Permission fault.

Gathering
In the Device memory attribute:
G Indicates that the location has the Gathering attribute.
ng Indicates that the location does not have the Gathering attribute, meaning it is non-Gathering.

The Gathering attribute determines whether it is permissible for either:
• Multiple memory accesses of the same type, read or write, to the same memory location to be merged into a single transaction.
• Multiple memory accesses of the same type, read or write, to different memory locations to be merged into a single memory transaction on an interconnect.

For memory types with the Gathering attribute, either of these behaviors is permitted, provided that the ordering and coherency rules of the memory location are followed.

For memory types with the non-Gathering attribute, neither of these behaviors is permitted. As a result:
• The number of memory accesses that are made corresponds to the number that would be generated by a simple sequential execution of the program.
• All access occur at their programmed size, except that there is no requirement for the memory system beyond the PE to be able to identify the elements accessed by multi-register Load/Store instructions. See Multi-register loads and stores that access Device memory on page E2-3040.
Gathering between memory accesses separated by a memory barrier that affects those memory accesses is not permitted. This applies if one memory access is in Group A and one memory access is in Group B. That is, gathering is not permitted between a memory access in Group A and a memory access in Group B if the two accesses are separated by a barrier that affects at least one of the accesses.

Gathering between two memory accesses generated by a Load-Acquire/Store-Release is not permitted.

A read from a memory location with the non-Gathering attribute cannot come from a cache or a buffer, but must come from the endpoint for that address in the memory system. Typically this is a peripheral or physical memory.

--- Note ---

- A read from a memory location with the Gathering attribute can come from intermediate buffering of a previous write, provided that:
  - The accesses are not separated by a DMB or DSB barrier that affects both of the accesses, for example if one access is in Group A and the other is in Group B.
  - The accesses are not separated by other ordering constructions that require that the accesses are in order. Such a construction might be a combination of Load-Acquire and Store-Release.
  - The accesses are not generated by a Store-Release instruction.
- The ARM architecture only defines programmer visible behavior. Therefore, gathering can be performed if a programmer cannot tell whether gathering has occurred.

An implementation is permitted to perform an access with the Gathering attribute in a manner consistent with the requirements specified by the non-Gathering attribute.

An implementation is not permitted to perform an access with the non-Gathering attribute in a manner consistent with the relaxations allowed by the Gathering attribute.

--- Reordering ---

In the Device memory attribute:

\[ R \]
Indicates that the location has the Reordering attribute.

\[ nR \]
Indicates that the location does not have the Reordering attribute, meaning it is non-Reordering.

For all memory types with the non-Reordering attribute, the order of memory accesses arriving at a single peripheral of IMPLEMENTATION DEFINED size, as defined by the peripheral, must be the same order that occurs in a simple sequential execution of the program. That is, the accesses appear in program order. This ordering applies to all accesses using any of the memory types with the non-Reordering attribute. As a result, if there is a mixture of Device-nGnRE and Device-nGnRnE accesses to the same peripheral, these occur in program order. If the memory accesses are not to a peripheral, then this attribute imposes no restrictions.

--- Note ---

- The IMPLEMENTATION DEFINED size of the single peripheral is the same as applies for the ordering guarantee provided by the DMB instruction.
- The ARM architecture only defines programmer visible behavior. Therefore, reordering can be performed if a programmer cannot tell whether reordering has occurred.

An implementation is permitted to perform an access with the Reordering attribute in a manner consistent with the requirements specified by the non-Reordering attribute.

An additional relaxation is that an implementation is not permitted to perform an access with the non-Reordering attribute in a manner consistent with the relaxations allowed by the Reordering attribute.

The non-Reordering attribute does not require any additional ordering, other than that which applies to Normal memory, between:

- Accesses with the non-Reordering attribute and accesses with the Reordering attribute.
• Accesses with the non-Reordering attribute and accesses to Normal memory.

• Accesses with the non-Reordering attribute and accesses to different peripherals of IMPLEMENTATION DEFINED size.

**Early Write Acknowledgement**

In the Device memory attribute:

- **E** Indicates that the location has the Early Write Acknowledgement attribute.
- **nE** Indicates that the location has the No Early Write Acknowledgement attribute.

For memory system endpoints where the system architecture in which the PE is operating requires that acknowledgement of a write comes from the endpoint, assigning the No Early Write Acknowledgement attribute to a Device memory location guarantees that:

- Only the endpoint of the write access returns a write acknowledgement of the access.
- No earlier point in the memory system returns a write acknowledgement.

This means that a DSB barrier instruction, executed by the PE that performed the write to the No Early Write Acknowledgement Location, completes only after the write has reached its endpoint in the memory system.

Peripherals are an example of system endpoints that require that the acknowledgement of a write comes from the endpoint.

**Note**

- The Early Write Acknowledgement attribute only affects where the endpoint acknowledgement is returned from, and does not affect the ordering of arrival at the endpoint between accesses, which is determined by either the Device Reordering attribute, or the use of barriers to create order.

- The areas of the physical memory map for which write acknowledgement from the endpoint is required is outside the scope of the ARM Architecture definition and must be defined as part of the system architecture in which the PE is operating. In particular, regions of memory handled as PCIe configuration writes are expected to support write acknowledgement from the endpoint.

- ARM recognizes that not all areas of a physical memory map will be capable of supporting write acknowledgement from the endpoint. In particular, ARM expects that regions of memory handled as posted writes under PCIe will not support write acknowledgement from the endpoint.

- For maximum software compatibility, ARM strongly recommends that all peripherals for which standard software drivers expect that the use of a DSB instruction will determine that a write has reached its endpoint are placed in areas of the physical memory map that support write acknowledgement from the endpoint.

**Multi-register loads and stores that access Device memory**

For all instructions that load or store more than one general-purpose register there is no requirement for the memory system beyond the PE to be able to identify the size of the elements accessed by these load and store instructions.

For all instructions that load or store one or more registers from the SIMD and floating-point register file there is no requirement for the memory system beyond the PE to be able to identify the size of the element accessed by these load and store instructions.

For an LDRD, STRD, or LDM instruction with a register list that includes the PC, or an STM instruction with a register list that includes the PC, the order in which the registers are accessed is not defined by the architecture.

For a load or store of an Advanced SIMD element or structure, the order in which the registers are accessed is not defined by the architecture.

For a VLDM and VSTM instruction with a register list that does not include the PC, all registers are accessed in ascending address order for accesses to Device memory with the non-Reordering attribute.
For a **LDM** or **STM** instruction with a register list that does not include the PC:

- When ARMv8.2-LSMAOC is not implemented, and when ARMv8.2-LSMAOC is implemented and the value of the applicable LSMAOE field is 1, all registers are accessed in ascending address order for accesses to Device memory with the non-Reordering attribute.

- When ARMv8.2-LSMAOC is implemented and the value of the applicable LSMAOE field is 0, no memory accesses are required to be ordered.

- When ARMv8.2-LSMAOC is implemented and the value of the applicable nTLSMD field is 0, any memory access to an address that the stage 1 translation assigns as Device-nGRE, Device-nGnRE, or Device-nGnRnE generates an Alignment fault.

The applicable LSMAOE or nTLSMD field is the field in the SCTLR_EL1, SCTLR_EL2, HSCTLR, or SCTLR register that applies to the Exception level and Security state at which the **LDM** or **STM** instruction is executed.

ARMv8.2 deprecates software relying on accesses to Device memory made by a single **LDM** or **STM** instruction not being reordered.

### E2.7.3 Memory access restrictions

The following restrictions apply to memory accesses:

- For accesses to any two bytes, \( p \) and \( q \), that are generated by the same instruction:
  - The bytes \( p \) and \( q \) must have the same memory type and Shareability attributes. Otherwise the results are CONSTRAINED UNPREDICTABLE. For example, an **LDC**, **LDM**, **LDRD**, **STC**, **STM** or **STRD** instruction, or an unaligned load or store that spans the boundary between Normal memory and Device memory is CONSTRAINED UNPREDICTABLE.
  - Except for possible differences in the cache allocation hints, ARM deprecates having different cacheability attributes for bytes \( p \) and \( q \).

For the permitted CONSTRAINED UNPREDICTABLE behavior, see *Crossing a page boundary with different memory types or Shareability attributes on page K1-6399*.

- If the accesses of an instruction that causes multiple accesses to any type of Device memory cross a 4KB address boundary then behavior is CONSTRAINED UNPREDICTABLE and *Crossing a 4KB boundary with a Device access on page K1-6400* describes the permitted behaviors.

**Note**

- The boundary referred to is between two Device memory regions that are both of 4KB and aligned to 4KB.
- This restriction means it is important that an access to a volatile memory device is not made using a single instruction that crosses a 4KB address boundary.
- ARM expects this restriction to constrain the placing of volatile memory devices in the system memory map, rather than expecting a compiler to be aware of the alignment of memory accesses.
E2.8 Mismatched memory attributes

In the ARMv8 architecture mismatched memory attributes are controlled by privileged software. For more information, see Chapter G4 The AArch32 Virtual Memory System Architecture.

Physical memory Locations are accessed with mismatched attributes if all accesses to the Location do not use a common definition of all of the following attributes of that Location:

- Memory type, Device or Normal.
- Shareability.
- Cacheability, for the same level of the inner or outer cache, but excluding any cache allocation hints.

Collectively these are referred to as memory attributes.

--- Note ---

In this document, the terms location and memory location refer to any byte within the current coherency granule and are used interchangeably.

When a memory Location is accessed with mismatched attributes the only software visible effects are one or more of the following:

- Uniprocessor semantics for reads and writes to that memory Location might be lost. This means:
  - A read of the memory Location by one agent might not return the value most recently written to that memory Location by the same agent.
  - Multiple writes to the memory Location by one agent with different memory attributes might not be ordered in program order.

- There might be a loss of coherency when multiple agents attempt to access a memory Location.

- There might be a loss of properties derived from the memory type, as described in later bullets in this section.

- If all Load-Exclusive/Store-Exclusive instructions executed across all threads to access a given memory Location do not use consistent memory attributes, the Exclusives monitor state becomes UNKNOWN.

- Bytes written without the Write-Back cacheable attribute within the same Write-Back granule as bytes written with the Write-Back cacheable attribute might have their values reverted to the old values as a result of cache Write-Back.

The loss of properties associated with mismatched memory type attributes refers only to the following properties of Device memory that are additional to the properties of Normal memory:

- Prohibition of speculative read accesses.
- Prohibition on Gathering.
- Prohibition on Re-ordering.

For the following situations, when a physical memory Location is accessed with mismatched attributes, a more restrictive set of behaviors applies. The description of each situation also describes the behaviors that apply:

1. If the only memory type mismatch associated with a memory Location across all users of the memory Location is between different types of Device memory, then all accesses might take the properties of the weakest Device memory type.

2. Any agent that reads that memory Location using the same common definition of the Shareability and Cacheability attributes is guaranteed to access it coherently, to the extent required by that common definition of the memory attributes, only if all the following conditions are met:

   - All writes are performed to an alias of the memory Location that uses the same definition of the Shareability and Cacheability attributes.
   - Either:
     - In the Non-secure PL1&0 translation regime, HCR2.MIOCNCE has a value of 0.
     - All aliases with write permission have the Inner Cacheability attribute the same as the Outer Cacheability attribute.
The possible software-visible effects caused by mismatched attributes for a memory Location are defined more precisely if all of the mismatched attributes define the memory Location as one of:

- Any Device memory type.
- Normal Inner Non-cacheable, Outer Non-cacheable memory.

In these cases, the only permitted software-visible effects of the mismatched attributes are one or more of the following:

- Possible loss of properties derived from the memory type when multiple agents attempt to access the memory Location.
- Possible reordering of memory transactions to the same memory Location with different memory attributes, potentially leading to a loss of coherency or uniprocessor semantics. Any possible loss of coherency or uniprocessor semantics can be avoided by inserting DMB barrier instructions between accesses to the same memory Location that might use different attributes.

Where there is a loss of the uniprocessor semantics, ordering, or coherency, the following approaches can be used:

1. If the mismatched attributes for a memory Location all assign the same Shareability attribute to a Location that has a cacheable attribute, any loss of uniprocessor semantics, ordering, or coherency within a Shareability domain can be avoided by use of software cache management. To do so, software must use the techniques that are required for the software management of the ordering or coherency of cacheable Locations between agents in different shareability domains. This means:

   - Before writing to a cacheable Location not using the Write-Back attribute, software must invalidate, or clean, a Location from the caches if any agent might have written to the Location with the Write-Back attribute. This avoids the possibility of overwriting the Location with stale data.
   - After writing to a cacheable Location with the Write-Back attribute, software must clean the Location from the caches, to make the write visible to external memory.
   - Before reading the Location with a cacheable attribute, software must invalidate, or clean and invalidate, the Location from the caches, to ensure that any value held in the caches reflects the last value made visible in external memory.
   - Executing a DMB barrier instruction, with scope that applies to the common Shareability of the accesses, between any accesses to the same cacheable Location that use different attributes.

Note

In AArch32 state, cache maintenance instructions can only be accessed from an Exception level that is higher than EL0, and therefore require a system call. For information on system calls, see Exception-generating and exception-handling instructions on page F1-3077. For information about the AArch32 cache maintenance instructions, see AArch32 cache and branch predictor support on page G3-4809.

In all cases:

- Location refers to any byte within the current coherency granule.
- A clean and invalidate instruction can be used instead of a clean instruction, or instead of an invalidate instruction.
- In the sequences outlined in this section, all cache maintenance instructions and memory transactions must be completed, or ordered by the use of barrier operations, if they are not naturally ordered by the use of a common address, see Ordering of cache and branch predictor maintenance instructions on page G3-4829.
E2 The AArch32 Application Level Memory Model
E2.8 Mismatched memory attributes

--- Note ---

With software management of cohereency, race conditions can cause loss of data. A race condition occurs when different agents write simultaneously to bytes that are in the same Location, and the invalidate, write, clean sequence of one agent overlaps with the equivalent sequence of another agent. A race condition also occurs if the first operation of either sequence is a clean, rather than an invalidate.

2. If the mismatched attributes for a Location mean that multiple cacheable accesses to the Location might be made with different Shareability attributes, then ordering and coherency are guaranteed only if:

   • Each PE that accesses the Location with a cacheable attribute performs a clean and invalidate of the Location before and after accessing that Location.
   • A DMB barrier with scope that covers the full Shareability of the accesses is placed between any accesses to the same memory Location that use different attributes.

--- Note ---

The Note in rule 1 of this list, about possible race conditions, also applies to this rule.

In addition, if multiple agents attempt to use Load-Exclusive or Store-Exclusive instructions to access a Location, and the accesses from the different agents have different memory attributes associated with the Location, the Exclusives monitor state becomes UNKNOWN.

ARM strongly recommends that software does not use mismatched attributes for aliases of the same Location. An implementation might not optimize the performance of a system that uses mismatched aliases.
E2.9 Synchronization and semaphores

ARMv8 provides non-blocking synchronization of shared memory, using synchronization primitives. The information in this section about memory accesses by synchronization primitives applies to accesses to both Normal and Device memory.

Note

Use of the ARMv8 synchronization primitives scales for multiprocessing system designs.

Table E2-6 shows the synchronization primitives and the associated CLREX instruction.

a. Instruction in the T32 and A32 instruction sets.

Except for the row showing the CLREX instruction, the two instructions in a single row are a Load-Exclusive/Store-Exclusive instruction pair. The model for the use of a Load-Exclusive/Store-Exclusive instruction pair accessing a non-aborting memory address \( x \) is:

- The Load-Exclusive instruction reads a value from memory address \( x \).
- The corresponding Store-Exclusive instruction succeeds in writing back to memory address \( x \) only if no other observer, process, or thread has performed a more recent store to address \( x \). The Store-Exclusive instruction returns a status bit that indicates whether the memory write succeeded.

A Load-Exclusive instruction marks a small block of memory for exclusive access. The size of the marked block is IMPLEMENTATION DEFINED, see Marking and the size of the marked memory block on page E2-3051. A Store-Exclusive instruction to any address in the marked block clears the marking.

Note

In this section, the term PE includes any observer that can generate a Load-Exclusive or a Store-Exclusive instruction.

The following sections give more information:

- Exclusive access instructions and Non-shareable memory locations on page E2-3046.
- Exclusive access instructions and shareable memory locations on page E2-3048.
- Marking and the size of the marked memory block on page E2-3051.
- Context switch support on page E2-3051.
- Load-Exclusive and Store-Exclusive instruction usage restrictions on page E2-3052.
- Use of WFE and SEV instructions by spin-locks on page E2-3054.
For memory locations for which the Shareability attribute is Non-shareable, the exclusive access instructions rely on a local Exclusives monitor, or local monitor, that marks any address from which the PE executes a Load-Exclusive instruction. Any non-aborted attempt by the same PE to use a Store-Exclusive instruction to modify any address is guaranteed to clear the marking.

A Load-Exclusive instruction performs a load from memory, and:
- The executing PE marks the physical memory address for exclusive access.
- The local monitor of the executing PE transitions to the Exclusive Access state.

A Store-Exclusive instruction performs a conditional store to memory that depends on the state of the local monitor:

**If the local monitor is in the Exclusive Access state**

- If the address of the Store-Exclusive instruction is the same as the address that has been marked in the monitor by an earlier Load-Exclusive instruction, then the store occurs. Otherwise, it is IMPLEMENTATION DEFINED whether the store occurs.
- A status value is returned to a register:
  - If the store took place the status value is 0.
  - Otherwise, the status value is 1.
- The local monitor of the executing PE transitions to the Open Access state.

When an Exclusives monitor is in the Exclusive Access state the monitor is *set*.

**If the local monitor is in the Open Access state**

- No store takes place.
- A status value of 1 is returned to a register.
- The local monitor remains in the Open Access state.

When an Exclusives monitor is in the Exclusive Access state the monitor is *clear*.

The Store-Exclusive instruction defines the register to which the status value is returned.

When a PE writes using any instruction other than a Store-Exclusive instruction:

- If the write is to a PA that is not marked as Exclusive Access by its local monitor and that local monitor is in the Exclusive Access state it is IMPLEMENTATION DEFINED whether the write affects the state of the local monitor.
- If the write is to a PA that is marked as Exclusive Access by its local monitor it is IMPLEMENTATION DEFINED whether the write affects the state of the local monitor.

It is IMPLEMENTATION DEFINED whether a store to a marked PA causes a mark in the local monitor to be cleared if that store is by an observer other than the one that caused the PA to be marked.

Figure E2-4 on page E2-3047 shows the state machine for the local monitor and the effect of each of the operations shown in the figure.
For more information about marking see *Marking and the size of the marked memory block* on page E2-3051.

--- **Note** ---

For the local monitor state machine, as shown in Figure E2-4:

- The IMPLEMENTATION DEFINED options for the local monitor are consistent with the local monitor being constructed so that it does not hold any PA, but instead treats any access as matching the address of the previous Load-Exclusive instruction.

- A local monitor implementation can be unaware of Load-Exclusive and Store-Exclusive instructions from other PEs.

- The architecture does not require a load instruction, by another PE, that is not a Load-Exclusive instruction, to have any effect on the local monitor.

- It is IMPLEMENTATION DEFINED whether the transition from Exclusive Access to Open Access state occurs when the Store or StoreExcl is from another observer.

--- **Changes to the local monitor state resulting from speculative execution** ---

The architecture permits a local monitor to transition to the Open Access state as a result of speculation, or from some other cause. This is in addition to the transitions to Open Access state caused by the architectural execution of an operation shown in Figure E2-4.

An implementation must ensure that:

- The local monitor cannot be seen to transition to the Exclusive Access state except as a result of the architectural execution of one of the operations shown in Figure E2-4.

- Any transition of the local monitor to the Open Access state not caused by the architectural execution of an operation shown in Figure E2-4 must not indefinitely delay forward progress of execution.
E2.9.2 Exclusive access instructions and shareable memory locations

In the context of this section, a shareable memory location is a memory location that has, or is treated as if it has, a Shareability attribute of Inner Shareable or Outer Shareable.

For shareable memory locations, exclusive access instructions rely on:

- A local monitor for each PE in the system, that marks any address from which the PE executes a Load-Exclusive. The local monitor operates as described in Exclusive access instructions and Non-shareable memory locations on page E2-3046, except that for shareable memory any Store-Exclusive is then subject to checking by the global monitor if it is described in that section as doing at least one of the following:
  - Updating memory.
  - Returning a status value of 0.

  The local monitor can ignore accesses from other PEs in the system.

- A global monitor that marks a PA as exclusive access for a particular PE. This marking is used later to determine whether a Store-Exclusive to that address that has not been failed by the local monitor can occur. Any successful write to the marked block by any other observer in the Shareability domain of the memory location is guaranteed to clear the marking. For each PE in the system, the global monitor:
  - Can hold at least one marked block.
  - Maintains a state machine for each marked block it can hold.

  Note

  For each PE, the architecture only requires global monitor support for a single marked address. Any situation that might benefit from the use of multiple marked addresses on a single PE is CONSTRAINED UNPREDICTABLE, see Load-Exclusive and Store-Exclusive instruction usage restrictions on page E2-3052.

  Note

  The global monitor can either reside in a block that is part of the hardware on which the PE executes or exist as a secondary monitor at the memory interfaces. The IMPLEMENTATION DEFINED aspects of the monitors mean that the global monitor and local monitor can be combined into a single unit, provided that the unit performs the global monitor and local monitor functions defined in this manual.

  Note

  For shareable memory locations, in some implementations and for some memory types, the properties of the global monitor require functionality outside the PE. Some system implementations might not implement this functionality for all locations of memory. In particular, this can apply to:

  - Any type of memory in the system implementation that does not support hardware cache coherency.
  - Non-cacheable memory, or memory treated as Non-cacheable, in an implementation that does support hardware cache coherency.

  In such a system, it is defined by the system:

  - Whether the global monitor is implemented.
  - If the global monitor is implemented, which address ranges or memory types it monitors.

  Note

  To support the use of the Load-Exclusive/Store-Exclusive mechanism when address translation is disabled, a system might define at least one location of memory, of at least the size of the translation granule, in the system memory map to support the global monitor for all PEs within a common Inner Shareable domain. However, this is not an architectural requirement. Therefore, architecturally-compliant software that requires mutual exclusion must not rely on using the Load-Exclusive/Store-Exclusive mechanism, and must instead use a software algorithm such as Lamport’s Bakery algorithm to achieve mutual exclusion.
Because implementations can choose which memory types are treated as Non-cacheable, the only memory types for which it is architecturally guaranteed that a global Exclusives monitor is implemented are:

- Inner Shareable, Inner Write-Back, Outer Write-Back Normal memory with Read allocation hint and Write allocation hint and not transient.
- Outer Shareable, Inner Write-Back, Outer Write-Back Normal memory with Read allocation hint and Write allocation hints and not transient.

If the global monitor is not implemented for an address range or memory type, then performing a Load-Exclusive/Store-Exclusive instruction to such a location has one or more of the following effects:

- The instruction generates an External abort.
- The instruction generates an IMPLEMENTATION DEFINED MMU fault. This is reported using the Fault status code of:
  - DFSR.STATUS = 0b110101 when using the Long-descriptor translation table format. The fault can also be reported in the HSR.ISS[5:0] field for exceptions to Hyp mode.
  - DFSR.FS = 0b10101 when using the Short-descriptor translation table format.

If the IMPLEMENTATION DEFINED MMU fault is generated for the Non-secure PL1&0 translation regime then:

- If the fault is generated because of the memory type defined in the first stage of translation, or if the second stage of translation is disabled, then this is a first stage fault and the exception is taken to EL1.
- Otherwise, the fault is a second stage fault and the exception is taken to EL2.

The priority of this fault is IMPLEMENTATION DEFINED.

- The instruction is treated as a NOP.
- The Load-Exclusive instruction is treated as if it were accessing a Non-shareable location, but the state of the local monitor becomes UNKNOWN.
- The Store-Exclusive instruction is treated as if it were accessing a Non-shareable location, but the state of the local monitor becomes UNKNOWN.
- The value held in the result register of the Store-Exclusive instruction becomes UNKNOWN.

In addition, for write transactions generated by non-PE observers that do not implement exclusive accesses or other atomic access mechanisms, the effect that writes have on the global and local monitors used by an ARM PE is IMPLEMENTATION DEFINED. The writes might not clear the global monitors of other PEs for:

- Some address ranges.
- Some memory types.

**Operation of the global Exclusives monitor**

A Load-Exclusive instruction from shareable memory performs a load from memory, and causes the PA of the access to be marked as exclusive access for the requesting PE. This access can also cause the exclusive access mark to be removed from any other PA that has been marked by the requesting PE.

**Note**

The global monitor only supports a single outstanding exclusive access to shareable memory for each PE.

A Load-Exclusive instruction by one PE has no effect on the global monitor state for any other PE.

A Store-Exclusive instruction performs a conditional store to memory:

- The store is guaranteed to succeed only if the PA accessed is marked as exclusive access for the requesting PE and both the local monitor and the global monitor state machines for the requesting PE are in the Exclusive Access state. In this case:
  - A status value of 0 is returned to a register to acknowledge the successful store.
  - The final state of the global monitor state machine for the requesting PE is IMPLEMENTATION DEFINED.
  - If the address accessed is marked for exclusive access in the global monitor state machine for any other PE then that state machine transitions to Open Access state.
• If no address is marked as exclusive access for the requesting PE, the store does not succeed:
  — A status value of 1 is returned to a register to indicate that the store failed.
  — The global monitor is not affected and remains in Open Access state for the requesting PE.

• If a different PA is marked as exclusive access for the requesting PE, it is IMPLEMENTATION DEFINED whether
  the store succeeds or not:
  — If the store succeeds a status value of 0 is returned to a register, otherwise a value of 1 is returned.
  — If the global monitor state machine for the PE was in the Exclusive Access state before the
    Store-Exclusive instruction it is IMPLEMENTATION DEFINED whether that state machine transitions to
    the Open Access state.

The Store-Exclusive instruction defines the register to which the status value is returned.

In a shared memory system, the global monitor implements a separate state machine for each PE in the system. The
state machine for accesses to shareable memory by PE(n) can respond to all the shareable memory accesses visible
to it. This means it responds to:
• Accesses generated by PE(n).
• Accesses generated by the other observers in the Shareability domain of the memory location. These accesses
  are identified as (!n).

In a shared memory system, the global monitor implements a separate state machine for each observer that can
generate a Load-Exclusive or a Store-Exclusive instruction in the system.

A global monitor:
• In the Exclusive Access state is set.
• In the Open Access state is clear.

Clear global monitor event

 Whenever the global monitor state for a PE changes from Exclusive access to Open access, an event is generated
and held in the Event register for that PE. This register is used by the Wait for Event mechanism, see Wait For Event
and Send Event on page G1-4688.

Figure E2-5 shows the state machine for PE(n) in a global monitor.

---

Any LoadExc1 operation updates the marked address to the most significant bits of the address x used for the operation.

Figure E2-5 Global monitor state machine diagram for PE(n) in a multiprocessor system

For more information about marking see Marking and the size of the marked memory block on page E2-3051.
Note

For the global monitor state machine, as shown in Figure E2-5 on page E2-3050:

- The architecture does not require a load instruction by another PE, that is not a Load-Exclusive instruction, to have any effect on the global monitor.
- Whether a Store-Exclusive instruction successfully updates memory or not depends on whether the address accessed matches the marked shareable memory address for the PE issuing the Store-Exclusive instruction, and whether the local and global monitors are in the exclusive state. For this reason, Figure E2-5 on page E2-3050 only shows how the operations by ('n) cause state transitions of the state machine for PE(n).
- A Load-Exclusive instruction can only update the marked shareable memory address for the PE issuing the Load-Exclusive instruction.
- When the global monitor is in the Exclusive Access state, it is IMPLEMENTATION DEFINED whether a CLREX instruction causes the global monitor to transition from Exclusive Access to Open Access state.
- It is IMPLEMENTATION DEFINED:
  - Whether a modification to a Non-shareable memory location can cause a global monitor to transition from Exclusive Access to Open Access state.
  - Whether a Load-Exclusive instruction to a Non-shareable memory location can cause a global monitor to transition from Open Access to Exclusive Access state.

E2.9.3 Marking and the size of the marked memory block

When a Load-Exclusive instruction is executed, the resulting marked block ignores the least significant bits of the 64-bit memory address.

When a Load-Exclusive instruction is executed, a marked block of size $2^a$ bytes is created by ignoring the least significant bits of the memory address. A marked address is any address within this marked block. The size of the marked memory block is called the Exclusives reservation granule. The Exclusives reservation granule is IMPLEMENTATION DEFINED in the range 4 - 512 words.

Note

This definition means that the Exclusives reservation granule is:

- 4 words in an implementation where $a$ is 4.
- 512 words in an implementation where $a$ is 11.

For example, in an implementation where $a$ is 4, a successful LDREXB of address 0x341B4 defines a marked block using bits[47:4] of the address. This means that the four words of memory from 0x341B0 to 0x341BF are marked for exclusive access.

In some implementations the CTR identifies the Exclusives reservation granule, see CTR. Otherwise, software must assume that the maximum Exclusives reservation granule, 512 words, is implemented.

E2.9.4 Context switch support

An exception return clears the local monitor. As a result, performing a CLREX instruction as part of a context switch is not required in most situations.

Note

Context switching is not an application level operation. However, this information is included here to complete the description of the exclusive operations.
E2.9.5 Load-Exclusive and Store-Exclusive instruction usage restrictions

The Load-Exclusive and Store-Exclusive instructions are intended to work together as a pair, for example a LDREX/STREX pair or a LDREXB/STREXB pair. To support different implementations of these functions, software must follow the notes and restrictions given in this subsection.

The following notes describe use of a Load-Exclusive/Store-Exclusive instruction pair, LoadExcl/StoreExcl, to indicate the use of any of the Load-Exclusive/Store-Exclusive instruction pairs shown in Table E2-6 on page E2-3045. In this context, a LoadExcl/StoreExcl pair comprises two instructions in the same thread of execution:

• The exclusives support a single outstanding exclusive access for each PE thread that is executed. The architecture makes use of this by not requiring an address or size check as part of the IsExclusiveLocal() function. If the target VA of a StoreExcl is different from the VA of the preceding LoadExcl instruction in the same thread of execution, behavior can be CONSTRAINED UNPREDICTABLE with the following behavior:
  — The StoreExcl either passes or fails, the status value returned by the StoreExcl is UNKNOWN, and the states of the local and global monitors for that PE are UNKNOWN.

  Note
  This means the StoreExcl might pass for some instances of a LoadExcl/StoreExcl pair with mismatched addresses, and fail for other instances of a LoadExcl/StoreExcl pair with mismatched addresses.

  — The data at the address accessed by the LoadExcl, and at the address accessed by the StoreExcl, is UNKNOWN.

This means software can rely on a LoadExcl/StoreExcl pair to eventually succeed only if the LoadExcl and the StoreExcl are executed with the same VA.

• An implementation of the Load-Exclusive and Store-Exclusive instructions can require that, in any thread of execution, the transaction size of a StoreExcl instruction is the same as the transaction size of the preceding LoadExcl instruction executed in that thread. If the transaction size of a StoreExcl instruction is different from the preceding LoadExcl instruction in the same thread of execution, behavior can be CONSTRAINED UNPREDICTABLE with the following behavior:
  — The StoreExcl either passes or fails, and the status value returned by the StoreExcl is UNKNOWN.

  Note
  This means the StoreExcl might pass for some instances of a LoadExcl/StoreExcl pair with mismatched transaction sizes, and fail for other instances of a LoadExcl/StoreExcl pair with mismatched transaction sizes.

  — The block of data of the size of the larger of the transaction sizes used by the LoadExcl/StoreExcl pair at the address accessed by the LoadExcl/StoreExcl pair, is UNKNOWN.

This means software can rely on a LoadExcl/StoreExcl pair to eventually succeed only if the LoadExcl and the StoreExcl have the same transaction size.

• LoadExcl/StoreExcl loops are guaranteed to make forward progress only if, for any LoadExcl/StoreExcl loop within a single thread of execution, the software meets all of the following conditions:

  1 Between the Load-Exclusive and the Store-Exclusive, there are no explicit memory accesses, preloads, direct or indirect System register writes, address translation instructions, cache or TLB maintenance instructions, exception generating instructions, exception returns, or indirect branches.

  2 Between the Store-Exclusive returning a failing result and the retry of the corresponding Load-Exclusive:

    • There are no stores or PLDW instructions to any address within the Exclusives reservation granule accessed by the Store-Exclusive.

    • There are no loads or preloads to any address within the Exclusives reservation granule accessed by the Store-Exclusive that use a different VA alias to that address.

    • There are no direct or indirect System register writes, other than changes to the flag fields in the CPSR or FPSCR, caused by data processing or comparison instructions.
• There are no direct or indirect address translation instructions, cache or TLB maintenance instructions, exception generating instructions, exception returns, or indirect branches.

• All loads and stores are to a block of contiguous virtual memory of not more than 512 bytes in size.

The Exclusives monitor can be cleared at any time without an application-related cause, provided that such clearing is not systematically repeated so as to prevent the forward progress in finite time of at least one of the threads that is accessing the Exclusives monitor. However, it is permissible for the LoadExc1/StoreExc1 loop not to make forward progress if a different thread is repeatedly doing any of the following in a tight loop:

— Performing stores to a PA covered by the Exclusives monitor.
— Prefetching with intent to write to a PA covered by the Exclusives monitor.
— Executing data cache clean, data cache invalidate, or data cache clean and invalidate instructions to a PA covered by the Exclusives monitor.
— Executing instruction cache invalidate all instructions.
— Executing instruction cache invalidate by VA instructions to a PA covered by the Exclusives monitor.

• Implementations can benefit from keeping the LoadExc1 and StoreExc1 operations close together in a single thread of execution. This minimizes the likelihood of the Exclusives monitor state being cleared between the LoadExc1 instruction and the StoreExc1 instruction. Therefore, for best performance, ARM strongly recommends a limit of 128 bytes between LoadExc1 and StoreExc1 instructions in a single thread of execution.

• The architecture sets an upper limit of 2048 bytes on the Exclusives reservation granule that can be marked as exclusive. For performance reasons, ARM recommends that objects that are accessed by exclusive accesses are separated by the size of the Exclusives reservation granule. This is a performance guideline rather than a functional requirement.

• After taking a Data Abort exception, the state of the Exclusives monitors is UNKNOWN.

• For the memory location accessed by a LoadExc1/StoreExc1 pair, if the memory attributes for a StoreExc1 instruction are different from the memory attributes for the preceding LoadExc1 instruction in the same thread of execution, behavior is CONSTRAINED UNPREDICTABLE. Where this occurs because the translation of the accessed address changes between the LoadExc1 instruction and the StoreExc1 instruction, the CONSTRAINED UNPREDICTABLE behavior is as follows:

— The StoreExc1 either passes or fails, and the status value returned by the StoreExc1 is UNKNOWN.

Note
This means the StoreExc1 might pass for some instances of a LoadExc1/StoreExc1 pair with changed memory attributes, and fail for other instances of a LoadExc1/StoreExc1 pair with changed memory attributes.

— The data at the address accessed by the StoreExc1 is UNKNOWN.

Note

Another bullet point in this list covers the case where the memory attributes of a LoadExc1/StoreExc1 pair differ as a result of using different VAs with different attributes that point to the same PA.

• The effect of a data or unified cache invalidate, clean, or clean and invalidate instruction on a local or global Exclusives monitor that is in the Exclusive Access state is CONSTRAINED UNPREDICTABLE, and the instruction might clear the monitor, or it might leave it in the Exclusive Access state. For address-based maintenance instructions, this also applies to the monitors of other PEs in the same Shareability domain as the PE executing the cache maintenance instruction, as determined by the Shareability domain of the address being maintained.

Note

ARM strongly recommends that implementations ensure that the use of such maintenance instructions by a PE in the Non-secure state cannot cause a denial of service on a PE in the Secure state.
• If the mapping of the VA to PA is changed between the LoadExc1 instruction and the StoreExc1 instruction, and the change is performed using a break-before-make sequence as described in Using break-before-make when updating translation table entries on page G4-4916, if the StoreExc1 is performed after another write to the same PA as the StoreExc1, and that other write was performed after the old translation was properly invalidated and that invalidation was properly synchronized, then the StoreExc1 will not pass its monitor check.

—— Note ———
ARM expects that, in many implementations, either:
— The TLB invalidation will clear either the local or global monitor.
— The PA will be checked between the LoadExc1 and StoreExc1.

• The Exclusive Access state for an address accessed by a PE can be lost as a result of a PLDW instruction to the same PA executed by another PE. This means that a very high rate of repeated PLDW accesses to a memory location might impede the forward progress of another PE.

—— Note ———
In the event of repeatedly-contending LoadExc1/StoreExc1 instruction sequences from multiple PEs, an implementation must ensure that forward progress is made by at least one PE.

E2.9.6 Use of WFE and SEV instructions by spin-locks

ARMv8 provides Wait For Event, Send Event, and Send Event Local instructions, WFE, SEV, SEVL, that can assist with reducing power consumption and bus contention caused by PEs repeatedly attempting to obtain a spin-lock. These instructions can be used at the application level, but a complete understanding of what they do depends on a system level understanding of exceptions. They are described in Wait For Event and Send Event on page G1-4688. However, in ARMv8, when the global monitor for a PE changes from Exclusive Access state to Open Access state, an event is generated.

—— Note ———
This is equivalent to issuing an SEVL instruction on the PE for which the monitor state has changed. It removes the need for spinlock code to include an SEV instruction after clearing a spinlock.
Part F
The AArch32 Instruction Sets
Chapter F1
The AArch32 Instruction Sets Overview

This chapter describes the T32 and A32 instruction sets. It contains the following sections:

- Support for instructions in different versions of the ARM architecture on page F1-3058.
- Unified Assembler Language on page F1-3059.
- Branch instructions on page F1-3061.
- Data-processing instructions on page F1-3062.
- PSTATE and banked register access instructions on page F1-3070.
- Load/store instructions on page F1-3071.
- Load/store multiple instructions on page F1-3074.
- Miscellaneous instructions on page F1-3075.
- Exception-generating and exception-handling instructions on page F1-3077.
- System register access instructions on page F1-3079.
- Advanced SIMD and floating-point load/store instructions on page F1-3080.
- Advanced SIMD and floating-point register transfer instructions on page F1-3082.
- Advanced SIMD data-processing instructions on page F1-3083.
- Floating-point data-processing instructions on page F1-3093.
F1.1 **Support for instructions in different versions of the ARM architecture**

This manual describes the ARM AArch32 instruction sets, T32 and A32, for the ARMv8 architecture. Therefore, it indicates how any options or extensions in the ARMv8 architecture affect the available instructions.

This manual does not provide any information about which T32 and A32 instructions were supported in specific earlier versions of the architecture. For this information, see the *ARM® Architecture Reference Manual, ARMv7-A and ARMv7-R edition.*
F1.2 Unified Assembler Language

This manual uses the ARM Unified Assembler Language (UAL). This assembly language syntax provides a canonical form for all T32 and A32 instructions.

UAL describes the syntax for the mnemonic and the operands of each instruction. In addition, it assumes that instructions and data items can be given labels. It does not specify the syntax to be used for labels, nor what assembler directives and options are available. See your assembler documentation for these details.

Most earlier ARM assembly language mnemonics are still supported as synonyms, as described in the instruction details.

--- Note ---

Most earlier T32 assembly language mnemonics are not supported.

---

UAL includes instruction selection rules that specify which instruction encoding is selected when more than one can provide the required functionality. For example, both 16-bit and 32-bit encodings exist for an ADD R0, R1, R2 instruction. The most common instruction selection rule is that when both a 16-bit encoding and a 32-bit encoding are available, the 16-bit encoding is selected, to optimize code density.

Syntax options exist to override the normal instruction selection rules and ensure that a particular encoding is selected. These are useful when disassembling code, to ensure that subsequent assembly produces the original code, and in some other situations.

F1.2.1 Conditional instructions

For maximum portability of UAL assembly language between the T32 and A32 instruction sets, ARM recommends that:

- IT instructions are written before conditional instructions in the correct way for the T32 instruction set.
- When assembling to the A32 instruction set, assemblers check that any IT instructions are correct, but do not generate any code for them.

Although other T32 instructions are unconditional, all instructions that are made conditional by an IT instruction must be written with a condition. These conditions must match the conditions imposed by the IT instruction. For example, an ITTEE EQ instruction imposes the EQ condition on the first two following instructions, and the NE condition on the next two. Those four instructions must be written with EQ, EQ, NE and NE conditions respectively.

Some instructions cannot be made conditional by an IT instruction. Some instructions can be conditional if they are the last instruction in the IT block, but not otherwise.

The branch instruction encodings that include a Condition code field cannot be made conditional by an IT instruction. If the assembler syntax indicates a conditional branch that correctly matches a preceding IT instruction, it is assembled using a branch instruction encoding that does not include a Condition code field.

--- Note ---

For performance reasons ARMv8 deprecates many uses of IT, see Partial deprecation of IT on page F1-3076. As described in that section, an implementation can include ITD controls that disable those uses of IT, making them UNDEFINED.

---

F1.2.2 Use of labels in UAL instruction syntax

The UAL syntax for some instructions includes the label of an instruction or a literal data item that is at a fixed offset from the instruction being specified. The assembler must:

1. Calculate the PC or Align(PC, 4) value of the instruction. The PC value of an instruction is its address plus 4 for a T32 instruction, or plus 8 for an A32 instruction. The Align(PC, 4) value of an instruction is its PC value ANDed with 0xFFFFFFF0 to force it to be word-aligned. There is no difference between the PC and Align(PC, 4) values for an A32 instruction, but there can be for a T32 instruction.
2. Calculate the offset from the \(PC\) or \(\text{Align}(PC, 4)\) value of the instruction to the address of the labeled instruction or literal data item.

3. Assemble a \(PC\)-relative encoding of the instruction, that is, one that reads its \(PC\) or \(\text{Align}(PC, 4)\) value and adds the calculated offset to form the required address.

\[\text{Note}\]

For instructions that can encode a subtraction operation, if the instruction cannot encode the calculated offset but can encode minus the calculated offset, the instruction encoding specifies a subtraction of minus the calculated offset.

The syntax of the following instructions includes a label:

- \(B, BL, \text{and BLX (immediate)}\): The assembler syntax for these instructions always specifies the label of the instruction that they branch to. Their encodings specify a sign-extended immediate offset that is added to the \(PC\) value of the instruction to form the target address of the branch.

- \(C\text{BNZ and C\text{BZ}}\): The assembler syntax for these instructions always specifies the label of the instruction that they branch to. Their encodings specify a zero-extended immediate offset that is added to the \(PC\) value of the instruction to form the target address of the branch. They do not support backward branches.

- \(\text{LDR, LDRB, LDRD, LDRH, LDRSB, LDRSH, PLD, PLDW, PLI, and VLDR}\): The normal assembler syntax of these load instructions can specify the label of a literal data item that is to be loaded. The encodings of these instructions specify a zero-extended immediate offset that is either added to or subtracted from the \(\text{Align}(PC, 4)\) value of the instruction to form the address of the data item. A few such encodings perform a fixed addition or a fixed subtraction and must only be used when that operation is required, but most contain a bit that specifies whether the offset is to be added or subtracted.

When the assembler calculates an offset of 0 for the normal syntax of these instructions, it must assemble an encoding that adds 0 to the \(\text{Align}(PC, 4)\) value of the instruction. Encodings that subtract 0 from the \(\text{Align}(PC, 4)\) value cannot be specified by the normal syntax.

There is an alternative syntax for these instructions that specifies the addition or subtraction and the immediate offset explicitly. In this syntax, the label is replaced by \([PC, #+-<\text{imm}>]\), where:

- \(+-\): Is + or omitted to specify that the immediate offset is to be added to the \(\text{Align}(PC, 4)\) value, or if it is to be subtracted.

- \(<\text{imm}>\): Is the immediate offset.

This alternative syntax makes it possible to assemble the encodings that subtract 0 from the \(\text{Align}(PC, 4)\) value, and to disassemble them to a syntax that can be re-assembled correctly.

- \(\text{ADR}\): The normal assembler syntax for this instruction can specify the label of an instruction or literal data item whose address is to be calculated. Its encoding specifies a zero-extended immediate offset that is either added to or subtracted from the \(\text{Align}(PC, 4)\) value of the instruction to form the address of the data item, and some opcode bits that determine whether it is an addition or subtraction.

When the assembler calculates an offset of 0 for the normal syntax of this instruction, it must assemble the encoding that adds 0 to the \(\text{Align}(PC, 4)\) value of the instruction. The encoding that subtracts 0 from the \(\text{Align}(PC, 4)\) value cannot be specified by the normal syntax.

There is an alternative syntax for this instruction that specifies the addition or subtraction and the immediate value explicitly, by writing them as additions \(\text{ADD} <\text{Rd}, PC, #<\text{imm}>\) or subtractions \(\text{SUB} <\text{Rd}, PC, #<\text{imm}>\). This alternative syntax makes it possible to assemble the encoding that subtracts 0 from the \(\text{Align}(PC, 4)\) value, and to disassemble it to a syntax that can be re-assembled correctly.

\[\text{Note}\]

ARM recommends that where possible, software avoids using:

- The alternative syntax for the \(\text{ADR, LDC, LDR, LDRB, LDRD, LDRH, LDRSB, LDRSH, PLD, PLDW, PLI, and VLDR}\) instructions.

- The encodings of these instructions that subtract 0 from the \(\text{Align}(PC, 4)\) value.
F1.3 Branch instructions

Table F1-1 summarizes the branch instructions in the T32 and A32 instruction sets. In addition to providing for changes in the flow of execution, some branch instructions can change instruction set.

<table>
<thead>
<tr>

<tr>
<td>Table Branch (halfword offsets)</td>
<td>0-131070 bytes</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

a. These instructions do not exist in the A32 instruction set.
b. The range is determined by the instruction set of the \( BLX \) instruction, not of the instruction it branches to.

Branches to loaded and calculated addresses can be performed by \( LDR, LDM \) and data-processing instructions. For details see Load/store instructions on page F1-3071, Load/store multiple instructions on page F1-3074, Standard data-processing instructions on page F1-3062, and Shift instructions on page F1-3064.

In addition to the branch instructions shown in Table F1-1:

- In the A32 instruction set, a data-processing instruction that targets the PC behaves as a branch instruction. For more information, see Data-processing instructions on page F1-3062.
- In the T32 and A32 instruction sets, a load instruction that targets the PC behaves as a branch instruction. For more information, see Load/store instructions on page F1-3071.
F1.4 Data-processing instructions

Core data-processing instructions belong to one of the following groups:

- **Standard data-processing instructions.**
  These instructions perform basic data-processing operations, and share a common format with some variations.

- **Shift instructions** on page F1-3064.
- **Multiply instructions** on page F1-3064.
- **Saturating instructions** on page F1-3066.
- **Saturating addition and subtraction instructions** on page F1-3066.
- **Packing and unpacking instructions** on page F1-3067.
- **Parallel addition and subtraction instructions** on page F1-3068.
- **Divide instructions** on page F1-3069.
- **Miscellaneous data-processing instructions** on page F1-3069.

For related Advanced SIMD and floating-point instructions see **Advanced SIMD data-processing instructions** on page F1-3083 and **Floating-point data-processing instructions** on page F1-3093.

F1.4.1 Standard data-processing instructions

These instructions generally have a destination register Rd, a first operand register Rn, and a second operand. The second operand can be another register Rm, or an immediate constant.

If the second operand is an immediate constant, it can be:

- Encoded directly in the instruction.
- A modified immediate constant that uses 12 bits of the instruction to encode a range of constants. T32 and A32 instructions have slightly different ranges of modified immediate constants. For more information, see **Modified immediate constants in T32 instructions** on page F2-3116 and **Modified immediate constants in A32 instructions**.

If the second operand is another register, it can optionally be shifted in any of the following ways:

- LSL Logical Shift Left by 1-31 bits.
- LSR Logical Shift Right by 1-32 bits.
- ASR Arithmetic Shift Right by 1-32 bits.
- ROR Rotate Right by 1-31 bits.
- RRX Rotate Right with Extend. For details see **Shift and rotate operations** on page E1-2980.

In T32 code, the amount to shift by is always a constant encoded in the instruction. In A32 code, the amount to shift by is either a constant encoded in the instruction, or the value of a register, Rs.

For instructions other than CMP, TST, and TEQ, the result of the data-processing operation is placed in the destination register. In the A32 instruction set, the destination register can be the PC, causing the result to be treated as a branch address. In the T32 instruction set, this is only permitted for some 16-bit forms of the ADD and MOV instructions.

These instructions can optionally set the Condition flags, according to the result of the operation. If they do not set the flags, existing flag settings from a previous instruction are preserved.

Table F1-2 on page F1-3063 summarizes the main data-processing instructions in the T32 and A32 instruction sets. Generally, each of these instructions is described in three sections in Chapter F2 About the T32 and A32 Instruction Descriptions, one section for each of the following:

- INSTRUCTION (immediate) where the second operand is a modified immediate constant.
- INSTRUCTION (register) where the second operand is a register, or a register shifted by a constant.
- INSTRUCTION (register-shifted register) where the second operand is a register shifted by a value obtained from another register. These are only available in the A32 instruction set.

</tbody>
</table>

In the A32 instruction set only, the destination register of these instructions can be the PC, causing the result to be treated as an address to branch to.

F1.4.3 Multiply instructions

These instructions can operate on signed or unsigned quantities. In some types of operation, the results are the same whether the operands are signed or unsigned.

- Table F1-4 summarizes the multiply instructions where there is no distinction between signed and unsigned quantities.
  The least significant 32 bits of the result are used. More significant bits are discarded.
- Table F1-5 on page F1-3065 summarizes the signed multiply instructions.
- Table F1-6 on page F1-3065 summarizes the unsigned multiply instructions.

</tbody>
</table>
F1.4.7 Parallel addition and subtraction instructions

These instructions perform additions and subtractions on the values of two registers and write the result to a destination register, treating the register values as sets of two halfwords or four bytes. That is, they perform SIMD additions or subtractions on the general-purpose registers.

These instructions consist of a prefix followed by a main instruction mnemonic. The prefixes are as follows:

- **S**: Signed arithmetic modulo $2^8$ or $2^{16}$.
- **Q**: Signed saturating arithmetic.
- **SH**: Signed arithmetic, halving the results.
- **U**: Unsigned arithmetic modulo $2^8$ or $2^{16}$.
- **UQ**: Unsigned saturating arithmetic.
- **UH**: Unsigned arithmetic, halving the results.

The main instruction mnemonics are as follows:

- **ADD16**: Adds the top halfwords of two operands to form the top halfword of the result, and the bottom halfwords of the same two operands to form the bottom halfword of the result.
- **ASX**: Exchanges halfwords of the second operand, and then adds top halfwords and subtracts bottom halfwords.
- **SAX**: Exchanges halfwords of the second operand, and then subtracts top halfwords and adds bottom halfwords.
- **SUB16**: Subtracts each halfword of the second operand from the corresponding halfword of the first operand to form the corresponding halfword of the result.
- **ADD8**: Adds each byte of the second operand to the corresponding byte of the first operand to form the corresponding byte of the result.
- **SUB8**: Subtracts each byte of the second operand from the corresponding byte of the first operand to form the corresponding byte of the result.

The instruction set permits all 36 combinations of prefix and main instruction operand, as Table F1-10 shows.

See also *Advanced SIMD parallel addition and subtraction* on page F1-3084.

F1.4.8 Divide instructions

In ARMv8, signed and unsigned integer divide instructions are included in both the T32 instruction set and the A32 instruction set. For more information about their implementation in previous versions of the ARM architecture see the *ARM® Architecture Reference Manual, ARMv7-A and ARMv7-R edition*.

For descriptions of the instructions see:
- \textit{SDIV} on page F5-3661.
- \textit{UDIV} on page F5-3864.

For the SDIV and UDIV instructions, division by zero always returns a zero result.

The ID_ISAR0.Divide_instrs field indicates the level of support for these instructions. The field value of 0b0010 indicates they are implemented in both the T32 and A32 instruction sets.

F1.4.9 Miscellaneous data-processing instructions

Table F1-11 lists the miscellaneous data-processing instructions in the T32 and A32 instruction sets. Immediate values in these instructions are simple binary numbers.

F1.5 PSTATE and banked register access instructions

These instructions transfer PE state information to or from a general-purpose register.

F1.5.1 PSTATE access instructions

PSTATE holds process state information, see Process state, PSTATE on page E1-2984. In AArch32 state:

- At EL1 or higher, PSTATE is accessible using the Current Program Status Register (CPSR).
- At EL0, a subset of the CPSR is accessible as the Application Program Status Register (APSR).
- On taking an exception, the contents of the CPSR are copied to the Saved Program Status Register (SPSR) of the mode from which the exception is taken.

The MRS and MSR instructions move the contents of the CPSR, APSR, or the SPSR of the current mode to or from a general-purpose register, see:

- MRS on page F5-3529.
- MSR (immediate) on page F5-3539.
- MSR (register) on page F5-3541.

When executed at EL0, MRS and MSR instructions can only access the APSR.

The PSTATE Condition flags, PSTATE.\{N, Z, C, V\} are set by the execution of data-processing instructions, and can control the execution of conditional instructions. However, software can set the Condition flags explicitly using the MSR instruction, and can read the current state of the Condition flags explicitly using the MRS instruction.

In addition, at EL1 or higher, software can use the CPS instruction to change the PSTATE.M field and the PSTATE.\{A, I, F\} interrupt mask bits, see CPS, CPSID, CPSIE on page F5-3343.

F1.5.2 Banked register access instructions

At EL1 or higher, the MRS (banked register) and MSR (banked register) instructions move the contents of a banked general-purpose register, the SPSR, or the ELR_hyp, to or from a general-purpose register. See:

- MRS (Banked register) on page F5-3531.
- MSR (Banked register) on page F5-3535.
F1.6 Load/store instructions

Table F1-12 summarizes the general-purpose register load/store instructions in the T32 and A32 instruction sets. Some of these instructions can also operate on the PC. See also:

- Load/store multiple instructions on page F1-3074.
- Synchronization and semaphores on page E2-3045, for more information about the Load-Exclusive and Store-Exclusive instructions.
- Advanced SIMD and floating-point load/store instructions on page F1-3080.

Load/store instructions have several options for addressing memory. For more information, see Addressing modes on page F1-3072.

</table>

F1.6.1 Loads to the PC

The LDR instruction can load a value into the PC. The value loaded is treated as an interworking address, as described by the LoadWritePC() pseudocode function in Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.

F1.6.2 Halfword and byte loads and stores

Halfword and byte stores store the least significant halfword or byte from the register, to 16 or 8 bits of memory respectively. There is no distinction between signed and unsigned stores.

Halfword and byte loads load 16 or 8 bits from memory into the least significant halfword or byte of a register. Unsigned loads zero-extend the loaded value to 32 bits, and signed loads sign-extend the value to 32 bits.
F1.6.3 Load unprivileged and Store unprivileged

When executing at EL0, a Load unprivileged or Store unprivileged instruction operates in exactly the same way as the corresponding ordinary load or store instruction. For example, an LDRT instruction executes in exactly the same way as the equivalent LDR instruction. When executed at PL1, Load unprivileged and Store unprivileged instructions behave as they would if they were executed at EL0. For example, an LDRT instruction executes in exactly the same way that the equivalent LDR instruction would execute at EL0. In particular, the instructions make unprivileged memory accesses.

--- Note ---

As described in Security state, Exception levels, and AArch32 execution privilege on page G1-4600, execution at PL1 describes all of the following:

- Execution at Non-secure EL1 using AArch32.
- Execution at Secure EL1 using AArch32 when EL3 is not implemented.
- Execution at Secure EL1 using AArch32 when EL3 is implemented and is using AArch64.
- Execution at Secure EL3 when EL3 is implemented and is using AArch32.

The Load unprivileged and Store unprivileged instructions are CONstrained UnPREDICTable if executed at EL2, see Execution of Load/Store unprivileged instructions in Hyp mode on page K1-6409.

For more information about execution privilege, see About access permissions on page G4-4888.

F1.6.4 Load-Exclusive and Store-Exclusive

Load-Exclusive and Store-Exclusive instructions provide shared memory synchronization. For more information, see Synchronization and semaphores on page E2-3045.

F1.6.5 Load-Acquire and Store-Release

Load-Acquire and Store-Release instructions provide memory barriers. Load-Acquire Exclusive and Store-Release Exclusive instructions provide memory barriers with shared memory synchronization. For more information, see Load-Acquire, Store-Release on page E2-3020.

F1.6.6 Addressing modes

The address for a load or store is formed from two parts: a value from a base register, and an offset.

The base register can be any one of the general-purpose registers R0-R12, SP, or LR.

For loads, the base register can be the PC. This provides PC-relative addressing for position-independent code.

Instructions marked (literal) in their title in Chapter F2 About the T32 and A32 Instruction Descriptions are PC-relative loads.

The offset takes one of three formats:

- **Immediate**
  The offset is an unsigned number that can be added to or subtracted from the base register value. Immediate offset addressing is useful for accessing data elements that are a fixed distance from the start of the data object, such as structure fields, stack offsets and input/output registers.

- **Register**
  The offset is a value from a general-purpose register. The value can be added to, or subtracted from, the base register value. Register offsets are useful for accessing arrays or blocks of data.

- **Scaled register**
  The offset is a general-purpose register, shifted by an immediate value, then added to or subtracted from the base register. This means an array index can be scaled by the size of each array element.
The offset and base register can be used in three different ways to form the memory address. The addressing modes are described as follows:

**Offset**
- The offset is added to or subtracted from the base register to form the memory address.

**Pre-indexed**
- The offset is added to or subtracted from the base register to form the memory address. The base register is then updated with this new address, to permit automatic indexing through an array or memory block.

**Post-indexed**
- The value of the base register alone is used as the memory address. The offset is then added to or subtracted from the base register. The result is stored back in the base register, to permit automatic indexing through an array or memory block.

**Note**
Not every variant is available for every instruction, and the range of permitted immediate values and the options for scaled registers vary from instruction to instruction. See Chapter F2 About the T32 and A32 Instruction Descriptions for full details for each instruction.
F1.7 Load/store multiple instructions

Load Multiple instructions load from memory a subset, or possibly all, of the general-purpose registers and the PC. Store Multiple instructions store to memory a subset, or possibly all, of the general-purpose registers.

The memory locations are consecutive word-aligned words. The addresses used are obtained from a base register, and can be either above or below the value in the base register. The base register can optionally be updated by the total size of the data transferred.

Table F1-13 summarizes the load/store multiple instructions in the T32 and A32 instruction sets.

<table>

</table>

a. Not available in the T32 instruction set.
b. This instruction is equivalent to an LDM instruction with the SP as base register, and base register updating.
c. This instruction is equivalent to an STM8 instruction with the SP as base register, and base register updating.

When executing at EL1, variants of the LDM and STM instructions load and store User mode registers. Another system level variant of the LDM instruction performs an exception return.

F1.7.1 Loads to the PC

The LDM, LDMDA, LDMDB, LDMEA, and POP instructions can load a value into the PC. The value loaded is treated as an interworking address, as described by the LoadWritePC() pseudocode function in Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
F1.8 Miscellaneous instructions

<tr>
<td>Wait For Interrupt</td>
<td>WFI on page F5-3924</td>
</tr>
<tr>
<td>Yield</td>
<td>YIELD on page F5-3926(^c)</td>
</tr>
</tbody>
</table>

\(^a\) For performance reasons, ARM deprecates many uses of the IT instruction, see Partial deprecation of IT on page F1-3076.

\(^b\) ARM deprecates any use of the SETEND instruction.

\(^c\) See also The Yield instruction.

--- Note ---

Previous versions of the architecture defined the DBG instruction, that could provide a hint to the debug system, in this group. In ARMv8, this instruction executes as a NOP. ARM deprecates any use of the DBG instruction.

F1.8.1 The Yield instruction

In a Symmetric Multithreading (SMT) design, a thread can use the YIELD instruction to give a hint to the PE that it is running on. The YIELD hint indicates that whatever the thread is currently doing is of low importance, and so could yield. For example, the thread might be sitting in a spin-lock. A similar use might be in modifying the arbitration priority of the snoop bus in a multiprocessor (MP) system. Defining such an instruction permits binary compatibility between SMT and SMP systems.

AArch32 state defines a YIELD instruction as a specific NOP (No Operation) hint instruction.
The \texttt{YIELD} instruction has no effect in a single-threaded system, but developers of such systems can use the instruction to flag its intended use on migration to a multiprocessor or multithreading system. Operating systems can use \texttt{YIELD} in places where a yield hint is wanted, knowing that it will be treated as a \texttt{NOP} if there is no implementation benefit.

\subsection*{F1.8.2 Partial deprecation of IT}

ARMv8-A deprecates some uses of the T32 IT instruction, for performance reasons. All uses of IT that apply to instructions other than a single subsequent 16-bit instruction from a restricted set are deprecated, as are explicit references to the PC within that single 16-bit instruction. This permits the non-deprecated forms of IT and subsequent instructions to be treated as a single 32-bit conditional instruction. Table F1-15 shows the restricted set of 16-bit instructions that are not deprecated when used in conjunction with IT.

\begin{table}[h]
\centering
\small
\begin{tabular}{lll}
\hline
Non-deprecated 16-bit instructions & Class & Notes \\
\hline
\texttt{MOV}, \texttt{MVN} & Move & Deprecated when \texttt{Rn} or \texttt{Rd} is the PC. \\
\texttt{LDR}, \texttt{LDRB}, \texttt{LDRH}, \texttt{LDRSB}, \texttt{LDRSH} & Load & Deprecated for PC-relative load literal forms \\
\texttt{STR}, \texttt{STRB}, \texttt{STRH} & Store & - \\
\texttt{ADD}, \texttt{ADC}, \texttt{RSB}, \texttt{SBC}, \texttt{SUB} & Add/Subtract & Deprecated for \texttt{ADD SP,SP,#imm}, \texttt{SUB SP,SP,#imm}, and when \texttt{Rn}, \texttt{Rdn}, or \texttt{Rdm} is the PC \\
\texttt{CMP}, \texttt{CMN} & Compare & Deprecated when \texttt{Rn} or \texttt{Rn} is the PC \\
\texttt{MUL} & Multiply & - \\
\texttt{ASR}, \texttt{LSL}, \texttt{LSR}, \texttt{ROR} & Shift & - \\
\texttt{AND}, \texttt{BIC}, \texttt{EOR}, \texttt{ORR}, \texttt{TST} & Logical & - \\
\texttt{BX}, \texttt{BLX} & Branch to register & Deprecated when \texttt{Rn} is the PC \\
\hline
\end{tabular}
\caption{Non-deprecated IT 16-bit conditional instructions}
\end{table}

The full ARMv7 IT instruction functionality remains available in order to execute legacy T32 code. It is \texttt{IMPLEMENTATION DEFINED} whether an ARMv8 implementation provides an ITD control, that software can use to disable the deprecated uses of the IT instruction. In an implementation that included the ITD control, setting an ITD field to 1 disables the deprecated uses of the IT instruction, making those uses of the IT instruction \texttt{UNDEFINED}. The ITD control fields are:

\texttt{HSCTLR.ITD} When EL2 is using AArch32, makes execution of the deprecated uses of the IT \texttt{UNDEFINED} at EL2.

\texttt{SCTLR.ITD} When EL1 is using AArch32, makes execution of the deprecated uses of the IT \texttt{UNDEFINED} at EL0 and EL1.

\texttt{SCTLR_EL1.ITD} When EL1 is using AArch64, makes execution of the deprecated uses of the IT \texttt{UNDEFINED} at EL0 when EL0 is using AArch32.
F1.9 Exception-generating and exception-handling instructions

The following instructions are intended specifically to cause a synchronous exception to occur:

- The SVC instruction generates a Supervisor Call exception. For more information, see Supervisor Call (SVC) exception on page G1-4665.
- The Breakpoint instruction BKPT provides software breakpoints. For more information, see Breakpoint Instruction exceptions on page G2-4751.
- In an implementation that includes EL3, when executing at EL1 or higher, the SMC instruction generates a Secure Monitor Call exception. For more information, see Secure Monitor Call (SMC) exception on page G1-4667.
- In an implementation that includes EL2, in software executing in a Non-secure EL1 mode, the HVC instruction generates a Hypervisor Call exception. For more information, see Hypervisor Call (HVC) exception on page G1-4668.

Debug state on page F1-3078 summarizes the Debug state instructions.

For an exception taken to an EL1 mode:

- The system level variants of the SUBS and LDM instructions can perform a return from an exception.

  **Note**

  The variants of SUBS include MOVS. See the references to Subtract (exception return), Move (exception return), and Load Multiple (exception return) in Table F1-16 for more information.

- The SRS instruction can be used near the start of the handler, to store return information. The RFE instruction can then perform a return from the exception using the stored return information.

In an implementation that includes EL2, the ERET instruction performs a return from an exception taken to Hyp mode.

For more information, see Exception return to an Exception level using AArch32 on page G1-4645.

Table F1-16 summarizes the instructions, in the T32 and A32 instruction sets, for generating or handling an exception. Except for BKPT and SVC, these are system level instructions.

</tr>
</tbody>
</table>
F1.10 System register access instructions

The System register encoding space is indexed using the parameters \{coproc, opc1, CRn, CRm, opc2\}, see The AArch32 System register interface on page G1-4693. This encoding space provides System registers and System instructions. In ARMv8, the only permitted values of coproc are 0b1110 and 0b1111, and the following instructions give access to this encoding space:

- Instructions that transfer data between general-purpose registers and System registers. See:
  - MCR on page F5-3503.
  - MCRR on page F5-3505.
  - MRC on page F5-3525.
  - MRRC on page F5-3527.

- Instructions that load or store from memory to a System register. See:
  - LDC (immediate) on page F5-3394.
  - LDC (literal) on page F5-3396.
  - STC on page F5-3732.

--- Note ---

The System register encoding space with coproc == 0b101x is redefined to provide some of the Advanced SIMD and floating-point functionality. That is, to:

- Initiate a floating-point data-processing operation, see Floating-point data-processing instructions on page F1-3093.
- Transfer data between general-purpose registers and the Advanced SIMD and floating-point registers, see Advanced SIMD and floating-point register transfer instructions on page F1-3082.
- Load or store data to the Advanced SIMD and floating-point registers, see Advanced SIMD and floating-point load/store instructions on page F1-3080.

System register access instructions are part of the instruction stream executed by the PE, and therefore any System register access instruction that cannot be executed by the implementation causes an Undefined Instruction exception. In ARMv8-A and ARMv8-R, the instruction encodings in the System register access instruction encoding space are unallocated, and generate Undefined Instruction exceptions, except for:

- The instructions summarized in this section that access the coproc == 0b111x encoding space.
- The instructions in the coproc == 0b101x encoding space that are redefined to provide Advanced SIMD and floating-point functionality, as summarized in the Note in this section.
Advanced SIMD and floating-point load/store instructions

Table F1-18 summarizes the SIMD and floating-point register file load/store instructions in the Advanced SIMD and floating-point instruction sets.

Advanced SIMD also provides instructions for loading and storing multiple elements, or structures of elements, see "Element and structure load/store instructions."

### Table F1-18 SIMD and floating-point register file load/store instructions

### Table F1-19 Element and structure load/store instructions

Table F1-19 shows the element and structure load/store instructions available in the Advanced SIMD instruction set. Loading and storing structures of more than one element automatically de-interleaves or interleaves the elements, see Figure F1-1 on page F1-3081 for an example of de-interleaving. Interleaving is the inverse process.

<table>

Figure F1-1 shows the de-interleaving of a VLD3.16 (multiple 3-element structures) instruction:

- Different instructions in this group would produce similar figures, but operate on different numbers of registers. For example, VLD4 and VST4 instructions operate on four registers.
- Different element sizes would produce similar figures but with 8-bit or 32-bit elements.
- These instructions operate only on doubleword (64-bit) registers.
**F1.12 Advanced SIMD and floating-point register transfer instructions**

Table F1-20 summarizes the SIMD and floating-point register file transfer instructions in the Advanced SIMD and floating-point instruction sets. These instructions transfer data between the general-purpose registers and the registers in the SIMD and floating-point register file.

Advanced SIMD vectors, and single-precision and double-precision floating-point registers, are all views of the same register file. For details see *The SIMD and floating-point register file* on page E1-2990.

F1.13 Advanced SIMD data-processing instructions

Advanced SIMD data-processing instructions process registers containing vectors of elements of the same type packed together, enabling the same operation to be performed on multiple items in parallel.

Instructions operate on vectors held in 64-bit or 128-bit registers. Figure F1-2 shows an operation on two 64-bit operand vectors, generating a 64-bit vector result.

--- Note ---

Figure F1-2 and other similar figures show 64-bit vectors that consist of four 16-bit elements, and 128-bit vectors that consist of four 32-bit elements. Other element sizes produce similar figures, but with one, two, eight, or sixteen operations performed in parallel instead of four.

Figure F1-2 Advanced SIMD instruction operating on 64-bit registers

Many Advanced SIMD instructions have variants that produce vectors of elements double the size of the inputs. In this case, the number of elements in the result vector is the same as the number of elements in the operand vectors, but each element, and the whole vector, is double the size.

Figure F1-3 shows an example of an Advanced SIMD instruction operating on 64-bit registers, and generating a 128-bit result.

Figure F1-3 Advanced SIMD instruction producing wider result

There are also Advanced SIMD instructions that have variants that produce vectors containing elements half the size of the inputs. Figure F1-4 on page F1-3084 shows an example of an Advanced SIMD instruction operating on one 128-bit register, and generating a 64-bit result.
Some Advanced SIMD instructions do not conform to these standard patterns. Their operation patterns are described in the individual instruction descriptions.

Advanced SIMD instructions that perform floating-point arithmetic use the ARM standard floating-point arithmetic defined in *Advanced SIMD and floating-point support* on page A1-50.

The following sections summarize the Advanced SIMD data-processing instructions:

- Advanced SIMD parallel addition and subtraction.
- Bitwise Advanced SIMD data-processing instructions on page F1-3085.
- Advanced SIMD comparison instructions on page F1-3086.
- Advanced SIMD shift instructions on page F1-3087.
- Advanced SIMD multiply instructions on page F1-3088.
- Advanced SIMD dot product instructions on page F1-3089.
- Miscellaneous Advanced SIMD data-processing instructions on page F1-3090.
- The Cryptographic Extension in AArch32 state on page F1-3091.

</tbody>
</table>

Advanced SIMD multiply instructions can operate on vectors of:

- 8-bit, 16-bit, or 32-bit unsigned integers.
- 8-bit, 16-bit, or 32-bit signed integers.
- 8-bit polynomials over \{0, 1\}. \texttt{VMUL} and \texttt{VMULL} are the only instructions that operate on polynomials. \texttt{VMULL} produces a 16-bit polynomial over \{0, 1\}.
• Single-precision (32-bit) or half-precision (16-bit) floating-point numbers.

They can also act on one vector and one scalar.

Long instructions have doubleword (64-bit) operands, and produce quadword (128-bit) results. Other Advanced SIMD multiply instructions can have either doubleword or quadword operands, and produce results of the same size.

Floating-point multiply instructions can operate on:
• Half-precision (16-bit) floating-point numbers.
• Single-precision (32-bit) floating-point numbers.
• Double-precision (64-bit) floating-point numbers.

### F1.13.6 Advanced SIMD dot product instructions

**ARMv8.2-DotProd** provides SIMD instructions that perform the dot product of the four 8-bit subelements of the 32-bit elements of one vector with the four 8-bit subelements of a second vector. It provides two forms of the instructions, each with signed and unsigned versions:

**Vector form** The dot product is calculated for each element of the first vector with the corresponding element of the second element.

**Indexed form** The dot product is calculated for each element of the first vector with the element of the second vector that is indicated by the index argument to the instruction.

---

**Note**

That is, a single element from the second vector is used, and the dot product is calculated between each element of the first vector and this single element from the second vector.

### F1.13.7 Advanced SIMD complex number arithmetic instructions

**ARMv8.3-CompNum** provides AArch32 Advanced SIMD instructions that perform arithmetic on complex numbers held in element pairs in vector registers, where the less significant element of the pair contains the real component and the more significant element contains the imaginary component.

These instructions provide single-precision versions. If **ARMv8.2-FP16** is implemented they also provide half-precision versions, otherwise the half-precision encodings are UNDEFINED.
Table F1-27 shows the ARMv8.3-CompNum AArch32 Advanced SIMD instructions:

Table F1-27 Advanced SIMD complex number arithmetic instructions

<table>
<thead>
<tr>
<th>Mnemonic</th>
<th>Instruction</th>
<th>See</th>
</tr>
</thead>
<tbody>
<tr>
<td>VCADD</td>
<td>Floating-point complex add</td>
<td>VCADD on page F6-4015</td>
</tr>
<tr>
<td>VOCLA</td>

*Note: SHA256SU1 is added to the instruction set.*

---

a. The Cryptographic Extension adds the variant of the instruction that operates on two 64-bit polynomials.

See [The ARMv8 Cryptographic Extension](#) on page A1-58 for information about the permitted implementation options for the Cryptographic Extension.
### F1.14 Floating-point data-processing instructions

Table F1-30 summarizes the data-processing instructions in the floating-point instruction set. In this table, *floating-point register* means a register in the SIMD and floating-point register file.

For details of the floating-point arithmetic used by floating-point instructions, see *Advanced SIMD and floating-point support* on page A1-50.

Chapter F2
About the T32 and A32 Instruction Descriptions

This chapter describes each instruction. It contains the following sections:

- Format of instruction descriptions on page F2-3096.
- Standard assembler syntax fields on page F2-3100.
- Conditional execution on page F2-3101.
- Shifts applied to a register on page F2-3104.
- Memory accesses on page F2-3106.
- Encoding of lists of general-purpose registers and the PC on page F2-3107.
- General information about the T32 and A32 instruction descriptions on page F2-3108.
- Additional pseudocode support for instruction descriptions on page F2-3121.
- Additional information about Advanced SIMD and floating-point instructions on page F2-3122.
F2.1 Format of instruction descriptions

The instruction descriptions in Chapter F5 T32 and A32 Base Instruction Set Instruction Descriptions and Chapter F6 T32 and A32 Advanced SIMD and Floating-point Instruction Descriptions normally use the following format:

- Instruction section title.
- Introduction to the instruction.
- A description of each encoding of the instruction.
- Assembler syntax.
- Pseudocode describing how the instruction operates.
- Notes, if applicable.

Each of these items is described in more detail in the following subsections.

F2.1.1 Instruction section title

The instruction section title gives the base mnemonic for the instruction or instructions described in the section. When one mnemonic has multiple forms described in separate instruction sections, this is followed by a short description of the form in parentheses. The most common use of this is to distinguish between forms of an instruction in which one of the operands is an immediate value and forms in which it is a register.

F2.1.2 Introduction to the instruction

The introduction to the instruction briefly describes the main features of the instruction. This description is not necessarily complete and is not definitive. If there is any conflict between it and the more detailed information that follows, the latter takes priority.

F2.1.3 Instruction encodings

This is a list of one or more instruction encodings. Each instruction encoding is labelled as:

- A1, A2, A3 … for the first, second, third and any additional A32 encodings.
- T1, T2, T3 … for the first, second, third and any additional T32 encodings.

Each instruction encoding description consists of:

- An assembly syntax that ensures that the assembler selects the encoding in preference to any other encoding. In some cases, multiple syntax variants are given. These are written in a typewriter font using the conventions described in Assembler syntax prototype line conventions on page F2-3098. The correct one to use can be indicated by:
  - A subheading that identifies the encodings that correspond to the syntax. See, for example, the subheading Flag setting, rotate right with extend variant in the description of the A1 encoding of the ADC, ADCS (register) instructions in A1 on page F5-3261.
  - An annotation to the syntax, such as Inside IT block or Outside IT block. See, for example, the syntax descriptions of the T1 encoding of the ADC, ADCS (register) instructions in T1 on page F5-3262.

In other cases, the correct one to use can be determined by looking at the assembler syntax description and using it to determine which syntax corresponds to the instruction being disassembled.

There is usually more than one syntax variant that ensures re-assembly to any particular encoding, and the exact set of syntaxes that do so usually depends on the register numbers, immediate constants and other operands to the instruction. For example, when assembling to the T32 instruction set, the syntax AND R0, R0, R8 ensures selection of a 32-bit encoding but AND R0, R0, R1 selects a 16-bit encoding.
For each instruction encoding belonging to a target instruction set, an assembler can use this information to determine whether it can use that encoding to encode the instruction requested by the UAL source. If multiple encodings can encode the instruction then:

— If both a 16-bit encoding and a 32-bit encoding can encode the instruction, the architecture prefers the 16-bit encoding. This means the assembler must use the 16-bit encoding rather than the 32-bit encoding.
  
  Software can use the .W and .N qualifiers to specify the required encoding width, see Standard assembler syntax fields on page F2-3100.

— If multiple encodings of the same length can encode the instruction, the Assembler syntax subsection says which encoding is preferred, and how software can, instead, select the other encodings.
  
  Each encoding also documents UAL syntax that selects it in preference to any other encoding.

If no encodings of the target instruction set can encode the instruction requested by the UAL source, normally the assembler generates an error saying that the instruction is not available in that instruction set.

Note

In some cases, an instruction is available in one instruction set but not in another. The Assembler syntax subsection identifies many of these cases. For example, the A32 instructions with bits<31:28> == 0b1111 described in Branch, branch with link, and block data transfer on page F4-3224, System register access, Advanced SIMD, floating-point, and Supervisor call on page F4-3226, and Unconditional instructions on page F4-3239 cannot have a Condition code, but the equivalent T32 instructions often can, and this usually appears in the Assembler syntax subsection as a statement that the A32 instruction cannot be conditional.

However, some such cases are too complex to describe in the available space, so the definitive test of whether an instruction is available in a given instruction set is whether there is an available encoding for it in that instruction set.

The assembly syntax given for an encoding is therefore a suitable one for a disassembler to disassemble that encoding to. However, disassemblers might wish to use simpler syntaxes when they are suitable for the operand combination, in order to produce more readable disassembled code.

• An encoding diagram, where:
  
  — For a 32-bit A32 encoding diagram, the bits are numbered from 31 to 0.
  
  — For a 16-bit T32 encoding diagram, the bits are numbered from 15 to 0.
    
    This halfword can be described as hw1 of the instruction.
  
  — For a 32-bit T32 encoding diagram, the bits are numbered from 15 to 0 for each halfword, as a reminder that a 32-bit T32 instruction consists of two consecutive halfwords rather than a word.
    
    In this case, the left-hand halfword in the diagram is identified as hw1, and the right-hand halfword is identified as hw2.

Where instructions are stored using the standard little-endian instruction endianness:

— The encoding diagram for an A32 instruction at address A shows, from left to right, the bytes at addresses A+3, A+2, A+1, A.

— The encoding diagram for a 32-bit T32 instruction shows bytes in the order A+1, A for hw1, followed by bytes A+3, A+2 for hw2.

• Encoding-specific pseudocode. This is pseudocode that translates the encoding-specific instruction fields into inputs to the encoding-independent pseudocode in the Operation subsection, and that picks out any special cases in the encoding. For a detailed description of the pseudocode used and of the relationship between the encoding diagram, the encoding-specific pseudocode and the encoding-independent pseudocode, see Appendix K12 ARM Pseudocode Definition.
F2.1.4 Assembler symbols

The Assembly symbols describes the standard UAL syntax for the instruction.

Each syntax description consists of the following elements:

- Descriptions of all of the variable or optional fields of the syntax.

Some syntax fields are standardized across all or most instructions. Standard assembler syntax fields on page F2-3100 describes these fields.

By default, syntax fields that specify registers, such as <Rd>, <Rn>, or <Rt>, can be any of R0-R12 or LR in T32 instructions, and any of R0-R12, SP or LR in A32 instructions. These require that the encoding-specific pseudocode set the corresponding integer variable (such as d, n, or t) to the corresponding register number, using 0-12 for R0-R12, 13 for SP, or 14 for LR:

--- Normally, software can do this by setting the corresponding field in the instruction, typically named Rd, Rn, Rt, to the binary encoding of that number.
--- In the case of 16-bit T32 encodings, the field is normally of length 3, and so the encoding is only available when the assembler syntax specifies one of R0-R7. Such encodings often use a register field name like Rdn. This indicates that the encoding is only available if <Rd> and <Rn> specify the same register, and that the register number of that register is encoded in the field if they do.

The description of a syntax field that specifies a register sometimes extends or restricts the permitted range of registers or documents other differences from the default rules for such fields. Examples of extensions are permitting the use of the SP in a T32 instruction, or permitting the use of the PC, identified using register number 15.

- Where appropriate, text that briefly describes changes from the pre-UAL assembler syntax. Where present, this usually consists of an alternative pre-UAL form of the assembler mnemonic. The pre-UAL assembler syntax does not conflict with UAL. ARM recommends that it is supported, as an optional extension to UAL, so that pre-UAL assembler source files can be assembled.

Assembler syntax prototype line conventions

The following conventions are used in assembler syntax prototype lines and their subfields:

< > Any item bracketed by < and > is a short description of a type of value to be supplied by the user in that position. A longer description of the item is normally supplied by subsequent text. Such items often correspond to a similarly named field in an encoding diagram for an instruction. When the correspondence only requires the binary encoding of an integer value or register number to be substituted into the instruction encoding, it is not described explicitly. For example, if the assembler syntax for an instruction contains an item <Rn> and the instruction encoding diagram contains a 4-bit field named Rn, the number of the register specified in the assembler syntax is encoded in binary in the instruction field.

If the correspondence between the assembler syntax item and the instruction encoding is more complex than simple binary encoding of an integer or register number, the item description indicates how it is encoded. This is often done by specifying a required output from the encoding-specific pseudocode, such as add = T?uE. The assembler must only use encodings that produce that output.

{} Any item bracketed by { and } is optional. A description of the item and of how its presence or absence is encoded in the instruction is normally supplied by subsequent text. Many instructions have an optional destination register. Unless otherwise stated, if such a destination register is omitted, it is the same as the immediately following source register in the instruction syntax.

# In the assembler syntax, numeric constants are normally preceded by a #. Some UAL instruction syntax descriptions explicitly show this # as optional. Any UAL assembler:

- Must treat the # as optional where an instruction syntax description shows it as optional.
- Can treat the # either as mandatory or as optional where an instruction syntax description does not show it as optional.
**Note**

ARM recommends that UAL assemblers treat all uses of # shown in this manual as optional.

**spaces**  
Single spaces are used for clarity, to separate items. When a space is obligatory in the assembler syntax, two or more consecutive spaces are used.

**+/−**  
This indicates an optional + or - sign. If neither is coded, + is assumed.

All other characters must be encoded precisely as they appear in the assembler syntax. Apart from { and }, the special characters described above do not appear in the basic forms of assembler instructions documented in this manual. In a few places, the { and } characters must be encoded as part of a variable item. When this happens, the long description of the variable item indicates how they must be used.

**F2.1.5 Pseudocode describing how the instruction operates**

The *Operation for all classes* subsection contains encoding-independent pseudocode that describes the main operation of the instruction. For a detailed description of the pseudocode used and of the relationship between the encoding diagram, the encoding-specific pseudocode and the encoding-independent pseudocode, see *Appendix K12 ARM Pseudocode Definition*. 
F2.2 Standard assembler syntax fields

The following assembler syntax fields are standard across all or most instructions:

<

Is an optional field. It specifies the condition under which the instruction is executed. See Conditional execution on page F2-3101 for the range of available conditions and their encoding. If < is omitted, it defaults to always (AL).

>

Specifies optional assembler qualifiers on the instruction. The following qualifiers are defined:

.N Meaning narrow, specifies that the assembler must select a 16-bit encoding for the instruction. If this is not possible, an assembler error is produced.

.W Meaning wide, specifies that the assembler must select a 32-bit encoding for the instruction. If this is not possible, an assembler error is produced.

If neither .W nor .N is specified, the assembler can select either 16-bit or 32-bit encodings. If both are available, it must select a 16-bit encoding. In a few cases, more than one encoding of the same length can be available for an instruction. The rules for selecting between such encodings are instruction-specific and are part of the instruction description. The assembler syntax includes a mandatory .W qualifier, along with a note describing the cases in which it applies, where this qualifier is required to select a particular encoding for an instruction. Additional assembler syntax will describe the syntax when the conditions are not met.

Note

When assembling to the A32 instruction set, the .N qualifier produces an assembler error and the .W qualifier has no effect.
F2.3 Conditional execution

Most T32 and A32 instructions can be executed conditionally, based on the values of the APSR Condition flags. Table F2-1 lists the available conditions.

Table F2-1 Condition codes

<table>

</tr>
<tr>
<td>1110</td>
<td>None (AL) d</td>
<td>Always (unconditional)</td>
<td>Always (unconditional)</td>
<td>Any</td>
</tr>
</tbody>
</table>

a. Unordered means at least one NaN operand.
b. HS (unsigned higher or same) is a synonym for CS.
c. LO (unsigned lower) is a synonym for CC.
d. AL is an optional mnemonic extension for always, except in IT instructions. For details see IT on page F5-3380.

In T32 instructions, the condition, if it is not AL, is normally encoded in a preceding IT instruction. For more information see Conditional instructions on page F1-3059 and IT on page F5-3380. Some conditional branch instructions do not require a preceding IT instruction, because they include a Condition code in their encoding.

For performance reasons, ARMv8 deprecates the use of IT other than with a single 16-bit T32 instruction from a specified subset of the 16-bit T32 instructions, see Partial deprecation of IT on page F1-3076. In addition, implementations can provide a set of ITD control fields, SCTLR.ITD, SCTLR_EL1.ITD, and HSCTLR.ITD, to disable these deprecated uses, making them UNDEFINED. For more information see:

- Disabling or enabling PL0 and PL1 use of AArch32 deprecated functionality on page G1-4705.
- Disabling or enabling EL2 use of AArch32 deprecated functionality on page G1-4714.

In A32 instructions, bits[31:28] of the instruction contain either:

- The Condition code, see The Condition code field in A32 instruction encodings on page F2-3102.
- 0b1111 for some A32 instructions that can only be executed unconditionally.
ARM deprecates the conditional execution of any instruction encoding provided by Advanced SIMD that is not also provided by floating-point, and strongly recommends that:

- For A32 instructions, any such Advanced SIMD instruction that can be conditionally executed is executed with the \(<c>\) field omitted or set to \(AL\).

  **Note**
  
  This applies only to \(VDUP\) (general-purpose register) on page F6-4113. The other A32 instructions do not permit conditional execution.

- For T32 instructions, such Advanced SIMD instructions are never included in an IT block. This means they must be specified with the \(<c>\) field omitted or set to \(AL\).

This deprecation does not apply to Advanced SIMD instruction encodings that are also available as floating-point instruction encodings. That is, it does not apply to the Advanced SIMD encodings of the instructions described in the following sections:

- \(VLDM, VLDMDB, VLDMIA\) on page F6-4209.
- \(VLDR\) (immediate) on page F6-4214 and \(VLDR\) (literal) on page F6-4217.
- \(VMOV\) (general-purpose register to scalar) on page F6-4276.
- \(VMOV\) (between two general-purpose registers and a doubleword floating-point register) on page F6-4262.
- \(VMRS\) on page F6-4291.
- \(VMSR\) on page F6-4294.
- \(VPUSH\) on page F6-4356.
- \(VSTM, VSTMDB, VSTMIA\) on page F6-4546.
- \(VSTR\) on page F6-4551.

See also *Conditional execution of undefined instructions* on page G1-4663.

### F2.3.1 The Condition code field in A32 instruction encodings

Every conditional A32 instruction contains a 4-bit Condition code field, the cond field, in bits 31 to 28:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | cond |

This field contains one of the values 0b0000-0b1110, as shown in Table F2-1 on page F2-3101. Most instruction mnemonics can be extended with the letters defined in the Mnemonic extension on page F2-3101 column of that table.

If the always (\(AL\)) condition is specified, the instruction is executed irrespective of the value of the Condition flags. The absence of a Condition code on an instruction mnemonic implies the \(AL\) Condition code.

### F2.3.2 Pseudocode description of conditional execution

The \(\text{AArch32.CurrentCond()}\) function returns a 4-bit condition specifier as follows:

- For A32 instructions, it returns bits[31:28] of the instruction.
- For the T1 and T3 encodings of the Branch instruction (see \(B\) on page F5-3305), it returns the 4-bit cond field of the encoding.
- For all other T32 instructions:
  - If \(PSTATE.IT<3:0> \neq \text{'}0000'\) it returns \(PSTATE.IT<7:4>\).
  - If \(PSTATE.IT<7:4> == \text{'}00000000'\) it returns \(\text{'}1110'\).
  - Otherwise, execution of the instruction is CONSTRAINED UNPREDICTABLE.

For more information, see *Process state, PSTATE* on page E1-2984.
The `ConditionPassed()` function uses this condition specifier and the Condition flags to determine whether the instruction must be executed, by calling the `ConditionHolds()` function.

Chapter J1 ARMv8 Pseudocode includes the definitions of these functions.

*Undefined Instruction exception on page G1-4661* describes the handling of conditional instructions that are UNDEFINED, UNPREDICTABLE, or CONSTRAINED UNPREDICTABLE. The pseudocode in the manual, as a sequential description of the instructions, has limitations in this respect. For more information, see *Limitations of the instruction pseudocode on page K12-6566.*
F2.4 Shifts applied to a register

A32 register offset load/store word and unsigned byte instructions can apply a wide range of different constant shifts to the offset register. Both T32 and A32 data-processing instructions can apply the same range of different constant shifts to the second operand register. For details see Constant shifts.

A32 data-processing instructions can apply a register-controlled shift to the second operand register.

F2.4.1 Constant shifts

These are the same in T32 and A32 instructions, except that the input bits come from different positions.

<shift> is an optional shift to be applied to <Rm>. It can be any one of:

- (omitted) No shift.
- LSL #<n> Logical shift left <n> bits. 1 <= <n> <= 31.
- LSR #<n> Logical shift right <n> bits. 1 <= <n> <= 32.
- ASR #<n> Arithmetic shift right <n> bits. 1 <= <n> <= 32.
- ROR #<n> Rotate right <n> bits. 1 <= <n> <= 31.
- RRX Rotate right one bit, with extend. Bit[0] is written to shifter_carry_out, bits[31:1] are shifted right one bit, and the Carry flag is shifted into bit[31].

**Note**

Assemblers can permit the use of some or all of ASR #0, LSL #0, LSR #0, and ROR #0 to specify that no shift is to be performed. This is not standard UAL, and the encoding selected for T32 instructions might vary between UAL assemblers if it is used. To ensure disassembled code assembles to the original instructions, disassemblers must omit the shift specifier when the instruction specifies no shift.

Similarly, assemblers can permit the use of #0 in the immediate forms of ASR, LSL, LSR, and ROR instructions to specify that no shift is to be performed, that is, that a MOV (register) instruction is wanted. Again, this is not standard UAL, and the encoding selected for T32 instructions might vary between UAL assemblers if it is used. To ensure disassembled code assembles to the original instructions, disassemblers must use the MOV (register) syntax when the instruction specifies no shift.

Encoding

The assembler encodes <shift> into two type bits and five immediate bits, as follows:

- (omitted) type = 0b00, immediate = 0.
- LSL #<n> type = 0b00, immediate = #<n>.
- LSR #<n> type = 0b01.
  - If #<n> < 32, immediate = #<n>.
  - If #<n> == 32, immediate = 0.
- ASR #<n> type = 0b10.
  - If #<n> < 32, immediate = #<n>.
  - If #<n> == 32, immediate = 0.
- ROR #<n> type = 0b11, immediate = #<n>.
- RRX type = 0b11, immediate = 0.
F2.4.2 Register controlled shifts

These are only available in A32 instructions.

<type> is the type of shift to apply to the value read from <Rm>. It must be one of:

- ASR  Arithmetic shift right, encoded as type = 0b10.
- LSL  Logical shift left, encoded as type = 0b00.
- LSR  Logical shift right, encoded as type = 0b01.
- ROR  Rotate right, encoded as type = 0b11.

The bottom byte of <Rs> contains the shift amount.

F2.4.3 Pseudocode description of instruction-specified shifts and rotates

The pseudocode enumeration SRTyp() defines the shift types. Shift and rotate instruction decode is described by the pseudocode function:

- DecodeImmShift() for a constant shift.
- DecodeRegShift() for a register controlled shift.

Shift and rotate operations are made by the pseudocode function Shift().
F2.5 Memory accesses

Commonly, the following addressing modes are permitted for memory access instructions:

**Offset addressing**

The offset value is applied to an address obtained from the base register. The result is used as the address for the memory access. The value of the base register is unchanged.

The assembly language syntax for this mode is:

\[
[<Rn>, \text{offset}]
\]

**Pre-indexed addressing**

The offset value is applied to an address obtained from the base register. The result is used as the address for the memory access, and written back into the base register.

The assembly language syntax for this mode is:

\[
[<Rn>, \text{offset}]!
\]

**Post-indexed addressing**

The address obtained from the base register is used, unchanged, as the address for the memory access. The offset value is applied to the address, and written back into the base register.

The assembly language syntax for this mode is:

\[
[<Rn>, \text{offset}]
\]

In each case, \(<Rn>\) is the base register. \(\text{offset}\) can be:

- An immediate constant, such as \(<\text{imm8}>\) or \(<\text{imm12}>\).
- An index register, \(<Rm>\).
- A shifted index register, such as \(<Rm>, \text{LSL } #<\text{shift}>\).

For information about unaligned access, endianness, and exclusive access, see:

- *Alignment support* on page E2-3027.
- *Endian support* on page E2-3029.
- *Synchronization and semaphores* on page E2-3045.
F2.6 Encoding of lists of general-purpose registers and the PC

A number of instructions operate on lists of general-purpose registers. For some load instructions, the list of registers to be loaded can include the PC. For these instructions, the assembler syntax includes a \(<\text{registers}>\) field, that provides a list of the registers to be operated on, with list entries separated by commas.

The registers list is encoded in the instruction encoding. Most often, this is done using an 8-bit, 13-bit, or 16-bit register_list field. This section gives more information about these and other possible register list encodings.

In a register_list field, each bit corresponds to a single register, and if the \(<\text{registers}>\) field of the assembler instruction includes Rt then register_list<\text{t}> is set to 1, otherwise it is set to 0.

The full rules for the encoding of lists of general-purpose registers, and possibly the PC, are:

- Except for the cases listed here, 16-bit T32 encodings use an 8-bit register list, and can access only registers R0-R7.
  
  The exceptions to this rule are:
  
  - The T1 encoding of \(\text{POP}\) uses an 8-bit register list, and an additional bit, \(P\), that corresponds to the PC. This means it can access any of R0-R7 and the PC.
  
  - The T1 encoding of \(\text{PUSH}\) uses an 8-bit register list, and an additional bit, \(M\), that corresponds to the LR. This means it can access any of R0-R7 and the LR.

- 32-bit T32 encodings of load operations use a 13-bit register list, and two additional bits, \(M\), corresponding to the LR, and \(P\), corresponding to the PC. This means these instructions can access any of R0-R12 and the LR and PC.

- 32-bit T32 encodings of store operations use a 13-bit register list, and one additional bit, \(M\), corresponding to the LR. This means these instructions can access any of R0-R12 and the LR.

- Except for the case listed here, A32 encodings use a 16-bit register list. This means these instructions can access any of R0-R12 and the SP, LR, and PC.
  
  The exception to this rule is:
  
  - The system instructions \(\text{LDM}\) (exception return) and \(\text{LDM}\) (User registers) use a 15-bit register list. This means these instructions can access any of R0-R12 and the SP and LR.

- The T3 and A2 encodings of \(\text{POP}\), and the T3 and A2 encodings of \(\text{PUSH}\), access a single register from the set of registers \{R0-R12, LR, PC\} and encode the register number in the \(\text{Rt}\) field.

---

**Note**

\(\text{POP}\) is a load operation, and \(\text{PUSH}\) is a store operation.

In every case, the encoding-specific pseudocode converts the register list into a 32-bit variable, \(\text{registers}\), with a bit corresponding to each of the registers R0-R12, SP, LR, and PC.

---

**Note**

Some Advanced SIMD and floating-point instructions operate on lists of SIMD and floating-point registers. The assembler syntax of these instructions includes a \(<\text{list}>\) field that specifies the registers to be operated on, and the description of the instruction in *Alphabetical list of T32 and A32 base instruction set instructions on page F5-3258* defines the use and encoding of this field.
F2.7 General information about the T32 and A32 instruction descriptions

Chapter F3 T32 Instruction Set Encoding describes the T32 instruction encodings, and Chapter F4 A32 Instruction Set Encoding describes the A32 instruction encodings. The following subsections give more information about the descriptions of these instructions and their encodings:

- Execution of instructions in debug state.
- Fixed values in AArch32 instruction and System register descriptions.
- UNDEFINED, UNPREDICTABLE, and CONSTRAINED UNPREDICTABLE instruction set space on page F2-3109.
- T32 and A32 Advanced SIMD and floating-point instruction encodings on page F2-3110.
- The PC and the use of 0b1111 as a register specifier in T32 and A32 instructions on page F2-3114.
- The SP and the use of 0b1101 as a register specifier in T32 and A32 instructions on page F2-3115.
- Modified immediate constants in T32 and A32 instructions on page F2-3115.

F2.7.1 Execution of instructions in debug state

In general, except for the instructions described in Debug state on page F1-3078, the T32 instruction descriptions do not indicate any differences in the behavior of the instruction if it is executed in Debug state. For this information, see Executing instructions in Debug state on page H2-5708.

--- Note ---

- A32 instructions cannot be executed in Debug state.
- For many T32 instructions, execution is unchanged in Debug state. Executing instructions in Debug state on page H2-5708 identifies these instructions.

F2.7.2 Fixed values in AArch32 instruction and System register descriptions

This section summarizes the terms used to describe fixed values in AArch64 register and instruction descriptions. The Glossary gives full descriptions of these terms, and each entry in this section includes a link to the corresponding Glossary entry.

--- Note ---

In register descriptions, the meaning of some bits depends on the PE state. This affects the definitions of RES0 and RES1, as shown in the Glossary.

The following terms are used to describe bits or fields with fixed values:

- **RAZ** Read-As-Zero. See Read-As-Zero (RAZ).
  - In diagrams, a RAZ bit can be shown as 0.

- **(0), RES0** Reserved, Should-Be-Zero (SBZ) or RES0.
  - In instruction encoding diagrams, and sometimes in other descriptions, (0) indicates an SBZ bit. If the bit is set to 1, behavior is CONSTRAINED UNPREDICTABLE, and must be one of the following:
    - The instruction is UNDEFINED.
    - The instruction is treated as a NOP.
    - The instruction executes as if the value of the bit was 0.
    - Any destination registers of the instruction become UNKNOWN.
  - This notation can be expanded for fields, so a three-bit field can be shown as either (0)(0)(0) or as (000).
  - In register diagrams, but not in the A64 encoding and instruction descriptions, bits or fields can be shown as RES0. See the Glossary definition of RES0 for more information.

--- Note ---

Some of the System instruction descriptions in this chapter are based on the field description of the input value for the instruction. These are register descriptions and therefore can include RES0 fields,
The (0) and RES0 descriptions can be applied to bits or bitfields that are read-only, or are write-only. The Glossary definitions cover these cases.

**RAO**
Read-As-One. See Read-As-One (RAO).

In diagrams, a RAO bit can be shown as 1.

**(1), RES1**
Reserved, Should-Be-One (SBO) or RES1.

In instruction encoding diagrams, and sometimes in other descriptions, (1) indicates a SBO bit. If the bit is set to 0, behavior is CONSTRAINED UNPREDICTABLE, and must be one of the following:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if the value of the bit was 1.
- Any destination registers of the instruction become UNKNOWN.

This notation can be expanded for fields, so a three-bit field can be shown as either (1)(1)(1) or as (111).

In register diagrams, but not in the A64 encoding and instruction descriptions, bits or fields can be shown as RES1. See the Glossary definition of RES1 for more information.

**Note**

Some of the System instruction descriptions in this chapter are based on the field description of the input value for the instruction. These are register descriptions and therefore can include RES1 fields, and RES1 descriptions can be applied to bits or bitfields that are read-only, or are write-only. The Glossary definitions cover these cases.

**Note**

In register diagrams, (0) is a synonym for RES0, and (1) is a synonym for RES1, where RES0 and RES1 are defined in the Glossary. However, when used in an instruction encoding diagram, (0) and (1) have the narrower definition that behavior is UNPREDICTABLE or CONSTRAINED UNPREDICTABLE if either:

- A bit marked as (0) has the value 1.
- A bit marked as (1) has the value 0.

**F2.7.3 UNDEFINED, UNPREDICTABLE, and CONSTRAINED UNPREDICTABLE instruction set space**

An attempt to execute an unallocated instruction results in either:

- Unpredictable behavior. The instruction is described as UNPREDICTABLE or CONSTRAINED UNPREDICTABLE. ARMv8-A greatly reduces the architecturally UNPREDICTABLE behavior in AArch32 state. Most cases that earlier versions of the architecture describe as UNPREDICTABLE become either:
  - CONSTRAINED UNPREDICTABLE, meaning the architecture defines a limited range of permitted behaviors.
  - Fully predictable.

  For more information see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

- An Undefined Instruction exception. The instruction is described as UNDEFINED.

An instruction is UNDEFINED if it is declared as UNDEFINED in an instruction description, or in Chapter F3 T32 Instruction Set Encoding or Chapter F4 A32 Instruction Set Encoding.

An instruction is UNPREDICTABLE only if:

- It is declared as UNPREDICTABLE in an instruction description or in Chapter F3 or Chapter F4, and Appendix K1 does not redefine the behavior as CONSTRAINED UNPREDICTABLE.

- The pseudocode for that encoding does not indicate that a different special case applies, and a bit marked (0) or (1) in the encoding diagram of an instruction is not 0 or 1 respectively. In most cases, ARMv8 makes these cases CONSTRAINED UNPREDICTABLE, as described in SBZ or SBO fields T32 and A32 in instructions on page K1-6394.
Unless otherwise specified, T32 and A32 instructions provided as part of an architectural extension, or by an optional feature of the architecture, are UNDEFINED in an implementation that does not include that extension or feature.

--- Note ---
Examples of where this rule applies are:

- The instructions provided by the Cryptographic Extension.
- The system instructions that provide access to the System registers of the OPTIONAL Performance Monitors Extension.
- The Advanced SIMD and floating-point instructions.

---

For more information about UNDEFINED, UNPREDICTABLE, and CONSTRAINED UNPREDICTABLE instruction behavior, see **Undefined Instruction exception** on page G1-4661.

For more information about the behavior of T32 and A32 instructions in earlier versions of the architecture see the *ARM® Architecture Reference Manual, ARMv7-A and ARMv7-R edition*.

### F2.7.4 T32 and A32 Advanced SIMD and floating-point instruction encodings

The T32 and A32 encodings of Advanced SIMD and floating-point instructions that are described in *Chapter F3 T32 Instruction Set Encoding* and in *Chapter F4 A32 Instruction Set Encoding* are common to the T32 and A32 instruction sets. This means:

- The instruction groups, and the set of instructions in each group, are identical for T32 and A32.
- For each instruction:
  - Each T32 encoding is exactly equivalent to an A32 encoding.
  - There is no T32 encoding without an equivalent A32 encoding, and no A32 encoding without an equivalent T32 encoding.

--- Note ---

- In the T32 instruction sets, the Advanced SIMD and floating-point instructions have 32-bit encodings.
- In the base instruction sets, some instructions are common to the T32 and A32 instruction sets, whereas other instructions have equivalent but not identical functionality in the two instruction sets.

32-bit T32 encodings are described as two contiguous halfwords, \{hw1:hw2\}, as described in **Instruction encodings** on page F2-3096. In general:

- \(hw1\) of a T32 encoding maps onto bits[31:16] of an equivalent A32 encoding.
- \(hw2\) of a T32 encoding maps onto bits[15:0] of an equivalent A32 encoding.

However, the different structures of the T32 instruction encoding space and the A32 instruction encoding space mean that:

- For a given Advanced SIMD and floating-point instruction group:
  - The positions of the fields that identify the instruction, or instruction encoding, within the instruction group might differ between the T32 encodings and the A32 encodings.
  - However, the field values that identify the instruction of instruction encoding are identical for the T32 encoding and the A32 encoding.

The remainder of this section describes the equivalence of the T32 and A32 encodings for each of the Advanced SIMD and floating-point instruction groups.

**Advanced SIMD data-processing**

The T32 encoding of the Advanced SIMD data-processing group is:
The A32 encoding of the Advanced SIMD data-processing group is:

```
<table>
<thead>
<tr>
<th>31</th>
<th>24 23 22</th>
<th></th>
<th></th>
<th>5 4 3 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>111001</td>
<td></td>
<td></td>
<td></td>
<td>------</td>
</tr>
</tbody>
</table>
```

The encodings in this group are identified by:

- \( w_1[15:13] \) of the T32 encoding is equivalent to bits\([27:25]\) of the A32 encoding, and:
  - Has the value \(0b111\) in the T32 encoding.
  - Has the value \(0b001\) in the A32 encoding.

- \( w_1[11:8] \) of the T32 encoding is equivalent to bits\([31:28]\) of the A32 encoding, and has the value \(0b111\).

This table shows the equivalence of the fields that identify the instructions, or instruction encodings, within this group:

<table>
<thead>
<tr>
<th>T32 encoding</th>
<th>A32 encoding</th>
<th>Field size</th>
</tr>
</thead>
<tbody>
<tr>
<td>op0:op1</td>
<td>op0</td>
<td>2 bits</td>
</tr>
<tr>
<td>op2</td>
<td>op1</td>
<td>15 bits</td>
</tr>
<tr>
<td>op3</td>
<td>op2</td>
<td>1 bit</td>
</tr>
<tr>
<td>op4</td>
<td>op3</td>
<td>1 bit</td>
</tr>
</tbody>
</table>

**Advanced SIMD element or structure load/store**

The T32 encoding of the Advanced SIMD element or structure load/store group is:

```
<table>
<thead>
<tr>
<th>15</th>
<th>7 6 5 4 3 0 15</th>
<th>12 11 10</th>
<th>9</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111001</td>
<td>0</td>
<td></td>
<td>op1</td>
<td></td>
</tr>
</tbody>
</table>
```

The A32 encoding of the Advanced SIMD element or structure load/store group is:

```
<table>
<thead>
<tr>
<th>31</th>
<th>23 22 21 20</th>
<th>19</th>
<th>12 11 10</th>
<th>9</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>11110100</td>
<td>0</td>
<td></td>
<td>op1</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

The encodings in this group are identified by:

- \( w_1[15:12] \) of the T32 encoding is equivalent to bits\([31:28]\) of the A32 encoding, and has the value \(0b1111\).
F2 About the T32 and A32 Instruction Descriptions

F2.7 General information about the T32 and A32 instruction descriptions

• \texttt{hw1}[11:8] of the T32 encoding is equivalent to bits[27:24] of the A32 encoding, and:
  — Has the value \texttt{0b1001} in the T32 encoding.
  — Has the value \texttt{0b0100} in the A32 encoding.

• \texttt{hw1}[4] of the T32 encoding is equivalent to bit[20] of the A32 encoding, and has the value \texttt{0b0}.

\texttt{op0}, \texttt{op1}, and \texttt{op2} are the fields that identify the instructions, or instruction encodings, within this group, and they are in equivalent positions in the T32 and A32 encodings.

**Floating-point and Advanced SIMD load/store and 64-bit register moves**

The T32 encoding of the Floating-point and Advanced SIMD load/store and 64-bit register moves group is:

\[
\begin{array}{ccccccc}
| & 15 & | & 8 & | & 5 & 4 & | & 0 & 15 & | & 12 & 11 & | & 8 & | & 0 | \\
1110110 & | & \text{op0} & | & & & & & & & & 101 & | & & & & & & & & 0 \\
\end{array}
\]

The A32 encoding of the Floating-point and Advanced SIMD load/store and 64-bit register moves group is:

\[
\begin{array}{ccccccc}
| & 31 & | & 27 & | & 24 & | & 21 & 20 & | & 12 & 11 & | & 8 & | & 0 | \\
!\text{=}1111 & | & 110 & | & \text{op0} & | & & & & & & 101 & | & & & & & & & & 0 \\
\end{array}
\]

The encodings in the group are identified by:

• \texttt{hw1}[15:12] of the T32 encoding is equivalent to bits[31:28] of the A32 encoding, and:
  — Has the value \texttt{0b1110} in the T32 encoding.
  — Can have any value other than \texttt{0b1111} in the A32 encoding.
  This range of values is required because A32 instructions in this group can be executed conditionally, see Conditional execution on page F2-3101.

• \texttt{hw1}[11:9] of the T32 encoding is equivalent to bits[27:25] of the A32 encoding, and has the value \texttt{0b110}.

• \texttt{hw2}[11:9] of the T32 encoding is equivalent to bits[11:9] of the A32 encoding, and has the value \texttt{0b101}.

\texttt{op0} is the field that identifies the instructions, or instruction encodings, within this group, and is in equivalent positions in the T32 and A32 encodings.

**Floating-point and Advanced SIMD 32-bit register moves**

The T32 encoding of the Floating-point and Advanced SIMD 32-bit register moves group is:

\[
\begin{array}{ccccccc}
| & 15 & | & 7 & | & 5 & 4 & | & 0 & 15 & | & 12 & 11 & | & 8 & 7 & 5 & 4 & | & 0 | \\
1110110 & | & \text{op0} & | & & & & & & & & 101 & | & & & 1 & & | & & & & & 0 \\
\end{array}
\]

The A32 encoding of the Advanced SIMD 32-bit register moves group is:

\[
\begin{array}{ccccccc}
| & 31 & | & 27 & | & 23 & | & 21 & 20 & | & 12 & 11 & | & 8 & 7 & 5 & 4 & | & 0 | \\
!\text{=}1111 & | & 1110 & | & \text{op0} & | & & & & & & 101 & | & & & 1 & & | & & & & & 0 \\
\end{array}
\]
The encodings in this group are identified by:

- \( \text{hw1}[15:12] \) of the T32 encoding is equivalent to bits[31:28] of the A32 encoding, and:
  - Has the value \( 0b1110 \) in the T32 encoding.
  - Can have any value other than \( 0b1111 \) in the A32 encoding.
  
  This range of values is required because A32 instructions in this group can be executed conditionally, see `Conditional execution` on page F2-3101.

- \( \text{hw1}[11:8] \) of the T32 encoding is equivalent to bits[27:24] of the A32 encoding, and has the value \( 0b1110 \).

- \( \text{hw2}[11:9] \) of the T32 encoding is equivalent to bits[11:9] of the A32 encoding, and has the value \( 0b101 \).

- \( \text{hw2}[4] \) of the T32 encoding is equivalent to bit[4] of the A32 encoding, and has the value \( 0b1 \).

\( \text{op0} \) is the field that identifies the instructions, or instruction encodings, within this group, and is in equivalent positions in the T32 and A32 encodings.

**Floating-point data-processing**

The T32 encoding of the Floating-point data-processing group is:

```
| 15 | 12 | 11 | 7 | 4 | 3 | 0 | 15 | 12 | 11 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 0 |
|----|----|----|---|---|---|---|----|----|----|---|---|---|---|---|---|---|---|---|
| 111 | 1110 | op1 | op2 | 10 | op3 | 0 |
```

\( \text{op0} \)

The A32 encoding of the Floating-point data-processing group is:

```
| 31 | 28 | 27 | 20 | 19 | 16 | 15 | 12 | 11 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 0 |
|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|
| cond | 1110 | op0 | op1 | 10 | op2 | 0 |
```

\( \text{op3} \)

The encodings in this group are identified by:

- \( \text{hw1}[15:12] \) of the T32 encoding is equivalent to bits[31:28] of the A32 encoding, and:
  - In the T32 encoding, \( \text{hw1}[15:13] \) has the value \( 0b111 \), and \( \text{hw1}[12] \) is the \( \text{op0} \) parameter used in identifying instruction encodings within this group.
  - In the A32 encoding, is the \( \text{cond} \) field and also implies the value of bit[28] of some A32 instruction encodings within this group, as the following table shows:

<table>
<thead>
<tr>
<th>cond</th>
<th>Significance of bit[28] in A32 encodings</th>
</tr>
</thead>
<tbody>
<tr>
<td>( \neq 0b1111 )</td>
<td>Part of the ( \text{cond} ) field.</td>
</tr>
<tr>
<td>( 0b1111 )</td>
<td>Has fixed value of 1.</td>
</tr>
</tbody>
</table>

The range of \( \text{cond} \) values other than \( 0b1111 \) is required because A32 instructions in this group can be executed conditionally, see `Conditional execution` on page F2-3101.

- \( \text{hw1}[11:8] \) of the T32 encoding is equivalent to bits[27:24] of the A32 encoding, and has the value \( 0b1110 \).

- \( \text{hw2}[11:9] \) of the T32 encoding is equivalent to bits[11:9] of the A32 encoding, and has the value \( 0b101 \).

- \( \text{hw2}[4] \) of the T32 encoding is equivalent to bit[4] of the A32 encoding, and has the value \( 0b0 \).
This table shows the equivalence of the fields that identify the instructions, or instruction encodings, within this group:

<table>
<thead>
<tr>
<th>T32 encoding</th>
<th>A32 encoding</th>
</tr>
</thead>
<tbody>
<tr>
<td>op0</td>
<td>Bit[28] of the instruction encoding is 1 when cond is 0b1111.</td>
</tr>
<tr>
<td>op1</td>
<td>op0</td>
</tr>
<tr>
<td>op2</td>
<td>op1</td>
</tr>
<tr>
<td>op3</td>
<td>op2</td>
</tr>
</tbody>
</table>

**F2.7.5 The PC and the use of 0b1111 as a register specifier in T32 and A32 instructions**

Restrictions on the use of PC or 0b1111 as a register specifier differ between the T32 and the A32 instruction sets, as described in:

- **T32 restrictions on the use of the PC, and use of 0b1111 as a register specifier.**
- **A32 restrictions on the use of PC or 0b1111 as a register specifier on page F2-3115.**

**T32 restrictions on the use of the PC, and use of 0b1111 as a register specifier**

The use of 0b1111 as a register specifier is not normally permitted in T32 instructions. When a value of 0b1111 is permitted, a variety of meanings is possible. For register reads, these meanings include:

- Read the PC value, that is, the address of the current instruction + 4. The base register of the table branch instructions TBB and TBH can be the PC. This means branch tables can be placed in memory immediately after the instruction.

  — **Note**

  ARM deprecates use of the PC as the base register in the STC instruction.

- Read the word-aligned PC value, that is, the address of the current instruction + 4, with bits[1:0] forced to zero. The base register of LDC, LDR, LDRB, LDRD (pre-indexed, no writeback), LDRH, LDRSB, and LDRSH instructions can be the word-aligned PC. This provides PC-relative data addressing. In addition, some encodings of the ADD and SUB instructions permit their source registers to be 0b1111 for the same purpose.

- Read zero. This is done in some cases when one instruction is a special case of another, more general instruction, but with one operand zero. In these cases, the instructions are listed on separate pages, with a special case in the pseudocode for the more general instruction cross-referencing the other page.

For register writes, these meanings include:

- The PC can be specified as the destination register of an LDR instruction. This is done by encoding Rt as 0b1111. The loaded value is treated as an address, and the effect of execution is a branch to that address. Bit[0] of the loaded value selects whether to execute A32 or T32 instructions after the branch.

- Some other instructions write the PC in similar ways. An instruction can specify that the PC is written:
  - Implicitly, for example, branch instructions.
  - Explicitly by a register specifier of 0b1111, for example 16-bit MOV (register) instructions.
  - Explicitly by using a register mask, for example LDM instructions.

  The address to branch to can be:
  - A loaded value, for example, RFE.
  - A register value, for example, BX.
  - The result of a calculation, for example, TBB or TBH.
The method of choosing the instruction set used after the branch can be:
- Similar to the LDR case, for example, LDM or BX.
- A fixed instruction set other than the one currently being used, for example, the immediate form of BLX.
- Unchanged, for example, branch instructions or 16-bit MOV (register) instructions.
- Set from the SPSR.T bit, for RFE and SUBS PC, LR, #imm8.

- Discard the result of a calculation. This is done in some cases when one instruction is a special case of another, more general instruction, but with the result discarded. In these cases, the instructions are listed on separate pages, with a special case in the pseudocode for the more general instruction cross-referencing the other page.
- If the destination register specifier of an LDRB, LDRH, LDRSB, or LDRSH instruction is 0b1111, the instruction is a memory hint instead of a load operation.
- If the destination register specifier of an MRC instruction is 0b1111, bits[31:28] of the value transferred from the System register are written to the N, Z, C, and V Condition flags in the APSR, and bits[27:0] are discarded.

### A32 restrictions on the use of PC or 0b1111 as a register specifier

In A32 instructions, the use of 0b1111 as a register specifier specifies the PC.

Many instructions are CONSTRAINED UNPREDICTABLE if they use 0b1111 as a register specifier. This is specified by pseudocode in the instruction description. ARMv8-A constrains the resulting CONSTRAINED UNPREDICTABLE behavior, see Using R15 on page K1-6391.

Note

ARM deprecates use of the PC as the base register in any store instruction.

### F2.7.6 The SP and the use of 0b1101 as a register specifier in T32 and A32 instructions

In the T32 and A32 instruction sets, ARM recommends that the use of 0b1101 as a register specifier specifies the SP.

Note

- The recommendation that the register specifier 0b1101 is only used to specify the SP applies to both the T32 and the A32 instruction sets.
- Despite this recommendation, T32 instructions that can access R13, or the SP, behave predictably in ARMv8. This differs from ARMv7, where many uses of R13 are defined as UNPREDICTABLE. For more information about these cases see the ARM® Architecture Reference Manual, ARMv7-A and ARMv7-R edition.

### F2.7.7 Modified immediate constants in T32 and A32 instructions

The following sections describe the encoding of modified immediate constants:
- Modified immediate constants in T32 instructions on page F2-3116.
- Modified immediate constants in A32 instructions on page F2-3117.
- Modified immediate constants in T32 and A32 Advanced SIMD instructions on page F2-3118.
- Modified immediate constants in T32 and A32 floating-point instructions on page F2-3119.
Modified immediate constants in T32 instructions

The encoding of a modified immediate constant in a 32-bit T32 instruction is:

Table F2-2 shows the range of modified immediate constants available in T32 data-processing instructions, and their encoding in the a, b, c, d, e, f, g, h, and i bits, and the imm3 field, in the instruction.

Table F2-2 Encoding of modified immediates in T32 data-processing instructions

</tr>
</tbody>
</table>

^a. This table shows the immediate constant value in binary form, to relate abcdefgh to the encoding diagram. In assembly syntax, the immediate value is specified in the usual way (a decimal number by default).

b. ARM deprecates using a modified immediate with abcdefgh == 00000000, and these cases are CONSTRAINED UNPREDICTABLE, see UNPREDICTABLE cases in immediate constants in T32 data-processing instructions on page K1-6394.

c. Not available in A32 instructions if h == 1.

---

**Note**

As the footnotes to Table F2-2 show, the range of values available in T32 modified immediate constants is slightly different from the range of values available in A32 instructions. See Modified immediate constants in A32 instructions on page F2-3117 for the A32 values.

---

**Carry out**

A logical instruction with i:imm3:a == '0' does not affect the Carry flag. Otherwise, a logical flag-setting instruction sets the Carry flag to the value of bit[31] of the modified immediate constant.

**Operation of modified immediate constants, T32 instructions**

For a T32 data-processing instruction, the T32ExpandImm() pseudocode function returns the value of the 32-bit immediate constant, calling T32ExpandImm_C() to evaluate the constant.
Modified immediate constants in A32 instructions

The encoding of a modified immediate constant in an A32 instruction is:

<table>
<thead>
<tr>
<th>rotation</th>
<th>&lt;const&gt; a</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>00000000 00000000 00000000 abcdefgh</td>
</tr>
<tr>
<td>0001</td>
<td>gh000000 00000000 00000000 0000abdef</td>
</tr>
<tr>
<td>0010</td>
<td>efgh0000 00000000 00000000 0000abcd</td>
</tr>
<tr>
<td>0011</td>
<td>cdefgh00 00000000 00000000 000000ab</td>
</tr>
<tr>
<td>0100</td>
<td>abcd0000 00000000 00000000 00000000</td>
</tr>
<tr>
<td></td>
<td>.</td>
</tr>
<tr>
<td>1001</td>
<td>00000000 00000000 00000000 abcdefgh</td>
</tr>
<tr>
<td></td>
<td>.</td>
</tr>
<tr>
<td>1110</td>
<td>00000000 00000000 00000000 abcd efgh0000</td>
</tr>
<tr>
<td>1111</td>
<td>00000000 00000000 00000000 abcd cdefgh00</td>
</tr>
</tbody>
</table>

a. This table shows the immediate constant value in binary form, to relate abcd0000 defgh0000 to the encoding diagram. In assembly syntax, the immediate value is specified in the usual way (a decimal number by default).

Note

The range of values available in A32 modified immediate constants is slightly different from the range of values available in 32-bit T32 instructions. See Modified immediate constants in T32 instructions on page F2-3116.

Carry out

A logical instruction with the rotation field set to 0b0000 does not affect APSR.C. Otherwise, a logical flag-setting instruction sets APSR.C to the value of bit[31] of the modified immediate constant.

Constants with multiple encodings

Some constant values have multiple possible encodings. In this case, a UAL assembler must select the encoding with the lowest unsigned value of the rotation field. This is the encoding that appears first in Table F2-3. For example, the constant #3 must be encoded with (rotation, abcd0000) == (0b0000, 0b00000001), not (0b0001, 0b00000110), (0b0010, 0b00100000), or (0b0011, 0b01100000).

In particular, this means that all constants in the range 0-255 are encoded with rotation == 0b0000, and permitted constants outside that range are encoded with rotation != 0b0000. A flag-setting logical instruction with a modified immediate constant therefore leaves APSR.C unchanged if the constant is in the range 0-255 and sets it to the most significant bit of the constant otherwise. This matches the behavior of T32 modified immediate constants for all constants that are permitted in both the A32 and T32 instruction sets.
An alternative syntax is available for a modified immediate constant that permits the programmer to specify the encoding directly. In this syntax, #<const> is instead written as #<byte>, #<rot>, where:

- <byte> is the numeric value of abcdefgh, in the range 0-255.
- <rot> is twice the numeric value of rotation, an even number in the range 0-30.

This syntax permits all A32 data-processing instructions with modified immediate constants to be disassembled to assembler syntax that assembles to the original instruction.

This syntax also makes it possible to write variants of some flag-setting logical instructions that have different effects on APSR.C to those obtained with the normal #<const> syntax. For example, ANDS R1, R2, #12, #2 has the same behavior as ANDS R1, R2, #3 except that it sets APSR.C to 0 instead of leaving it unchanged. Such variants of flag-setting logical instructions do not have equivalents in the T32 instruction set, and ARM deprecates their use.

**Operation of modified immediate constants, A32 instructions**

For an A32 data-processing instruction, the A32ExpandImm() pseudocode function returns the value of the 32-bit immediate constant, calling A32ExpandImm_C() to evaluate the constant.

### Modified immediate constants in T32 and A32 Advanced SIMD instructions

Table F2-4 shows the modified immediate constants available with Advanced SIMD instructions, and how they are encoded.

#### Table F2-4 Modified immediate values for Advanced SIMD instructions

</tr>
</tbody>
</table>

a. In this table, the immediate value is shown in binary form, to relate abcdefgh to the encoding diagram. In assembler syntax, the constant is specified by a data type and a value of that type. That value is specified in the normal way (a decimal number by default) and is replicated enough times to fill the 64-bit immediate. For example, a data type of I32 and a value of 10 specify the 64-bit constant 0x0000000A00000000.

b. This specifies the data type used when the instruction is disassembled. On assembly, the data type must be matched in the table if possible. Other data types are permitted as pseudo-instructions when a program is assembled, provided the 64-bit constant specified by the data type and value is available for the instruction. If a constant is available in more than one way, the first entry in this table that can produce it is used. For example, VMOV.I64 D0, 0x8000000000000000 does not specify a 64-bit constant that is available from the I64 line of the table, but does specify one that is available from the fourth I32 line or the F32 line. It is assembled to the first of these, and therefore is disassembled as VMOV.I32 D0, 0x80000000.

c. This constant is available for the VBIC, VMOV, VMN, and VORR instructions.
d. CONstrained UNPREDICTABLE if abcd efgh == 0b00000000, see UNPREDICTABLE cases in immediate constants in Advanced SIMD instructions on page K1-6395. The required behavior is that these encodings produce an immediate constant of zero.

e. This constant is available for the VMOV and VMVN instructions only.

f. This constant is available for the VMOV instruction only.

g. In this entry, 8 = NOT(b). The bit pattern represents the floating-point number \((-1)^S \times 2^{\text{exp}} \times \text{mantissa}\), where \(S = \text{UInt}(a)\), \(\text{exp} = \text{UInt}((\text{NOT}(b):c:d) - 3)\) and \(\text{mantissa} = (16 + \text{UInt}(e:f:g:h))/16\).

Operation of modified immediate constants, Advanced SIMD instructions

For a T32 or A32 Advanced SIMD instruction that uses a modified immediate constant, the operation described by the \(\text{AdvSIMDExpandImm()}\) pseudocode function returns the value of the 64-bit immediate constant.

Modified immediate constants in T32 and A32 floating-point instructions

Table F2-5 shows the immediate constants available in the VMOV (immediate) floating-point instruction, and Table F2-6 shows the resulting floating-point values.

Table F2-6 Floating-point constant values (continued)
F2.8 Additional pseudocode support for instruction descriptions

Earlier sections of this chapter include pseudocode that describes features of the execution of A32 and T32 instructions, see:

- Pseudocode description of conditional execution on page F2-3102.
- Pseudocode description of instruction-specified shifts and rotates on page F2-3105

The following subsection gives additional pseudocode support functions for some of the instructions described in Alphabetical list of T32 and A32 base instruction set instructions on page F5-3258. See also Pseudocode support for the banked register transfer instructions on page F5-3931.

F2.8.1 Pseudocode description of operations for System register access instructions

The AArch32.CheckSystemAccess() pseudocode function determines whether a System register access instruction is accepted for execution.

The AArch32.SysRegRead() function obtains the word for an MRC instruction from the System register.

The AArch32.SysRegRead64() function obtains the two words for an MRRC instruction from the System register.

Note

The relative significance of the two words returned is IMPLEMENTATION DEFINED, but all uses within this manual present the two words in the order (most significant, least significant).

The AArch32.SysRegWrite() procedure sends the word for an MCR instruction to the System register.

The AArch32.SysRegWrite64() procedure sends the two words for an MCRR instruction to the System register.

Note

The relative significance of word2 and word1 is IMPLEMENTATION DEFINED, but all uses within this manual treat word2 as more significant than word1.

The CPI4DebugInstrDecode() pseudocode function decodes an accepted access to a debug System register in the (coproc==0b1110) encoding space.

The CPI4JazelleInstrDecode() pseudocode function decodes an accepted access to a Jazelle System register. These registers are in the (coproc==0b1110) encoding space.

The CPI4TraceInstrDecode() pseudocode function decodes an accepted access to a Trace System register. These registers are in the (coproc==0b1110) encoding space.

The CPI5InstrDecode() pseudocode function decodes an accepted access to a System register in the (coproc==0b1111) encoding space.

F2.8.2 Pseudocode details of system calls

The AArch32.CallSupervisor() pseudocode function generates a Supervisor Call exception. Valid execution of the SVC instruction calls this function.

The AArch32.CallHypervisor() pseudocode function generates an HVC exception. Valid execution of the HVC instruction calls this function.
F2.9 Additional information about Advanced SIMD and floating-point instructions

The following subsections give additional information about the Advanced SIMD and floating-point instructions:

• Advanced SIMD and floating-point instruction syntax.
• The Advanced SIMD addressing mode.
• Advanced SIMD instruction modifiers on page F2-3123.
• Advanced SIMD operand shapes on page F2-3123.
• Data type specifiers on page F2-3124.
• Register specifiers on page F2-3125.
• Register lists on page F2-3126.
• Register encoding on page F2-3126.
• Advanced SIMD scalars on page F2-3127.

--- Note ---

The Advanced SIMD architecture, its associated implementations, and supporting software, are commonly referred to as NEON™ technology.

F2.9.1 Advanced SIMD and floating-point instruction syntax

Advanced SIMD and floating-point instructions use the general conventions of the T32 and A32 instruction sets. Advanced SIMD and floating-point data-processing instructions use the following general format:

V{<modifier>}<operation>{<shape>}{<c>}{<q>}{.<dt>} {<dest>,} <src1>, <src2>

All Advanced SIMD and floating-point instructions begin with a V. This distinguishes Advanced SIMD vector and floating-point instructions from scalar instructions.

The main operation is specified in the <operation> field. It is usually a three letter mnemonic the same as or similar to the corresponding scalar integer instruction.

The <c> and <q> fields are standard assembler syntax fields. For details see Standard assembler syntax fields on page F2-3100.

F2.9.2 The Advanced SIMD addressing mode

All the element and structure load/store instructions use this addressing mode. There is a choice of three formats:

[Rn]{:align}!

The address is contained in general-purpose register Rn.

Rn is updated by this instruction: Rn = Rn + transfer_size

Encoded as Rm = 0b1101.

transfer_size is the number of bytes transferred by the instruction. This means that, after the instruction is executed, Rn points to the address in memory immediately following the last address loaded from or stored to.

If Rn is encoded as 0b1111, the instruction is CONSTRAINED UNPREDICTABLE.

This addressing mode can also be written as:

[Rn]{:align}, #<transfer_size>

However, disassembly produces the [Rn]{:align}! form.
The address is contained in general-purpose register \(<Rn>\).

\(Rn\) is updated by this instruction: 
\[ Rn = Rn + Rm \]

Encoded as \(Rm = Rm\). \(Rm\) must not be encoded as \(0b1111\) or \(0b1101\), the PC or the SP.

If \(Rn\) is encoded as \(0b1111\), the instruction is CONSTRAINED UNPREDICTABLE.

The CONSTRAINED UNPREDICTABLE behavior of encodings where \(Rn\) is \(0b1111\) is described in the section: Using \(R15\) on page K1-6391.

In all cases, \(<align>\) specifies an alignment, as specified by the individual instruction descriptions.

Previous versions of the manual used the \(\@\) character for alignment. So, for example, the first format in this section was shown as \([<Rn>@<align>]\). Both \(\@\) and : are supported. However, to ensure portability of code to assemblers that treat \(\@\) as a comment character, : is preferred.

### F2.9.3 Advanced SIMD instruction modifiers

The \(<modifier>\) field provides additional variants of some instructions. Table F2-7 provides definitions of the modifiers. Modifiers are not available for every instruction.

<table>
<thead>
<tr>
<th>(&lt;modifier&gt;)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Q</td>
<td>The operation uses saturating arithmetic.</td>
</tr>
<tr>
<td>R</td>
<td>The operation performs rounding.</td>
</tr>
<tr>
<td>D</td>
<td>The operation doubles the result (before accumulation, if any).</td>
</tr>
<tr>
<td>H</td>
<td>The operation halves the result.</td>
</tr>
</tbody>
</table>

### F2.9.4 Advanced SIMD operand shapes

The \(<shape>\) field provides additional variants of some instructions. Table F2-8 provides definitions of the shapes. Operand shapes are not available for every instruction.

<table>
<thead>
<tr>
<th>(&lt;shape&gt;)</th>
<th>Meaning</th>
<th>Typical register shape</th>
</tr>
</thead>
<tbody>
<tr>
<td>(none)</td>
<td>The operands and result are all the same width.</td>
<td>Dd, Dn, Dm</td>
</tr>
<tr>
<td>L</td>
<td>Long operation - result is twice the width of both operands</td>
<td>Qd, Dn, Dm</td>
</tr>
<tr>
<td>N</td>
<td>Narrow operation - result is half the width of both operands</td>
<td>Dd, Qn, Qm</td>
</tr>
<tr>
<td>W</td>
<td>Wide operation - result and first operand are twice the width of the second operand</td>
<td>Qd, Qn, Dm</td>
</tr>
</tbody>
</table>

---

**Note**

- Some assemblers support a Q shape specifier, that requires all operands to be Q registers. An example of using this specifier is `VADDQ.S32 q0, q1, q2`. This is not standard UAL, and ARM recommends that programmers do not use a Q shape specifier.

- A disassembler must not generate any shape specifier not shown in Table F2-8.
F2.9.5 Data type specifiers

The `<dt>` field normally contains one data type specifier. Unless the assembler syntax description for the instruction indicates otherwise, this indicates the data type contained in:

- The second operand, if any.
- The operand, if there is no second operand.
- The result, if there are no operand registers.

The data types of the other operand and result are implied by the `<dt>` field combined with the instruction shape. For information about data type formats see *Data types supported by the Advanced SIMD implementation on page E1-2992*.

In the instruction syntax descriptions in Chapter F2 *About the T32 and A32 Instruction Descriptions*, the `<dt>` field is usually specified as a single field. However, where more convenient, it is sometimes specified as a concatenation of two fields, `<type><size>`.

Syntax flexibility

There is some flexibility in the data type specifier syntax:

- Software can specify three data types, specifying the result and both operand data types. For example:
  
  `VSUBW.I16.S8 Q3, Q5, D0` instead of `VSUBW.S8 Q3, Q5, D0`

- Software can specify two data types, specifying the data types of the two operands. The data type of the result is implied by the instruction shape. For example:
  
  `VSUBW.I16.S8 Q3, Q5, D0` instead of `VSUBW.S8 Q3, Q5, D0`

- Software can specify two data types, specifying the data types of the single operand and the result. For example:
  
  `VMOVN.I16.I32 D0, Q1` instead of `VMOVN.I32 D0, Q1`

- Where an instruction requires a less specific data type, software can instead specify a more specific type, as shown in Table F2-9.

- Where an instruction does not require a data type, software can provide one.

- The F32 data type can be abbreviated to F.

- The F64 data type can be abbreviated to D.

In all cases, if software provides additional information, the additional information must match the instruction shape. Disassembly does not regenerate this additional information.

<table>
<thead>
<tr>
<th>Specified data type</th>
<th>Permitted more specific data types</th>
</tr>
</thead>
<tbody>

F2.9.6 Register specifiers

The <dest>, <src1>, and <src2> fields contain register specifiers, or in some cases scalar specifiers or register lists. Table F2-10 shows the register and scalar specifier formats that appear in the instruction descriptions.

If <dest> is omitted, it is the same as <src1>.

Table F2-10 Advanced SIMD and floating-point register specifier formats

<table>
<thead>
<tr>
<th>&lt;specifier&gt;</th>
<th>Usual meaning a</th>
<th>Used in</th>
</tr>
</thead>
<tbody>
<tr>

<td>A source scalar for the first operand. Element x of vector &lt;Dn&gt;.</td>
<td>Both b</td>
</tr>
<tr>
<td>&lt;Dm[x]&gt;</td>
<td>A source scalar for the second operand. Element x of vector &lt;Dm&gt;.</td>
<td>Both b</td>
</tr>
<tr>
<td>&lt;Rt&gt;</td>
<td>A general-purpose register, used for a source or destination address.</td>
<td>Advanced SIMD</td>
</tr>
<tr>
<td>&lt;Rt2&gt;</td>
<td>A general-purpose register, used for a source or destination address.</td>
<td>Both</td>
</tr>
<tr>
<td>&lt;Rn&gt;</td>
<td>A general-purpose register, used as a load or store base address.</td>
<td>Both</td>
</tr>
<tr>
<td>&lt;Rm&gt;</td>
<td>A general-purpose register, used as a post-indexed address source.</td>
<td>Both</td>
</tr>
</tbody>
</table>

a. In some instructions the roles of registers are different.
b. In the floating-point instructions, <Dn[x]> is used only in VMOV (scalar to general-purpose register), see VMOV (scalar to general-purpose register) on page F6-4280.
F2.9.7 Register lists

A register list is a list of register specifiers separated by commas and enclosed in brackets { and }. There are restrictions on what registers can appear in a register list. These restrictions are described in the individual instruction descriptions. Table F2-11 shows some register list formats, with examples of actual register lists corresponding to those formats.

--- Note ---
Register lists must not wrap around the end of the register bank.
---

Syntax flexibility

There is some flexibility in the register list syntax:

- Where a register list contains consecutive registers, they can be specified as a range, instead of listing every register, for example {D0-D3} instead of {D0, D1, D2, D3}.

- Where a register list contains an even number of consecutive doubleword registers starting with an even numbered register, it can be written as a list of quadword registers instead, for example {Q1, Q2} instead of {D2-D5}.

- Where a register list contains only one register, the enclosing braces can be omitted, for example VLD1.8 D0, [R0] instead of VLD1.8 {D0}, [R0].

<table>
<thead>
<tr>
<th>Format</th>
<th>Example</th>

</tr>
</thead>
<tbody>
<tr>
<td>{&lt;Dd&gt;}</td>
<td>{D3}</td>
<td>D3</td>
</tr>
<tr>
<td>{&lt;Dd&gt;, &lt;Dd+1&gt;, &lt;Dd+2&gt;}</td>
<td>{D3, D4, D5}</td>
<td>{D3-D5}</td>
</tr>
<tr>
<td>{&lt;Dd[x]&gt;, &lt;Dd+2[x]}</td>
<td>{D0[3], D2[3]}</td>
<td>-</td>
</tr>
<tr>
<td>{&lt;Dd[]&gt;}</td>
<td>{D7[]}</td>
<td>D7[]</td>
</tr>
</tbody>
</table>

F2.9.8 Register encoding

An Advanced SIMD register is either:

- Quadword, meaning it is 128 bits wide.
- Doubleword, meaning it is 64 bits wide.

Some instructions have options for either doubleword or quadword registers. This is normally encoded in Q, bit[6], as Q = 0 for doubleword operations, or Q = 1 for quadword operations.

A floating-point register is either:

- Double-precision, meaning it is 64 bits wide.
- Single-precision, meaning it is 32 bits wide.

This is encoded in the sz field, bit[8], as sz = 1 for double-precision operations, or sz = 0 for single-precision operations.

The T32 instruction encoding of Advanced SIMD or floating-point registers is:

```
15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
D Vn Vd sz N Q M Vm
```

The A32 instruction encoding of Advanced SIMD or floating-point registers is:

```
31 30 29 28 27 26 25 24 23 22 21 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
D Vn Vd sz N Q M Vm
```
Some instructions use only one or two registers, and use the unused register fields as additional opcode bits.

Table F2-12 shows the encodings for the registers.

</tbody>
</table>

\(^{a}\) Bit numbers given for the A32 instruction encoding. See the figures in this section for the equivalent bits in the T32 encoding.

\(^{b}\) If this bit is 1, the instruction is UNDEFINED.

### F2.9.9 Advanced SIMD scalars

Advanced SIMD scalars can be 8-bit, 16-bit, 32-bit, or 64-bit. Instructions other than multiply instructions can access any element in the register set. The instruction syntax refers to the scalars using an index into a doubleword vector. The descriptions of the individual instructions contain details of the encodings.

Table F2-13 shows the form of encoding for scalars used in multiply instructions. These instructions cannot access scalars in some registers. The descriptions of the individual instructions contain cross references to this section where appropriate.

32-bit Advanced SIMD scalars, when used as single-precision floating-point numbers, are equivalent to Floating-point single-precision registers. That is, \(\text{D}[x]\) in a 32-bit context \((0 <= \text{x} <= 15, 0 <= \text{x} <= 1)\) is equivalent to \(S[2\text{m} + \text{x}]\).

### Table F2-13 Encoding of scalars in multiply instructions

Chapter F3
T32 Instruction Set Encoding

This chapter describes the encoding of the T32 instruction set. It contains the following sections:

•  *T32 instruction set encoding* on page F3-3130.
•  *About the T32 Advanced SIMD and floating-point instructions and their encoding* on page F3-3196.

In this chapter:

•  In the decode tables, an entry of - for a field value means the value of the field does not affect the decoding.
•  In the decode diagrams, a shaded field indicates that the bits in that field are not used in that level of decode.
F3.1 T32 instruction set encoding

The T32 instruction stream is a sequence of halfword-aligned halfwords. Each T32 instruction is either a single 16-bit halfword in that stream, or a 32-bit instruction consisting of two consecutive halfwords in that stream.

If the value of bits[15:11] of the halfword being decoded is one of the following, the halfword is the first halfword of a 32-bit instruction:
- \(0b11101\).
- \(0b11110\).
- \(0b11111\).

Otherwise, the halfword is a 16-bit instruction.

The T32 instruction encoding is:

<table>
<thead>
<tr>
<th>15</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>0</th>
<th>15</th>
</tr>
</thead>
<tbody>
<tr>
<td>op0</td>
<td>op1</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table F3-1 Main encoding table for the T32 instruction set

<table>
<thead>
<tr>
<th>Decode fields</th>
<th>Decode group or instruction page</th>
</tr>
</thead>
<tbody>
<tr>
<td>op0 op1</td>
<td></td>
</tr>
<tr>
<td>(!=\ 111)</td>
<td>(16)-bit</td>
</tr>
<tr>
<td>(111) (00)</td>
<td>B - T2 variant</td>
</tr>
<tr>
<td>(111) (!=\ 00)</td>
<td>(32)-bit on page F3-3141</td>
</tr>
</tbody>
</table>

F3.1.1 16-bit

This section describes the encoding of the 16-bit group. The encodings in this section are decoded from T32 instruction set encoding.

\[
<table>
<thead>
<tr>
<th>15</th>
<th>10</th>
<th>9</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>op0</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
\]

This decode also imposes the constraint:
- \(op0<5:3> \neq 111\).

Table F3-2 Encoding table for the 16-bit group

#### Branch and exchange

This section describes the encoding of the Branch and exchange instruction class. The encodings in this section are decoded from Special data instructions and branch and exchange.

### Add, subtract, compare, move (two high registers)

This section describes the encoding of the Add, subtract, compare, move (two high registers) instruction class. The encodings in this section are decoded from Special data instructions and branch and exchange.
F3.1.4 Miscellaneous 16-bit instructions

This section describes the encoding of the Miscellaneous 16-bit instructions group. The encodings in this section are decoded from \textit{16-bit on page F3-3130}.

\begin{verbatim}
<table>
<thead>
<tr>

Exception generation

This section describes the encoding of the Exception generation instruction class. The encodings in this section are decoded from Conditional branch, and Supervisor Call.
This section describes the encoding of the 32-bit group. The encodings in this section are decoded from T32 instruction set encoding on page F3-3130.

This decode also imposes the constraint:

- \( \text{op0} < 3:2 \neq 00 \).
Load/store multiple

This section describes the encoding of the Load/store multiple instruction class. The encodings in this section are decoded from 32-bit on page F3-3141.

Advanced SIMD three registers of the same length extension

This section describes the encoding of the Advanced SIMD three registers of the same length extension instruction class. The encodings in this section are decoded from System register access, Advanced SIMD, and floating-point on page F3-3147.

Advanced SIMD two registers and a scalar extension

This section describes the encoding of the Advanced SIMD two registers and a scalar extension instruction class. The encodings in this section are decoded from System register access, Advanced SIMD, and floating-point on page F3-3147.
F3.1.8 System register load/store and 64-bit move

This section describes the encoding of the System register load/store and 64-bit move group. The encodings in this section are decoded from System register access, Advanced SIMD, and floating-point on page F3-3147.

This group has encodings in both the T32 and A32 instruction sets. For information about mappings between the encodings of this group, see About the T32 Advanced SIMD and floating-point instructions and their encoding on page F3-3196.

F3.1.9 Floating-point data-processing

This section describes the encoding of the Floating-point data-processing group. The encodings in this section are decoded from System register access, Advanced SIMD, and floating-point on page F3-3147.

This group has encodings in both the T32 and A32 instruction sets. For information about mappings between the encodings of this group, see About the T32 Advanced SIMD and floating-point instructions and their encoding on page F3-3196.

### Floating-point data-processing (two registers)

This section describes the encoding of the Floating-point data-processing (two registers) instruction class. The encodings in this section are decoded from Floating-point data-processing.

Advanced SIMD data-processing

This section describes the encoding of the Advanced SIMD data-processing group. The encodings in this section are decoded from 'System register access, Advanced SIMD, and floating-point on page F3-3147'.

This group has encodings in both the T32 and A32 instruction sets. For information about mappings between the encodings of this group, see 'About the T32 Advanced SIMD and floating-point instructions and their encoding on page F3-3196'.
This section describes the encoding of the Advanced SIMD three registers of the same length instruction class. The encodings in this section are decoded from Advanced SIMD data-processing on page F3-3155.

### Advanced SIMD three registers of the same length

F3.2 About the T32 Advanced SIMD and floating-point instructions and their encoding

The Advanced SIMD and floating-point instructions are common to the T32 and A32 instruction sets. These instructions perform Advanced SIMD and floating-point operations on a common register file, the SIMD&FP register file. This means:

- In general, the instructions that load or store registers in this file, or move data between general-purpose registers and this register file, are common to the Advanced SIMD and floating-point instructions.
- There are distinct Advanced SIMD data-processing instructions and floating-point data-processing instructions.

All T32 Advanced SIMD and floating-point instructions have 32-bit encodings. Different groups of these instructions are decoded from different points in the 32-bit T32 instruction decode structure. Table F3-23 shows these instruction groups, and where each group is decoded from the overall T32 decode structure:

<table>
<thead>
<tr>
<th>Advanced SIMD and floating-point instruction group</th>
<th>T32 decode is from</th>
</tr>
</thead>
<tbody>

Chapter F4
A32 Instruction Set Encoding

This chapter describes the encoding of the A32 instruction set. It contains the following sections:

• A32 instruction set encoding on page F4-3198.
• About the A32 Advanced SIMD and floating-point instructions and their encoding on page F4-3256.

In this chapter:

• In the decode tables, an entry of - for a field value means the value of the field does not affect the decoding.
• In the decode diagrams, a shaded field indicates that the bits in that field are not used in that level of decode.
F4.1 A32 instruction set encoding

The A32 instruction stream is a sequence of word-aligned words. Each A32 instruction is either a single 32-bit word in that stream.

Most A32 instructions can be conditional, with a condition determined by bits[31:28] of the instruction, the cond field. For more information see The Condition code field in A32 instruction encodings on page F2-3102. This applies to all instructions except those with the cond field equal to 0b111.

The behavior of an attempt to execute an unallocated instruction is described in UNDEFINED, UNPREDICTABLE, and CONSTRAINED UNPREDICTABLE instruction set space on page F2-3109.

For more information on A32 instruction encodings see Chapter F2 About the T32 and A32 Instruction Descriptions.

The A32 instruction encoding is:

```

Integer Data Processing (two register and immediate)

This section describes the encoding of the Integer Data Processing (two register and immediate) instruction class. The encodings in this section are decoded from Data-processing immediate.
Move Halfword (immediate)

This section describes the encoding of the Move Halfword (immediate) instruction class. The encodings in this section are decoded from Data-processing immediate on page F4-3211.

**Integer Test and Compare (one register and immediate)**

This section describes the encoding of the Integer Test and Compare (one register and immediate) instruction class. The encodings in this section are decoded from *Data-processing immediate* on page F4-3211.
Logical Arithmetic (two register and immediate)

This section describes the encoding of the Logical Arithmetic (two register and immediate) instruction class. The encodings in this section are decoded from Data-processing immediate on page F4-3211.

F4.1.8 Load/Store Word, Unsigned Byte (immediate, literal)

This section describes the encoding of the Load/Store Word, Unsigned Byte (immediate, literal) instruction class. The encodings in this section are decoded from A32 instruction set encoding on page F4-3198.
### F4.1.9 Load/Store Word, Unsigned Byte (register)

This section describes the encoding of the Load/Store Word, Unsigned Byte (register) instruction class. The encodings in this section are decoded from A32 instruction set encoding on page F4-3198.

Reverse Bit/Byte

This section describes the encoding of the Reverse Bit/Byte instruction class. The encodings in this section are decoded from Media instructions on page F4-3216.

Saturate 32-bit

This section describes the encoding of the Saturate 32-bit instruction class. The encodings in this section are decoded from Media instructions on page F4-3216.
Extend and Add

This section describes the encoding of the Extend and Add instruction class. The encodings in this section are decoded from Media instructions on page F4-3216.

Signed multiply, Divide

This section describes the encoding of the Signed multiply, Divide instruction class. The encodings in this section are decoded from Media instructions on page F4-3216.
Unsigned Sum of Absolute Differences

This section describes the encoding of the Unsigned Sum of Absolute Differences instruction class. The encodings in this section are decoded from Media instructions on page F4-3216.
**Bitfield Insert**

This section describes the encoding of the Bitfield Insert instruction class. The encodings in this section are decoded from Media instructions on page F4-3216.

```
| 31 | 28|27|26|25|24|23|22|21|20|19|16|15|12|11| 8 | 7 | 6 | 5 | 4 | 3 | 0 |

### F4.1.13 System register load/store and 64-bit move

This section describes the encoding of the System register load/store and 64-bit move group. The encodings in this section are decoded from System register access, Advanced SIMD, floating-point, and Supervisor call on page F4-3226.
This group has encodings in both the T32 and A32 instruction sets. For information about mappings between the encodings of this group, see About the A32 Advanced SIMD and floating-point instructions and their encoding on page F4-3256.

</table>
Floating-point extraction and insertion

This section describes the encoding of the Floating-point extraction and insertion instruction class. The encodings in this section are decoded from Floating-point data-processing on page F4-3230.

Floating-point directed convert to integer

This section describes the encoding of the Floating-point directed convert to integer instruction class. The encodings in this section are decoded from Floating-point data-processing on page F4-3230.
Floating-point data-processing (two registers)

This section describes the encoding of the Floating-point data-processing (two registers) instruction class. The encodings in this section are decoded from Floating-point data-processing on page F4-3230.

**F4.1.17 Advanced SIMD and floating-point 32-bit move**

This section describes the encoding of the Advanced SIMD and floating-point 32-bit move group. The encodings in this section are decoded from System register access, Advanced SIMD, floating-point, and Supervisor call on page F4-3226.

This group has encodings in both the T32 and A32 instruction sets. For information about mappings between the encodings of this group, see About the A32 Advanced SIMD and floating-point instructions and their encoding on page F4-3256.
Floating-point move special register

This section describes the encoding of the Floating-point move special register instruction class. The encodings in this section are decoded from Advanced SIMD and floating-point 32-bit move on page F4-3237.

Advanced SIMD 8/16/32-bit element move/duplicate

This section describes the encoding of the Advanced SIMD 8/16/32-bit element move/duplicate instruction class. The encodings in this section are decoded from Advanced SIMD and floating-point 32-bit move on page F4-3237.
F4.1.18   Unconditional instructions

This section describes the encoding of the Unconditional instructions group. The encodings in this section are decoded from ARM A32 instruction set encoding on page F4-3198.

```
<table>
<thead>
<tr>
<th>31</th>
<th>26 25 24</th>
<th>21 20 19</th>
<th>18 17 16</th>
<th>15 14 13</th>

</tr>
</tbody>
</table>
The behavior of the CONSTRAINED UNPREDICTABLE encodings in this table is described in CONSTRAINED UNPREDICTABLE behavior for A32 and T32 instruction encodings on page K1-6401.

Change Process State

This section describes the encoding of the Change Process State instruction class. The encodings in this section are decoded from Miscellaneous on page F4-3239.

```
[31 30 29 28|27 26 25 24|23 22 21 20|19 18 17 16|15 14 13 12|11 10 9 8 | 7 6 5 4 | 0 ]

Advanced SIMD data-processing

This section describes the encoding of the Advanced SIMD data-processing group. The encodings in this section are decoded from Unconditional instructions on page F4-3239.

This group has encodings in both the T32 and A32 instruction sets. For information about mappings between the encodings of this group, see About the A32 Advanced SIMD and floating-point instructions and their encoding on page F4-3256.
Advanced SIMD three registers of the same length

This section describes the encoding of the Advanced SIMD three registers of the same length instruction class. The encodings in this section are decoded from Advanced SIMD data-processing on page F4-3240.

F4.2 About the A32 Advanced SIMD and floating-point instructions and their encoding

The Advanced SIMD and floating-point instructions are common to the T32 and A32 instruction sets. These instructions perform Advanced SIMD and floating-point operations on a common register file, the SIMD&FP register file. This means:

• In general, the instructions that load or store registers in this file, or move data between general-purpose registers and this register file, are common to the Advanced SIMD and floating-point instructions.
• There are distinct Advanced SIMD data-processing instructions and floating-point data-processing instructions.

All A32 Advanced SIMD and floating-point instructions have 32-bit encodings. Different groups of these instructions are decoded from different points in the 32-bit A32 instruction decode structure. Table F4-24 shows these instruction groups, and where each group is decoded from the overall A32 decode structure:

<table>
<thead>
<tr>
<th>Advanced SIMD and floating-point instruction group</th>
<th>A32 decode is from</th>
</tr>
</thead>

</tbody>
</table>
This chapter describes each instruction. It contains the following sections:

- *Alphabetical list of T32 and A32 base instruction set instructions* on page F5-3258.
- *Encoding and use of banked register transfer instructions* on page F5-3928.
F5.1 Alphabetical list of T32 and A32 base instruction set instructions

This section lists every instruction in the T32 and A32 base instruction sets. For details of the format used see Format of instruction descriptions on page F2-3096.

This section is formatted so that each instruction description starts on a new page.
F5.1.1 ADC, ADCS (immediate)

Add with Carry (immediate) adds an immediate value and the Carry flag value to a register value, and writes the result to the destination register.

If the destination register is not the PC, the ADCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The ADC variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2983.
- The ADCS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-4646.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

ADC{<c>}{<q>} {<Rd>,} <Rn>, #<const>

ADCS variant

Applies when S == 1.
ADCS{<c>}{<q>} {<Rd>,} <Rn>, #<const>

**Decode for all variants of this encoding**

\[ d = \text{UInt}(Rd); \ n = \text{UInt}(Rn); \ \text{setflags} = (S == '1'); \ \text{imm32} = T32\text{ExpandImm}(i:imm3:imm8); \]
\[ \text{if} \ d == 15 || n == 15 \ \text{then UNPREDICTABLE; } // \text{ARMv8-A removes UNPREDICTABLE for R13} \]

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

**Assembler symbols**

- `<c>`
  - See Standard assembler syntax fields on page F2-3100.
- `<q>`
  - See Standard assembler syntax fields on page F2-3100.
- `<Rd>`
  - For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`. ARM deprecates using the PC as the destination register, but if the PC is used:
    - For the ADC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
    - For the ADCS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.
  - For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`.
- `<Rn>`
  - For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.
  - For encoding T1: is the general-purpose source register, encoded in the "Rn" field.
- `<const>`
  - For encoding A1: an immediate value. See Modified immediate constants in A32 instructions on page F2-3117 for the range of values.
  - For encoding T1: an immediate value. See Modified immediate constants in T32 instructions on page F2-3116 for the range of values.

**Operation for all encodings**

```python
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcv) = AddWithCarry(R[n], imm32, PSTATE.C);
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```
F5.1.2 ADC, ADCS (register)

Add with Carry (register) adds a register value, the Carry flag value, and an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the ADCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The ADC variant of the instruction is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
- The ADCS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See Illegal return events from AArch32 state on page G1-4646.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1

```
| 31 28|26 25 24|23 22 21 20|19 16|15 12|11 |  7 6 5 4 |3 0 |

\text{if} \ d = 15 \land n = 15 \land m = 15 \text{ then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13}
\]

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.
Assembler symbols

\(<c>\) See Standard assembler syntax fields on page F2-3100.

\(<q>\) See Standard assembler syntax fields on page F2-3100.

\(<Rdn>\) Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.

\(<Rd>\) For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as \(<Rn>\). ARM deprecates using the PC as the destination register, but if the PC is used:
- For the ADC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
- For the ADCS variant, the instruction performs an exception return, that restores PSTATE from SPSR_\(<current_mode>\).

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as \(<Rn>\).

\(<Rn>\) For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.

\(<Rm>\) For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

\(<\text{shift}>\) Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

- \(\text{LSL}\) when \(\text{type} = 00\)
- \(\text{LSR}\) when \(\text{type} = 01\)
- \(\text{ASR}\) when \(\text{type} = 10\)
- \(\text{ROR}\) when \(\text{type} = 11\)

\(<\text{amount}>\) For encoding A1: is the shift amount, in the range 1 to 31 (when \(<\text{shift}> = \text{LSL} \text{ or ROR}\) or 1 to 32 (when \(<\text{shift}> = \text{LSR} \text{ or ASR}\) encoded in the "imm5" field as \(<\text{amount}>\) modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when \(<\text{shift}> = \text{LSL} \text{ or ROR}\) or 1 to 32 (when \(<\text{shift}> = \text{LSR} \text{ or ASR}\), encoded in the "imm3:imm2" field as \(<\text{amount}>\) modulo 32.

In T32 assembly:
- Outside an IT block, if ADCS \(<\text{Rd}>, \ <\text{Rn}>, \ <\text{Rd}>\) has \(<\text{Rd}>\) and \(<\text{Rn}>\) both in the range R0-R7, it is assembled using encoding T1 as though ADCS \(<\text{Rd}>, \ <\text{Rn}>\) had been written.
- Inside an IT block, if ADC\(<\text{Rd}>, \ <\text{Rn}>, \ <\text{Rd}>\) has \(<\text{Rd}>\) and \(<\text{Rn}>\) both in the range R0-R7, it is assembled using encoding T1 as though ADC\(<\text{Rd}>, \ <\text{Rn}>\) had been written.

To prevent either of these happening, use the .W qualifier.

Operation for all encodings

if ConditionPassed() then
  EncodingSpecificOperations();
  shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
  (result, nzcv) = AddWithCarry(R[n], shifted, PSTATE.C);
  if d == 15 then // Can only occur for A32 encoding
    if setflags then
      ALUEExceptionReturn(result);
    else
      ALUWritePC(result);
else
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzcv;
F5.1.3 ADC, ADCS (register-shifted register)

Add with Carry (register-shifted register) adds a register value, the Carry flag value, and a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

**A1**

```
| 31 | 28|27 26 25 24|23 22 21 20|19 |16|15 | 8 | 7 | 6 | 5 | 4 | 3 | 0 |
|----|----|----------------|---------------|---|---|---|---|---|---|---|---|---|---|---|---|
| !=1111 | 0 | 0 | 0 | 1 | 0 | 1 | S | Rn | Rd | Rs | 0 | type | 1 | Rm |
```

**Flag setting variant**

Applies when \( S = 1 \).

`ADCS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>`

**Not flag setting variant**

Applies when \( S = 0 \).

`ADC{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>`

**Decode for all variants of this encoding**

\[
d = \text{UInt}(\text{Rd}); \quad n = \text{UInt}(\text{Rn}); \quad m = \text{UInt}(\text{Rm}); \quad s = \text{UInt}(\text{Rs}); \\
\text{setflags} = (S == '1'); \quad \text{shift}_t = \text{DecodeRegShift}(\text{type}); \\
\text{if } d == 15 || n == 15 || m == 15 || s == 15 \text{ then UNPREDICTABLE;}
\]

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

**Assembler symbols**

- `<c>` See Standard assembler syntax fields on page F2-3100.
- `<q>` See Standard assembler syntax fields on page F2-3100.
- `<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.
- `<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.
- `<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.
- `<type>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:
  - LSL when type = 00
  - LSR when type = 01
  - ASR when type = 10
  - ROR when type = 11
- `<Rs>` Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.
Operation

if ConditionPassed() then
   EncodingSpecificOperations();
   shift_n = UInt(R[s]<7:0>);
   shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
   (result, nzcv) = AddWithCarry(R[n], shifted, PSTATE.C);
   R[d] = result;
   if setflags then
      PSTATE.<N,Z,C,V> = nzcv;
F5.1.4 ADD, ADDS (immediate)

Add (immediate) adds an immediate value to a register value, and writes the result to the destination register.

If the destination register is not the PC, the ADDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The ADD variant of the instruction is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.

- The ADDS variant of the instruction performs an exception return without the use of the stack. ARM deprecates use of this instruction. However, in this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See Illegal return events from AArch32 state on page G1-4646.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

**Assembler symbols**

<e>
See Standard assembler syntax fields on page F2-3100.

<q>
See Standard assembler syntax fields on page F2-3100.

<Rdn>
Is the general-purpose source and destination register, encoded in the "Rdn" field.

<imm8>
Is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field.

<Rd>
For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. If the PC is used:
  • For the ADD variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
  • For the ADXS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. ARM deprecates use of this instruction.
For encoding T1, T3 and T4: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn>
For encoding A1 and T4: is the general-purpose source register, encoded in the "Rn" field. If the SP is used, see ADD, ADXS (SP plus immediate). If the PC is used, see ADR.
For encoding T1: is the general-purpose source register, encoded in the "Rn" field.
For encoding T3: is the general-purpose source register, encoded in the "Rn" field. If the SP is used, see ADD, ADXS (SP plus immediate).

<imm3>
Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "imm3" field.

<imm12>
Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.

<const>
For encoding A1: an immediate value. See Modified immediate constants in A32 instructions on page F2-3117 for the range of values.
For encoding T3: an immediate value. See Modified immediate constants in T32 instructions on page F2-3116 for the range of values.

When multiple encodings of the same length are available for an instruction, encoding T3 is preferred to encoding T4 (if encoding T4 is required, use the ADDW syntax). Encoding T1 is preferred to encoding T2 if <Rd> is specified and encoding T2 is preferred to encoding T1 if <Rd> is omitted.

**Operation for all encodings**

if CurrentInstrSet() == InstrSet_A32 then
  if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcv) = AddWithCarry(R[n], imm32, '0');
    if d == 15 then  // Can only occur for A32 encoding
      if setflags then
        ALUExceptionReturn(result);
      else

ALUWritePC(result);
else
  R[d] = result;
  if setflags then
    PSTATE.<N,Z,C,V> = nzcv;
else
  if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcv) = AddWithCarry(R[n], imm32, '0');
  R[d] = result;
  if setflags then
    PSTATE.<N,Z,C,V> = nzcv;
F5.1.5 ADD, ADDS (register)

Add (register) adds a register value and an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the ADDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The ADD variant of the instruction is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
- The ADDS variant of the instruction performs an exception return without the use of the stack. ARM deprecates use of this instruction. However, in this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See Illegal return events from AArch32 state on page G1-4646.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

(\text{shift}_t, \text{shift}_n) = \text{DecodeImmShift}(\text{type, imm3:imm2});
\]
\[
\text{if } (d == 15 \&\& \neg\text{setflags}) || n == 15 || m == 15 \text{ then UNPREDICTABLE;}
// ARMv8-A removes UNPREDICTABLE for R13
\]

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

**Assembler symbols**

- `<c>` See Standard assembler syntax fields on page F2-3100.
- `<c>` See Standard assembler syntax fields on page F2-3100.
- `<Rdn>` Is the general-purpose source and destination register, encoded in the "DN:Rdn" field. If the PC is used, the instruction is a branch to the address calculated by the operation. This is a simple branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.

The assembler language allows `<Rdn>` to be specified once or twice in the assembler syntax. When used inside an IT block, and `<Rdn>` and `<Rm>` are in the range R0 to R7, `<Rdn>` must be specified once so that encoding T2 is preferred to encoding T1. In all other cases there is no difference in behavior when `<Rdn>` is specified once or twice.

- `<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`. If the PC is used:
  - For the ADD variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
  - For the ADDS variant, the instruction performs an exception return, that restores PSTATE from SPSR._<current_mode>. ARM deprecates use of this instruction.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field.

When used inside an IT block, `<Rd>` must be specified. When used outside an IT block, `<Rd>` is optional, and:
  - If omitted, this register is the same as `<Rn>`.
  - If present, encoding T1 is preferred to encoding T2.

For encoding T3: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`.

- `<Rn>` For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used. If the SP is used, see ADD, ADDS (SP plus register).
For encoding T1: is the first general-purpose source register, encoded in the "Rn" field.
For encoding T3: is the first general-purpose source register, encoded in the "Rn" field. If the SP is used, see ADD, ADDS (SP plus register).

<\text{Rm}> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.
For encoding T1 and T3: is the second general-purpose source register, encoded in the "Rm" field. For encoding T2: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

<\text{shift}> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:
- LSL when type = 00
- LSR when type = 01
- ASR when type = 10
- ROR when type = 11

<\text{amount}> For encoding A1: is the shift amount, in the range 1 to 31 (when <\text{shift}> = LSL or ROR) or 1 to 32 (when <\text{shift}> = LSR or ASR) encoded in the "imm5" field as <\text{amount}> modulo 32.
For encoding T3: is the shift amount, in the range 1 to 31 (when <\text{shift}> = LSL or ROR) or 1 to 32 (when <\text{shift}> = LSR or ASR), encoded in the "imm3:imm2" field as <\text{amount}> modulo 32.

Inside an IT block, if ADD<\text{c}> <\text{Rd}>, <\text{Rn}>, <\text{Rd}> cannot be assembled using encoding T1, it is assembled using encoding T2 as though ADD<\text{c}> <\text{Rd}>, <\text{Rn}> had been written. To prevent this happening, use the .\text{W} qualifier.

**Operation for all encodings**

```assembly
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], shifted, '0');
    if d == 15 then
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
        end
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
    end
```

F5.1.6 ADD, ADDS (register-shifted register)

Add (register-shifted register) adds a register value and a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

**A1**

|       | 31 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 16 | 15 | 12 | 11 | 8 | 7 | 6 | 5 | 4 | 3 | 0 |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Cond  | 0  | 0  | 0  | 0  | 1  | 0  | 0  | S  | Rn | Rd | Rs | 0  | type | 1  | Rm |

**Flag setting variant**

Applies when \( S = 1 \).

\[
\text{ADDS}\{<c>\}{<q>\} \{<Rd>,\} <Rn>, <Rm>, \text{<type>} <Rs>
\]

**Not flag setting variant**

Applies when \( S = 0 \).

\[
\text{ADD}\{<c>\}{<q>\} \{<Rd>,\} <Rn>, <Rm>, \text{<type>} <Rs>
\]

**Decode for all variants of this encoding**

\[
\begin{align*}
d & = \text{UInt}(Rd); \\
n & = \text{UInt}(Rn); \\
m & = \text{UInt}(Rm); \\
s & = \text{UInt}(Rs); \\
\text{setflags} & = (S == '1'); \\
\text{shift_t} & = \text{DecodeRegShift(type)}; \\
\text{if } d == 15 | | n == 15 | | m == 15 | | s == 15 \text{ then UNPREDICTABLE;}
\end{align*}
\]

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

**Assembler symbols**

\(<c>\) See Standard assembler syntax fields on page F2-3100.

\(<q>\) See Standard assembler syntax fields on page F2-3100.

\(<Rd>\) Is the general-purpose destination register, encoded in the "Rd" field.

\(<Rn>\) Is the first general-purpose source register, encoded in the "Rn" field.

\(<Rm>\) Is the second general-purpose source register, encoded in the "Rm" field.

\(<\text{type}>\) Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

- LSL when \( \text{type} = 00 \)
- LSR when \( \text{type} = 01 \)
- ASR when \( \text{type} = 10 \)
- ROR when \( \text{type} = 11 \)

\(<Rs>\) Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.
Operation

if ConditionPassed() then
  EncodingSpecificOperations();
  shift_n = UInt(R[s]<7:0>);
  shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
  (result, nzcv) = AddWithCarry(R[n], shifted, '0');
  R[d] = result;
  if setflags then
    PSTATE.<N,Z,C,V> = nzcv;
F5.1.7   ADD, ADDS (SP plus immediate)

Add to SP (immediate) adds an immediate value to the SP value, and writes the result to the destination register.

If the destination register is not the PC, the ADDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. However, when the destination register is the PC:

- The ADD variant of the instruction is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
- The ADDS variant of the instruction performs an exception return without the use of the stack. ARM deprecates use of this instruction. However, in this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See Illegal return events from AArch32 state on page G1-4646.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K.1 *Architectural Constraints on UNPREDICTABLE behaviors.*
Assembler symbols

<
  See Standard assembler syntax fields on page F2-3100.

>
  See Standard assembler syntax fields on page F2-3100.

<imm7>
  Is the unsigned immediate, a multiple of 4, in the range 0 to 508, encoded in the “imm7” field as <imm7>/4.

<Rd>
  For encoding A1: is the general-purpose destination register, encoded in the ”Rd” field. If omitted, this register is the SP. ARM deprecates using the PC as the destination register, but if the PC is used:
  - For the ADD variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
  - For the ADDS variant, the instruction performs an exception return, that restores PSTATE from SPSR_ <current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the ”Rd” field.
For encoding T3 and T4: is the general-purpose destination register, encoded in the ”Rd” field. If omitted, this register is the SP.

<imm8>
  Is an unsigned immediate, a multiple of 4, in the range 0 to 1020, encoded in the ”imm8” field as <imm8>/4.

<imm12>
  Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the ”i:imm3:imm8” field.

<const>
  For encoding A1: an immediate value. See Modified immediate constants in A32 instructions on page F2-3117 for the range of values.
  For encoding T3: an immediate value. See Modified immediate constants in T32 instructions on page F2-3116 for the range of values.

Operation for all encodings

if ConditionPassed() then
  EncodingSpecificOperations();
  (result, nzcv) = AddWithCarry(SP, imm32, '0');
  if d == 15 then          // Can only occur for A32 encoding
    if setflags then
      ALUExceptionReturn(result);
    else
      ALUWritePC(result);
  else
    R[d] = result;
    if setflags then
      PSTATE.<N,Z,C,V> = nzcv;
F5.1.8 ADD, ADDS (SP plus register)

Add to SP (register) adds an optionally-shifted register value to the SP value, and writes the result to the destination register.

If the destination register is not the PC, the ADDS variant of the instruction updates the condition flags based on the result.

The field descriptions for \(<Rd>\) identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The ADD variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2983.
- The ADDS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-4646.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

<...> See Standard assembler syntax fields on page F2-3100.
<...> See Standard assembler syntax fields on page F2-3100.
<Rdm> Is the general-purpose destination and second source register, encoded in the "Rdm" field. If omitted, this register is the SP. ARM deprecates using the PC as the destination register, but if the PC is used, the instruction is a branch to the address calculated by the operation. This is a simple branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP. ARM deprecates using the PC as the destination register, but if the PC is used:
  • For the ADD variant, the instruction is a branch to the address calculated by the operation.
  • This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.

For encoding T3: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP.

<Rm> For encoding A1 and T2: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T3: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:
  LSL when type = 00
  LSR when type = 01
  ASR when type = 10
  ROR when type = 11

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T3: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.
Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(SP, shifted, '0');
    if d == 15 then
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
    else
F5.1.9 ADD (immediate, to PC)

Add to PC adds an immediate value to the Align(PC, 4) value to form a PC-relative address, and writes the result to the destination register. ARM recommends that, where possible, software avoids using this alias.

This instruction is a pseudo-instruction of the ADR instruction. This means that:

- The encodings in this description are named to match the encodings of ADR.
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of ADR gives the operational pseudocode for this instruction.

A1

```
| 31 | 28|27|26|25|24|23|22|21|20|19|18|17|16|15 | 12|11 | 0 |

**T3 variant**

ADDW{<c>}{<q>} <Rd>, PC, #<imm12> // <Rd>, <imm12> can be represented in T1

is equivalent to

ADR{<c>}{<q>} <Rd>, <label>

and is never the preferred disassembly.
ADD{<c>}{<q>} <Rd>, PC, #<imm12>

is equivalent to

ADR{<c>}{<q>} <Rd>, <label>

and is never the preferred disassembly.

Assembler symbols

- `<c>` See Standard assembler syntax fields on page F2-3100.
- `<q>` See Standard assembler syntax fields on page F2-3100.
- `<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If the PC is used, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
  
  For encoding T1 and T3: is the general-purpose destination register, encoded in the "Rd" field.
- `<label>` For encoding A1 and A2: the label of an instruction or literal data item whose address is to be loaded into <Rd>. The assembler calculates the required value of the offset from the Align(PC, 4) value of the ADR instruction to this label.
  
  If the offset is zero or positive, encoding A1 is used, with imm32 equal to the offset.
  
  If the offset is negative, encoding A2 is used, with imm32 equal to the size of the offset. That is, the use of encoding A2 indicates that the required offset is minus the value of imm32.
  
  Permitted values of the size of the offset are any of the constants described in Modified immediate constants in A32 instructions on page F2-3117.
  
  For encoding T1: the label of an instruction or literal data item whose address is to be loaded into <Rd>. The assembler calculates the required value of the offset from the Align(PC, 4) value of the ADR instruction to this label. Permitted values of the size of the offset are multiples of 4 in the range 0 to 1020.
  
  For encoding T2 and T3: the label of an instruction or literal data item whose address is to be loaded into <Rd>. The assembler calculates the required value of the offset from the Align(PC, 4) value of the ADR instruction to this label.
  
  If the offset is zero or positive, encoding T3 is used, with imm32 equal to the offset.
  
  If the offset is negative, encoding T2 is used, with imm32 equal to the size of the offset. That is, the use of encoding T2 indicates that the required offset is minus the value of imm32.
  
  Permitted values of the size of the offset are 0-4095.
- `<imm8>` Is an unsigned immediate, a multiple of 4, in the range 0 to 1020, encoded in the "imm8" field as <imm8>/4.
- `<imm12>` Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.
- `<const>` An immediate value. See Modified immediate constants in A32 instructions on page F2-3117 for the range of values.

Operation for all encodings

The description of ADR gives the operational pseudocode for this instruction.
F5.1.10   ADR

Form PC-relative address adds an immediate value to the PC value to form a PC-relative address, and writes the result to the destination register.

This instruction is used by the pseudo-instructions ADD (immediate, to PC) and SUB (immediate, from PC). The pseudo-instruction is never the preferred disassembly.

Assembler symbols

<e> See Standard assembler syntax fields on page F2-3100.
<q> See Standard assembler syntax fields on page F2-3100.
<Rd> For encoding A1 and A2: is the general-purpose destination register, encoded in the "Rd" field. If the PC is used, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.

For encoding T1, T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.
<label> For encoding A1 and A2: the label of an instruction or literal data item whose address is to be loaded into <Rd>. The assembler calculates the required value of the offset from the Align(PC, 4) value of the ADR instruction to this label.

If the offset is zero or positive, encoding A1 is used, with imm32 equal to the offset.

If the offset is negative, encoding A2 is used, with imm32 equal to the size of the offset. That is, the use of encoding A2 indicates that the required offset is minus the value of imm32.
Permitted values of the size of the offset are any of the constants described in *Modified immediate constants in A32 instructions on page F2-3117*.

For encoding T1: the label of an instruction or literal data item whose address is to be loaded into \(<Rd>\). The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the ADR instruction to this label. Permitted values of the size of the offset are multiples of 4 in the range 0 to 1020.

For encoding T2 and T3: the label of an instruction or literal data item whose address is to be loaded into \(<Rd>\). The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the ADR instruction to this label.

If the offset is zero or positive, encoding T3 is used, with `imm32` equal to the offset.

If the offset is negative, encoding T2 is used, with `imm32` equal to the size of the offset. That is, the use of encoding T2 indicates that the required offset is minus the value of `imm32`.

Permitted values of the size of the offset are 0-4095.

The instruction aliases permit the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see *Use of labels in UAL instruction syntax on page F1-3059*.

**Operation for all encodings**

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = if add then (Align(PC,4) + imm32) else (Align(PC,4) - imm32);
    if d == 15 then          // Can only occur for A32 encodings
        ALUWritePC(result);
    else
        R[d] = result;
```
F5.1.11 AND, ANDS (immediate)

Bitwise AND (immediate) performs a bitwise AND of a register value and an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the ANDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The AND variant of the instruction is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
- The ANDS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See Illegal return events from AArch32 state on page G1-4646.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

\]

**Notes for all encodings**

For more information about the CONstrained UNPREDICTABLE behavior, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.
Assembler symbols

<c>
See Standard assembler syntax fields on page F2-3100.

<q>
See Standard assembler syntax fields on page F2-3100.

<Rdn>
Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.

<Rd>
For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:
  • For the AND variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
  • For the ANDS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn>
For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.

<Rm>
For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

<shift>
Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

- LSL when type = 00
- LSR when type = 01
- ASR when type = 10
- ROR when type = 11

<amount>
For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

In T32 assembly:

- Outside an IT block, if ANDS <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though ANDS <Rd>, <Rn> had been written.
- Inside an IT block, if AND<q> <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though AND<q> <Rd>, <Rn> had been written.

To prevent either of these happening, use the .W qualifier.

Operation for all encodings

if ConditionPassed() then
  EncodingSpecificOperations();
  (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
  result = R[n] AND shifted;
  if d == 15 then  // Can only occur for A32 encoding
    if setflags then
      ALUExceptionReturn(result);
    else
      ALUWritePC(result);
else
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
F5.1.13 AND, ANDS (register-shifted register)

Bitwise AND (register-shifted register) performs a bitwise AND of a register value and a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

A1

| 31 | 28|27 26 25 24|23 22 21 20|19 16|15 | 8 | 7 | 6 | 5 | 4 | 3 | 0 |

    \text{if } d == 15 || n == 15 || m == 15 || s == 15 \text{ then UNPREDICTABLE;}
\end{align*}\]

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

\(<c>\) See Standard assembler syntax fields on page F2-3100.

\(<q>\) See Standard assembler syntax fields on page F2-3100.

\(<Rd>\) Is the general-purpose destination register, encoded in the "Rd" field.

\(<Rn>\) Is the first general-purpose source register, encoded in the "Rn" field.

\(<Rm>\) Is the second general-purpose source register, encoded in the "Rm" field.

\(<\text{type}>\) Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

- LSL when type = 00
- LSR when type = 01
- ASR when type = 10
- ROR when type = 11

\(<Rs>\) Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.
Operation

if ConditionPassed() then
  EncodingSpecificOperations();
  shift_n = UInt(R[s]<7:0>);
  (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
  result = R[n] AND shifted;
  R[d] = result;
  if setflags then
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result);
    PSTATE.C = carry;
    // PSTATE.V unchanged
F5.1.14 ASR (immediate)

Arithmetic Shift Right (immediate) shifts a register value right by an immediate number of bits, shifting in copies of its sign bit, and writes the result to the destination register.

This instruction is an alias of the MOV, MOVS (register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register).
- The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.

is equivalent to

MOV{<c>}{<q>} <Rd>, <Rm>, ASR #<imm>

and is always the preferred disassembly.

Assembler symbols

<c> See Standard assembler syntax fields on page F2-3100.

<q> See Standard assembler syntax fields on page F2-3100.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. ARM deprecates using the PC as the destination register, but if the PC is used, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.

For encoding T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.

<Rm> For encoding A1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T2 and T3: is the general-purpose source register, encoded in the "Rm" field.

<imm> For encoding A1 and T2: is the shift amount, in the range 1 to 32, encoded in the "imm5" field as <imm> modulo 32.

For encoding T3: is the shift amount, in the range 1 to 32, encoded in the "imm3:imm2" field as <imm> modulo 32.

Operation for all encodings

The description of MOV, MOVs (register) gives the operational pseudocode for this instruction.
F5.1.15 ASR (register)

Arithmetic Shift Right (register) shifts a register value right by a variable number of bits, shifting in copies of its sign bit, and writes the result to the destination register. The variable number of bits is read from the bottom byte of a register.

This instruction is an alias of the MOV, MOVS (register-shifted register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register-shifted register).
- The description of MOV, MOVS (register-shifted register) gives the operational pseudocode for this instruction.

- \(<_q>\) See *Standard assembler syntax fields* on page F2-3100.
- \(<Rdm>\) Is the first general-purpose source register and the destination register, encoded in the "Rdm" field.
- \(<Rd>\) Is the general-purpose destination register, encoded in the "Rd" field.
- \(<Rm>\) Is the first general-purpose source register, encoded in the "Rm" field.
- \(<Rs>\) Is the second general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

**Operation for all encodings**

The description of MOV, MOVS (register-shifted register) gives the operational pseudocode for this instruction.
F5.1.16 ASRS (immediate)

Arithmetic Shift Right, setting flags (immediate) shifts a register value right by an immediate number of bits, shifting in copies of its sign bit, and writes the result to the destination register.

If the destination register is not the PC, this instruction updates the condition flags based on the result.

The field descriptions for \(<Rd>\) identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
- The PE checks SPSR_<current_mode> for an illegal return event. See Illegal return events from AArch32 state on page G1-4646.
- The instruction is UNDEFINED in Hyp mode.
- The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

This instruction is an alias of the MOV, MOVS (register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register).
- The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.

• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The value in the destination register is UNKNOWN.
F5.1.21 BIC, BICS (immediate)

Bitwise Bit Clear (immediate) performs a bitwise AND of a register value and the complement of an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the BICS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The BIC variant of the instruction is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
- The BICS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See Illegal return events from AArch32 state on page G1-4646.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

#### Notes for all encodings

For more information about the **CONSTRAINED UNPREDICTABLE** behavior, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*. 
Assembler symbols

<c>
See Standard assembler syntax fields on page F2-3100.

<q>
See Standard assembler syntax fields on page F2-3100.

<Rdn>
Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.

<Rd>
For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the BIC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
- For the BICS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn>
For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.

<Rm>
For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

<shift>
Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

- LSL when type = 00
- LSR when type = 01
- ASR when type = 10
- ROR when type = 11

<amount>
For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] AND NOT(shifted);
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged

    // Other encodings

F5.1.23 BIC, BICS (register-shifted register)

Bitwise Bit Clear (register-shifted register) performs a bitwise AND of a register value and the complement of a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

A1

```
| 31 | 28|27 26 25 24|23 22 21 20|19 | 16|15 | 8 | 7 | 6 | 5 | 4 | 3 | 0 |
|----|----|---------|---------|----|----|----|----|----|----|----|----|----|----|----|----|
| !=111 | 0 | 0 | 0 | 1 | 1 | 0 | S | Rn | Rd | Rs | 0 | type | 1 | Rm |
```

**Flag setting variant**

Applies when \( S = 1 \).

\[
\text{BICS}{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
\]

**Not flag setting variant**

Applies when \( S = 0 \).

\[
\text{BIC}{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
\]

**Decode for all variants of this encoding**

\[
d = \text{UInt(Rd)}; \quad n = \text{UInt(Rn)}; \quad m = \text{UInt(Rm)}; \quad s = \text{UInt(Rs)};
\]

\[
\text{setflags} = (S == '1'); \quad \text{shift}_t = \text{DecodeRegShift(type)};
\]

```
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

**Assembler symbols**

- `<c>` See Standard assembler syntax fields on page F2-3100.
- `<q>` See Standard assembler syntax fields on page F2-3100.
- `<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.
- `<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.
- `<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.
- `<type>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:
  - LSL when type = 00
  - LSR when type = 01
  - ASR when type = 10
  - ROR when type = 11
- `<Rs>` Is the general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.
Operation

if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] AND NOT(shifted);
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
F5.1.24 BKPT

Breakpoint causes a Breakpoint Instruction exception.

Breakpoint is always unconditional, even when inside an IT block.

A1

| 31 28|27 26 25 24|23 22 21 20|19 | 8 | 7 6 5 4 3 0 |
| !=1111 0 0 0 1 0 0 1 0 |imm12| 0 1 1 1 |imm4|

cond

A1 variant

BKPT{<q>} {#}<imm>

Decode for this encoding

imm16 = imm12:imm4;
if cond ! = '1110' then UNPREDICTABLE; // BKPT must be encoded with AL condition

CONSTRAINED UNPREDICTABLE behavior

If cond != '1110', then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The instruction executes unconditionally.
• The instruction executes conditionally.

T1

| 15 14 13 12|11 10 9 8 | 7 | 0 |
| 1 0 1 1 1 1 0 |imm8|

T1 variant

BKPT{<q>} {#}<imm>

Decode for this encoding

imm16 = ZeroExtend(imm8, 16);

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

<q> See Standard assembler syntax fields on page F2-3100. An BKPT instruction must be unconditional.
For encoding A1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm12:imm4" field. This value:

- Is recorded in the Comment field of ESR_ELx.ISS if the Software Breakpoint Instruction exception is taken to an exception level that is using AArch64.
- Is ignored otherwise.

For encoding T1: is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field. This value:

- Is recorded in the Comment field of ESR_ELx.ISS if the Software Breakpoint Instruction exception is taken to an exception level that is using AArch64.
- Is ignored otherwise.

**Operation for all encodings**

encodingSpecificOperations();
AArch32.SoftwareBreakpoint(imm16);
F5.1.25  BL, BLX (immediate)

Branch with Link calls a subroutine at a PC-relative address, and setting LR to the return address.

Branch with Link and Exchange Instruction Sets (immediate) calls a subroutine at a PC-relative address, setting LR to the return address, and changes the instruction set from A32 to T32, or from T32 to A32.

\]
T2 variant

BLX{<c>}{<q>} <label>

Decode for this encoding

if $H == '1'$ then UNDEFINED;
$I1 = NOT(J1 EOR S); I2 = NOT(J2 EOR S); imm32 = SignExtend(S:I1:I2:imm10H:imm10L:'00', 32);
targetInstrSet = InstrSet_A32;
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

For encoding A1, T1 and T2: see Standard assembler syntax fields on page F2-3100.
For encoding A2: see Standard assembler syntax fields on page F2-3100. $<$c> must be AL or omitted.

For encoding A2: see Standard assembler syntax fields on page F2-3100.
For encoding A1: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the BL instruction to this label, then selects an encoding that sets $imm32$ to that offset.
Permitted offsets are multiples of 4 in the range –33554432 to 33554428.
For encoding A2: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the BLX instruction to this label, then selects an encoding with $imm32$ set to that offset.
Permitted offsets are even numbers in the range –33554432 to 33554430.
For encoding T1: the label of the instruction that is to be branched to.
The assembler calculates the required value of the offset from the PC value of the BL instruction to this label, then selects an encoding with $imm32$ set to that offset.
Permitted offsets are even numbers in the range –16777216 to 16777214.
For encoding T2: the label of the instruction that is to be branched to.
The assembler calculates the required value of the offset from the $Align(PC, 4)$ value of the BLX instruction to this label, then selects an encoding with $imm32$ set to that offset.
Permitted offsets are multiples of 4 in the range –16777216 to 16777212.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    if CurrentInstrSet() == InstrSet_A32 then
        LR = PC - 4;
    else
        LR = PC<31:1> : '1';
    if targetInstrSet == InstrSet_A32 then
        targetAddress = Align(PC,4) + imm32;
    else
        targetAddress = PC + imm32;
    SelectInstrSet(targetInstrSet);
    BranchWritePC(targetAddress);
F5.1.26  BLX (register)

Branch with Link and Exchange (register) calls a subroutine at an address specified in the register, and if necessary changes to the instruction set indicated by bit[0] of the register value. If the value in bit[0] is 0, the instruction set after the branch will be A32. If the value in bit[0] is 1, the instruction set after the branch will be T32.

```

T1 variant

CLREX{<c>}{<q>}

**Decode for this encoding**

// No additional decoding required

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

**Assembler symbols**

- `<c>`: For encoding A1: see Standard assembler syntax fields on page F2-3100. Must be AL or omitted.
  - For encoding T1: see Standard assembler syntax fields on page F2-3100.
- `<q>`: See Standard assembler syntax fields on page F2-3100.

**Operation for all encodings**

```
if ConditionPassed() then
  EncodingSpecificOperations();
  ClearExclusiveLocal(ProcessorID());
```
F5.1.31   CLZ

Count Leading Zeros returns the number of binary zero bits before the first binary one bit in a value.

A1

```
| 31 28 27 26 25 24 23 22 21 20 19 18 17 16 | 15 14 13 12 11 10 9 8 7 6 5 4 3 0 |
`-=`1111 0 0 0 1 0 1 1 0 (1)(1)(1)(1)   Rd (1)(1)(1)(1) 0 0 0 1    Rm

cond
```

A1 variant

CLZ{<c>}{<q>} <Rd>, <Rm>

Decode for this encoding

\[
d = \text{UInt}(Rd); \quad m = \text{UInt}(Rm);
\]
\[
\text{if} \quad d = 15 || m = 15 \text{ then UNPREDICTABLE;}
\]

T1

```
| 15 14 13 12 | 11 10 9 8 | 7 6 5 4 | 3  0 | 15 14 13 12 | 11 8 7 6 5 4 | 3 0 |
`-=`1 1 1 1 0 1 0 1 1    Rn 1 1 1 1    Rd 1 0 0 0    Rm
```

T1 variant

CLZ{<c>}{<q>} <Rd>, <Rm>

Decode for this encoding

\[
d = \text{UInt}(Rd); \quad m = \text{UInt}(Rm); \quad n = \text{UInt}(Rn);
\]
\[
\text{if} \quad m != n || d = 15 || m = 15 \text{ then UNPREDICTABLE; } // \text{ARMv8-A removes UNPREDICTABLE for R13}
\]

CONSTRAINED UNPREDICTABLE behavior

If \( m != n \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as described, with no change to its behavior and no additional side effects.
- The instruction executes with the additional decode: \( m = \text{UInt}(Rn); \).
- The value in the destination register is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

- \(<c>\) See Standard assembler syntax fields on page F2-3100.
- \(<q>\) See Standard assembler syntax fields on page F2-3100.
- \(<Rd>\) Is the general-purpose destination register, encoded in the "Rd" field.
<Rm> For encoding A1: is the general-purpose source register, encoded in the "Rm" field.
For encoding T1: is the general-purpose source register, encoded in the "Rm" field. It must be
encoded with an identical value in the "Rn" field.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    result = CountLeadingZeroBits(R[m]);
    R[d] = result<31:0>;
F5.1.32   CMN (immediate)

Compare Negative (immediate) adds a register value and an immediate value. It updates the condition flags based on the result, and discards the result.

**Assembler symbols**

- `<c>` See Standard assembler syntax fields on page F2-3100.
- `<q>` See Standard assembler syntax fields on page F2-3100.
- `<Rn>` For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.
  - For encoding T1 and T2: is the first general-purpose source register, encoded in the "Rn" field.
- `<Rm>` For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.
  - For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.
- `<shift>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:
  - LSL when type = 00
  - LSR when type = 01
  - ASR when type = 10
  - ROR when type = 11
- `<amount>` For encoding A1: is the shift amount, in the range 1 to 31 (when `<shift>` = LSL or ROR) or 1 to 32 (when `<shift>` = LSR or ASR) encoded in the "imm5" field as `<amount>` modulo 32.
  - For encoding T2: is the shift amount, in the range 1 to 31 (when `<shift>` = LSL or ROR) or 1 to 32 (when `<shift>` = LSR or ASR), encoded in the "imm3:imm2" field as `<amount>` modulo 32.

**Operation for all encodings**

if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], shifted, '0');
    PSTATE.<N,Z,C,V> = nzcv;}
F5.1.34   CMN (register-shifted register)

Compare Negative (register-shifted register) adds a register value and a register-shifted register value. It updates the condition flags based on the result, and discards the result.

A1

A1 variant

CMN{<c>}{<q>} <Rn>, <Rm>, <type> <Rs>

Decode for this encoding

n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
shift_t = DecodeRegShift(type);
if n == 15 || m == 15 || s == 15 then UNPREDICTABLE;

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

<

See Standard assembler syntax fields on page F2-3100.

>@

See Standard assembler syntax fields on page F2-3100.

<Rn>

Is the first general-purpose source register, encoded in the "Rn" field.

<Rm>

Is the second general-purpose source register, encoded in the "Rm" field.

<type>

Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

- LSL  when type = 00
- LSR  when type = 01
- ASR  when type = 10
- ROR  when type = 11

<Rs>

Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], shifted, '0');
    PSTATE.<N,Z,C,V> = nzcv;

F5.1.35  CMP (immediate)

Compare (immediate) subtracts an immediate value from a register value. It updates the condition flags based on the result, and discards the result.
