**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

**Assembler symbols**

\[
\text{<c> \hspace{0.5cm} See Standard assembler syntax fields on page F2-3100.}
\]
See Standard assembler syntax fields on page F2-3100.

For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For encoding T1: is a general-purpose source register, encoded in the "Rn" field.

For encoding T2: is the general-purpose source register, encoded in the "Rn" field.

<imm8> Is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field.

<const> For encoding A1: an immediate value. See Modified immediate constants in A32 instructions on page F2-3117 for the range of values.

For encoding T2: an immediate value. See Modified immediate constants in T32 instructions on page F2-3116 for the range of values.

Operation for all encodings

if ConditionPassed() then
  EncodingSpecificOperations();
  \( \text{result, nzc} = \text{AddWithCarry}(R[n], \text{NOT}(\text{imm32}), '1'); \)
  \( \text{PSTATE.<N,Z,C,V> = nzc}; \)
F5.1.36 CMP (register)

Compare (register) subtracts an optionally-shifted register value from a register value. It updates the condition flags based on the result, and discards the result.

Assembler symbols

<
See Standard assembler syntax fields on page F2-3100.

>
See Standard assembler syntax fields on page F2-3100.

<Rn>
For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.
For encoding T1 and T3: is the first general-purpose source register, encoded in the "Rn" field.
For encoding T2: is the first general-purpose source register, encoded in the "N:Rn" field.

<Rm>
For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.
For encoding T1, T2 and T3: is the second general-purpose source register, encoded in the "Rm" field.

<shift>
Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

\[
\begin{align*}
\text{LSL} & \quad \text{when type} = 00
\end{align*}
\]
LSR when type = 01
ASR when type = 10
ROR when type = 11

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T3: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

**Operation for all encodings**

if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[n], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], NOT(shifted), '1');
    PSTATE.<N,Z,C,V> = nzcv;
F5.1.37   **CMP (register-shifted register)**

Compare (register-shifted register) subtracts a register-shifted register value from a register value. It updates the condition flags based on the result, and discards the result.

**A1**

```
|31|28|27|26|25|24|23|22|21|20|19|16|15|14|13|12|11| 8 | 7 | 6 | 5 | 4 | 3 | 0 |
| !=1111 | 0 | 0 | 0 | 1 | 0 | 1 | 1 | Rn | 0 | 0 | 0 | Rs | 0 | type | 1 | Rm |
```

**A1 variant**

`CMP{<c>}{<q>}{<Rn>}, {<Rm>}, {<type>}{<Rs>}`

**Decode for this encoding**

```
n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
shift_t = DecodeRegShift(type);
if n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

**Assembler symbols**

- `<c>` See *Standard assembler syntax fields* on page F2-3100.
- `<q>` See *Standard assembler syntax fields* on page F2-3100.
- `<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.
- `<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.
- `<type>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:
  - LSL when type = 00
  - LSR when type = 01
  - ASR when type = 10
  - ROR when type = 11
- `<Rs>` Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

**Operation**

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], NOT(shifted), '1');
    PSTATE.<N,Z,C,V> = nzcv;
```
F5.1.38 CPS, CPSID, CPSIE

Change PE State changes one or more of the PSTATE {A, I, F} interrupt mask bits and, optionally, the PSTATE.M mode field, without changing any other PSTATE bits.

CPS is treated as NOP if executed in User mode unless it is defined as being CONSTRAINED UNPREDICTABLE elsewhere in this section.

The PE checks whether the value being written to PSTATE.M is legal. See Illegal changes to PSTATE.M on page G1-4618.

- The instruction executes as NOP.
- The instruction behaves as if imod<1> == '0'.
- The instruction behaves as if A:I:F has an UNKNOWN nonzero value.

If imod<1> == '0' & A:I:F != '000', then one of the following behaviors must occur:
- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction behaves as if imod<1> == '1'.
- The instruction behaves as if A:I:F == '000'.

**Notes for all encodings**

Hint instructions: In encoding T2, if the imod field is 00 and the M bit is 0, a hint instruction is encoded. To determine which hint instruction, see *Branches and miscellaneous control on page F3-3172.*

For more information about the CONstrained UNPREDICTABLE behavior of this instruction, see *Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.*

**Assembler symbols**

<q> See *Standard assembler syntax fields on page F2-3100.*

<iflags> Is a sequence of one or more of the following, specifying which interrupt mask bits are affected:
- a Sets the A bit in the instruction, causing the specified effect on PSTATE.A, the SError interrupt mask bit.
- i Sets the I bit in the instruction, causing the specified effect on PSTATE.I, the IRQ interrupt mask bit.
- f Sets the F bit in the instruction, causing the specified effect on PSTATE.F, the FIQ interrupt mask bit.

<mode> Is the number of the mode to change to, in the range 0 to 31, encoded in the "mode" field.

**Operation for all encodings**

if CurrentInstrSet() == InstrSet_A32 then
  EncodingSpecificOperations();
if PSTATE.EL != EL0 then
  if enable then
    if affectA then PSTATE.A = '0';
    if affectI then PSTATE.I = '0';

         if affectF then PSTATE.F = '1';
      if changemode then
         // AArch32.WriteModeByInstr() sets PSTATE.IL to 1 if this is an illegal mode change.
         AArch32.WriteModeByInstr(mode);
F5.1.39   CRC32

CRC32 performs a cyclic redundancy check (CRC) calculation on a value held in a general-purpose register. It takes an input CRC value in the first source operand, performs a CRC on the input value in the second source operand, and returns the output CRC value. The second source operand can be 8, 16, or 32 bits. To align with common usage, the bit order of the values is reversed as part of the operation, and the polynomial 0x04C11DB7 is used for the CRC calculation.

In ARMv8-A, this is an optional instruction, and in ARMv8.1 it is mandatory for all implementations to implement it.

Note

ID_ISAR5.CRC32 indicates whether this instruction is supported in the T32 and A32 instruction sets.

    EncodingSpecificOperations();

    acc = R[n];               // accumulator
    val = R[m]<size-1:0>;     // input value
    poly = (if crc32c then 0x1EDC6F41 else 0x04C11DB7)<31:0>;
    tempacc = BitReverse(acc):Zeros(size);
    tempval = BitReverse(val):Zeros(32);
    // Poly32Mod2 on a bitstring does a polynomial Modulus over {0,1} operation
    R[d] = BitReverse(Poly32Mod2(tempacc EOR tempval, poly));
### F5.1.40 CRC32C

CRC32C performs a cyclic redundancy check (CRC) calculation on a value held in a general-purpose register. It takes an input CRC value in the first source operand, performs a CRC on the input value in the second source operand, and returns the output CRC value. The second source operand can be 8, 16, or 32 bits. To align with common usage, the bit order of the values is reversed as part of the operation, and the polynomial \(0x1EDC6F41\) is used for the CRC calculation.

In ARMv8-A, this is an optional instruction, and in ARMv8.1 it is mandatory for all implementations to implement it.

---

**Note**

ID_ISAR5.CRC32 indicates whether this instruction is supported in the T32 and A32 instruction sets.

---

// DBG executes as a NOP. The 'option' field is ignored

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

<=> See Standard assembler syntax fields on page F2-3100.

<q> See Standard assembler syntax fields on page F2-3100.

<option> Is a 4-bit unsigned immediate, in the range 0 to 15, encoded in the "option" field.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
F5.1.42   DCPS1, DCPS2, DCPS3

DCPSx, Debug Change PE State to ELx, where x is 1, 2, or 3.

When executed in Debug state, the target Exception level of the instruction is:

• Elx, if the instruction is executed at an Exception level lower than Elx.
• Otherwise, the Exception level at which the instruction is executed.

On executing a DCPSx instruction in Debug state when the instruction is not UNDEFINED:

• If the instruction is executed at an Exception level that is lower than the target Exception level the PE enters the target Exception level, Elx, and:
  — If Elx is using AArch64, the PE selects SP_ELx.
  — If the target Exception level is EL1 using AArch32 the PE enters Supervisor mode.
  — If the instruction was executed in Non-secure state and the target Exception level is EL2 using AArch32 the PE enters Hyp mode.
  — If the target Exception level is EL3 using AArch32 the PE enters Supervisor mode and SCR.NS is set to 0.

• Otherwise, there is no change to the Exception level and:
  — If the instruction was executed at EL1 the PE enters Supervisor mode.
  — If the instruction was executed at EL2 the PE remains in Hyp mode.
  — If the instruction was a DCPS1 instruction executed at EL3 the PE enters Supervisor mode and SCR.NS is set to 0.
  — If the instruction was a DCPS3 instruction executed at EL3 the PE enters Monitor mode and SCR.NS is set to 0.

These instructions are always UNDEFINED in Non-debug state.

DCPS1 is UNDEFINED at EL0 in Non-secure state if either:

• EL2 is implemented and using AArch64 and HCR_EL2.TGE == 1.
• EL2 is implemented and using AArch32 and HCR.TGE == 1.

DCPS2 is UNDEFINED at all Exception levels if EL2 is not implemented.

DCPS2 is UNDEFINED in the following states if EL2 is implemented:

• At EL0 and EL1 in Secure state.
• At EL3 if EL3 is using AArch32.

DCPS3 is UNDEFINED at all Exception levels if either:

• EDSCR.SDD == 1.
• EL3 is not implemented.

On executing a DCPSx instruction that is not UNDEFINED and targets ELx:

• If Elx is using AArch64:
  — ELR_ELx, SPSR_ELx, and ESR_ELx become UNKNOWN.
  — DLR_EL0 and DSPSR_EL0 become UNKNOWN.

• If Elx is using AArch32 DLR and DSPSR become UNKNOWN and:
  — If the target Exception level is EL1 or EL3, the LR and SPSR of the target PE mode become UNKNOWN.
  — If the target Exception level is EL2, then ELR_hyp, SPSR_hyp, and HSR become UNKNOWN.
For more information on the operation of these instructions, see DCPS\textsubscript{n} on page H2-5724.

ISH  Inner Shareable is the required shareability domain, reads and writes are the required access types, both before and after the barrier instruction. Encoded as option = 0b1011.

ISHST Inner Shareable is the required shareability domain, writes are the required access type, both before and after the barrier instruction. Encoded as option = 0b1010.

ISHLD Inner Shareable is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as option = 0b1001.

NSH  Non-shareable is the required shareability domain, reads and writes are the required access, both before and after the barrier instruction. Encoded as option = 0b0111.

NSHST Non-shareable is the required shareability domain, writes are the required access type, both before and after the barrier instruction. Encoded as option = 0b0110.

NSHLD Non-shareable is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as option = 0b0101.

OSH  Outer Shareable is the required shareability domain, reads and writes are the required access types, both before and after the barrier instruction. Encoded as option = 0b0011.

OSHST Outer Shareable is the required shareability domain, writes are the required access type, both before and after the barrier instruction. Encoded as option = 0b0010.

OSHLD Outer Shareable is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as option = 0b0001.

For more information on whether an access is before or after a barrier instruction, see Data Memory Barrier (DMB) on page E2-3018. All other encodings of option are reserved. It is IMPLEMENTATION DEFINED whether options other than SY are implemented. All unsupported and reserved options must execute as a full system DMB operation, but software must not rely on this behavior.

Note

The instruction supports the following alternative <option> values, but ARM recommends that software does not use these alternative values:
- SH as an alias for ISH.
- SHST as an alias for ISHST.
- UN as an alias for NSH.
- UNST as an alias for NSHST.

Operation for all encodings

domain = MBRegDomain_OuterShareable;
if HCR.BSU == '01' && domain == MBRegDomain_Nonshareable then
domain = MBRegDomain_InnerShareable;

DataSynchronizationBarrier(domain, types);
F5.1.45   EOR, EORS (immediate)

Bitwise Exclusive OR (immediate) performs a bitwise Exclusive OR of a register value and an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the EORS variant of the instruction updates the condition flags based on the result.

The field descriptions for \(<Rd>\) identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The EOR variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2983.
- The EORS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-4646.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

```

*Notes for all encodings*

For more information about the CONstrained UNPREDICTABLE behavior, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

*Assembler symbols*

- `<>` See Standard assembler syntax fields on page F2-3100.
- `<q>` See Standard assembler syntax fields on page F2-3100.
- `<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`. ARM deprecates using the PC as the destination register, but if the PC is used:
  - For the EOR variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
  - For the EORS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<_current_mode>.
- `<Rn>` For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.
  - For encoding T1: is the general-purpose source register, encoded in the "Rn" field.
- `<const>` For encoding A1: an immediate value. See Modified immediate constants in A32 instructions on page F2-3117 for the range of values.
  - For encoding T1: an immediate value. See Modified immediate constants in T32 instructions on page F2-3116 for the range of values.

*Operation for all encodings*

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations();
    result = R[n] EOR imm32;
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

---

EORS{<c>}{<q>} {<Rd>,} <Rn>, #<const>

*Decode for all variants of this encoding*

```plaintext
if Rd == '1111' & S == '1' then SEE "TEQ (immediate)";
d = UInt(Rd); n = UInt(Rn); setflags = (S == '1');
(imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
if (d == 15 & !setflags) || n == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

*Notes for all encodings*

For more information about the CONstrained UNPREDICTABLE behavior, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

*Operation for all encodings*

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations();
    result = R[n] EOR imm32;
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```
**F5.1.46 EOR, EORS (register)**

Bitwise Exclusive OR (register) performs a bitwise Exclusive OR of a register value and an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the EORS variant of the instruction updates the condition flags based on the result.

The field descriptions for \(<Rd>\) identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The EOR variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.*
- The EORS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state on page G1-4646.*
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

// ARMv8-A removes UNPREDICTABLE for R13

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.
Assembler symbols

<c> See Standard assembler syntax fields on page F2-3100.

<q> See Standard assembler syntax fields on page F2-3100.

<Rdn> Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the EOR variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
- For the EORS variant, the instruction performs an exception return, that restores PSTATE from SPSR_ <current_mode>.

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.

<Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:
- LSL  when type = 00
- LSR  when type = 01
- ASR  when type = 10
- ROR  when type = 11

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

In T32 assembly:

- Outside an IT block, if EORS <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though EORS <Rd>, <Rn> had been written.
- Inside an IT block, if EOR<c> <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though EOR<c> <Rd>, <Rn> had been written.

To prevent either of these happening, use the .W qualifier.

Operation for all encodings

if ConditionPassed() then
  EncodingSpecificOperations();
  (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
  result = R[n] EOR shifted;
  if d == 15 then          // Can only occur for A32 encoding
    if setflags then
      ALUExceptionReturn(result);
    else
      ALUWritePC(result);

In T32 assembly:

- Outside an IT block, if EORS <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though EORS <Rd>, <Rn> had been written.
- Inside an IT block, if EOR<c> <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though EOR<c> <Rd>, <Rn> had been written.

To prevent either of these happening, use the .W qualifier.
else
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
F5.1.47   EOR, EORS (register-shifted register)

Bitwise Exclusive OR (register-shifted register) performs a bitwise Exclusive OR of a register value and a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

A1

```
!111  0  0  0  0  0  1  S  Rn  Rd  Rs  0  type  1  Rm
```

Flag setting variant

Applies when $S = 1$.

EORS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>

Not flag setting variant

Applies when $S = 0$.

EOR{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>

Decode for all variants of this encoding

\[
d = \text{UInt}(Rd); \quad n = \text{UInt}(Rn); \quad m = \text{UInt}(Rm); \quad s = \text{UInt}(Rs);
\]

\[
\text{setflags} = (S == '1'); \quad \text{shift}_t = \text{DecodeRegShift}(\text{type});
\]

\[
\text{if } d == 15 \quad || \quad n == 15 \quad || \quad m == 15 \quad || \quad s == 15 \quad \text{then UNPREDICTABLE;}
\]

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

- `<c>` See Standard assembler syntax fields on page F2-3100.
- `<q>` See Standard assembler syntax fields on page F2-3100.
- `<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.
- `<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.
- `<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.
- `<type>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:
  - LSL when type = 00
  - LSR when type = 01
  - ASR when type = 10
  - ROR when type = 11
- `<Rs>` Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.
Operation

if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] EOR shifted;
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
F5.1.48   ERET

Exception Return.

The PE branches to the address held in the register holding the preferred return address, and restores PSTATE from SPSR_<current_mode>.

The register holding the preferred return address is:

- ELR_hyp, when executing in Hyp mode.
- LR, when executing in a mode other than Hyp mode, User mode, or System mode.

The PE checks SPSR_<current_mode> for an illegal return event. See Illegal return events from AArch32 state on page G1-4646.

Exception Return is CONSTRAINED UNPREDICTABLE in User mode and System mode.

In Debug state, the T1 encoding of ERET executes the DRPS operation.

**Assembler symbols**

<q> See *Standard assembler syntax fields* on page F2-3100. An HLT instruction must be unconditional.

<imm> For encoding A1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm12:imm4" field. This value is for assembly and disassembly only. It is ignored by the PE, but can be used by a debugger to store more information about the halting breakpoint.
For encoding T1: is a 6-bit unsigned immediate, in the range 0 to 63, encoded in the "imm6" field. This value is for assembly and disassembly only. It is ignored by the PE, but can be used by a debugger to store more information about the halting breakpoint.

**Operation for all encodings**

```c
EncodingSpecificOperations();
Halt(DebugHalt_HaltInstruction);
```
HVC

Hypervisor Call causes a Hypervisor Call exception. For more information see Hypervisor Call (HVC) exception on page G1-4668. Non-secure software executing at EL1 can use this instruction to call the hypervisor to request a service.

The HVC instruction is:

- UNDEFINED in Secure state, and in User mode in Non-secure state.
- When SCR.HCE is set to 0, UNDEFINED in Non-secure EL1 modes and CONSTRAINED UNPREDICTABLE in Hyp mode.

On executing an HVC instruction, the HSR reports the exception as a Hypervisor Call exception, using the EC value 0x12, and captures the value of the immediate argument, see Use of the HSR on page G4-4958.

imm16 = imm4:imm12;
if InITBlock() then UNPREDICTABLE;
Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

<q> See Standard assembler syntax fields on page F2-3100. An HVC instruction must be unconditional.

<imm16> For encoding A1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm12:imm4" field. This value is for assembly and disassembly only. It is reported in the HSR but otherwise is ignored by hardware. An HVC handler might interpret imm16, for example to determine the required service.

For encoding T1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:imm12" field. This value is for assembly and disassembly only. It is reported in the HSR but otherwise is ignored by hardware. An HVC handler might interpret imm16, for example to determine the required service.

Operation for all encodings

EncodingSpecificOperations();
if !HaveEL(EL2) || PSTATE.EL == EL0 || IsSecure() then
  UNDEFINED;

if HaveEL(EL3) then
  if ELUsingAArch32(EL3) && SCR.HCE == '0' && PSTATE.EL == EL2 then
    UNPREDICTABLE;
  else
    hvc_enable = SCR_GEN[].HCE;
  else
    hvc_enable = if ELUsingAArch32(EL2) then NOT(HCR.HCD) else NOT(HCR_EL2.HCD);

if hvc_enable == '0' then
  UNDEFINED;
else
  AArch32.CallHypervisor(imm16);

CONSTRAINED UNPREDICTABLE behavior

If ELUsingAArch32(EL3) && SCR.HCE == '0' && PSTATE.EL == EL2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
F5.1.52 ISB

Instruction Synchronization Barrier flushes the pipeline in the PE and is a context synchronization event. For more information, see Instruction Synchronization Barrier (ISB) on page E2-3018.

Assembler symbols

%c For encoding A1: see Standard assembler syntax fields on page F2-3100. Must be AL or omitted.
For encoding T1: see Standard assembler syntax fields on page F2-3100.

%q See Standard assembler syntax fields on page F2-3100.

<option> Specifies an optional limitation on the barrier operation. Values are:
SY Full system barrier operation, encoded as option = 0b1111. Can be omitted.
All other encodings of option are reserved. The corresponding instructions execute as full system barrier operations, but must not be relied upon by software.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    InstructionSynchronizationBarrier();
F5.1.53   IT

If-Then makes up to four following instructions (the IT block) conditional. The conditions for the instructions in the IT block are the same as, or the inverse of, the condition the IT instruction specifies for the first instruction in the block.

The IT instruction itself does not affect the condition flags, but the execution of the instructions in the IT block can change the condition flags.

16-bit instructions in the IT block, other than CMP, CMN and TST, do not set the condition flags. An IT instruction with the AL condition can change the behavior without conditional execution.

The architecture permits exception return to an instruction in the IT block only if the restoration of the CPSR restores ITSTATE to a state consistent with the conditions specified by the IT instruction. Any other exception return to an instruction in an IT block is UNPREDICTABLE. Any branch to a target instruction in an IT block is not permitted, and if such a branch is made it is UNPREDICTABLE what condition is used when executing that target instruction and any subsequent instruction in the IT block.

Many uses of the IT instruction are deprecated for performance reasons, and an implementation might include ITD controls that can disable those uses of IT, making them UNDEFINED.

For more information see Conditional execution on page F2-3101 and Conditional instructions on page F1-3059. The first of these sections includes more information about the ITD controls.

<table>
<thead>
<tr>
<th>15 14 13 12</th>
<th>11 10 9 8</th>
<th>7 4 3 0</th>
</tr>
</thead>
</table>
|1 0 1 1 1 | firstcond ...

T1 variant

IT{(<>{(<>{<z>}}){<q>}} <cond>

Decode for this encoding

if mask == '0000' then SEE "Related encodings";
if firstcond == '1111' || (firstcond == '1110' && BitCount(mask) != 1) then UNPREDICTABLE;
if InITBlock() then UNPREDICTABLE;

CONSTRUED UNPREDICTABLE behavior

If firstcond == '1111' || (firstcond == '1110' && BitCount(mask) != 1), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The '1111' condition is treated as being the same as the '1110' condition, meaning always, and the ITSTATE state machine is progressed in the same way as for any other cond_base value.

Notes for all encodings

For more information about the CONSTRUED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Related encodings: Miscellaneous 16-bit instructions on page F3-3137.
Assembler symbols

<\(\times\)> The condition for the second instruction in the IT block. If omitted, the "mask" field is set to \(0b1000\). If present it is encoded in the "mask[3]" field:
- \(T\)  firstcond[0]
- \(E\)  NOT firstcond[0]

<\(\gamma\)> The condition for the third instruction in the IT block. If omitted and <\(\times\)> is present, the "mask[2:0]" field is set to \(0b100\). If <\(\gamma\)> is present it is encoded in the "mask[2]" field:
- \(T\)  firstcond[0]
- \(E\)  NOT firstcond[0]

<\(\zeta\)> The condition for the fourth instruction in the IT block. If omitted and <\(\gamma\)> is present, the "mask[1:0]" field is set to \(0b10\). If <\(\zeta\)> is present, the "mask[0]" field is set to 1, and it is encoded in the "mask[1]" field:
- \(T\)  firstcond[0]
- \(E\)  NOT firstcond[0]

<\(\varphi\)> See Standard assembler syntax fields on page F2-3100.

<\(\kappa\)> The condition for the first instruction in the IT block, encoded in the "firstcond" field. See Table F2-1 on page F2-3101 for the range of conditions available, and the encodings.

The conditions specified in an IT instruction must match those specified in the syntax of the instructions in its IT block. When assembling to A32 code, assemblers check IT instruction syntax for validity but do not generate assembled instructions for them. See Conditional instructions on page F1-3059.

Operation

```assembly
EncodingSpecificOperations();
AArch32.CheckITEnabled(mask);
PSTATE.IT<7:0> = firstcond:mask;
```

F5.1.61   LDC (immediate)

Load data to System register (immediate) calculates an address from a base register value and an immediate offset, loads a word from memory, and writes it to the DBGDTRTXint System register. It can use offset, post-indexed, pre-indexed, or unindexed addressing. For information about memory accesses see Memory accesses on page F2-3106.

In an implementation that includes EL2, the permitted LDC access to DBGDTRTXint can be trapped to Hyp mode, meaning that an attempt to execute an LDC instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see Trapping general Non-secure System register accesses to debug registers on page G1-4727.

For simplicity, the LDC pseudocode does not show this possible trap to Hyp mode.

Decode for this encoding

if P == '0' && U == '0' && W == '0' then UNDEFINED;
index = (P == '1'); add = (U == '1'); cp = 14; imm32 = ZeroExtend(imm8:'00', 32);
if W == '1' || (P == '0' && CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;

CONstrained UNPREDICTABLE behavior

If W == '1' || P == '0', then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The instruction executes without writeback of the base address.
• The instruction executes as LDC (immediate) with writeback to the PC. The instruction is handled as described in Using R15 on page K1-6391.

Assembler symbols

<> See Standard assembler syntax fields on page F2-3100.
<q> See Standard assembler syntax fields on page F2-3100.
<option> Is an 8-bit immediate, in the range 0 to 255 enclosed in { }, encoded in the "imm8" field. The value of this field is ignored when executing this instruction.
<label> The label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. Permitted values of the offset are multiples of 4 in the range -1020 to 1020.
If the offset is zero or positive, imm32 is equal to the offset and add == TRUE (encoded as U == 1).
If the offset is negative, imm32 is equal to minus the offset and add == FALSE (encoded as U == 0).
<+/-> Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when U = 0
+ when U = 1
<imm> Is the immediate offset used for forming the address, a multiple of 4 in the range 0-1020, defaulting to 0 and encoded in the "imm8" field, as <imm>/4.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see Use of labels in UAL instruction syntax on page F1-3059.

Operation for all encodings

if ConditionPassed() then
  EncodingSpecificOperations();
  AArch32.CheckSystemAccess(cp, ThisInstr());
  offset_addr = if add then (Align(PC,4) + imm32) else (Align(PC,4) - imm32);
  address = if index then offset_addr else Align(PC,4);
  // System register write to DBGDRTRXint.
  DBGDRTR_EL0[] = MemA[address,4];
F5.1.63   LDM, LDMIA, LDMFD

Load Multiple (Increment After, Full Descending) loads multiple registers from consecutive memory locations using an address from a base register. The consecutive memory locations start at this address, and the address just above the highest of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also Encoding of lists of general-purpose registers and the PC on page F2-3107.

ARMv8.2 permits the deprecation of some Load Multiple ordering behaviors in AArch32 state, for more information see ARMv8.2-LSMAOC. The registers loaded can include the PC, causing a branch to a loaded address. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983. Related system instructions are LDM (User registers) and LDM (exception return).

This instruction is used by the alias POP (multiple registers). See Alias conditions on page F5-3400 for details of when each alias is preferred.

\[ \text{if wback && registers<n> == '1' then UNPREDICTABLE; } \]

**CONSTRANDED UNPREDICTABLE behavior**

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

If wback && registers<n> == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

if registers<\n> == '1' then UNPREDICTABLE;

if registers<\n> == '1' \&\& InITBlock() \&\& !LastInITBlock() then UNPREDICTABLE;

**CONSTRAINED UNPREDICTABLE behavior**

If \(\text{BitCount}(\text{registers}) < 1\), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.
If `wback && registers<n> == '1'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

If \( \text{BitCount}(\text{registers}) = 1 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction loads a single register using the specified addressing modes.
- The instruction executes as LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

If `registers<13> == '1'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode, but R13 is UNKNOWN.

If `P == '1' && M == '1'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction loads the register list and either R14 or R15, both R14 and R15, or neither of these registers.

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

### Alias conditions

<table>

<td>W == '1' &amp;&amp; Rn == '1101' &amp;&amp; BitCount(register_list) &gt; 1</td>
<td></td>
</tr>
</tbody>
</table>

### Assembler symbols

- **IA**
  - Is an optional suffix for the Increment After form.

- **<>**
  - See Standard assembler syntax fields on page F2-3100.

- **<op>**
  - See Standard assembler syntax fields on page F2-3100.

- **<Rn>**
  - Is the general-purpose base register, encoded in the "Rn" field.

- **!**
  - For encoding A1 and T2: the address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.
For encoding T1: the address adjusted by the size of the data loaded is written back to the base register. It is omitted if <Rn> is included in <registers>, otherwise it must be present.

<registers> For encoding A1: is a list of one or more registers to be loaded, separated by commas and surrounded by { and }.
The PC can be in the list.
ARM deprecates using these instructions with both the LR and the PC in the list.
For encoding T1: is a list of one or more registers to be loaded, separated by commas and surrounded by { and }.
The registers in the list must be in the range R0-R7, encoded in the "register_list" field.
For encoding T2: is a list of one or more registers to be loaded, separated by commas and surrounded by { and }.
The registers in the list must be in the range R0-R12, encoded in the "register_list" field,
and can optionally contain one of the LR or the PC. If the LR is in the list, the "M" field is set to 1,
otherwise it defaults to 0. If the PC is in the list, the "P" field is set to 1, otherwise it defaults to 0.
If the PC is in the list:
- The LR must not be in the list.
- The instruction must be either outside any IT block, or the last instruction in an IT block.

Operation for all encodings

if ConditionPassed() then
  EncodingSpecificOperations();
  for i = 0 to 14
    if registers<i> == '1' then
      R[i] = MemA[address,4];  address = address + 4;
    if registers<15> == '1' then
      LoadWritePC(MemA[address,4]);
    if wback && registers<n> == '0' then R[n] = R[n] + 4*BitCount(registers);
    if wback && registers<n> == '1' then R[n] = bits(32) UNKNOWN;
F5.1.64   LDM (exception return)

Load Multiple (exception return) loads multiple registers from consecutive memory locations using an address from a base register. The SPSR of the current mode is copied to the CPSR. An address adjusted by the size of the data loaded can optionally be written back to the base register.

The registers loaded include the PC. The word loaded for the PC is treated as an address and a branch occurs to that address.

Load Multiple (exception return) is:

- UNDEFINED in Hyp mode.
- UNPREDICTABLE in debug state, and in User mode and System mode.

A1

A1 variant

LDM{<amode>}{<c>}{<q>} <Rn>{!}, <registers_with_pc>^  

Decode for this encoding

n = UInt(Rn);  registers = register_list;  
wbback = (W == '1');  increment = (U == '1');  wordhigher = (P == U);  
if n == 15 then UNPREDICTABLE;  
if wbback && registers<n> == '1' then UNPREDICTABLE;  

CONSTRAINED UNPREDICTABLE behavior

If wbback & registers<n> == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all the loads using the specified addressing mode and the content of the register being written back is UNKNOWN. In addition, if an exception occurs during the execution of this instruction, the base address might be corrupted so that the instruction cannot be repeated.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

<amode> is one of:

DA  Decrement After. The consecutive memory addresses end at the address in the base register. Encoded as P = 0, U = 0.

FA  Full Ascending. For this instruction, a synonym for DA.

DB  Decrement Before. The consecutive memory addresses end one word below the address in the base register. Encoded as P = 1, U = 0.

EA  Empty Ascending. For this instruction, a synonym for DB.
IA
Increment After. The consecutive memory addresses start at the address in the base register. This is the default. Encoded as P = 0, U = 1.

FD
Full Descending. For this instruction, a synonym for IA.

IB
Increment Before. The consecutive memory addresses start one word above the address in the base register. Encoded as P = 1, U = 1.

ED
Empty Descending. For this instruction, a synonym for IB.

<e>
See Standard assembler syntax fields on page F2-3100.

<q>
See Standard assembler syntax fields on page F2-3100.

<Rn>
Is the general-purpose base register, encoded in the "Rn" field.

!
The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.

<registers_with_pc> Is a list of one or more registers, separated by commas and surrounded by { and }. It specifies the set of registers to be loaded. The registers are loaded with the lowest-numbered register from the lowest memory address, through to the highest-numbered register from the highest memory address. The PC must be specified in the register list, and the instruction causes a branch to the address (data) loaded into the PC. See also Encoding of lists of general-purpose registers and the PC on page F2-3107.

Instructions with similar syntax but without the PC included in the registers list are described in LDM (User registers).

Operation
if ConditionPassed() then
  EncodingSpecificOperations();
  if PSTATE.EL == EL2 then
    UNDEFINED;
  elseif PSTATE.M IN {M32_User,M32_System} then
    UNPREDICTABLE;  // UNDEFINED or NOP
  else
    length = 4*BitCount(registers) + 4;
    address = if increment then R[n] else R[n]-length;
    if wordhigher then address = address+4;
    for i = 0 to 14
      if registers<i> == '1' then
        R[i] = MemA[address,4]; address = address + 4;
        new_pc_value = MemA[address,4];
      if wback && registers<n> == '0' then R[n] = if increment then R[n]+length else R[n]-length;
      if wback && registers<n> == '1' then R[n] = bits(32) UNKNOWN;
      AArch32.ExceptionReturn(new_pc_value, SPSR[]);

CONstrained Unpredictable behavior
If PSTATE.M IN {M32_User,M32_System}, then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
F5.1.65 LDM (User registers)

In an EL1 mode other than System mode, Load Multiple (User registers) loads multiple User mode registers from consecutive memory locations using an address from a base register. The registers loaded cannot include the PC. The PE reads the base register value normally, using the current mode to determine the correct Banked version of the register. This instruction cannot writeback to the base register.

Load Multiple (User registers) is UNDEFINED in Hyp mode, and UNPREDICTABLE in User and System modes.

ARMv8.2 permits the deprecation of some Load Multiple ordering behaviors in AArch32 state, for more information see ARMv8.2-LSMAOC.

A1

![LDM (User registers) assembly instruction](image)

A1 variant

LDM{<amode>}{<c>}{<q>} <Rn>, <registers_without_pc>^

Decode for this encoding

\[
n = \text{UInt}(Rn); \quad \text{registers} = \text{register_list}; \quad \text{increment} = (U == '1'); \quad \text{wordhigher} = (P == U);
\]

\[
\text{if } n == 15 || \text{BitCount(registers)} < 1 \text{ then UNPREDICTABLE};
\]

CONstrained UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as an LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

Notes for all encodings

For more information about the CONstrained UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

<amode> is one of:

- DA: Decrement After. The consecutive memory addresses end at the address in the base register. Encoded as P = 0, U = 0.
- FA: Full Ascending. For this instruction, a synonym for DA.
- DB: Decrement Before. The consecutive memory addresses end one word below the address in the base register. Encoded as P = 1, U = 0.
- EA: Empty Ascending. For this instruction, a synonym for DB.
- IA: Increment After. The consecutive memory addresses start at the address in the base register. This is the default. Encoded as P = 0, U = 1.
- FD: Full Descending. For this instruction, a synonym for IA.
- IB: Increment Before. The consecutive memory addresses start one word above the address in the base register. Encoded as P = 1, U = 1.
ED    Empty Descending. For this instruction, a synonym for IB.

See Standard assembler syntax fields on page F2-3100.

<q>    See Standard assembler syntax fields on page F2-3100.

<Rn>   Is the general-purpose base register, encoded in the "Rn" field.

<registers_without_pc>
Is a list of one or more registers, separated by commas and surrounded by { and }. It specifies the set of registers to be loaded by the LDM instruction. The registers are loaded with the lowest-numbered register from the lowest memory address, through to the highest-numbered register from the highest memory address. The PC must not be in the register list. See also Encoding of lists of general-purpose registers and the PC on page F2-3107.

Instructions with similar syntax but with the PC included in <registers_without_pc> are described in LDM (exception return).

Operation
if ConditionPassed() then
   EncodingSpecificOperations();
   if PSTATE.EL == EL2 then UNDEFINED;
   elseif PSTATE.M IN {M32_User, M32_System} then UNPREDICTABLE;
   else
      length = 4*BitCount(registers);
      address = if increment then R[n] else R[n]-length;
      if wordhigher then address = address+4;
      for i = 0 to 14
         if registers<i> == '1' then  // Load User mode register
            Rmode[i, M32_User] = MemA[address,4];  address = address + 4;

CONSTRANED UNPREDICTABLE behavior
If PSTATE.M IN {M32_User, M32_System}, then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The instruction operates as an LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.
F5.1.66   LDMDA, LDMFA

Load Multiple Decrement After (Full Ascending) loads multiple registers from consecutive memory locations using
an address from a base register. The consecutive memory locations end at this address, and the address just below
the lowest of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register
from the highest memory address. See also Encoding of lists of general-purpose registers and the PC on page F2-3107.

ARMv8.2 permits the deprecation of some Load Multiple ordering behaviors in AArch32 state, for more
information see ARMv8.2-LSMAOC. The registers loaded can include the PC, causing a branch to a loaded
address. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose
registers and the PC on page E1-2983. Related system instructions are LDM (User registers) and LDM (exception
return).

LDMEA{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Empty Ascending stack

Decode for this encoding

n = UInt(Rn);  registers = P:M:register_list;  wback = (W == '1');
if n == 15 || BitCount(registers) < 2 || (P == '1' && M == '1') then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
if registers<13> == '1' then UNPREDICTABLE;
if registers<15> == '1' && InITBlock() && !LastInITBlock() then UNPREDICTABLE;

CONSTRANDED UNPREDICTABLE behavior

If wback && registers<n> == '1', then one of the following behaviors must occur:
• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

If BitCount(registers) < 1, then one of the following behaviors must occur:
• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The instruction executes as LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

If BitCount(registers) == 1, then one of the following behaviors must occur:
• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The instruction loads a single register using the specified addressing modes.
• The instruction executes as LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

If registers<13> == '1', then one of the following behaviors must occur:
• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The instruction performs all of the loads using the specified addressing mode, but R13 is UNKNOWN.

If P == ‘1’ && M == ‘1’, then one of the following behaviors must occur:
• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The instruction loads the register list and either R14 or R15, both R14 and R15, or neither of these registers.

Notes for all encodings

For more information about the CONSTRANDED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.
Assembler symbols

<c>
See Standard assembler syntax fields on page F2-3100.

<q>
See Standard assembler syntax fields on page F2-3100.

<Rn>
Is the general-purpose base register, encoded in the "Rn" field.

! The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.

<registers>
For encoding A1: is a list of one or more registers to be loaded, separated by commas and surrounded by { and }.

The PC can be in the list.

ARM deprecates using these instructions with both the LR and the PC in the list.

For encoding T1: is a list of one or more registers to be loaded, separated by commas and surrounded by { and }.

The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain one of the LR or the PC. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0. If the PC is in the list, the "P" field is set to 1, otherwise it defaults to 0.

If the PC is in the list:

• The LR must not be in the list.
• The instruction must be either outside any IT block, or the last instruction in an IT block.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] - 4*BitCount(registers);
    for i = 0 to 14
        if registers<i> == '1' then
            R[i] = MemA[address,4];  address = address + 4;
    if registers<15> == '1' then
        LoadWritePC(MemA[address,4]);
    if wback && registers<n> == '0' then R[n] = R[n] - 4*BitCount(registers);
    if wback && registers<n> == '1' then R[n] = bits(32) UNKNOWN;
F5.1.68 LDMIB, LDMED

Load Multiple Increment Before (Empty Descending) loads multiple registers from consecutive memory locations using an address from a base register. The consecutive memory locations start just above this address, and the address of the last of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also Encoding of lists of general-purpose registers and the PC on page F2-3107.

ARMv8.2 permits the deprecation of some Load Multiple ordering behaviors in AArch32 state, for more information see ARMv8.2-LSMAOC. The registers loaded can include the PC, causing a branch to a loaded address. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983. Related system instructions are LDM (User registers) and LDM (exception return).

**Offset variant**

Applies when \(P == 1 && U == 0 && W == 0\).

LDR{<c>}{<q>} <Rt>, [<Rn> {, {-<imm>}}]

**Post-indexed variant**

Applies when \(P == 0 && W == 1\).

LDR{<c>}{<q>} <Rt>, [<Rn>], #{+/-/<imm>
Pre-indexed variant

Applies when \( P = 1 \) \&\& \( W = 1 \).

\[
\text{LDR}\{\langle c \rangle}\{\langle q \rangle\} <\text{Rt}>, [<\text{Rn}>, \{\#\langle +/- \rangle\langle \text{imm} \}]!
\]

Decode for all variants of this encoding

- if \( \text{Rn} = '1111' \) then SEE "LDR (literal)";
- if \( P = '1' \) \&\& \( U = '1' \) \&\& \( W = '0' \) then SEE "LDRT";
- if \( P = '0' \) \&\& \( W = '0' \) then UNDEFINED;
- \( t = \text{UInt}(\text{Rt}); \ n = \text{UInt}(\text{Rn}); \)
- \( \text{imm32} = \text{ZeroExtend}(\text{imm8}, 32); \ index = (P = '1'); \ add = (U = '1'); \ wback = (W = '1'); \)
- if \( \text{wback} \&\& n = t \) || (\( t = 15 \) \&\& \( \text{InITBlock}() \) \&\& \( \text{LastInITBlock}() \)) then UNPREDICTABLE;

CONstrained UNPREDICTABLE behavior

If \( \text{wback} \&\& n = t \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

Notes for all encodings

For more information about the CONstrained UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

</table>

Assembler symbols

\( <\langle c \rangle > \) See Standard assembler syntax fields on page F2-3100.

\( <\langle q \rangle > \) See Standard assembler syntax fields on page F2-3100.

\( <\langle Rt \rangle > \) For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.

For encoding T1 and T2: is the general-purpose register to be transferred, encoded in the "Rt" field.

For encoding T3 and T4: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, provided the instruction is either outside an IT block or the last instruction of an IT block. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.

\( <\langle Rn \rangle > \) For encoding A1, T3 and T4: is the general-purpose base register, encoded in the "Rn" field. For PC use see LDR (literal).

For encoding T1: is the general-purpose base register, encoded in the "Rn" field.
+-
Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when U = 0
+ when U = 1
+
Specifies the offset is added to the base register.

<imm>
For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.
For encoding T1: is the optional positive unsigned immediate byte offset, a multiple of 4, in the range 0 to 124, defaulting to 0 and encoded in the "imm5" field as <imm>/4.
For encoding T2: is the optional positive unsigned immediate byte offset, a multiple of 4, in the range 0 to 1020, defaulting to 0 and encoded in the "imm8" field as <imm>/4.
For encoding T3: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.
For encoding T4: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

Operation for all encodings

  else
    UNPREDICTABLE;
else
  R[t] = data;
F5.1.70 LDR (literal)

Load Register (literal) calculates an address from the PC value and an immediate offset, loads a word from memory, and writes it to a register. For information about memory accesses see Memory accesses on page F2-3106.

A1

\[
\begin{array}{cccccccccc}
| & | & | & | & | & | & | & | & | \\
| & | & | & | & | & | & | & |
\end{array}
\]

A1 variant

Applies when \(!\left( P = 0 \land W = 1 \right)\).

LDR{<c>}{<q>} <Rt>, <label> // Normal form
LDR{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative form

Decode for this encoding

if \( P = '0' \land W = '1' \) then \( \text{SEE "LDRT";} \)
\( t = \text{ UInt}(Rt); \) \( \text{imm32} = \text{ZeroExtend}(\text{imm12}, \text{32}); \)
\( \text{add} = (U == '1'); \) \( w\text{back} = (P == '0') \lor (W == '1'); \)
if \( w\text{back} \) then UNPREDICTABLE;

CONstrained UNPREDICTABLE behavior

If \( w\text{back} \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: \( w\text{back} = \text{FALSE}; \)
- The instruction treats bit[24] as the P bit, and bit[21] as the writeback (W) bit, and uses the same addressing mode as described in LDR (immediate). The instruction uses post-indexed addressing when \( P == '0' \) and uses pre-indexed addressing otherwise. The instruction is handled as described in Using R15 on page K1-6391.

T1

\[
\begin{array}{cccccccccc}
| & | & | & | & | & | & | & | \\
| & | & | & | & | & | & | & |
\end{array}
\]

T1 variant

Decode for this encoding

\( t = \text{ UInt}(Rt); \) \( \text{imm32} = \text{ZeroExtend}(\text{imm8:'00'}, \text{32}); \) \( \text{add} = \text{TRUE}; \)

T2

\[
\begin{array}{cccccccccc}
| & | & | & | & | & | & | | \\
| & | & | & | & | | | | |
\end{array}
\]
T2 variant

LDR{<c>}.W <Rt>, <label> // Preferred syntax, and <Rt>, <label> can be represented in T1
LDR{<c>{<p> <Rt>, <label> // Preferred syntax
LDR{<c>{<p> <Rt>, [PC, #{+/-}<imm>] // Alternative syntax

Decode for this encoding

t = UInt(Rt);  imm32 = ZeroExtend(imm12, 32);  add = (U == '1');
if t == 15 && InITBlock() && !LastInITBlock() then UNPREDICTABLE;

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

<c> See Standard assembler syntax fields on page F2-3100.
<p> See Standard assembler syntax fields on page F2-3100.
<Rt> For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
For encoding T1: is the general-purpose register to be transferred, encoded in the "Rt" field.
For encoding T2: is the general-purpose register to be transferred, encoded in the "Rt" field. The SP can be used. The PC can be used, provided the instruction is either outside an IT block or the last instruction of an IT block. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
<label> For encoding A1 and T2: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the Align(\(PC, 4\)) value of the instruction to this label. Permitted values of the offset are -4095 to 4095.
If the offset is zero or positive, imm32 is equal to the offset and add == TRUE, encoded as \(U == 1\).
If the offset is negative, imm32 is equal to minus the offset and add == FALSE, encoded as \(U == 0\).
For encoding T1: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the Align(\(PC, 4\)) value of the instruction to this label. Permitted values of the offset are Multiples of four in the range 0 to 1020.
+/\- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when \(U == 0\)
+ when \(U == 1\)
<imm> For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.
For encoding T2: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see Use of labels in UAL instruction syntax on page F1-3059.
Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    base = Align(PC,4);
    address = if add then (base + imm32) else (base - imm32);
    data = MemU[address,4];
    if t == 15 then
        if address<1:0> == '00' then
            LoadWritePC(data);
        else
            UNPREDICTABLE;
    else
        R[t] = data;
### F5.1.71 LDR (register)

Load Register (register) calculates an address from a base register value and an offset register value, loads a word from memory, and writes it to a register. The offset register value can optionally be shifted. For information about memory accesses, see *Memory accesses* on page F2-3106.

The T32 form of LDR (register) does not support register writeback.

#### A1

\text{index} = (P == '1'); \quad \text{add} = (U == '1'); \quad \text{wback} = (W == '1');
\]

// ARMv8-A removes UNPREDICTABLE for R13
CONstrained UNPREDICTABLE behavior

If \( \text{wback} \land n = t \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

- `<c>` See Standard assembler syntax fields on page F2-3100.
- `<q>` See Standard assembler syntax fields on page F2-3100.
- `<Rt>` Is the general-purpose register to be transferred, encoded in the "Rt" field.
- `<Rn>` For encoding A1, T2 and T3: is the general-purpose base register, encoded in the "Rn" field. For PC use see LDRB (literal).
  For encoding T1: is the general-purpose base register, encoded in the "Rn" field.
- `+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
  - \(+\) when \( U = 0 \)
  - \(-\) when \( U = 1 \)
  + Specifies the offset is added to the base register.
- `<imm>` For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.
  For encoding T1: is an optional 5-bit unsigned immediate byte offset, in the range 0 to 31, defaulting to 0 and encoded in the "imm5" field.
  For encoding T2: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.
  For encoding T3: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

Operation for all encodings

```c
if CurrentInstrSet() == InstrSet_A32 then
  if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    R[t] = ZeroExtend(MemU[address,1], 32);
    if wback then R[n] = offset_addr;
  else
    if ConditionPassed() then
      EncodingSpecificOperations();
      offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
      address = if index then offset_addr else R[n];
      R[t] = ZeroExtend(MemU[address,1], 32);
      if wback then R[n] = offset_addr;
```
F5.1.73   LDRB (literal)

Load Register Byte (literal) calculates an address from the PC value and an immediate offset, loads a byte from memory, zero-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see Memory accesses on page F2-3106.

A1

```
| 31  28|27  26  25  24|23  22  21  20|19  18  17  16|15  12||11 0 | 0 | P | U | W | 1 | 1 | 1 | 1 | Rt | imm12 |

cond
```

A1 variant

Applies when !(P == 0 && W == 1).

LDRB{<c>}{<q>} <Rt>, <label>  // Normal form
LDRB{<c>}{<q>} <Rt>, [PC, #{+/-}imm]  // Alternative form

Decode for this encoding

if P == '0' && W == '1' then SEE "LDRBT";

```
t = UInt(Rt);  imm32 = ZeroExtend(imm12, 32);
add = (U == '1');  wback = (P == '0') || (W == '1');
if t == 15 || wback then UNPREDICTABLE;
```

CONSTRANDED UNPREDICTABLE behavior

If wback, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: wback = FALSE.
- The instruction treats bit[24] as the P bit, and bit[21] as the writeback (W) bit, and uses the same addressing mode as described in LDRB (immediate). The instruction uses post-indexed addressing when P == '0' and uses pre-indexed addressing otherwise. The instruction is handled as described in Using R15 on page K1-6391.

T1

```
| 15 14 13|12|11 10 9 |8|7 6 5 4|3 2 1 0|15 12||11 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 0 | imm12 |

Rt
```

T1 variant

LDRB{<c>}{<q>} <Rt>, <label>  // Preferred syntax
LDRB{<c>}{<q>} <Rt>, [PC, #{+/-}imm]  // Alternative syntax

Decode for this encoding

if Rt == '1111' then SEE "PLD";

```
t = UInt(Rt);  imm32 = ZeroExtend(imm12, 32);  add = (U == '1');
// ARMv8-A removes UNPREDICTABLE for R13
```
Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

- `<c>` See Standard assembler syntax fields on page F2-3100.
- `<q>` See Standard assembler syntax fields on page F2-3100.
- `<Rt>` Is the general-purpose register to be transferred, encoded in the "Rt" field.
- `<label>` The label of the literal data item that is to be loaded into `<Rt>`. The assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. Permitted values of the offset are -4095 to 4095.
  - If the offset is zero or positive, `imm32` is equal to the offset and `add == TRUE`, encoded as `U == 1`.
  - If the offset is negative, `imm32` is equal to minus the offset and `add == FALSE`, encoded as `U == 0`.
- `+/` Specifies the offset is added to or subtracted from the base register, defaulting to `+` if omitted and encoded in the "U" field. It can have the following values:
  - `-` when `U = 0`
  - `+` when `U = 1`
- `<imm>` For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.
  - For encoding T1: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see Use of labels in UAL instruction syntax on page F1-3059.

Operation for all encodings

```assembly
if ConditionPassed() then
    EncodingSpecificOperations();
    base = Align(PC, 4);
    address = if add then (base + imm32) else (base - imm32);
    R[t] = ZeroExtend(MemU[address, 1], 32);
```

...
F5.1.74   LDRB (register)

Load Register Byte (register) calculates an address from a base register value and an offset register value, loads a byte from memory, zero-extends it to form a 32-bit word, and writes it to a register. The offset register value can optionally be shifted. For information about memory accesses see Memory accesses on page F2-3106.

A1

Offset variant

Applies when \( P == 1 && W == 0 \).

LDRB{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]}

Post-indexed variant

Applies when \( P == 0 && W == 0 \).

LDRB{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}

Pre-indexed variant

Applies when \( P == 1 && W == 1 \).

LDRB{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift}>]!

Decode for all variants of this encoding

if \( P == '0' && W == '1' \) then SEE "LDRBT";

\[ t = \text{UInt}(Rt); \ n = \text{UInt}(Rn); \ m = \text{UInt}(Rm); \]

\[ \text{index} = (P == '1'); \ \text{add} = (U == '1'); \ \text{wback} = (P == '0') \ || \ (W == '1'); \]

\[ (\text{shift}, \text{shift}_n) = \text{DecodeImmShift(type, imm5);} \]

if \( t == 15 \ || \ m == 15 \) then UNPREDICTABLE;

if wback && \( n == t \) then UNPREDICTABLE;

CONstrained UNPREDICTABLE behavior

If \( wback && n == t \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

\(<c>\)  See Standard assembler syntax fields on page F2-3100.
\(<q>\)  See Standard assembler syntax fields on page F2-3100.
\(<Rt>\)  Is the general-purpose register to be transferred, encoded in the "Rt" field.
\(<Rn>\)  For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant.
For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.
\(+/\)  Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when \(U = 0\)
+ when \(U = 1\)
\(<Rm>\)  Is the general-purpose index register, encoded in the "Rm" field.
\(<\text{shift}>\)  The shift to apply to the value read from \(<Rm>\). If absent, no shift is applied. Otherwise, see Shifts applied to a register on page F2-3104.
\(<\text{imm}>\)  If present, the size of the left shift to apply to the value from \(<Rm>\), in the range 1-3. \(<\text{imm}>\) is encoded in imm2. If absent, no shift is specified and imm2 is encoded as \(0b00\).
Operation for all encodings

if `ConditionPassed()` then
    EncodingSpecificOperations();
    offset = `Shift(R[m], shift_t, shift_n, PSTATE.C)`;
    offset_addr = if add then `R[n] + offset` else `R[n] - offset`;
    address = if index then offset_addr else `R[n]`;
    `R[t] = ZeroExtend(MemU[address,1],32)`;
    if `wback` then `R[n] = offset_addr`;
F5.1.75 LDRBT

Load Register Byte Unprivileged loads a byte from memory, zero-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see Memory accesses on page F2-3106.

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

LDRBT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or an optionally-shifted register value.

A1

| [31] | 28|27 26 25 24|23 22 21 20|19 | 16|15 | 12|11 | | | 0 |
|---|---|---|---|---|---|---|---|---|---|---|

cond

A1 variant

LDRBT{{<c>}}{<q>} <Rt>, [Rn] {, #{+/-}<imm>}

Decode for this encoding

t = UInt(Rt); n = UInt(Rn); postindex = TRUE; add = (U == '1');
register_form = FALSE; imm32 = ZeroExtend(imm12, 32);
if t == 15 || n == 15 || n == t then UNPREDICTABLE;

CONSTRANGED UNPREDICTABLE behavior

If n == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction uses post-indexed addressing with the base register as PC. This is handled as described in Using R15 on page K1-6391.
- The instruction uses immediate offset addressing with the base register as PC, without writeback.

If n == t && n != 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

\[ \text{register_form} = \text{FALSE}; \; \text{imm32} = \text{ZeroExtend}(\text{imm8}, 32); \]

\[ \text{if } t == 15 \; \text{then \textsc{unpredictable}}; \; \text{ARMv8-A removes \textsc{unpredictable} for R13} \]

**Notes for all encodings**

For more information about the **CONSTRAINED UNPREDICTABLE behavior** of this instruction, see Appendix K1, *Architectural Constraints on UNPREDICTABLE behaviors*.

### Assembler symbols

- **<c>**  
  See *Standard assembler syntax fields on page F2-3100*.

- **<q>**  
  See *Standard assembler syntax fields on page F2-3100*.

- **<Rt>**  
  For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated.

  For encoding A2 and T1: is the general-purpose register to be transferred, encoded in the "Rt" field.

- **<Rn>**  
  Is the general-purpose base register, encoded in the "Rn" field.

- **+/−**  
  For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

  - when \( U == 0 \):
    - when \( U == 1 \):
For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when $U = 0$
+ when $U = 1$

$\langle Rm \rangle$ Is the general-purpose index register, encoded in the "Rm" field.

$\langle shift \rangle$ The shift to apply to the value read from $\langle Rm \rangle$. If absent, no shift is applied. Otherwise, see *Shifts applied to a register* on page F2-3104.

+ Specifies the offset is added to the base register.

$\langle imm \rangle$ For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.

For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

**Operation for all encodings**

```cpp
if ConditionPassed() then
  if PSTATE.EL == EL2 then UNPREDICTABLE; // Hyp mode
  EncodingSpecificOperations();
  offset = if register_form then Shift(R[m], shift_t, shift_n, PSTATE.C) else imm32;
  offset_addr = if add then (R[n] + offset) else (R[n] - offset);
  address = if postindex then R[n] else offset_addr;
  R[t] = ZeroExtend(MemU_unpriv[address,1],32);
  if postindex then R[n] = offset_addr;
```

**CONSTRAINED UNPREDICTABLE behavior**

If PSTATE.EL == EL2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as LDRB (immediate).
F5.1.76   LDRD (immediate)

Load Register Dual (immediate) calculates an address from a base register value and an immediate offset, loads two words from memory, and writes them to two registers. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see Memory accesses on page F2-3106.

A1

index = (P == '1'); add = (U == '1'); wback = (W == '1');
if wback && (n == t || n == t2) then UNPREDICTABLE;
if t == 15 || t2 == 15 || t == t2 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13

CONSTRAINED UNPREDICTABLE behavior
If wback && (n == t || n == t2), then one of the following behaviors must occur:
• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

If t == t2, then one of the following behaviors must occur:
• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The load instruction executes but the destination register takes an UNKNOWN value.

Notes for all encodings
For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

**Assembler symbols**

<\>  
See Standard assembler syntax fields on page F2-3100.

<\p>  
See Standard assembler syntax fields on page F2-3100.

<\Rt>  
For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. This register must be even-numbered and not R14.

For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.

<\Rt2>  
For encoding A1: is the second general-purpose register to be transferred. This register must be \(\langle R(t+1)\rangle\).

For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.

<\Rn>  
Is the general-purpose base register, encoded in the "Rn" field. For PC use see LDRD (literal).

+/-  
Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

-  when \(U = 0\)
+  when \(U = 1\)

<\imm>  
For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is the unsigned immediate byte offset, a multiple of 4, in the range 0 to 1020, defaulting to 0 if omitted, and encoded in the "imm8" field as \(<\imm>/4\).

**Operation for all encodings**

```c
if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    if address == Align(address, 8) then
        data = MemA[address, 8];
        if BigEndian() then
            R[t] = data<63:32>;  
            R[t2] = data<31:0>;  
        else
            R[t] = data<31:0>;  
            R[t2] = data<63:32>;  
        else
            R[t] = MemA[address, 4];
            R[t2] = MemA[address+4, 4];
        if wback then R[n] = offset_addr;
```
F5.1.77 LDRD (literal)

Load Register Dual (literal) calculates an address from the PC value and an immediate offset, loads two words from memory, and writes them to two registers. For information about memory accesses see Memory accesses on page F2-3106.

A1

| 31 28 27 26 25 24 23 22 21 20 19 18 17 15 12 | 11 8 7 6 5 4 3 0 |

A1 variant

LDRD{<c>}{<q>} <Rt>, <Rt2>, <label> // Normal form
LDRD{<c>}{<q>} <Rt>, <Rt2>, [PC, #{+/-}imm] // Alternative form

Decode for this encoding

if \( Rt<0 > == '1' \) then UNPREDICTABLE;
\( t = \text{UInt}(Rt); \ t2 = t+1; \ \text{imm32} = \text{ZeroExtend}(\text{imm4H:imm4L, 32}); \ \text{add} = (U == '1'); \)
if \( t2 == 15 \) then UNPREDICTABLE;

CONSTRANDED UNPREDICTABLE behavior

If \( Rt<0 > == '1' \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: \( t<0 > == '0' \);
- The instruction executes with the additional decode: \( t2 == t \);
- The instruction executes as described, with no change to its behavior and no additional side-effects. This does not apply when \( Rt == '1111' \).

If \( P == '0' \) || \( W == '1' \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if \( P == 1 \) and \( W == 0 \).

T1

T1 variant

Applies when \(! (P == 0 \&\& W == 0)\).

LDRD{<c>}{<q>} <Rt>, <Rt2>, <label> // Normal form
LDRD{<c>}{<q>} <Rt>, <Rt2>, [PC, #{+/-}imm] // Alternative form
Decode for this encoding

if \( P == '0' \) \&\& \( W == '0' \) then SEE "Related encodings";
\( t = UInt(Rt); \) \( t2 = UInt(Rt2); \)
\( \text{imm32} = \text{ZeroExtend}(\text{imm8}:'00', 32); \) \( \text{add} = (U == '1'); \)
if \( t == 15 \) \| \( t2 == 15 \) \| \( t == t2 \) then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
if \( W == '1' \) then UNPREDICTABLE;

**CONSTRAINED UNPREDICTABLE behavior**

If \( t == t2 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The load instruction executes but the destination register takes an UNKNOWN value.

If \( W == '1' \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction uses post-indexed addressing when \( P == '0' \) and uses pre-indexed addressing otherwise. The instruction is handled as described in *Using R15 on page K1-6391*.

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors*.

**Assembler symbols**

- \(<c>\) See *Standard assembler syntax fields on page F2-3100.*
- \(<q>\) See *Standard assembler syntax fields on page F2-3100.*
- \(<Rt>\) For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. This register must be even-numbered and not R14.
- For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.
- \(<Rt2>\) For encoding A1: is the second general-purpose register to be transferred. This register must be \(<R(t+1)>\).
- For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.
- \(<\text{label}>\) For encoding A1: the label of the literal data item that is to be loaded into \(<Rt>\). The assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. Any value in the range -255 to 255 is permitted.
  - If the offset is zero or positive, \( \text{imm32} \) is equal to the offset and \( \text{add} == \text{TRUE} \), encoded as \( U == 1 \). If the offset is negative, \( \text{imm32} \) is equal to minus the offset and \( \text{add} == \text{FALSE} \), encoded as \( U == 0 \).
  - For encoding T1: the label of the literal data item that is to be loaded into \(<Rt>\). The assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. Permitted values of the offset are multiples of 4 in the range -1020 to 1020.
  - If the offset is zero or positive, \( \text{imm32} \) is equal to the offset and \( \text{add} == \text{TRUE} \), encoded as \( U == 1 \). If the offset is negative, \( \text{imm32} \) is equal to minus the offset and \( \text{add} == \text{FALSE} \), encoded as \( U == 0 \).
+/-  Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
-  when U = 0
+  when U = 1

<imm>  For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.
  For encoding T1: is the optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see Use of labels in UAL instruction syntax on page F1-3059.

**Operation for all encodings**

```assembly
if ConditionPassed() then
    EncodingSpecificOperations();
    address = if add then (Align(PC,4) + imm32) else (Align(PC,4) - imm32);
    if address == Align(address, 8) then
        data = MemA[address,8];
        if BigEndian() then
            R[t] = data<63:32>;
            R[t2] = data<31:0>;
        else
            R[t] = data<31:0>;
            R[t2] = data<63:32>;
    else
        R[t] = MemA[address,4];
        R[t2] = MemA[address+4,4];
```
F5.1.78   LDRD (register)

Load Register Dual (register) calculates an address from a base register value and a register offset, loads two words from memory, and writes them to two registers. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see Memory accesses on page F2-3106.

Offset variant

 Applies when \( P == 1 \) \&\& \( W == 0 \).

\[
\text{LDRD}\{<c>\}{<q>} <Rt>, <Rt2>, [<Rn>, {+/-}<Rm>]
\]

Post-indexed variant

 Applies when \( P == 0 \) \&\& \( W == 0 \).

\[
\text{LDRD}\{<c>\}{<q>} <Rt>, <Rt2>, [<Rn>], {+/-}<Rm>
\]

Pre-indexed variant

 Applies when \( P == 1 \) \&\& \( W == 1 \).

\[
\text{LDRD}\{<c>\}{<q>} <Rt>, <Rt2>, [<Rn>, {+/-}<Rm>]
\]

Decode for all variants of this encoding

\[
\begin{align*}
\text{if } & \text{Rt}<0> == '1' \text{ then UNPREDICTABLE;} \\
& t = \text{UInt}(Rt); \quad t2 = t+1; \quad n = \text{UInt}(Rn); \quad m = \text{UInt}(Rm); \\
& \text{if } P == '0' \text{ \&\& \( W == '1' \text{ then UNPREDICTABLE;} \\
& \text{if } t2 == 15 || m == 15 || m == t || m == t2 \text{ then UNPREDICTABLE;} \\
& \text{if wback \&\& (n == 15 || n == t || n == t2) then UNPREDICTABLE;}
\end{align*}
\]

CONstrained UNPREDICTABLE behavior

If wback \&\& (n == t || n == t2), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

If \( P == '0' \) \&\& \( W == '1' \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as an LDRD using one of offset, post-indexed, or pre-indexed addressing.

If n == t || m == t2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
• The instruction loads register Rm with an **UNKNOWN** value.

If Rt<0> == '1', then one of the following behaviors must occur:

• The instruction is **UNDEFINED**.
• The instruction executes as **NOP**.
• The instruction executes with the additional decode: t<0> = '0'.
• The instruction executes with the additional decode: t2 = 1.
• The instruction executes as described, with no change to its behavior and no additional side-effects. This does not apply when Rt == '1111'.

**Notes for all encodings**

For more information about the **CONSTRAINED UNPREDICTABLE** behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

**Assembler symbols**

<ci> See *[Standard assembler syntax fields]* on page F2-3100.
<qi> See *[Standard assembler syntax fields]* on page F2-3100.
<Rt> Is the first general-purpose register to be transferred, encoded in the "Rt" field. This register must be even-numbered and not R14.
<Rt2> Is the second general-purpose register to be transferred. This register must be <R(t+1)>.
<Rn> Is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant.
<+/-> Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when U = 0
+ when U = 1

<Rm> Is the general-purpose index register, encoded in the "Rm" field.

**Operation**

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + R[m]) else (R[n] - R[m]);
    address = if index then offset_addr else R[n];
    if address == Align(address, 8) then
        data = MemA[address,8];
        if BigEndian() then

Assembler symbols

- \(<c>\) See Standard assembler syntax fields on page F2-3100.
- \(<q>\) See Standard assembler syntax fields on page F2-3100.
- \(<Rt>\) Is the general-purpose register to be transferred, encoded in the "Rt" field.
- \(<Rn>\) For encoding A1, T2 and T3: is the general-purpose base register, encoded in the "Rn" field. For PC use see LDRH (literal).
  For encoding T1: is the general-purpose base register, encoded in the "Rn" field.
- +/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
  - when \( U = 0 \)
  - when \( U = 1 \)
- + Specifies the offset is added to the base register.
- \(<\text{imm}>\) For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.
  For encoding T1: is the optional positive unsigned immediate byte offset, a multiple of 2, in the range 0 to 62, defaulting to 0 and encoded in the "imm5" field as \(<\text{imm}>/2\).
  For encoding T2: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.
  For encoding T3: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

Operation for all encodings

```plaintext
if CurrentInstrSet() == InstrSet_A32 then
  if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + \text{imm32}) else (R[n] - \text{imm32});
    address = if index then offset_addr else R[n];
    data = MemU[address, 2];
    if wback then R[n] = offset_addr;
    R[t] = ZeroExtend(data, 32);
  else
    if ConditionPassed() then
      EncodingSpecificOperations();
      offset_addr = if add then (R[n] + \text{imm32}) else (R[n] - \text{imm32});
      address = if index then offset_addr else R[n];
```

```plaintext
```
data = MemU[address,2];
if wback then R[n] = offset_addr;
R[t] = ZeroExtend(data, 32);
F5.1.84   LDRH (literal)

Load Register Halfword (literal) calculates an address from the PC value and an immediate offset, loads a halfword from memory, zero-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see Memory accesses on page F2-3106.

A1

\[
\begin{array}{cccccccccccccccccccc}
\end{array}
\]

\[
\begin{array}{cccccccccccccccccccc}
!=1111 & 0 & 0 & 0 & P & U & 1 & W & 1 & 1 & 1 & 1 & Rt & imm4H & 1 & 0 & 1 & 1 & imm4L
\end{array}
\]

A1 variant

Applies when \((P == 0 && W == 1)\).

LDRH{<c>}{<q>} <Rt>, <label> // Normal form

LDRH{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative form

Decode for this encoding

if \(P == '0' && W == '1'\) then SEE "LDRHT";

t = UInt(Rt); imm32 = ZeroExtend(imm4H:imm4L, 32);

add = (U == '1'); wback = (P == '0') || (W == '1');

if t == 15 || wback then UNPREDICTABLE;

CONSTRANDED UNPREDICTABLE behavior

If wback, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: wback = FALSE.
- The instruction treats bit[24] as the P bit, and bit[21] as the writeback (W) bit, and uses the same addressing mode as described in LDRH (immediate). The instruction uses post-indexed addressing when \(P == '0'\) and uses pre-indexed addressing otherwise. The instruction is handled as described in Using R15 on page K1-6391.

// ARMv8-A removes UNPREDICTABLE for R13
Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

<<c>> See Standard assembler syntax fields on page F2-3100.

<<p>> See Standard assembler syntax fields on page F2-3100.

<<Rt>> Is the general-purpose register to be transferred, encoded in the "Rt" field.

<<label>> For encoding A1: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. Any value in the range -255 to 255 is permitted.

If the offset is zero or positive, imm32 is equal to the offset and add == TRUE, encoded as U == 1. If the offset is negative, imm32 is equal to minus the offset and add == FALSE, encoded as U == 0.

For encoding T1: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. Permitted values of the offset are -4095 to 4095.

If the offset is zero or positive, imm32 is equal to the offset and add == TRUE, encoded as U == 1. If the offset is negative, imm32 is equal to minus the offset and add == FALSE, encoded as U == 0.

<+/-> Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when U = 0
+ when U = 1

<imm> For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see Use of labels in UAL instruction syntax on page F1-3059.

Operation for all encodings

if ConditionPassed() then
  EncodingSpecificOperations();
  base = Align(PC,4);
  address = if add then (base + imm32) else (base - imm32);
  data = MemU[address,2];
  R[t] = ZeroExtend(data, 32);
F5.1.85   LDRH (register)

Load Register Halfword (register) calculates an address from a base register value and an offset register value, loads a halfword from memory, zero-extends it to form a 32-bit word, and writes it to a register. The offset register value can be shifted left by 0, 1, 2, or 3 bits. For information about memory accesses see Memory accesses on page F2-3106.

\( R[t] = \text{ZeroExtend}(\text{data}, 32) \);
F5.1.86 LDRHT

Load Register Halfword Unprivileged loads a halfword from memory, zero-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see Memory accesses on page F2-3106.

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

LDRHT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or a register value.

A1

A1 variant

LDRHT{<c>}{<q>} <Rt>, [<Rn>] {, #{+/-}<imm>}

Decode for this encoding

t = UInt(Rt);  n = UInt(Rn);  postindex = TRUE;  add = (U == '1');
register_form = FALSE;  imm32 = ZeroExtend(imm4H:imm4L, 32);
if t == 15 || n == 15 || n = t then UNPREDICTABLE;

CONstrained UNPREDICTABLE behavior

If n == 15, then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The instruction uses post-indexed addressing with the base register as PC. This is handled as described in Using R15 on page K1-6391.
• The instruction is treated as if bit[24] == '1' and bit[21] == '0'. The instruction uses immediate offset addressing with the base register as PC, without writeback.

If n == t && n != 15, then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.
A2

LDRHT{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>

Decode for this encoding

t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);  postindex = TRUE;  add = (U == '1');
register_form = TRUE;
if t == 15 || n == 15 || n == t || m == 15 then UNPREDICTABLE;

CONstrained UNPREDICTABLE behavior

If n == t && n != 15, then one of the following behaviors must occur:

• The instruction is UNDEFINED.

• The instruction executes as NOP.

• The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

T1

LDRHT{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]}

Decode for this encoding

if Rn == '1111' then SEE "LDRH (literal)";
t = UInt(Rt);  n = UInt(Rn);  postindex = FALSE;  add = TRUE;
register_form = FALSE;  imm32 = ZeroExtend(imm8, 32);
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13

Notes for all encodings

If wback && n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

Notes for all encodings

For more information about the CONSTRANDED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

<->  See Standard assembler syntax fields on page F2-3100.
See *Standard assembler syntax fields on page F2-3100*.

<q><r>
Is the general-purpose register to be transferred, encoded in the "Rt" field.

<q><rn>
Is the general-purpose base register, encoded in the "Rn" field. For PC use see `LDRSB (literal)`.

<q><m/>+-
Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when \( U = 0 \)
- when \( U = 1 \)

<q><imm>
+ Specifies the offset is added to the base register.

For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

For encoding T2: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

**Operation for all encodings**

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    R[t] = SignExtend(MemU[address, 1], 32);
    if wback then R[n] = offset_addr;
```

[Q1]
F5.1.88  LDRSB (literal)

Load Register Signed Byte (literal) calculates an address from the PC value and an immediate offset, loads a byte from memory, sign-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see Memory accesses on page F2-3106.

A1

|31 28|27 26 25 24|23 22 21 20|19 18 17 16|15 12|11 8 7 6 5 4 3 0 |
|---|---|---|---|---|---|---|---|---|
| !=1111 | 0 0 0 | P | U | W | 1 | 1 | 1 | 1 |
| Rt | imm4H | 1 | 1 | 0 | 1 | imm4L |
| cond |

**A1 variant**

Applies when !(P == 0 && W == 1).

LDRSB{<c>}{<q>} <Rt>, <label> // Normal form
LDRSB{<c>}{<q>} <Rt>, [PC, #{+/-}imm] // Alternative form

**Decode for this encoding**

if P == '0' && W == '1' then SEE "LDRSBT";

\[ t = \text{UInt}(Rt); \; \text{imm32} = \text{ZeroExtend}(\text{imm4H:imm4L}, 32); \]
\[ \text{add} = (U == '1'); \; \text{wback} = (P == '0') || (W == '1'); \]
\[ \text{if } t == 15 || \text{wback then UNPREDICTABLE; } \]

**CONSTRAINED UNPREDICTABLE behavior**

If wback, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: wback = FALSE.
- The instruction treats bit[24] as the P bit, and bit[21] as the writeback (W) bit, and uses the same addressing mode as described in LDRSB (immediate). The instruction uses post-indexed addressing when P == '0' and uses pre-indexed addressing otherwise. The instruction is handled as described in Using R15 on page K1-6391.

\[ // \text{ARMv8-A removes UNPREDICTABLE for R13 } \]
Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

<cer> See Standard assembler syntax fields on page F2-3100.

<qer> See Standard assembler syntax fields on page F2-3100.

<رت> Is the general-purpose register to be transferred, encoded in the "Rt" field.

<رر> For encoding A1: the label of the literal data item that is to be loaded into <rt>. The assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. Any value in the range -255 to 255 is permitted.

If the offset is zero or positive, imm32 is equal to the offset and add == TRUE, encoded as U == 1. If the offset is negative, imm32 is equal to minus the offset and add == FALSE, encoded as U == 0.

For encoding T1: the label of the literal data item that is to be loaded into <rt>. The assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. Permitted values of the offset are -4095 to 4095.

If the offset is zero or positive, imm32 is equal to the offset and add == TRUE, encoded as U == 1. If the offset is negative, imm32 is equal to minus the offset and add == FALSE, encoded as U == 0.

+/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when U = 0
+ when U = 1

<imm> For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see Use of labels in UAL instruction syntax on page F1-3059.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    base = Align(PC,4);
    address = if add then (base + imm32) else (base - imm32);
    R[t] = SignExtend(MemU[address,1], 32);
F5.1.89  LDRSB (register)

Load Register Signed Byte (register) calculates an address from a base register value and an offset register value, loads a byte from memory, sign-extends it to form a 32-bit word, and writes it to a register. The offset register value can be shifted left by 0, 1, 2, or 3 bits. For information about memory accesses see Memory accesses on page F2-3106.

if wback then \(R[n] = \text{offset_addr}\);
F5.1.90  LDRSBT

Load Register Signed Byte Unprivileged loads a byte from memory, sign-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see Memory accesses on page F2-3106.

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

LDRSBT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or a register value.

A1

A1 variant

LDRSBT{<c>{<q>}}<Rt>, [<Rn>] {, #{+/-}<imm>}

Decode for this encoding

t = UInt(Rt);  n = UInt(Rn);  postindex = TRUE;  add = (U == '1');
register_form = FALSE;  imm32 = ZeroExtend(imm4H:imm4L, 32);
if t == 15 || n == 15 || n == t then UNPREDICTABLE;

CONSTRANDED UNPREDICTABLE behavior

If n == 15, then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The instruction uses post-indexed addressing with the base register as PC. This is handled as described in Using R15 on page K1-6391.
• The instruction is treated as if bit[24] == '1' and bit[21] == '0'. The instruction uses immediate offset addressing with the base register as PC, without writeback.

If n == t && n != 15, then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.
A2

LDRSBT{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>

Decode for this encoding

\[ t = \text{UInt}(Rt);\ n = \text{UInt}(Rn);\ m = \text{UInt}(Rm);\ \text{postindex} = \text{TRUE};\ \text{add} = (U == \text{'}1\text{'});\ \text{register\_form} = \text{TRUE};\ \text{if} t == 15 || n == 15 || n == t || m == 15 \text{ then UNPREDICTABLE;} \]

CONSTRAINED UNPREDICTABLE behavior

If \( n == t \&\& n != 15 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

T1

    See *Standard assembler syntax fields* on page F2-3100.

<
    Is the general-purpose register to be transferred, encoded in the "Rt" field.

<
    Is the general-purpose base register, encoded in the "Rn" field. For PC use see LDRSH (literal).

+/-  
    Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
    - when U = 0
    + when U = 1

+  
    Specifies the offset is added to the base register.

<imm>  
    For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.
    For encoding T1: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.
    For encoding T2: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    data = MemU[address, 2];
    if wback then R[n] = offset_addr;
    R[t] = SignExtend(data, 32);
F5.1.92 LDRSH (literal)

Load Register Signed Halfword (literal) calculates an address from the PC value and an immediate offset, loads a halfword from memory, sign-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see Memory accesses on page F2-3106.

A1

![Instruction Format]

A1 variant

Applies when !(P == 0 && W == 1).

LDRSH{<c>}{<q>} <Rt>, <label> // Normal form
LDRSH{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative form

Decode for this encoding

if P == '0' && W == '1' then SEE "LDRSHT";
  t = UInt(Rt);  imm32 = ZeroExtend(imm4H:imm4L, 32);
  add = (U == '1');  wback = (P == '0') || (W == '1');
  if t == 15 || wback then UNPREDICTABLE;

CONstrained UNPREDICTABLE behavior

If wback, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: wback = FALSE;
- The instruction treats bit[24] as the P bit, and bit[21] as the writeback (W) bit, and uses the same addressing mode as described in LDRSH (immediate). The instruction uses post-indexed addressing when P == '0' and uses pre-indexed addressing otherwise. The instruction is handled as described in Using R15 on page K1-6391.

T1

![Instruction Format]

T1 variant

LDRSH{<c>}{<q>} <Rt>, <label> // Preferred syntax
LDRSH{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative syntax

Decode for this encoding

if Rt == '1111' then SEE "Related instructions";
  t = UInt(Rt);  imm32 = ZeroExtend(imm12, 32);  add = (U == '1');
  // ARMv8-A removes UNPREDICTABLE for R13
Notes for all encodings

For more information about the CONSTRUED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Related instructions: Load, signed (literal) on page F3-3189.

Assembler symbols

<>< See Standard assembler syntax fields on page F2-3100.

<q> See Standard assembler syntax fields on page F2-3100.

<rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.

<label> For encoding A1: the label of the literal data item that is to be loaded into <rt>. The assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. Any value in the range -255 to 255 is permitted.

If the offset is zero or positive, imm32 is equal to the offset and add == TRUE, encoded as U == 1. If the offset is negative, imm32 is equal to minus the offset and add == FALSE, encoded as U == 0.

For encoding T1: the label of the literal data item that is to be loaded into <rt>. The assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. Permitted values of the offset are -4095 to 4095.

If the offset is zero or positive, imm32 is equal to the offset and add == TRUE, encoded as U == 1.

If the offset is negative, imm32 is equal to minus the offset and add == FALSE, encoded as U == 0.

+/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when U = 0
+ when U = 1

<imm> For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see Use of labels in UAL instruction syntax on page F1-3059.

Operation for all encodings

if ConditionPassed() then
  EncodingSpecificOperations();
  base = Align(PC, 4);
  address = if add then (base + imm32) else (base - imm32);
  data = MemU[address, 2];
  R[t] = SignExtend(data, 32);
F5.1.93   LDRSH (register)

Load Register Signed Halfword (register) calculates an address from a base register value and an offset register value, loads a halfword from memory, sign-extends it to form a 32-bit word, and writes it to a register. The offset register value can be shifted left by 0, 1, 2, or 3 bits. For information about memory accesses see Memory accesses on page F2-3106.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

- `<c>` See Standard assembler syntax fields on page F2-3100.
- `<q>` See Standard assembler syntax fields on page F2-3100.
- `<Rt>` For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated.
  For encoding A2 and T1: is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn> Is the general-purpose base register, encoded in the "Rn" field.

+/- For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to 
+ if omitted and encoded in the "U" field. It can have the following values:
- when U = 0
+ when U = 1

For encoding A2: specifies the index register is added to or subtracted from the base register, 
defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when U = 0
+ when U = 1

<Rm> Is the general-purpose index register, encoded in the "Rm" field.

<shift> The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see Shifts 
applied to a register on page F2-3104.

+ Specifies the offset is added to the base register.

<imm> For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 
0 if omitted, and encoded in the "imm12" field.

For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, 
defaulting to 0 and encoded in the "imm8" field.

Operation for all encodings

if ConditionPassed() then
  if PSTATE.EL == EL2 then UNPREDICTABLE; // Hyp mode
  EncodingSpecificOperations();
  offset = if register_form then Shift(R[m], shift_t, shift_n, PSTATE.C) else imm32;
  offset_addr = if add then (R[n] + offset) else (R[n] - offset);
  address = if postindex then R[n] else offset_addr;
  data = MemU_unpriv[address,4];
  if postindex then R[n] = offset_addr;
  R[t] = data;

CONstrained UNPREDICTABLE behavior

If PSTATE.EL == EL2, then one of the following behaviors must occur:

• The instruction is UNDEFINED.

• The instruction executes as NOP.

• The instruction executes as LDR (immediate).
Logical Shift Left (immediate) shifts a register value left by an immediate number of bits, shifting in zeros, and writes the result to the destination register.

This instruction is an alias of the MOV, MOVS (register) instruction. This means that:

• The encodings in this description are named to match the encodings of MOV, MOVS (register).
• The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.

**MOV, shift or rotate by value variant**

LSL\{<c>\}{<q>} \{<Rd>,\} <Rm>, #<imm>

is equivalent to

MOV\{<c>\}{<q>} <Rd>, <Rm>, LSL #<imm>

and is the preferred disassembly when InITBlock().

**MOV, shift or rotate by value variant**

LSL\{.<W\} \{<Rd>,\} <Rm>, #<imm> // Inside IT block, and <Rd>, <Rm>, #<imm> can be represented in T2

is equivalent to

MOV\{.<W\} \{<Rd>,\} <Rm>, LSL #<imm>

and is always the preferred disassembly.
is equivalent to

\[
\text{MOV}\{<c>\}\{<q>\} <Rd>, <Rm>, \text{LSL } \#<\text{imm}>
\]

and is always the preferred disassembly.

**Assembler symbols**

- `<c>` See Standard assembler syntax fields on page F2-3100.
- `<q>` See Standard assembler syntax fields on page F2-3100.
- `<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. ARM deprecates using the PC as the destination register, but if the PC is used, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983. For encoding T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.
- `<Rm>` For encoding A1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated. For encoding T2 and T3: is the general-purpose source register, encoded in the "Rm" field.
- `<imm>` For encoding A1: is the shift amount, in the range 0 to 31, encoded in the "imm5" field as `<imm>` modulo 32. For encoding T2: is the shift amount, in the range 1 to 31, encoded in the "imm5" field as `<amount>` modulo 32. For encoding T3: is the shift amount, in the range 0 to 31, encoded in the "imm3:imm2" field as `<imm>` modulo 32.

**Operation for all encodings**

The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.
F5.1.97  LSL (register)

Logical Shift Left (register) shifts a register value left by a variable number of bits, shifting in zeros, and writes the result to the destination register. The variable number of bits is read from the bottom byte of a register.

This instruction is an alias of the MOV, MOVS (register-shifted register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register-shifted register).
- The description of MOV, MOVS (register-shifted register) gives the operational pseudocode for this instruction.

- **<Rs>** Is the second general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

**Operation for all encodings**

The description of MOV, MOVS (register-shifted register) gives the operational pseudocode for this instruction.
F5.1.98   LSLS (immediate)

Logical Shift Left, setting flags (immediate) shifts a register value left by an immediate number of bits, shifting in zeros, and writes the result to the destination register.

If the destination register is not the PC, this instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
- The PE checks SPSR_<current_mode> for an illegal return event. See Illegal return events from AArch32 state on page G1-4646.
- The instruction is UNDEFINED in Hyp mode.
- The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

This instruction is an alias of the MOV, MOVVS (register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVVS (register).
- The description of MOV, MOVVS (register) gives the operational pseudocode for this instruction.

T3

MOVS, shift or rotate by value variant

LSRS.W \{<Rd>,\} <Rm>, #<imm> // Outside IT block, and \(<Rd>, <Rm>, <imm>\) can be represented in T2

is equivalent to

MOVS{\(<c>\)}{\(<q>\)} <Rd>, <Rm>, LSR #<imm>

and is always the preferred disassembly.

LSRS{\(<c>\)}{\(<q>\)} \{<Rd>,\} <Rm>, #<imm>

is equivalent to

MOVS{\(<c>\)}{\(<q>\)} <Rd>, <Rm>, LSR #<imm>

and is always the preferred disassembly.

Assembler symbols

\(<c>\) \hspace{1em} See Standard assembler syntax fields on page F2-3100.

\(<q>\) \hspace{1em} See Standard assembler syntax fields on page F2-3100.

\(<Rd>\) \hspace{1em} For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. ARM deprecates using the PC as the destination register, but if the PC is used, the instruction performs an exception return, that restores PSTATE from SPSR_\(<current\_mode>\).

For encoding T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.

\(<Rm>\) \hspace{1em} For encoding A1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T2 and T3: is the general-purpose source register, encoded in the "Rm" field.

\(<imm>\) \hspace{1em} For encoding A1 and T2: is the shift amount, in the range 1 to 32, encoded in the "imm5" field as \(<imm>\) modulo 32.

For encoding T3: is the shift amount, in the range 1 to 32, encoded in the "imm3:imm2" field as \(<imm>\) modulo 32.

Operation for all encodings

The description of MOVS, MOVs (register) gives the operational pseudocode for this instruction.
F5.1.103  LSRS (register)

Logical Shift Right, setting flags (register) shifts a register value right by an immediate number of bits, shifting in zeros, writes the result to the destination register, and updates the condition flags based on the result. The variable number of bits is read from the bottom byte of a register.

This instruction is an alias of the MOV, MOVVS (register-shifted register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVVS (register-shifted register).
- The description of MOV, MOVVS (register-shifted register) gives the operational pseudocode for this instruction.

```
and is always the preferred disassembly.

\[ \text{LSRS}\{<c}\}{<q}>\{<Rd>,\} <Rm>, <Rs> \]

is equivalent to

\[ \text{MOVS}\{<c}\}{<q}> <Rd>, <Rm>, \text{LSR} <Rs> \]

and is always the preferred disassembly.

**Assembler symbols**

- `<c>` See *Standard assembler syntax fields* on page F2-3100.
- `<q>` See *Standard assembler syntax fields* on page F2-3100.
- `<Rdm>` Is the first general-purpose source register and the destination register, encoded in the "Rdm" field.
- `<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.
- `<Rm>` Is the first general-purpose source register, encoded in the "Rm" field.
- `<Rs>` Is the second general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

**Operation for all encodings**

The description of MOV, MOVS (register-shifted register) gives the operational pseudocode for this instruction.
Move to System register from general-purpose register or execute a System instruction. This instruction copies the value of a general-purpose register to a System register, or executes a System instruction.

The System register and System instruction descriptions identify valid encodings for this instruction. Other encodings are UNDEFINED. For more information see About the AArch32 System register interface on page E1-3001 and General behavior of System registers on page G7-5012.

In an implementation that includes EL2, MCR accesses to System registers can be trapped to Hyp mode, meaning that an attempt to execute an MCR instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see EL2 configurable controls on page G1-4711.

Because of the range of possible traps to Hyp mode, the MCR pseudocode does not show these possible traps.

if \( t = IS \) then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

\(<c>\) See Standard assembler syntax fields on page F2-3100.
\(<q>\) See Standard assembler syntax fields on page F2-3100.
<coproc>  Is the System register encoding space, encoded in the "<coproc><0>" field. It can have the following values:
  p14    when <coproc><0> = 0
  p15    when <coproc><0> = 1

<opc1>  Is the opc1 parameter within the System register encoding space, in the range 0 to 7, encoded in the "opc1" field.

<Rt>    Is the general-purpose register to be transferred, encoded in the "Rt" field.

<CRn>   Is the CRn parameter within the System register encoding space, in the range c0 to c15, encoded in the "CRn" field.

<CRm>   Is the CRm parameter within the System register encoding space, in the range c0 to c15, encoded in the "CRm" field.

<opc2>  Is the opc2 parameter within the System register encoding space, in the range 0 to 7, encoded in the "opc2" field.

The possible values of {<coproc>, opc1, CRn, CRm, opc2} encode the entire System register and System instruction encoding space. Not all of this space is allocated, and the System register and System instruction descriptions identify the allocated encodings.

Operation for all encodings

if ConditionPassed() then
  EncodingSpecificOperations();
  AArch32.CheckSystemAccess(cp, ThisInstr());
  AArch32.SysRegWrite(cp, ThisInstr(), R[t]);
F5.1.105 MCRR

Move to System register from two general-purpose registers. This instruction copies the values of two general-purpose registers to a System register.

The System register descriptions identify valid encodings for this instruction. Other encodings are UNDEFINED. For more information see About the AArch32 System register interface on page E1-3001 and General behavior of System registers on page G7-5012.

In an implementation that includes EL2, MCRR accesses to System registers can be trapped to Hyp mode, meaning that an attempt to execute an MCRR instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see EL2 configurable controls on page G1-4711.

Because of the range of possible traps to Hyp mode, the MCRR pseudocode does not show these possible traps.

if \( t == 15 \) || \( t2 == 15 \) then UNPREDICTABLE;

// ARMv8-A removes UNPREDICTABLE for R13

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

**Assembler symbols**

\(<c>\) See Standard assembler syntax fields on page F2-3100.
See *Standard assembler syntax fields* on page F2-3100.

<coproc> Is the System register encoding space, encoded in the "coproc<0>" field. It can have the following values:

- p14 when coproc<0> = 0
- p15 when coproc<0> = 1

<opc1> Is the opc1 parameter within the System register encoding space, in the range 0 to 15, encoded in the "opc1" field.

<Rt> Is the first general-purpose register that is transferred into, encoded in the "Rt" field.

<Rt2> Is the second general-purpose register that is transferred into, encoded in the "Rt2" field.

<CRm> Is the CRm parameter within the System register encoding space, in the range c0 to c15, encoded in the "CRm" field.

The possible values of {<coproc>, opc1, CRm} encode the entire System register encoding space. Not all of this space is allocated, and the System register descriptions identify the allocated encodings.

For the permitted uses of these instructions, as described in this manual, <Rt2> transfers bits[63:32] of the selected System register, while <Rt> transfers bits[31:0].

**Operation for all encodings**

```c
if ConditionPassed() then
    EncodingSpecificOperations();
    AArch32.CheckSystemAccess(cp, ThisInstr());
    value = R[t2]:R[t];
    AArch32.SysRegWrite64(cp, ThisInstr(), value);
```
F5.1.106 MLA, MLAS

Multiply Accumulate multiplies two register values, and adds a third register value. The least significant 32 bits of the result are written to the destination register. These 32 bits do not depend on whether the source register values are considered to be signed values or unsigned values.

In an A32 instruction, the condition flags can optionally be updated based on the result. Use of this option adversely affects performance on many implementations.

A1

Flag setting variant
Applies when $S == 1$.

$\text{MLAS} \{<c>\} \{<q>\} <Rd>, <Rn>, <Rm>, <Ra>$

Not flag setting variant
Applies when $S == 0$.

$\text{MLA} \{<c>\} \{<q>\} <Rd>, <Rn>, <Rm>, <Ra>$

Decode for all variants of this encoding

$d = \text{UInt}(Rd); \ n = \text{UInt}(Rn); \ m = \text{UInt}(Rm); \ a = \text{UInt}(Ra); \ setflags = (S == '1');$

if $d == 15 \ | \ n == 15 \ | \ m == 15 \ | \ a == 15$ then UNPREDICTABLE;

T1

T1 variant

$\text{MLA} \{<c>\} \{<q>\} <Rd>, <Rn>, <Rm>, <Ra>$

Decode for this encoding

if $Ra == '1111$' then SEE "MUL";

d = $\text{UInt}(Rd); \ n = \text{UInt}(Rn); \ m = \text{UInt}(Rm); \ a = \text{UInt}(Ra); \ setflags = \text{FALSE};$

if $d == 15 \ | \ n == 15 \ | \ m == 15$ then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

$<c>$ See Standard assembler syntax fields on page F2-3100.

$<q>$ See Standard assembler syntax fields on page F2-3100.

$<Rd>$ Is the general-purpose destination register, encoded in the "Rd" field.
<Rn> Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

<Ra> Is the third general-purpose source register holding the addend, encoded in the "Ra" field.

**Operation for all encodings**

if ConditionPassed() then

    EncodingSpecificOperations();

    operand1 = SInt(R[n]); // operand1 = UInt(R[n]) produces the same final results
    operand2 = SInt(R[m]); // operand2 = UInt(R[m]) produces the same final results
    addend = SInt(R[a]); // addend = UInt(R[a]) produces the same final results

    result = operand1 * operand2 + addend;
    R[d] = result<31:0>;

    if setflags then

        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result<31:0>);

        // PSTATE.C, PSTATE.V unchanged
F5.1.107   MLS

Multiply and Subtract multiplies two register values, and subtracts the product from a third register value. The least significant 32 bits of the result are written to the destination register. These 32 bits do not depend on whether the source register values are considered to be signed values or unsigned values.

    result = addend - operand1 * operand2;
    R[d] = result<31:0>;
F5.1.108   MOV, MOVS (immediate)

Move (immediate) writes an immediate value to the destination register.

If the destination register is not the PC, the MOVS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The MOV variant of the instruction is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.

- The MOVS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See Illegal return events from AArch32 state on page G1-4646.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

<=> See Standard assembler syntax fields on page F2-3100.

<#> See Standard assembler syntax fields on page F2-3100.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the MOV variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
- For the MOVS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding A2, T1, T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.

<imm8> Is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field.

<imm16> For encoding A2: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:imm12" field.

For encoding T3: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:i:imm3:imm8" field.

<const> For encoding A1: an immediate value. See Modified immediate constants in A32 instructions on page F2-3117 for the range of values.

For encoding T2: an immediate value. See Modified immediate constants in T32 instructions on page F2-3116 for the range of values.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    result = imm32;
    if d == 15 then  // Can only occur for encoding A1
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged

    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
F5.1.109 MOV, MOVS (register)

Move (register) copies a value from a register to the destination register.

If the destination register is not the PC, the MOVS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The MOV variant of the instruction is a branch. In the T32 instruction set (encoding T1) this is a simple branch, and in the A32 instruction set it is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.

- The MOVS variant of the instruction performs an exception return without the use of the stack. In this case:
  — The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  — The PE checks SPSR_<current_mode> for an illegal return event. See Illegal return events from AArch32 state on page G1-4646.
  — The instruction is UNDEFINED in Hyp mode.
  — The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

This instruction is used by the aliases ASRS (immediate), ASR (immediate), LSLS (immediate), LSL (immediate), LSRs (immediate), LSR (immediate), RORS (immediate), ROR (immediate), RRXS, and RRX. See Alias conditions on page F5-3516 for details of when each alias is preferred.

A1

| 31 28 27 26 25 24 23 22 21 20 19 18 17 16 15 12 11 7 6 5 4 3 0 |

| cond        |                |          |       |          |

MOV, rotate right with extend variant

Applies when $S == 0 && \text{imm5} == 00000 && \text{type} == 11$.

MOV{<c>}{<q>} <Rd>, <Rm>, RRX

MOV, shift or rotate by value variant

Applies when $S == 0 && !(\text{imm5} == 00000 && \text{type} == 11)$.

MOV{<c>}{<q>} <Rd>, <Rm> {, <shift> #<amount>}

MOVS, rotate right with extend variant

Applies when $S == 1 && \text{imm5} == 00000 && \text{type} == 11$.

MOVS{<c>}{<q>} <Rd>, <Rm>, RRX

MOVS, shift or rotate by value variant

Applies when $S == 1 && !(\text{imm5} == 00000 && \text{type} == 11)$.

MOVS{<c>}{<q>} <Rd>, <Rm> {, <shift> #<amount>}

Decode for all variants of this encoding

d = UInt(Rd);
m = UInt(Rm);
setflags = ($S == '1')
(shift_t, shift_n) = DecodeImmShift(type, imm5);
T1

```
| 15 14 13 12|11 10  9  8  7  6  5  4  3  2  1  0 |
| 0 0 0 0 1 1 0 | D | Rm | Rd |
```

**T1 variant**

`MOV{<c>}{<q>} <Rd>, <Rm>`

**Decode for this encoding**

\[d = \text{UInt}(D:Rd); \ m = \text{UInt}(Rm); \ \text{setflags} = \text{FALSE};\]
\[(\text{shift}_t, \ \text{shift}_n) = (\text{SRType}_{LSL}, 0);\]
\[\text{if } d == 15 \ \&\& \ \text{InITBlock()} \ \&\& \ !\text{LastInITBlock()} \text{ then UNPREDICTABLE;}\]

T2

```
| 15 14 13 12|11 10  9  8  7  6  5  4  3  2  1  0 |
| 0 0 0 0 1 1 0 | 1 5 | imm5 | Rd | Rd |
```

**T2 variant**

`MOV{<c>}{<q>} <Rd>, <Rm> {, <shift> #<amount>} // Inside IT block`

`MOV{<q>} <Rd>, <Rm> {, <shift> #<amount>} // Outside IT block`

**Decode for this encoding**

\[d = \text{UInt}(Rd); \ m = \text{UInt}(Rm); \ \text{setflags} = \text{!InITBlock}();\]
\[(\text{shift}_t, \ \text{shift}_n) = \text{DecodeImmShift}(op, \text{imm5});\]
\[\text{if } op == '00' \ \&\& \ \text{imm5} == '00000' \ \&\& \ \text{InITBlock()} \text{ then UNPREDICTABLE;}\]

**CONSTRAINED UNPREDICTABLE behavior**

If \( op == '00' \ \&\& \ \text{imm5} == '00000' \ \&\& \ \text{InITBlock()} \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passed its condition code check.
- The instruction executes as NOP, as if it failed its condition code check.
- The instruction executes as `MOV Rd, Rm`.

T3

```
| 15 14 13 12|11 10  9  8  7  6  5  4  3  2  1  0 |
| 1 1 1 0 1 0 1 0 0 1 0 | S | 1 1 1 0 \text{imm3} | Rd | imm2 | type | Rm |
```

**MOV, rotate right with extend variant**

Applies when \( S == 0 \ \&\& \ \text{imm3} == 000 \ \&\& \ \text{imm2} == 00 \ \&\& \ \text{type} == 11.\)

`MOV{<c>}{<p}> <Rd>, <Rm>, \text{RX}`
MOV, shift or rotate by value variant
Applies when $S = 0 \&\& (! (imm3 == 000 \&\& imm2 == 00 \&\& type == 11))$.

MOV{$<c>$.W}<Rd>, <Rm> {, LSL #0} // <Rd>, <Rm> can be represented in T1
MOV{$<c>$.W}<Rd>, <Rm> {, <shift> #<amount>} // Inside IT block, and <Rd>, <Rm>, <shift>, <amount> can be represented in T2
MOV{$<c>}{<q>}<Rd>, <Rm> {, <shift> #<amount>}

MOVS, rotate right with extend variant
Applies when $S = 1 \&\& imm3 == 000 \&\& imm2 == 00 \&\& type == 11$.

MOVS{$<c>}{<q>}<Rd>, <Rm>, RRX

MOVS, shift or rotate by value variant
Applies when $S = 1 \&\& !(imm3 == 000 \&\& imm2 == 00 \&\& type == 11)$.

MOVS.W<Rd>, <Rm> {, <shift> #<amount>} // Outside IT block, and <Rd>, <Rm>, <shift>, <amount> can be represented in T1 or T2
MOVS{$<c>}{<q>}<Rd>, <Rm> {, <shift> #<amount>}

Decode for all variants of this encoding

$d = \text{UInt}(Rd)$; $m = \text{UInt}(Rm)$; setflags = ($S = '1'$);
$(\text{shift}_t, \text{shift}_n) = \text{DecodeImmShift}(\text{type}, \text{imm3:imm2})$;
if $d == 15 || m == 15$ then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13

Notes for all encodings
For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

<c> See Standard assembler syntax fields on page F2-3100.

<op> See Standard assembler syntax fields on page F2-3100.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If the PC is used:

- For the MOV variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983. ARM deprecates use of the instruction if <Rd> is the PC.

- For the MOV variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. ARM deprecates use of the instruction if <Rd> is not the LR, or if the optional shift or RRX argument is specified.

For encoding T1: is the general-purpose destination register, encoded in the "D:Rd" field. If the PC is used:

- The instruction causes a branch to the address moved to the PC. This is a simple branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.

- The instruction must either be outside an IT block or the last instruction of an IT block.

For encoding T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.

<rm> For encoding A1 and T1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used. ARM deprecates use of the instruction if <Rd> is the PC.

For encoding T2 and T3: is the general-purpose source register, encoded in the "Rm" field.

<shift> For encoding A1 and T3: is the type of shift to be applied to the source register, encoded in the "type" field. It can have the following values:

- LSL when type = 00
- LSR when type = 01
- ASR when type = 10
- ROR when type = 11
For encoding T2: is the type of shift to be applied to the source register, encoded in the "op" field. It can have the following values:

- LSL when \( \text{op} = 00 \)
- LSR when \( \text{op} = 01 \)
- ASR when \( \text{op} = 10 \)

\(<\text{amount}>\) For encoding A1: is the shift amount, in the range 0 to 31 (when <shift> = LSL), or 1 to 31 (when <shift> = ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm5" field as <amount> modulo 32.

For encoding T3: is the shift amount, in the range 0 to 31 (when <shift> = LSL) or 1 to 31 (when <shift> = ROR), or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

**Operation for all encodings**

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations();
    \((\text{shifted, carry}) = \text{Shift.C}(R[m], \text{shift}_t, \text{shift}_n, \text{PSTATE}.C)\);
    \(\text{result} = \text{shifted};\)
    if \(d == 15\) then
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        \(R[d] = \text{result};\)
        if setflags then
            \(\text{PSTATE}.N = \text{result}<31>;\)
            \(\text{PSTATE}.Z = \text{IsZeroBit(result)};\)
            \(\text{PSTATE}.C = \text{carry};\)
            // PSTATE.V unchanged
    \end{if}
```

For encoding T2: is the type of shift to be applied to the source register, encoded in the "op" field. It can have the following values:
F5.1.110 MOV, MOVS (register-shifted register)

Move (register-shifted register) copies a register-shifted register value to the destination register. It can optionally update the condition flags based on the value.

This instruction is used by the aliases ASRS (register), ASR (register), LSLS (register), LSL (register), LSRS (register), LSR (register), RORS (register), and ROR (register). See Alias conditions on page F5-3521 for details of when each alias is preferred.

### Assembler symbols

<\>()

See **Standard assembler syntax fields on page F2-3100**.

<\p>

See **Standard assembler syntax fields on page F2-3100**.

<\Rdm>

Is the general-purpose source register and the destination register, encoded in the "Rdm" field.

<\Rd>

Is the general-purpose destination register, encoded in the "Rd" field.

<\Rm>

Is the general-purpose source register, encoded in the "Rm" field.
<type> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:
- LSL when type = 00
- LSR when type = 01
- ASR when type = 10
- ROR when type = 11

<Rs> Is the general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R<s><7:0>);
    (result, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
F5.1.111  **MOVT**

Move Top writes an immediate value to the top halfword of the destination register. It does not affect the contents of the bottom halfword.

```

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

**Assembler symbols**

- `<c>` See **Standard assembler syntax fields** on page F2-3100.
- `<q>` See **Standard assembler syntax fields** on page F2-3100.
- `<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.
- `<imm16>` For encoding A1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:imm12" field.
  For encoding T1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:i:imm3:imm8" field.
Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    \[ R[d]<31:16> = \text{imm16}; \]
    // \[ R[d]<15:0> \] unchanged
F5.1.112  MRC

Move to general-purpose register from System register. This instruction copies the value of a System register to a
general-purpose register.

The System register descriptions identify valid encodings for this instruction. Other encodings are UNDEFINED. For
more information see About the AArch32 System register interface on page E1-3001 and General behavior of
System registers on page G7-5012.

In an implementation that includes EL2, MRC accesses to system control registers can be trapped to Hyp mode,
meaning that an attempt to execute an MRC instruction in a Non-secure mode other than Hyp mode, that would be
permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see EL2
configurable controls on page G1-4711.

Because of the range of possible traps to Hyp mode, the MRC pseudocode does not show these possible traps.

\[ t = \text{UInt}(Rt); \quad cp = \text{if coproc}<0> == '0' \text{ then } 14 \text{ else } 15; \]
// ARMv8-A removes UNPREDICTABLE for R13

Assembler symbols

\(<c>\)  See Standard assembler syntax fields on page F2-3100.
\(<q>\)  See Standard assembler syntax fields on page F2-3100.
\(<\text{coproc}>\)  Is the System register encoding space, encoded in the "coproc<0>" field. It can have the following
values:
\[ p_{14} \quad \text{when coproc}<0> = 0 \]
\[ p_{15} \quad \text{when coproc}<0> = 1 \]
<opc1> Is the opc1 parameter within the System register encoding space, in the range 0 to 7, encoded in the "opc1" field.

<Rt> Is the general-purpose register to be transferred or APSR_nzcv (encoded as 0b1111), encoded in the "Rt" field. If APSR_nzcv is used, bits [31:28] of the transferred value are written to the PSTATE condition flags.

<CRn> Is the CRn parameter within the System register encoding space, in the range c0 to c15, encoded in the "CRn" field.

<CRm> Is the CRm parameter within the System register encoding space, in the range c0 to c15, encoded in the "CRm" field.

<opc2> Is the opc2 parameter within the System register encoding space, in the range 0 to 7, encoded in the "opc2" field.

The possible values of { <coproc>, <opc1>, <CRn>, <CRm>, <opc2> } encode the entire System register and System instruction encoding space. Not all of this space is allocated, and the System register and System instruction descriptions identify the allocated encodings.

**Operation for all encodings**

if ConditionPassed() then
    EncodingSpecificOperations();
    AArch32.CheckSystemAccess(cp, ThisInstr());
    bits(32) value = AArch32.SysRegRead(cp, ThisInstr());
    if t != 15 then
        R[t] = value;
    elsif AArch32.SysRegReadCanWriteAPSR(cp, ThisInstr()) then
        PSTATE.<N,Z,C,V> = value<31:28>;
        // value<27:0> are not used.
    else
        PSTATE.<N,Z,C,V> = bits(4) UNKNOWN;
F5.1.113  MRRC

Move to two general-purpose registers from System register. This instruction copies the value of a System register to two general-purpose registers.

The System register descriptions identify valid encodings for this instruction. Other encodings are UNDEFINED. For more information see About the AArch32 System register interface on page E1-3001 and General behavior of System registers on page G7-5012.

In an implementation that includes EL2, MRRC accesses to System registers can be trapped to Hyp mode, meaning that an attempt to execute an MRRC instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see EL2 configurable controls on page G1-4711.

Because of the range of possible traps to Hyp mode, the MRRC pseudocode does not show these possible traps.

**A1**

```
x = 31 28 26 25 24 23 22 21 20 19 16 15 12 11 9 8 7 4 3 0

<td>Rt2</td>
<td>1 1 1</td>
</tr>
</tbody>
</table>
```

**T1 variant**

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

**Decode for this encoding**

\[t = \text{UInt}(Rt); \ t2 = \text{UInt}(Rt2); \ \ cp = \text{if} \ \ \text{coproc}<0> \ \text{==} \ '0' \ \text{then} \ 14 \ \text{else} \ 15; \]
\[\text{if} \ t == 15 || t2 == 15 || t == t2 \ \text{then} \ \text{UNPREDICTABLE}; \ \text{ARMv8-A} \ \text{removes} \ \text{UNPREDICTABLE for R13} \]
**CONSTRANGED UNPREDICTABLE behavior**

If \( t = t_2 \), then one of the following behaviors must occur:

- The instruction is **UNDEFINED**.
- The instruction executes as **NOP**.
- The value in the destination register is **UNKNOWN**.

**Notes for all encodings**

For more information about the **CONSTRANGED UNPREDICTABLE** behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

**Assembler symbols**

\(<c>\)   See *Standard assembler syntax fields* on page F2-3100.
\(<q>\)   See *Standard assembler syntax fields* on page F2-3100.
\(<\text{coproc}>\)   Is the System register encoding space, encoded in the "\text{coproc}<0>" field. It can have the following values:
\( p14 \)   when \( \text{coproc}<0> = 0 \)
\( p15 \)   when \( \text{coproc}<0> = 1 \)
\(<\text{opc1}>\)   Is the opc1 parameter within the System register encoding space, in the range 0 to 15, encoded in the "opc1" field.
\(<\text{Rt}>\)   Is the first general-purpose register that is transferred into, encoded in the "Rt" field.
\(<\text{Rt2}>\)   Is the second general-purpose register that is transferred into, encoded in the "Rt2" field.
\(<\text{CRm}>\)   Is the CRm parameter within the System register encoding space, in the range c0 to c15, encoded in the "CRm" field.

The possible values of \{ \text{coproc}, \text{opc1}, \text{CRm} \} encode the entire System register encoding space. Not all of this space is allocated, and the System register descriptions identify the allocated encodings.

For the permitted uses of these instructions, as described in this manual, \(<\text{Rt2}>\) transfers bits[63:32] of the selected System register, while \(<\text{Rt}>\) transfers bits[31:0].

**Operation for all encodings**

```c
if ConditionPassed() then
    EncodingSpecificOperations();
    AArch32.CheckSystemAccess(cp, ThisInstr());
    value = AArch32.SysRegRead64(cp, ThisInstr());
    R[t] = value<31:0>;
    R[t2] = value<63:32>;
```
F5.1.114  MRS
Move Special register to general-purpose register moves the value of the APSR, CPSR, or SPSR_<current_mode> into a general-purpose register.

ARM recommends the APSR form when only the N, Z, C, V, Q, and GE[3:0] bits are being written. For more information, see *The Application Program Status Register, APSR on page E1-2986.*

An MRS that accesses the SPSR is UNPREDICTABLE if executed in User mode or System mode.

An MRS that is executed in User mode and accesses the CPSR returns an UNKNOWN value for the CPSR. {E, A, I, F, M} fields.

      psr_val<9:6> = bits(4) UNKNOWN;
      psr_val<4:0> = bits(5) UNKNOWN;
      R[d] = psr_val;

CONSTRANGED UNPREDICTABLE behavior

If PSTATE.M IN {M32_User, M32_System} && read_spsr, then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
F5.1.115  MRS (Banked register)

Move to Register from Banked or Special register moves the value from the Banked general-purpose register or
SPSR of the specified mode, or the value of ELR_hyp on page G1-4613, to a general-purpose register.

MRS (Banked register) is UNPREDICTABLE if executed in User mode.

When EL3 is using AArch64, if an MRS (Banked register) instruction that is executed in a Secure EL1 mode would
access SPSR_mon, SP_mon, or LR_mon, it is trapped to EL3.

The effect of using an MRS (Banked register) instruction with a register argument that is not valid for the current mode
is UNPREDICTABLE. For more information see Usage restrictions on the banked register transfer instructions
on page F5-3929.

                    when '1010x' // Access the Undefined mode registers
                        m = 14 - UInt(SYSm<0>); // LR when SYSm<0> == 0, otherwise SP
                        R[d] = Rmode[m,M32_Undef];
                    when '1011x' // Access Monitor registers
                        if !ELUsingAArch32(EL3) then AArch64.MonitorModeTrap();
                        m = 14 - UInt(SYSm<0>); // LR when SYSm<0> == 0, otherwise SP
                        R[d] = Rmode[m,M32_Monitor];
                    when '11100' // Access ELR_hyp register
                        R[d] = ELR_hyp;
                    when '11111' // Access SP_hyp register
                        R[d] = Rmode[13,M32_Hyp];

        CONSTRAINED UNPREDICTABLE behavior

        If PSTATE_EL == EL0, then one of the following behaviors must occur:

        • The instruction is UNDEFINED.
• The instruction executes as \texttt{NOP}. 
Move to Banked or Special register from general-purpose register moves the value of a general-purpose register to the Banked general-purpose register or SPSR of the specified mode, or to \textit{ELR\_hyp} on page G1-4613.

\texttt{MSR} (Banked register) is \texttt{UNPREDICTABLE} if executed in User mode.

When EL3 is using AArch64, if an \texttt{MSR} (Banked register) instruction that is executed in a Secure EL1 mode would access SPSR\_mon, SP\_mon, or LR\_mon, it is trapped to EL3.

The effect of using an \texttt{MSR} (Banked register) instruction with a register argument that is not valid for the current mode is \texttt{UNPREDICTABLE}. For more information see \textit{Usage restrictions on the banked register transfer instructions} on page F5-3929.

\texttt{A1}

\begin{verbatim}

\textit{Assembler symbols}

\texttt{<c>} See \textit{Standard assembler syntax fields} on page F2-3100.

\texttt{<q>} See \textit{Standard assembler syntax fields} on page F2-3100.
<banked_reg> Is the name of the banked register to be transferred to or from, encoded in the "R:M:M1" field. It can have the following values:

- **R8_usr** when \( R = 0, M = 0, M1 = 0000 \)
- **R9_usr** when \( R = 0, M = 0, M1 = 0001 \)
- **R10_usr** when \( R = 0, M = 0, M1 = 0010 \)
- **R11_usr** when \( R = 0, M = 0, M1 = 0011 \)
- **R12_usr** when \( R = 0, M = 0, M1 = 0100 \)
- **SP_usr** when \( R = 0, M = 0, M1 = 0101 \)
- **LR_usr** when \( R = 0, M = 0, M1 = 0110 \)
- **R8_fiq** when \( R = 0, M = 0, M1 = 1000 \)
- **R9_fiq** when \( R = 0, M = 0, M1 = 1001 \)
- **R10_fiq** when \( R = 0, M = 0, M1 = 1010 \)
- **R11_fiq** when \( R = 0, M = 0, M1 = 1011 \)
- **R12_fiq** when \( R = 0, M = 0, M1 = 1100 \)
- **SP_fiq** when \( R = 0, M = 0, M1 = 1101 \)
- **LR_fiq** when \( R = 0, M = 0, M1 = 1110 \)
- **LR_irq** when \( R = 0, M = 1, M1 = 0000 \)
- **SP_irq** when \( R = 0, M = 1, M1 = 0001 \)
- **LR_svc** when \( R = 0, M = 1, M1 = 0010 \)
- **SP_svc** when \( R = 0, M = 1, M1 = 0011 \)
- **LR_abt** when \( R = 0, M = 1, M1 = 0100 \)
- **SP_abt** when \( R = 0, M = 1, M1 = 0101 \)
- **LR_und** when \( R = 0, M = 1, M1 = 0110 \)
- **SP_und** when \( R = 0, M = 1, M1 = 0111 \)
- **LR_mon** when \( R = 0, M = 1, M1 = 1100 \)
- **SP_mon** when \( R = 0, M = 1, M1 = 1101 \)
- **ELR_hyp** when \( R = 0, M = 1, M1 = 1110 \)
- **SP_hyp** when \( R = 0, M = 1, M1 = 1111 \)
- **SPSR_fiq** when \( R = 1, M = 0, M1 = 1110 \)
- **SPSR_irq** when \( R = 1, M = 1, M1 = 0000 \)
- **SPSR_svc** when \( R = 1, M = 1, M1 = 0001 \)
- **SPSR_abt** when \( R = 1, M = 1, M1 = 0100 \)
- **SPSR_und** when \( R = 1, M = 1, M1 = 0110 \)
- **SPSR_mon** when \( R = 1, M = 1, M1 = 1100 \)
- **SPSR_hyp** when \( R = 1, M = 1, M1 = 1110 \)

The following encodings are UNPREDICTABLE:

- \( R = 0, M = 0, M1 = 0111 \)
- \( R = 0, M = 0, M1 = 1111 \)
- \( R = 0, M = 1, M1 = 10xx \)
- \( R = 1, M = 0, M1 = 0xxx \)
- \( R = 1, M = 0, M1 = 10xx \)
- \( R = 1, M = 0, M1 = 110x \)
- \( R = 1, M = 0, M1 = 1111 \)
- \( R = 1, M = 1, M1 = 0001 \)
R = 1, M = 1, M1 = 0011.
R = 1, M = 1, M1 = 0101.
R = 1, M = 1, M1 = 0111.
R = 1, M = 1, M1 = 10xx.
R = 1, M = 1, M1 = 1101.
R = 1, M = 1, M1 = 1111.

<rn> Is the general-purpose source register, encoded in the "Rn" field.

### Operation for all encodings

```c
if ConditionPassed() then
    EncodingSpecificOperations();
else
    mode = PSTATE.M;
if write_spsr then
    SPSRAccessValid(SYSm, mode); // Check for UNPREDICTABLE cases
    case SYSm of
        when '01110' SPSR_fiq = R[n];
        when '10000' SPSR_irq = R[n];
        when '10010' SPSR_svc = R[n];
        when '10100' SPSR_abt = R[n];
        when '10110' SPSR_und = R[n];
        when '11100' if !ELUsingAArch32(EL3) then AArch64.MonitorModeTrap();
        SPSR_mon = R[n];
        when '11110' SPSR_hyp = R[n];
    else
        BankedRegisterAccessValid(SYSm, mode); // Check for UNPREDICTABLE cases
        case SYSm of
            when '00xxx' // Access the User mode registers
                m = UInt(SYSm<2:0>) + 8;
                Rmode[m,M32_User] = R[n];
            when '01xxx' // Access the FIQ mode registers
                m = UInt(SYSm<2:0>) + 8;
                Rmode[m,M32_FIQ] = R[n];
            when '1000x' // Access the IRQ mode registers
                m = 14 - UInt(SYSm<0>); // LR when SYSm<0> == 0, otherwise SP
                Rmode[m,M32_IRQ] = R[n];
            when '1001x' // Access the Supervisor mode registers
                m = 14 - UInt(SYSm<0>); // LR when SYSm<0> == 0, otherwise SP
                Rmode[m,M32_Svc] = R[n];
            when '1010x' // Access the Abort mode registers
                m = 14 - UInt(SYSm<0>); // LR when SYSm<0> == 0, otherwise SP
                Rmode[m,M32_Abort] = R[n];
            when '1011x' // Access the Undefined mode registers
                m = 14 - UInt(SYSm<0>); // LR when SYSm<0> == 0, otherwise SP
                Rmode[m,M32_Undef] = R[n];
            when '1100x' // Access Monitor registers
                if !ELUsingAArch32(EL3) then AArch64.MonitorModeTrap();
                m = 14 - UInt(SYSm<0>); // LR when SYSm<0> == 0, otherwise SP
                Rmode[m,M32_Monitor] = R[n];
            when '11100' ELR_hyp = R[n];
            when '11111' // Access SP_hyp register
                Rmode[13,M32_Hyp] = R[n];
    end_case;
end_if;
```
CONSTRAINED UNPREDICTABLE behavior

If PSTATE.EL == EL0, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
F5.1.117 MSR (immediate)

Move immediate value to Special register moves selected bits of an immediate value to the corresponding bits in the APSR, CPSR, or SPSR_<current_mode>.

Because of the Do-Not-Modify nature of its reserved bits, the immediate form of MSR is normally only useful at the Application level for writing to APSR_nzcvq (CPSR_f).

If an MSR (immediate) moves selected bits of an immediate value to the CPSR, the PE checks whether the value being written to PSTATE.M is legal. See Illegal changes to PSTATE.M on page G1-4618.

An MSR (immediate) executed in User mode:

- Is CONSTRAINED UNPREDICTABLE if it attempts to update the SPSR.
- Otherwise, does not update any CPSR field that is accessible only at EL1 or higher.

An MSR (immediate) executed in System mode is CONSTRAINED UNPREDICTABLE if it attempts to update the SPSR.

The CPSR.E bit is writable from any mode using an MSR instruction. ARM deprecates using this to change its value.

A1

```
| 31 28|27 26 25 24|23 22 21 20|19 16|15 14 13 12|11 | | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| !=1111 | 0 0 1 1 0 | R 1 0 | mask | (1)| (1)| (1) | imm12 |
cond
```

A1 variant

Applies when !(R == 0 && mask == 0000).

MSR{<c>}{<q>} <spec_reg>, #<imm>

**Decode for this encoding**

```
if mask == '0000' && R == '0' then SEE "Related encodings";
imm32 = A32ExpandImm(imm12); write_spsr = (R == '1');
if mask == '0000' then UNPREDICTABLE;
```

**CONSTRAINED UNPREDICTABLE behavior**

If mask == '0000' && R == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Related encodings: Move Special Register and Hints (immediate) on page F4-3213.

**Assembler symbols**

- See Standard assembler syntax fields on page F2-3100.
- See Standard assembler syntax fields on page F2-3100.
- Is one of:
  - APSR_bits.
• CPSR_<fields>.
• SPSR_<fields>.

For CPSR and SPSR, <fields> is a sequence of one or more of the following:

c mask<0> = '1' to enable writing of bits<7:0> of the destination PSR.
x mask<1> = '1' to enable writing of bits<15:8> of the destination PSR.
s mask<2> = '1' to enable writing of bits<23:16> of the destination PSR.
f mask<3> = '1' to enable writing of bits<31:24> of the destination PSR.

For APSR, <bits> is one of nzcvq, g, or nzcvqg. These map to the following CPSR_<fields> values:

• APSR_nzcvq is the same as CPSR_f (mask== '1000').
• APSR_g is the same as CPSR_s (mask == '0100').
• APSR_nzcvqg is the same as CPSR_fs (mask == '1100').

ARM recommends the APSR_<bits> forms when only the N, Z, C, V, Q, and GE[3:0] bits are being written. For more information, see The Application Program Status Register, APSR on page E1-2986.

<imm> is an immediate value. See Modified immediate constants in A32 instructions on page F2-3117 for the range of values.

**Operation**

if ConditionPassed() then
    EncodingSpecificOperations();
    if write_spsr then
        if PSTATE.M IN {M32_User,M32_System} then
            UNPREDICTABLE;
        else
            SPSRWriteByInstr(imm32, mask);
    else
        // Attempts to change to an illegal mode will invoke the Illegal Execution state mechanism
        CPSRWriteByInstr(imm32, mask);

**CONSTRAINED UNPREDICTABLE behavior**

If PSTATE.M IN {M32_User,M32_System} && write_spsr, then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
F5.1.118   MSR (register)

Move general-purpose register to Special register moves selected bits of a general-purpose register to the APSR, CPSR or SPSR.<current_mode>.

Because of the Do-Not-Modify nature of its reserved bits, a read-modify-write sequence is normally required when the MSR instruction is being used at Application level and its destination is not APSR.nzcvq (CPSR.f).

If an MSR (register) moves selected bits of an immediate value to the CPSR, the PE checks whether the value being written to PSTATE.M is legal. See Illegal changes to PSTATE.M on page G1-4618.

An MSR (register) executed in User mode:
• Is UNPREDICTABLE if it attempts to update the SPSR.
• Otherwise, does not update any CPSR field that is accessible only at EL1 or higher.

An MSR (register) executed in System mode is UNPREDICTABLE if it attempts to update the SPSR.

The CPSR.E bit is writable from any mode using an MSR instruction. ARM deprecates using this to change its value.

\[ \text{if } n == 15 \text{ then UNPREDICTABLE;} // ARMv8-A removes UNPREDICTABLE for R13 \]
CONSTRAINED UNPREDICTABLE behavior

If \( \text{mask} = '0000' \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

- `<c>` See Standard assembler syntax fields on page F2-3100.
- `<q>` See Standard assembler syntax fields on page F2-3100.
- `<spec_reg>` Is one of:
  - `APSR_<bits>`.
  - `CPSR_<fields>`.
  - `SPSR_<fields>`.

  For CPSR and SPSR, `<fields>` is a sequence of one or more of the following:
  - `c` mask<0> = '1' to enable writing of bits<7:0> of the destination PSR.
  - `x` mask<1> = '1' to enable writing of bits<15:8> of the destination PSR.
  - `s` mask<2> = '1' to enable writing of bits<23:16> of the destination PSR.
  - `f` mask<3> = '1' to enable writing of bits<31:24> of the destination PSR.

  For APSR, `<bits>` is one of `nzcvq`, `g`, or `nzcvqg`. These map to the following CPSR_<fields> values:
  - `APSR_nzcvq` is the same as `CPSR_f` (mask== '1000').
  - `APSR_g` is the same as `CPSR_s` (mask == '0100').
  - `APSR_nzcvqg` is the same as `CPSR_fs` (mask == '1100').

  ARM recommends the `APSR_<bits>` forms when only the N, Z, C, V, Q, and GE[3:0] bits are being written. For more information, see The Application Program Status Register, APSR on page E1-2986.

- `<Rn>` Is the general-purpose source register, encoded in the "Rn" field.

Operation for all encodings

    CPSRWriteByInstr(R[n], mask);

CONSTRAINED UNPREDICTABLE behavior

If write_spsr && PSTATE.M IN {M32_User,M32_System}, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
• The instruction executes as `NOP`. 
F5.1.119  MUL, MULS

Multiply multiplies two register values. The least significant 32 bits of the result are written to the destination register. These 32 bits do not depend on whether the source register values are considered to be signed values or unsigned values.

Optionally, it can update the condition flags based on the result. In the T32 instruction set, this option is limited to only a few forms of the instruction. Use of this option adversely affects performance on many implementations.

T2 variant

$\text{MUL}\{c\}.W <Rd>, <Rn>\{, <Rm>\} // Inside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1$

$\text{MUL}\{c\}\{q\} <Rd>, <Rn>\{, <Rm>\}$
Decode for this encoding

d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); setflags = FALSE;
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

<
See Standard assembler syntax fields on page F2-3100.

>
See Standard assembler syntax fields on page F2-3100.

<Rdm>
Is the second general-purpose source register holding the multiplier and the destination register, encoded in the "Rdm" field.

<Rd>
Is the general-purpose destination register, encoded in the "Rd" field.

<Rn>
Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

<Rm>
Is the second general-purpose source register holding the multiplier, encoded in the "Rm" field. If omitted, <Rd> is used.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    operand1 = SInt(R[n]); // operand1 = UInt(R[n]) produces the same final results
    operand2 = SInt(R[m]); // operand2 = UInt(R[m]) produces the same final results
    result = operand1 * operand2;
    R[d] = result<31:0>;
    if setflags then
        PSTATE.N = result<31:0>;
        PSTATE.Z = IsZeroBit(result<31:0>);
        // PSTATE.C, PSTATE.V unchanged
F5.1.120  **MVN, MVNS (immediate)**

Bitwise NOT (immediate) writes the bitwise inverse of an immediate value to the destination register.

If the destination register is not the PC, the MVNS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The MVN variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2983.
- The MVNS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-4646.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

        PSTATE.C = carry;
        // PSTATE.V unchanged
```
F5.1.126 ORR, ORRS (immediate)

Bitwise OR (immediate) performs a bitwise (inclusive) OR of a register value and an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the ORRS variant of the instruction updates the condition flags based on the result.

The field descriptions for `<Rd>` identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The ORR variant of the instruction is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
- The ORRS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See Illegal return events from AArch32 state on page G1-4646.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1

```
![1111] 0 0 1 1 0 0 S  Rn  Rd  imm12  
cond

ORR variant

Applies when $S = 0$.

ORR{<c>}{<q>} {<Rd>,} <Rn>, #<const>

ORRS variant

Applies when $S = 1$.

ORRS{<c>}{<q>} {<Rd>,} <Rn>, #<const>

Decode for all variants of this encoding

$d = $UInt(Rd);  $n = $UInt(Rn);  $setflags = ($S == '1');
(imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);
```

T1

```
[1111] 0 0 1 1 0 0 S  l=1111 0  imm3  Rd  imm8  
Rn

ORR variant

Applies when $S = 0$.

ORR{<c>}{<q>} {<Rd>,} <Rn>, #<const>

ORRS variant

Applies when $S = 1$.
ORRS{<c>}{<q>} {<Rd>,} <Rn>, #<const>

**Decode for all variants of this encoding**

if Rn == '1111' then SEE "MOV (immediate)";
\[ d = \text{UInt}(\text{Rd}); \quad n = \text{UInt}(\text{Rn}); \quad \text{setflags} = (S == '1'); \]
\[ (\text{imm32}, \text{carry}) = \text{T32ExpandImm}_C(i:imm3:imm8, \text{PSTATE.C}); \]
if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

**Assembler symbols**

- `<c>` See Standard assembler syntax fields on page F2-3100.
- `<q>` See Standard assembler syntax fields on page F2-3100.
- `<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`. ARM deprecates using the PC as the destination register, but if the PC is used:
  - For the ORR variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
  - For the ORRS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.
- `<Rn>` For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.
  For encoding T1: is the general-purpose source register, encoded in the "Rn" field.
- `<const>` For encoding A1: an immediate value. See Modified immediate constants in A32 instructions on page F2-3117 for the range of values.
  For encoding T1: an immediate value. See Modified immediate constants in T32 instructions on page F2-3116 for the range of values.

**Operation for all encodings**

if ConditionPassed() then
    EncodingSpecificOperations();
    result = R[n] OR imm32;
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
F5.1.127 ORR, ORRS (register)

Bitwise OR (register) performs a bitwise (inclusive) OR of a register value and an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the ORRS variant of the instruction updates the condition flags based on the result.

The field descriptions for $<Rd>$ identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The ORR variant of the instruction is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
- The ORRS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See Illegal return events from AArch32 state on page G1-4646.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

**Notes for all encodings**

For more information about the **CONSTRAINED UNPREDICTABLE** behavior of this instruction, see Appendix K1

**Architectural Constraints on UNPREDICTABLE behaviors.**

Related encodings: **Data-processing (shifted register) on page F3-3142**
Assembler symbols

<c>
See Standard assembler syntax fields on page F2-3100.

<q>
See Standard assembler syntax fields on page F2-3100.

<Rdn>
Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.

<Rd>
For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the ORR variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
- For the ORRS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn>
For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.

<Rm>
For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

<shift>
Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

- LSL when type = 00
- LSR when type = 01
- ASR when type = 10
- ROR when type = 11

<amount>
For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

In T32 assembly:

- Outside an IT block, if ORRS <Rd>, <Rn>, <Rd> is written with <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though ORRS <Rd>, <Rn> had been written.
- Inside an IT block, if ORR<c> <Rd>, <Rn>, <Rd> is written with <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though ORR<c> <Rd>, <Rn> had been written.

To prevent either of these happening, use the .W qualifier.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] OR shifted;
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
else
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
F5.1.128 **ORR, ORRS (register-shifted register)**

Bitwise OR (register-shifted register) performs a bitwise (inclusive) OR of a register value and a register-shifted register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

  R[d]<31:16> = if tbform then R[n]<31:16> else operand2<31:16>;
F5.1.130   PLD, PLDW (immediate)

Preload Data (immediate) signals the memory system that data memory accesses from a specified address are likely
in the near future. The memory system can respond by taking actions that are expected to speed up the memory
accesses when they do occur, such as preloading the cache line containing the specified address into the data cache.

The PLD instruction signals that the likely memory access is a read, and the PLDW instruction signals that it is a write.

The effect of a PLD or PLDW instruction is IMPLEMENTATION DEFINED. For more information, see Preloading caches
on page E2-3025.

\]
F5.1.131  PLD (literal)

Preload Data (literal) signals the memory system that data memory accesses from a specified address are likely in
the near future. The memory system can respond by taking actions that are expected to speed up the memory
accesses when they do occur, such as preloading the cache line containing the specified address into the data cache.

The effect of a PLD instruction is IMPLEMENTATION DEFINED. For more information, see Preloading caches
on page E2-3025.

A1

```
| 31 30 29 28|27 26 25 24|23 22 21 20|19 18 17 16|15 14 13 12|11 | | 0 |
| 1 1 1 0 0 |1 U(1) 0 1 |1 1 1 1 |1 1 |1 |1 |
```

**A1 variant**

PLD{<c>}{<q>} <label> // Normal form
PLD{<c>}{<q>} [PC, #{+/-}<imm>] // Alternative form

**Decode for this encoding**

\[\text{imm32} = \text{ZeroExtend}(\text{imm12}, 32); \quad \text{add} = (U == '1');\]

T1

```
| 15 14 13 12|11 10 9 |8 7 6 5 |4 3 2 1 |0 |15 14 13 12|11 | | 0 |
| 1 1 1 1 0 |0 0 U 1 |1 1 1 1 |1 1 |1 |
```

**T1 variant**

PLD{<c>}{<q>} <label> // Preferred syntax
PLD{<c>}{<q>} [PC, #{+/-}<imm>] // Alternative syntax

**Decode for this encoding**

\[\text{imm32} = \text{ZeroExtend}(\text{imm12}, 32); \quad \text{add} = (U == '1');\]

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1
Architectural Constraints on UNPREDICTABLE behaviors.

**Assembler symbols**

- `<c>`  For encoding A1: see Standard assembler syntax fields on page F2-3100. Must be AL or omitted.
  For encoding T1: see Standard assembler syntax fields on page F2-3100.

- `<q>`  See Standard assembler syntax fields on page F2-3100.

- `<label>`  The label of the literal data item that is likely to be accessed in the near future. The assembler
calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label.
The offset must be in the range –4095 to 4095.
If the offset is zero or positive, \(\text{imm32}\) is equal to the offset and \(\text{add} = \text{TRUE}\).
If the offset is negative, \(\text{imm32}\) is equal to minus the offset and \(\text{add} = \text{FALSE}\).
+/−  Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when $U = 0$
+ when $U = 1$

<imm>  For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.
For encoding T1: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see Use of labels in UAL instruction syntax on page F1-3059.

**Operation for all encodings**

if ConditionPassed() then
   EncodingSpecificOperations();
   address = if add then (Align(PC,4) + imm32) else (Align(PC,4) - imm32);
   Hint_PreloadData(address);
F5.1.132   PLD, PLDW (register)

Preload Data (register) signals the memory system that data memory accesses from a specified address are likely in
the near future. The memory system can respond by taking actions that are expected to speed up the memory
accesses when they do occur, such as preloading the cache line containing the specified address into the data cache.

The PLD instruction signals that the likely memory access is a read, and the PLDW instruction signals that it is a write.

The effect of a PLD or PLDW instruction is IMPLEMENTATION DEFINED. For more information, see Preloading caches
on page E2-3025.

**Notes for all encodings**

For more information about the CONSTRANGED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

**Assembler symbols**

- **<c>** For encoding A1: see *Standard assembler syntax fields* on page F2-3100. <c> must be AL or omitted.
  
  For encoding T1: see *Standard assembler syntax fields* on page F2-3100.

- **<q>** See *Standard assembler syntax fields* on page F2-3100.

- **<Rn>** For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used.
  
  For encoding T1: is the general-purpose base register, encoded in the "Rn" field.

- **/+/-** Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

  - - when U = 0
  - + when U = 1

- **+** Specifies the index register is added to the base register.

- **<Rm>** Is the general-purpose index register, encoded in the "Rm" field.

- **<shift>** Is the type of shift to be applied to the index register, encoded in the "type" field. It can have the following values:

  - LSL when type = 00
  - LSR when type = 01
  - ASR when type = 10
  - ROR when type = 11

- **<amount>** For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

  For encoding T1: is the shift amount, in the range 0 to 3, defaulting to 0 and encoded in the "imm2" field.

**Operation for all encodings**

if ConditionPassed() then

    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    address = if add then R[n] + offset else R[n] - offset;
    if is_pldw then

PLI{<c>}{<q>} [PC, #{+/-}<imm>] // Alternative syntax

Decode for this encoding

n = 15;  imm32 = ZeroExtend(imm12, 32);  add = (U == '1');

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

<c> For encoding A1: see Standard assembler syntax fields on page F2-3100. Must be AL or omitted.

For encoding T1, T2 and T3: see Standard assembler syntax fields on page F2-3100.

<q> See Standard assembler syntax fields on page F2-3100.

<label> The label of the instruction that is likely to be accessed in the near future. The assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. The offset must be in the range –4095 to 4095.

If the offset is zero or positive, imm32 is equal to the offset and add == TRUE.

If the offset is negative, imm32 is equal to minus the offset and add == FALSE.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

+/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when U = 0
+ when U = 1

+ Specifies the offset is added to the base register.

<imm> For encoding A1: is the optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

For encoding T1: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

For encoding T2: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

For encoding T3: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

For the literal forms of the instruction, encoding T3 is used, or Rn is encoded as 0b1111 in encoding A1, to indicate that the PC is the base register.

The alternative literal syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see Use of labels in UAL instruction syntax on page F1-3059.

Assembler symbols

<>

For encoding A1: see Standard assembler syntax fields on page F2-3100. <> must be AL or omitted.
For encoding T1: see *Standard assembler syntax fields* on page F2-3100.

\(<q>\) See *Standard assembler syntax fields* on page F2-3100.

\(<Rn>\) Is the general-purpose base register, encoded in the "Rn" field.

\(+/−\) Specifies the index register is added to or subtracted from the base register, defaulting to \(+\) if omitted and encoded in the "U" field. It can have the following values:
- \(-\) when \(U = 0\)
+ \(+\) when \(U = 1\)

\(+\) Specifies the index register is added to the base register.

\(<Rm>\) Is the general-purpose index register, encoded in the "Rm" field.

\(<\text{shift}>\) Is the type of shift to be applied to the index register, encoded in the "type" field. It can have the following values:
- LSL when \(type = 00\)
- LSR when \(type = 01\)
- ASR when \(type = 10\)
- ROR when \(type = 11\)

\(<\text{amount}>\) For encoding A1: is the shift amount, in the range 1 to 31 (when \(<\text{shift}> = \text{LSL or ROR}\) or 1 to 32 (when \(<\text{shift}> = \text{LSR or ASR}\) encoded in the "imm5" field as \(<\text{amount}>\) modulo 32.

For encoding T1: is the shift amount, in the range 0 to 3, defaulting to 0 and encoded in the "imm2" field.

**Operation for all encodings**

\[\text{if ConditionPassed()} \text{ then} \]
\[\text{EncodingSpecificOperations();} \]
\[\text{offset = Shift(R[m], shift_t, shift_n, PSTATE.C);} \]
\[\text{address = if add then (R[n] + offset) else (R[n] - offset);} \]
\[\text{Hint_PreloadInstr(address);} \]
**F5.1.135 POP**

Pop Multiple Registers from Stack loads multiple general-purpose registers from the stack, loading from consecutive memory locations starting at the address in SP, and updates SP to point just above the loaded data.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also *Encoding of lists of general-purpose registers and the PC on page F2-3107*.

The registers loaded can include the PC, causing a branch to a loaded address. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983*.

**T1**

```
|15 14 13 12|11 10 9 8 7 | 0 |
1 0 1 1 1 0 P register_list
```

**T1 variant**

POP{<c>}{<q>} {registers} // Preferred syntax
LDM{<c>}{<q>} SP!, {registers} // Alternate syntax

**Decode for this encoding**

```
registers = P:’0000000’::register_list; UnalignedAllowed = FALSE;
if BitCount(registers) < 1 then UNPREDICTABLE;
if registers<15> == ’1’ && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

**CONSTRAINED UNPREDICTABLE behavior**

If `BitCount(registers) < 1`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction targets an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors*.

**Assembler symbols**

- `<c>` See *Standard assembler syntax fields on page F2-3100*.
- `<q>` See *Standard assembler syntax fields on page F2-3100*.
- `<registers>` Is a list of one or more registers to be loaded, separated by commas and surrounded by `{ and `}.

The registers in the list must be in the range R0-R7, encoded in the "register_list" field, and can optionally include the PC. If the PC is in the list, the "P" field is set to 1, otherwise this field defaults to 0.

If the PC is in the list, the instruction must be either outside any IT block, or the last instruction in an IT block.
Operation

if ConditionPassed() then
    EncodingSpecificOperations();
    address = SP;
    for i = 0 to 14
        if registers<i> == '1' then
            R[i] = if UnalignedAllowed then MemU[address,4] else MemA[address,4];
            address = address + 4;
        if registers<15> == '1' then
            if UnalignedAllowed then
                if address<1:0> == '00' then
                    LoadWritePC(MemU[address,4]);
                else
                    UNPREDICTABLE;
                else
                    LoadWritePC(MemA[address,4]);
                end
            if registers<13> == '0' then
                SP = SP + 4*BitCount(registers);
            if registers<13> == '1' then
                SP = bits(32) UNKNOWN;
        end
### F5.1.136 POP (multiple registers)

Pop Multiple Registers from Stack loads multiple general-purpose registers from the stack, loading from consecutive memory locations starting at the address in SP, and updates SP to point just above the loaded data.

This instruction is an alias of the LDM, LDMIA, LDMFD instruction. This means that:

- The encodings in this description are named to match the encodings of LDM, LDMIA, LDMFD.
- The description of LDM, LDMIA, LDMFD gives the operational pseudocode for this instruction.

#### A1 variant

\[
\text{POP}\{<c>\}{<q>} <\text{registers}>
\]

is equivalent to

\[
\text{LDM}\{<c>\}{<q>} SP!, <\text{registers}>
\]

and is the preferred disassembly when \(\text{BitCount}(\text{register\_list}) \geq 1\).

#### T2 variant

\[
\text{POP}\{<c>\}W <\text{registers}> // \text{All registers in R0-R7, PC}
\]

is equivalent to

\[
\text{LDM}\{<c>\}SP!, <\text{registers}>
\]

and is the preferred disassembly when \(\text{BitCount(P:M:register\_list)} \geq 1\).

\[
\text{POP}\{<c>\}{<p>} <\text{registers}>
\]

is equivalent to

\[
\text{LDM}\{<c>\}SP!, <\text{registers}>
\]

and is the preferred disassembly when \(\text{BitCount(P:M:register\_list)} \geq 1\).

#### Assembler symbols

- `<c>` See *Standard assembler syntax fields on page F2-3100*.
- `<p>` See *Standard assembler syntax fields on page F2-3100*.
- `<registers>` For encoding A1: is a list of two or more registers to be loaded, separated by commas and surrounded by `{` and `}`. The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also *Encoding of lists of general-purpose registers and the PC on page F2-3107*.  

If the SP is in the list, the value of the SP after such an instruction is **UNKNOWN**.
The PC can be in the list. If it is, the instruction branches to the address loaded to the PC. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2983.

ARM deprecated the use of this instruction with both the LR and the PC in the list.

For encoding T2: is a list of two or more registers to be loaded, separated by commas and surrounded by { and }. The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also *Encoding of lists of general-purpose registers and the PC* on page F2-3107.

The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain one of the LR or the PC. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0. If the PC is in the list, the "P" field is set to 1, otherwise it defaults to 0.

The PC can be in the list. If it is, the instruction branches to the address loaded to the PC. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2983. If the PC is in the list:

- The LR must not be in the list.
- The instruction must be either outside any IT block, or the last instruction in an IT block.

**Operation for all encodings**

The description of LDM, LDMIA, LDMFD gives the operational pseudocode for this instruction.
F5.1.137 POP (single register)

Pop Single Register from Stack loads a single general-purpose register from the stack, loading from the address in SP, and updates SP to point just above the loaded data.

This instruction is an alias of the LDR (immediate) instruction. This means that:

- The encodings in this description are named to match the encodings of LDR (immediate).
- The description of LDR (immediate) gives the operational pseudocode for this instruction.

### A1

![Instruction format](image)

**Post-indexed variant**

POP{<c>}{<q>} <single_register_list>

is equivalent to

LDR{<c>}{<q>} <Rt>, [SP], #4

and is always the preferred disassembly.

### T4

![Instruction format](image)

**Post-indexed variant**

POP{<c>}{<q>} <single_register_list>

is equivalent to

LDR{<c>}{<q>} <Rt>, [SP], #4

and is always the preferred disassembly.

### Assembler symbols

- **<c>** See Standard assembler syntax fields on page F2-3100.
- **<q>** See Standard assembler syntax fields on page F2-3100.
- **<single_register_list>**
  - Is the general-purpose register <Rt> to be loaded surrounded by { and }.
- **<Rt>** For encoding A1, is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
For encoding T4: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, provided the instruction is either outside an IT block or the last instruction of an IT block. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.

**Operation for all encodings**

The description of LDR (immediate) gives the operational pseudocode for this instruction.
### F5.1.138 PUSH

Push Multiple Registers to Stack stores multiple general-purpose registers to the stack, storing to consecutive memory locations ending just below the address in SP, and updates SP to point to the start of the stored data. The lowest-numbered register is stored to the lowest memory address, through to the highest-numbered register to the highest memory address. See also Encoding of lists of general-purpose registers and the PC on page F2-3107.

#### T1

```
15 14 13 12|11 10 9 8 7 | 0 |
1 0 1 1 0 1 0 M  register_list
```

#### T1 variant

PUSH{<c>}{<q>} <registers> // Preferred syntax
STMDB{<c>}{<q>} SP!, <registers> // Alternate syntax

**Decode for this encoding**

- registers = '0':M:'000000':register_list; UnalignedAllowed = FALSE;
- if BitCount(registers) < 1 then UNPREDICTABLE;

**CONSTRAINED UNPREDICTABLE behavior**

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction targets an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

**Assembler symbols**

- `<>` See Standard assembler syntax fields on page F2-3100.
- `<q>` See Standard assembler syntax fields on page F2-3100.
- `<registers>` Is a list of one or more registers to be stored, separated by commas and surrounded by { and }.

The registers in the list must be in the range R0-R7, encoded in the "register_list" field, and can optionally include the LR. If the LR is in the list, the "M" field is set to 1, otherwise this field defaults to 0.

**Operation**

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations();
    address = SP - 4*BitCount(registers);
    for i = 0 to 14
        if registers<i> == '1' then
            if i == 13 && i != LowestSetBit(registers) then // Only possible for encoding A1
                MemA[address,4] = bits(32) UNKNOWN;
```
else
  if UnalignedAllowed then
    MemU[address,4] = R[i];
  else
    MemA[address,4] = R[i];
  address = address + 4;
if registers<15> == '1' then  // Only possible for encoding A1 or A2
  if UnalignedAllowed then
    MemU[address,4] = PCStoreValue();
  else
    MemA[address,4] = PCStoreValue();
SP = SP - 4*BitCount(registers);
F5.1.139  **PUSH (multiple registers)**

Push multiple registers to Stack stores multiple general-purpose registers to the stack, storing to consecutive memory locations ending just below the address in SP, and updates SP to point to the start of the stored data.

This instruction is an alias of the STMDB, STMFD instruction. This means that:

- The encodings in this description are named to match the encodings of STMDB, STMFD.
- The description of STMDB, STMFD gives the operational pseudocode for this instruction.

### A1 variant

```
PUSH{<c>}{<q>} <registers>
```

is equivalent to

```
STMDB{<c>}{<q>} SP!, <registers>
```

and is the preferred disassembly when `BitCount(register_list) > 1`.

### T1 variant

```
PUSH{<c>}.W <registers> // All registers in R0-R7, LR
```

is equivalent to

```
STMDB{<c>}{<q>} SP!, <registers>
```

and is the preferred disassembly when `BitCount(M:register_list) > 1`.

### Assembler symbols

- `<c>`: See **Standard assembler syntax fields** on page F2-3100.
- `<q>`: See **Standard assembler syntax fields** on page F2-3100.
- `<registers>`: For encoding A1: is a list of two or more registers to be stored, separated by commas and surrounded by `{` and `}`. The lowest-numbered register is stored to the lowest memory address, through to the highest-numbered register to the highest memory address. See also **Encoding of lists of general-purpose registers and the PC** on page F2-3107.
The SP and PC can be in the list. However:

- ARM deprecates the use of instructions that include the PC in the list.
- If the SP is in the list, and it is not the lowest-numbered register in the list, the instruction stores an UNKNOWN value for the SP.

For encoding T1: is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The lowest-numbered register is stored to the lowest memory address, through to the highest-numbered register to the highest memory address. See also Encoding of lists of general-purpose registers and the PC on page F2-3107.

The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain the LR. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0.

**Operation for all encodings**

The description of STMDB, STMFD gives the operational pseudocode for this instruction.
F5.1.140   PUSH (single register)

Push Single Register to Stack stores a single general-purpose register to the stack, storing to the 32-bit word below the address in SP, and updates SP to point to the start of the stored data.

This instruction is an alias of the STR (immediate) instruction. This means that:

- The encodings in this description are named to match the encodings of STR (immediate).
- The description of STR (immediate) gives the operational pseudocode for this instruction.

A1

```
|31  28|27 26 25 24|23 22 21 20|19 16|15 |12|11 | | | 0 |
     !=1111  0 1 0 1 0 0 1 1 0 1 0 | Rt 0 0 0 0 0 0 0 0 1 0 0 |
cond P U W Rn imm12
```

**Pre-indexed variant**

PUSH{<c>}{<q>} <single_register_list>

is equivalent to

STR{<c>}{<q>} <Rt>, [SP, #-4]!

and is always the preferred disassembly.

T4

```
|15 14 13 12|11 10 9 8|7 6 5 4|3 0|15 |12|11|10 9 8|7 | | 0 |
1 1 1 1 1 1 0 0 0 1 0 1 1 0 1 0 | Rt 1 1 0 1 0 0 0 0 1 0 0 |
Rn P U W imm8
```

**Pre-indexed variant**

PUSH{<c>}{<q>} <single_register_list> // Standard syntax

is equivalent to

STR{<c>}{<q>} <Rt>, [SP, #-4]!

and is always the preferred disassembly.

**Assembler symbols**

- `<c>` See [Standard assembler syntax fields on page F2-3100](#).
- `<q>` See [Standard assembler syntax fields on page F2-3100](#).
- `<single_register_list>` Is the general-purpose register <Rt> to be stored surrounded by { and }.
- `<Rt>` For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated.
  For encoding T4: is the general-purpose register to be transferred, encoded in the "Rt" field.

**Operation for all encodings**

The description of STR (immediate) gives the operational pseudocode for this instruction.
F5.1.141   QADD

Saturating Add adds two register values, saturates the result to the 32-bit signed integer range \(-2^{31}\) to \(2^{31} - 1\), and writes the result to the destination register. If saturation occurs, it sets PSTATE.Q to 1.

A1

\[
\text{if } m != n \quad \text{||} \quad d == 15 \quad \text{||} \quad m == 15 \text{ then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13}
\]

CONSTRAINED UNPREDICTABLE behavior

If m != n, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
• The instruction executes with the additional decode: \( m = \text{UInt}(Rn) \);
• The instruction executes with the additional decode: \( m = \text{UInt}(Rm) \);
• The value in the destination register is \text{UNKNOWN}.

Notes for all encodings

For more information about the \text{CONSTRAINED UNPREDICTABLE} behavior of this instruction, see Appendix K1 \textit{Architectural Constraints on UNPREDICTABLE behaviors}.

Assembler symbols

<
> See \textit{Standard assembler syntax fields} on page F2-3100.

<
> See \textit{Standard assembler syntax fields} on page F2-3100.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<Rm> For encoding A1 and T1: is the general-purpose source register, encoded in the "Rm" field.
For encoding T2: is the general-purpose source register, encoded in the "Rm" field. It must be encoded with an identical value in the "Rn" field.

Operation for all encodings

    EncodingSpecificOperations();
    \text{bits(32) result;}
    \text{result}<31:8> = \text{SignExtend}(R[m]<7:0>, 24);
    \text{result}<7:0> = R[m]<15:8>
    R[d] = result;
F5.1.155  RFE, RFEDA, RFEDB, RFEIA, RFEIB

Return From Exception loads two consecutive memory locations using an address in a base register:

- The word loaded from the lower address is treated as an instruction address. The PE branches to it.
- The word loaded from the higher address is used to restore PSTATE. This word must be in the format of an SPSR.

An address adjusted by the size of the data loaded can optionally be written back to the base register.

The PE checks the value of the word loaded from the higher address for an illegal return event. See Illegal return events from AArch32 state on page G1-4646.

RFE is UNDEFINED in Hyp mode and CONSTRAINED UNPREDICTABLE in User mode.

**T3**

```
|[15 14 13 12|11 10 9 8 7 6 5 4|3 2 1 0|15 14 12|11 8 7 6 5 4 3 0 |
|1 1 1 0 1 0 0 0 1 1 1 1 1 (0) (0) (0) 0 0 0 0 |
|S imm3 imm2 type |
```

**MOVS, rotate right with extend variant**

RRXS{<c>}{<q>} {<Rd>,} <Rm>

is equivalent to

MOVS{<c>}{<q>} <Rd>, <Rm>, RRX

and is always the preferred disassembly.

**Assembler symbols**

<>

See Standard assembler syntax fields on page F2-3100.
See Standard assembler syntax fields on page F2-3100.

For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. ARM deprecates using the PC as the destination register, but if the PC is used, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T3: is the general-purpose destination register, encoded in the "Rd" field.

For encoding A1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T3: is the general-purpose source register, encoded in the "Rm" field.

Operation for all encodings

The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.
F5.1.162 RSB, RSBS (immediate)

Reverse Subtract (immediate) subtracts a register value from an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the RSBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The RSB variant of the instruction is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
- The RSBS variant of the instruction performs an exception return without the use of the stack. In this case:
  — The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  — The PE checks SPSR_<current_mode> for an illegal return event. See Illegal return events from AArch32 state on page G1-4646.
  — The instruction is UNDEFINED in Hyp mode.
  — The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

#### Notes for all encodings

For more information about the CONstrained UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

- `<c>` See Standard assembler syntax fields on page F2-3100.
- `<p>` See Standard assembler syntax fields on page F2-3100.
- `<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`. ARM deprecates using the PC as the destination register, but if the PC is used:
  - For the RSB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
  - For the RSBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.
    - For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`.
- `<Rn>` For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.
  - For encoding T1: is the first general-purpose source register, encoded in the "Rn" field.
<Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.
For encoding T1: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:
- LSL when type = 00
- LSR when type = 01
- ASR when type = 10
- ROR when type = 11

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.
For encoding T1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(NOT(R[n]), shifted, '1');
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
F5.1.164   RSB, RSBS (register-shifted register)

Reverse Subtract (register-shifted register) subtracts a register value from a register-shifted register value, and
writes the result to the destination register. It can optionally update the condition flags based on the result.

A1

Flag setting variant

Applies when \( S = 1 \).

\[
\text{RSBS}\{<c>\}{<q>} \{<Rd>,\} <Rn>, <Rm>, <type> <Rs>
\]

Not flag setting variant

Applies when \( S = 0 \).

\[
\text{RSB}\{<c>\}{<q>} \{<Rd>,\} <Rn>, <Rm>, <type> <Rs>
\]

Decode for all variants of this encoding

\[
\begin{align*}
d &= \text{UInt}(Rd); \quad n &= \text{UInt}(Rn); \quad m &= \text{UInt}(Rm); \quad s &= \text{UInt}(Rs); \\
\text{setflags} &= (S == '1'); \quad \text{shift_t} &= \text{DecodeRegShift}(type); \\
\text{if } d == 15 \quad || \quad n == 15 \quad || \quad m == 15 \quad || \quad s == 15 \quad \text{then UNPREDICTABLE;}
\end{align*}
\]

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1
Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

\(<c>\)   See Standard assembler syntax fields on page F2-3100.

\(<q>\)   See Standard assembler syntax fields on page F2-3100.

\(<Rd>\)  Is the general-purpose destination register, encoded in the "Rd" field.

\(<Rn>\)  Is the first general-purpose source register, encoded in the "Rn" field.

\(<Rm>\)  Is the second general-purpose source register, encoded in the "Rm" field.

\(<type>\) Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have
the following values:

<table>
<thead>
<tr>
<th>Shift Type</th>
<th>Type Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>LSL</td>
<td>type = 00</td>
</tr>
<tr>
<td>LSR</td>
<td>type = 01</td>
</tr>
<tr>
<td>ASR</td>
<td>type = 10</td>
</tr>
<tr>
<td>ROR</td>
<td>type = 11</td>
</tr>
</tbody>
</table>

\(<Rs>\)   Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in
the "Rs" field.
Operation

if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(NOT(R[n]), shifted, 'I');
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzcv;
F5.1.165 RSC, RSCS (immediate)

Reverse Subtract with Carry (immediate) subtracts a register value and the value of NOT (Carry flag) from an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the RSCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The RSC variant of the instruction is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
- The RSCS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See Illegal return events from AArch32 state on page G1-4646.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

**Not flag setting variant**

Applies when \( S = 0 \).

\[ \text{RSC} \langle c \rangle \{ \langle q \rangle \{ \langle Rd \rangle, \langle Rn \rangle, \langle Rm \rangle, \text{type} \langle Rs \rangle \} \]

**Decode for all variants of this encoding**

\[
d = \text{UInt}(Rd); \quad n = \text{UInt}(Rn); \quad m = \text{UInt}(Rm); \quad s = \text{UInt}(Rs); \\
\text{setflags} = (S == '1'); \quad \text{shift_t} = \text{DecodeRegShift}(\text{type}); \\
\text{if } d == 1S \quad \text{|| } n == 1S \quad \text{|| } m == 1S \quad \text{|| } s == 1S \text{ then UNPREDICTABLE;}
\]

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

**Assembler symbols**

\[ \langle c \rangle \]

See Standard assembler syntax fields on page F2-3100.

\[ \langle q \rangle \]

See Standard assembler syntax fields on page F2-3100.

\[ \langle Rd \rangle \]

Is the general-purpose destination register, encoded in the "Rd" field.

\[ \langle Rn \rangle \]

Is the first general-purpose source register, encoded in the "Rn" field.

\[ \langle Rm \rangle \]

Is the second general-purpose source register, encoded in the "Rm" field.

\[ \langle \text{type} \rangle \]

Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

- LSL when type = 00
- LSR when type = 01
- ASR when type = 10
- ROR when type = 11

\[ \langle Rs \rangle \]

Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.
Operation

if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(NOT(R[n]), shifted, PSTATE.C);
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzcv;
F5.1.168  SADD16

Signed Add 16 performs two 16-bit signed integer additions, and writes the results to the destination register. It sets PSTATE.GE according to the results of the additions.

PSTATE.GE<3:2> = if sum >= 0 then '11' else '00';
F5.1.171 **SBC, SBCS (immediate)**

Subtract with Carry (immediate) subtracts an immediate value and the value of NOT (Carry flag) from a register value, and writes the result to the destination register.

If the destination register is not the PC, the SBCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The SBC variant of the instruction is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
- The SBCS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See Illegal return events from AArch32 state on page G1-4646.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

Assembler symbols

<c>
See Standard assembler syntax fields on page F2-3100.

<q>
See Standard assembler syntax fields on page F2-3100.

<Rdn>
Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.

<Rd>
For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the SBC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
- For the SBCS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn>
For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.

<Rm>
For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

<shift>
Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

<table>
<thead>
<tr>
<th>Shift Type</th>
<th>Type Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>LSL</td>
<td>type = 00</td>
</tr>
<tr>
<td>LSR</td>
<td>type = 01</td>
</tr>
<tr>
<td>ASR</td>
<td>type = 10</td>
</tr>
<tr>
<td>ROR</td>
<td>type = 11</td>
</tr>
</tbody>
</table>

<amount>
For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], NOT(shifted), PSTATE.C);
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
        end
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
        end
    end
end
F5.1.173 SBC, SBCS (register-shifted register)

Subtract with Carry (register-shifted register) subtracts a register-shifted register value and the value of NOT (Carry flag) from a register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

\]

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

- \(<\text{c}>\) See Standard assembler syntax fields on page F2-3100.
- \(<\text{q}>\) See Standard assembler syntax fields on page F2-3100.
- \(<\text{Rd}>\) Is the general-purpose destination register, encoded in the "Rd" field.
- \(<\text{Rn}>\) Is the first general-purpose source register, encoded in the "Rn" field.
- \(<\text{Rm}>\) Is the second general-purpose source register, encoded in the "Rm" field.
- \(<\text{type}>\) Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:
  - LSL when \( \text{type} = 00 \)
  - LSR when \( \text{type} = 01 \)
  - ASR when \( \text{type} = 10 \)
  - ROR when \( \text{type} = 11 \)
- \(<\text{Rs}>\) Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.
Operation

if ConditionPassed() then
   EncodingSpecificOperations();
   shift_n = UInt(R[s]<7:0>);
   shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
   (result, nzcv) = AddWithCarry(R[n], NOT(shifted), PSTATE.C);
   R[d] = result;
   if setflags then
      PSTATE.<N,Z,C,V> = nzcv;
F5.1.174 SBFX

Signed Bit Field Extract extracts any number of adjacent bits at any position from a register, sign-extends them to 32 bits, and writes the result to the destination register.

\text{width} & \quad \text{Is the width of the field, in the range 1 to 32-<ls>, encoded in the "widthm1" field as <\text{width}>-1.}
\end{align*}
\]
Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    msbit = lsb + width\textminus1;
    if msbit \leq 31 then
        R[d] = \text{SignExtend}(R[n]<msbit:lb>, 32);
    else
        UNPREDICTABLE;

CONSTRAINED UNPREDICTABLE behavior

If msbit > 31, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.
F5.1.175   SDIV

Signed Divide divides a 32-bit signed integer register value by a 32-bit signed integer register value, and writes the result to the destination register. The condition flags are not affected.

A1

\[
\begin{array}{cccccccccccc}
\hline
\text{cond} & 1=1111 & 0 & 1 & 1 & 0 & 0 & 0 & 1 & \text{Rd} & (1)(1)(1)(1) & \text{Rm} & 0 & 0 & 0 & 1 & \text{Rn} & \\
\end{array}
\]

A1 variant

SDIV{<c>}{<q>} {<Rd>,} <Rn>, <Rm>

Decode for this encoding

\[
d = \text{ UInt(Rd)}; \quad n = \text{ UInt(Rn)}; \quad m = \text{ UInt(Rm)}; \quad a = \text{ UInt(Ra)}; \\
\text{if } d = 15 | n = 15 | m = 15 | a \neq 15 \text{ then UNPREDICTABLE;}
\]

CONSTRAINED UNPREDICTABLE behavior

If\[ Ra \neq '1111',\]
then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as described, with no change to its behavior and no additional side effects.
- The instruction executes as described, and the register specified by Ra becomes UNKNOWN.

T1

\[
\begin{array}{cccccccccccccccc}
\hline
\text{cond} & 1=1111 & 0 & 1 & 1 & 1 & 0 & 1 & 1 & 1 & 0 & 0 & 1 & \text{Rn} & (1)(1)(1)(1) & \text{Rd} & 1 & 1 & 1 & 1 & \text{Rm} & \\

Decode for this encoding

\[
d = \text{ UInt(Rd)}; \quad n = \text{ UInt(Rn)}; \quad m = \text{ UInt(Rm)}; \quad a = \text{ UInt(Ra)}; \\
\text{if } d = 15 | n = 15 | m = 15 | a \neq 15 \text{ then UNPREDICTABLE; } // \text{ ARMv8-A removes UNPREDICTABLE for R13}
\]

CONSTRAINED UNPREDICTABLE behavior

If\[ Ra \neq '1111',\]
then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as described, with no change to its behavior and no additional side effects.
- The instruction executes as described, and the register specified by Ra becomes UNKNOWN.
Notes for all encodings

For more information about the CONstrained UNpredictable behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

<c> See Standard assembler syntax fields on page F2-3100.

<q> See Standard assembler syntax fields on page F2-3100.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<Rn> Is the first general-purpose source register holding the dividend, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register holding the divisor, encoded in the "Rm" field.

Overflow

If the signed integer division \(0x80000000 \div 0xFFFFFFFF\) is performed, the pseudocode produces the intermediate integer result \(+2^{31}\), that overflows the 32-bit signed integer range. No indication of this overflow case is produced, and the 32-bit result written to \(<Rd>\) must be the bottom 32 bits of the binary representation of \(+2^{31}\). So the result of the division is \(0x80000000\).

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    if SInt(R[m]) == 0 then
        result = 0;
    else
        result = RoundTowardsZero(Real(SInt(R[n])) / Real(SInt(R[m])));
    R[d] = result<31:0>;
F5.1.176   SEL

Select Bytes selects each byte of its result from either its first operand or its second operand, according to the values of the PSTATE.GE flags.

A1

A1 variant

SEL{<c>}{<q>} {<Rd>,} <Rn>, <Rm>

Decode for this encoding

d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;

T1

F5.1.187 SMC

Secure Monitor Call causes a Secure Monitor Call exception. For more information see Secure Monitor Call (SMC) exception on page G1-4667.

SMC is available only for software executing at EL1 or higher. It is UNDEFINED in User mode.

If the values of HCR.TSC and SCR.SCD are both 0, execution of an SMC instruction at EL1 or higher generates a Secure Monitor Call exception that is taken to EL3. When EL3 is using AArch32 this exception is taken to Monitor mode. When EL3 is using AArch64, it is the SCR_EL3.SMD bit, rather than the SCR.SCD bit, that can change the effect of executing an SMC instruction.

If the value of HCR.TSC is 1, execution of an SMC instruction in a Non-secure EL1 mode generates an exception that is taken to EL2, regardless of the value of SCR.SCD. When EL2 is using AArch32, this is a Hyp Trap exception that is taken to Hyp mode. For more information see Traps to Hyp mode of Non-secure EL1 execution of SMC instructions on page G1-4718.

If the value of HCR.TSC is 0 and the value of SCR.SCD is 1, the SMC instruction is:

• UNDEFINED in Non-secure state.
• CONSTRAINED UNPREDICTABLE if executed in Secure state at EL1 or higher.

                // SMC disabled
                if IsSecure() then
                    // Executes either as a NOP or UNALLOCATED.
                    c = ConstrainUnpredictable(Unpredictable_SMD);
                    assert c IN {Constraint_NOP, Constraint_UNDEF};
                    if c == Constraint_NOP then EndOfInstruction();
                    UNDEFINED;
                else
                    AArch32.TakeSMCException();
            end

    else
        AArch64.CallSecureMonitor(Zeros(16));
    end

CONSTRAINED UNPREDICTABLE behavior

If SCR.SCD == '1' && IsSecure(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
F5.1.188 SMLABB, SMLABT, SMLATB, SMLATT

Signed Multiply Accumulate (halfwords) performs a signed multiply accumulate operation. The multiply acts on two signed 16-bit quantities, taken from either the bottom or the top half of their respective source registers. The other halves of these source registers are ignored. The 32-bit product is added to a 32-bit accumulate value and the result is written to the destination register.

If overflow occurs during the addition of the accumulate value, the instruction sets PSTATE.Q to 1. It is not possible for overflow to occur during the multiplication.

PSTATE.Q = '1';
F5.1.189 SMLAD, SMLADX

Signed Multiply Accumulate Dual performs two signed 16 x 16-bit multiplications. It adds the products to a 32-bit accumulate operand.

Optionally, the instruction can exchange the halfwords of the second operand before performing the arithmetic. This produces top x bottom and bottom x top multiplication.

This instruction sets PSTATE.Q to 1 if the accumulate operation overflows. Overflow cannot occur during the multiplications.

        // PSTATE.C, PSTATE.V unchanged
```
F5.1.191  SMLALBB, SMLALBT, SMLALTB, SMLALTT

Signed Multiply Accumulate Long (halfwords) multiplies two signed 16-bit values to produce a 32-bit value, and accumulates this with a 64-bit value. The multiply acts on two signed 16-bit quantities, taken from either the bottom or the top half of their respective source registers. The other halves of these source registers are ignored. The 32-bit product is sign-extended and accumulated with a 64-bit accumulate value.

Overflow is possible during this instruction, but only as a result of the 64-bit addition. This overflow is not detected if it occurs. Instead, the result wraps around modulo 2^64.

F5.1.193 SMLAWB, SMLAWT

Signed Multiply Accumulate (word by halfword) performs a signed multiply accumulate operation. The multiply acts on a signed 32-bit quantity and a signed 16-bit quantity. The signed 16-bit quantity is taken from either the bottom or the top half of its source register. The other half of the second source register is ignored. The top 32 bits of the 48-bit product are added to a 32-bit accumulate value and the result is written to the destination register. The bottom 16 bits of the 48-bit product are ignored.

If overflow occurs during the addition of the accumulate value, the instruction sets PSTATE.Q to 1. No overflow can occur during the multiplication.

F5.1.197  SMMLS, SMMLSR

Signed Most Significant Word Multiply Subtract multiplies two signed 32-bit values, subtracts the result from a 32-bit accumulate value that is shifted left by 32 bits, and extracts the most significant 32 bits of the result of that subtraction.

Optionally, the instruction can specify that the result of the instruction is rounded instead of being truncated. In this case, the constant 0x80000000 is added to the result of the subtraction before the high word is extracted.

<q> See Standard assembler syntax fields on page F2-3100.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<Rn> Is the first general-purpose source register, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register, encoded in the "Rm" field.

Operation for all encodings

if ConditionPassed() then
  EncodingSpecificOperations();
  result = SInt(R[n]) * SInt(R[m]);
  if round then result = result + 0x80000000;
  R[d] = result<63:32>;
F5.1.199  SMUAD, SMUADX

Signed Dual Multiply Add performs two signed 16 x 16-bit multiplications. It adds the products together, and writes
the result to the destination register.

Optionally, the instruction can exchange the halfwords of the second operand before performing the arithmetic. This
produces top x bottom and bottom x top multiplication.

This instruction sets PSTATE.Q to 1 if the addition overflows. The multiplications cannot overflow.

A1

```
SMUAD variant

   result = SInt(operand1) * SInt(operand2);
   R[d] = result<31:0>;
   // Signed overflow cannot occur
F5.1.201   SMULL, SMULLS

Signed Multiply Long multiplies two 32-bit signed values to produce a 64-bit result.

In A32 instructions, the condition flags can optionally be updated based on the result. Use of this option adversely affects performance on many implementations.

A1

Flag setting variant

Applies when $S == 1$.

SMULLS{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>

Not flag setting variant

Applies when $S == 0$.

SMULL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>

Decode for all variants of this encoding

\[
d\text{Lo} = \text{UInt}(R\text{dLo});
\quad d\text{Hi} = \text{UInt}(R\text{dHi});
\quad n = \text{UInt}(R\text{n});
\quad m = \text{UInt}(R\text{m});
\quad \text{setflags} = (S == '1');
\]

if $d\text{Lo} == 15 || d\text{Hi} == 15 || n == 15 || m == 15$ then UNPREDICTABLE;

if $d\text{Hi} == d\text{Lo}$ then UNPREDICTABLE;

CONSTRANDED UNPREDICTABLE behavior

If $d\text{Hi} == d\text{Lo}$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

T1

T1 variant

SMULL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>

Decode for this encoding

\[
d\text{Lo} = \text{UInt}(R\text{dLo});
\quad d\text{Hi} = \text{UInt}(R\text{dHi});
\quad n = \text{UInt}(R\text{n});
\quad m = \text{UInt}(R\text{m});
\quad \text{setflags} = \text{FALSE};
\]

if $d\text{Lo} == 15 || d\text{Hi} == 15 || n == 15 || m == 15$ then UNPREDICTABLE;

// ARMv8-A removes UNPREDICTABLE for R13

if $d\text{Hi} == d\text{Lo}$ then UNPREDICTABLE;
**CONSTRAINED UNPREDICTABLE behavior**

If $d_{Hi} = d_{Lo}$, then one of the following behaviors must occur:

- The instruction is **UNDEFINED**.
- The instruction executes as **NOP**.
- The value in the destination register is **UNKNOWN**.

**Notes for all encodings**

For more information about the **CONSTRAINED UNPREDICTABLE behavior** of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

**Assembler symbols**

- `<c>` See *Standard assembler syntax fields* on page F2-3100.
- `<q>` See *Standard assembler syntax fields* on page F2-3100.
- `<RdLo>` Is the general-purpose destination register for the lower 32 bits of the result, encoded in the "RdLo" field.
- `<RdHi>` Is the general-purpose destination register for the upper 32 bits of the result, encoded in the "RdHi" field.
- `<Rn>` Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
- `<Rm>` Is the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

**Operation for all encodings**

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations();
    result = SInt(R[n]) * SInt(R[m]);
    R[dHi] = result<63:32>;
    R[dLo] = result<31:0>;
    if setflags then
        PSTATE.N = result<63>;
        PSTATE.Z = IsZeroBit(result<63:0>);
        // PSTATE.C, PSTATE.V unchanged
```
F5.1.202  SMULWB, SMULWT

Signed Multiply (word by halfword) multiplies a signed 32-bit quantity and a signed 16-bit quantity. The signed 16-bit quantity is taken from either the bottom or the top half of its source register. The other half of the second source register is ignored. The top 32 bits of the 48-bit product are written to the destination register. The bottom 16 bits of the 48-bit product are ignored. No overflow is possible during this instruction.

    // Signed overflow cannot occur
F5.1.204  **SRS, SRSDA, SRSDB, SRSIA, SRSIB**

Store Return State stores the LR_<current_mode> and SPSR_<current_mode> to the stack of a specified mode. For information about memory accesses see Memory accesses on page F2-3106.

SRS is **UNDEFINED** in Hyp mode.

SRS is **CONSTRAINED UNPREDICTABLE** if it is executed in User or System mode, or if the specified mode is any of the following:

- Not implemented.
- A mode that Table G1-5 on page G1-4604 does not show.
- Hyp mode.
- Monitor mode, if the SRS instruction is executed in Non-secure state.

If EL3 is using AArch64 and an SRS instruction that is executed in a Secure EL1 mode specifies Monitor mode, it is trapped to EL3.

See Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32 on page D1-1944.

CONstrained UNPREDICTABLE behavior

If PSTATE.M IN {M32_User,M32_System}, then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.

If mode == M32_Hyp, then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.

If mode == M32_Monitor && (!HaveEL(EL3) || !IsSecure()), then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.

If BadMode(mode), then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The instruction stores to the stack of the mode in which it is executed.
• The instruction stores to an UNKNOWN address, and if the instruction specifies writeback then any
general-purpose register that can be accessed from the current Exception level without a privilege violation
becomes UNKNOWN.
F5.1.205   SSAT

Signed Saturate saturates an optionally-shifted signed value to a selectable signed range.
This instruction sets PSTATE.Q to 1 if the operation saturates.

Assembler symbols

⟨c⟩ See Standard assembler syntax fields on page F2-3100.

⟨q⟩ See Standard assembler syntax fields on page F2-3100.

⟨Rd⟩ Is the general-purpose destination register, encoded in the "Rd" field.

⟨imm⟩ Is the bit position for saturation, in the range 1 to 32, encoded in the "sat_imm" field as ⟨imm⟩-1.

⟨Rn⟩ Is the general-purpose source register, encoded in the "Rn" field.

⟨amount⟩ For encoding A1: is the optional shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm5" field.

For encoding A1: is the shift amount, in the range 1 to 32 encoded in the "imm5" field as ⟨amount⟩ modulo 32.

For encoding T1: is the optional shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm3:imm2" field.

For encoding T1: is the shift amount, in the range 1 to 31 encoded in the "imm3:imm2" field as ⟨amount⟩.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    operand = Shift(R[n], shift_t, shift_n, PSTATE.C); // PSTATE.C ignored
    (result, sat) = SignedSatQ(SInt(operand), saturate_to);
    R[d] = SignExtend(result, 32);
    if sat then
        PSTATE.Q = '1';
F5.1.206   SSAT16

Signed Saturate 16 saturates two signed 16-bit values to a selected signed range.

This instruction sets PSTATE.Q to 1 if the operation saturates.

PSTATE.GE<3> = if diff4 >= 0 then '1' else '0';
STC

Store data to System register calculates an address from a base register value and an immediate offset, and stores a word from the DBGDTRRXint System register to memory. It can use offset, post-indexed, pre-indexed, or unindexed addressing. For information about memory accesses see Memory accesses on page F2-3106.

In an implementation that includes EL2, the permitted STC access to DBGDTRRXint can be trapped to Hyp mode, meaning that an attempt to execute an STC instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see Trapping general Non-secure System register accesses to debug registers on page G1-4727.

For simplicity, the STC pseudocode does not show this possible trap to Hyp mode.

**Offset variant**

Applies when \(P == 1 \&\& W == 0\).

\[
\text{STC}\{<c>\};\{<q>\} \ p14, c5, [<Rn>{, #{+/-}<imm>}]
\]

**Post-indexed variant**

Applies when \(P == 0 \&\& W == 1\).

\[
\text{STC}\{<c>\};\{<q>\} \ p14, c5, [<Rn>], #{+/-}<imm>
\]

**Pre-indexed variant**

Applies when \(P == 1 \&\& W == 1\).

\[
\text{STC}\{<c>\};\{<q>\} \ p14, c5, [<Rn>, #{+/-}<imm>]
\]

**Unindexed variant**

Applies when \(P == 0 \&\& U == 1 \&\& W == 0\).

\[
\text{STC}\{<c>\};\{<q>\} \ p14, c5, [<Rn>, <option>]
\]

**Decode for all variants of this encoding**

\[
\text{if } P == '0' \&\& U == '0' \&\& W == '0' \text{ then UNDEFINED;}
\]

\[
n = \text{UInt}(Rn); \ cp = 14;
\]

\[
\text{imm32} = \text{ZeroExtend}(\text{imm8:'00', 32}); \ \text{index} = (P == '1'); \ \text{add} = (U == '1'); \ \text{wback} = (W == '1');
\]

\[
\text{if } n == 15 \&\& (\text{wback} \mid \text{CurrentInstrSet()} != \text{InstrSet_A32}) \text{ then UNPREDICTABLE;}
\]

**CONSTRAINED UNPREDICTABLE behavior**

If \(n == 15 \&\& \text{wback} \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction executes with writeback to the PC. The instruction is handled as described in Using R15 on page K1-6391.
F5.1 Alphabetical list of T32 and A32 base instruction set instructions

T1

| 15 14 13 12 | 11 10 9 8 7 6 5 4 3 | 0 | 15 14 13 12 | 11 10 9 8 7 | 0 |

\[
\text{STC}\{<c>\}{<q>} \text{p14}, c5, [\text{<Rn>}, \#\{+/-\}<imm>] 
\]

Unindexed variant
Applies when \( P == 0 \) \&\& \( U == 1 \) \&\& \( W == 0 \).

\[
\text{STC}\{<c>\}{<q>} \text{p14}, c5, [\text{<Rn>}], \text{<option> } 
\]

Decode for all variants of this encoding

\[
\begin{align*}
\text{if } P == '0' \&\& U == '0' \&\& W == '0' \text{ then UNDEFINED;} \\
n & = \text{UInt}(Rn); \quad cp = 14; \\
\text{imm32} & = \text{ZeroExtend}(\text{imm8}"00", 32); \quad \text{index} = (P == '1'); \quad \text{add} = (U == '1'); \quad wbback = (W == '1'); \\
\text{if } n == 15 \&\& (\text{wbback || CurrentInstrSet()} != \text{InstrSet_A32}) \text{ then UNPREDICTABLE;}
\end{align*}
\]

CONstrained UNPREDICTABLE behavior

If \( n == 15 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction executes with writeback to the PC. The instruction is handled as described in Using R15 on page K1-6391.

Assembler symbols

- \(<c>`\) See Standard assembler syntax fields on page F2-3100.
- \(<q>`\) See Standard assembler syntax fields on page F2-3100.
- \(<Rn>`\) For the offset or unindexed variant: is the general-purpose base register, encoded in the "Rn" field. The PC can be used, but this is deprecated.
  
  For the offset, post-indexed or pre-indexed variant: is the general-purpose base register, encoded in the "Rn" field.

- \(<\text{option}>`\) Is an 8-bit immediate, in the range 0 to 255 enclosed in \{ \}, encoded in the "imm8" field. The value of this field is ignored when executing this instruction.
+/-  Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
-  when \( U = 0 \)
+  when \( U = 1 \)

<imm>  Is the immediate offset used for forming the address, a multiple of 4 in the range 0-1020, defaulting to 0 and encoded in the "imm8" field, as \(<imm>/4\).

### Operation for all encodings

if \( \text{ConditionPassed()} \) then
  EncodingSpecificOperations();
  AArch32.CheckSystemAccess(cp, ThisInstr());
  offset_addr = if add then \( R[n] + \text{imm32} \) else \( R[n] - \text{imm32} \);
  address = if index then offset_addr else \( R[n] \);
  // System register read from DBGDTRRXint.
  MemA[address,4] = DBGDTR_EL0[];
  if wback then \( R[n] = \text{offset_addr} \);
F5.1.211   STL

Store-Release Word stores a word from a register to memory. The instruction also has memory ordering semantics as described in Load-Acquire, Store-Release on page E2-3020.

For more information about support for shared memory see Synchronization and semaphores on page E2-3045. For information about memory accesses see Memory accesses on page F2-3106.

A1 variant

STLEX{<c>}{<q>} <Rd>, <Rt>, [<Rn>]

Decode for this encoding

d = UInt(Rd);  t = UInt(Rt);  n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t then UNPREDICTABLE;

CONSTRANGED UNPREDICTABLE behavior

If d == t, then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The store instruction executes but the value stored is UNKNOWN.

If d == n, then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The instruction performs the store to an UNKNOWN address.

T1

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

T1 variant

STLEX{<c>}{<q>} <Rd>, <Rt>, [<Rn>]

Decode for this encoding

d = UInt(Rd);  t = UInt(Rt);  n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t then UNPREDICTABLE;
**CONSTRAINED UNPREDICTABLE behavior**

If \( d = t \), then one of the following behaviors must occur:

- The instruction is **UNDEFINED**.
- The instruction executes as **NOP**.
- The store instruction executes but the value stored is **UNKNOWN**.

If \( d = n \), then one of the following behaviors must occur:

- The instruction is **UNDEFINED**.
- The instruction executes as **NOP**.
- The instruction performs the store to an **UNKNOWN** address.

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

**Assembler symbols**

\(<c>\) See *Standard assembler syntax fields* on page F2-3100.

\(<q>\) See *Standard assembler syntax fields* on page F2-3100.

\(<\text{Rd}>\) Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:

- \( 0 \) If the operation updates memory.
- \( 1 \) If the operation fails to update memory.

\(<\text{Rt}>\) Is the general-purpose register to be transferred, encoded in the "Rt" field.

\(<\text{Rn}>\) Is the general-purpose base register, encoded in the "Rn" field.

**Aborts and alignment**

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- \(<\text{Rd}>\) is not updated.

A non word-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If \( \text{AArch32.ExclusiveMonitorsPass()} \) returns **TRUE**, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If \( \text{AArch32.ExclusiveMonitorsPass()} \) returns **FALSE** and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

**Operation for all encodings**

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    if AArch32.ExclusiveMonitorsPass(address,4) then
        Memo[address, 4] = R[t];
```
R[d] = ZeroExtend('0');
else
  R[d] = ZeroExtend('1');
STLEXB

Store-Release Exclusive Byte stores a byte from a register to memory if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

The instruction also has memory ordering semantics as described in *Load-Acquire, Store-Release* on page E2-3020.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-3045. For information about memory accesses see *Memory accesses* on page F2-3106.

### A1

0 If the operation updates memory.
1 If the operation fails to update memory.
\(<Rt>\) For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. \(<Rt>\) must be even-numbered and not R14.
For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.
\(<Rt2>\) For encoding A1: is the second general-purpose register to be transferred. \(<Rt2>\) must be \( R(t+1) \).
For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.
\(<Rn>\) Is the general-purpose base register, encoded in the "Rn" field.
Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- \(<Rd>\) is not updated.

A non word-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If AArch32.ExclusiveMonitorsPass() returns TRUE, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If AArch32.ExclusiveMonitorsPass() returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    address = \(R[n]\);
    // Create doubleword to store such that \(R[t]\) will be stored at address and \(R[t2]\) at address+4.
    value = if BigEndian() then \(R[t]:R[t2]\) else \(R[t2]:R[t]\);
    if AArch32.ExclusiveMonitorsPass(address, 8) then
        MemO[address, 8] = value;
        \(R[d] = \text{ZeroExtend('0')};\)
    else
        \(R[d] = \text{ZeroExtend('1')};\)
F5.1.216  STLEXH

Store-Release Exclusive Halfword stores a halfword from a register to memory if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

The instruction also has memory ordering semantics as described in Load-Acquire, Store-Release on page E2-3020.

For more information about support for shared memory see Synchronization and semaphores on page E2-3045. For information about memory accesses see Memory accesses on page F2-3106.

\]

if \[n == 15 \&\& \text{BitCount(registers)} < 2 \text{ then UNPREDICTABLE};\]

if wback \&\& \text{registers}<16> == '1' then UNPREDICTABLE;

if \text{registers}<13> == '1' then UNPREDICTABLE;

if \text{registers}<15> == '1' then UNPREDICTABLE;

CONSTRANDED UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers stored.
If \texttt{BitCount(registers) == 1}, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as \texttt{NOP}.
- The instruction executes as described, with no change to its behavior and no additional side effects.
- The instruction operates as an \texttt{STM} with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

If \texttt{wback \&\& registers<1> == '1'}, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as \texttt{NOP}.
- The store instruction executes but the value stored for the base register is UNKNOWN.

If \texttt{registers<13> == '1'}, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as \texttt{NOP}.
- The store instruction performs all of the stores using the specified addressing mode but the value of R13 is UNKNOWN.

If \texttt{registers<15> == '1'}, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as \texttt{NOP}.
- The store instruction performs all of the stores using the specified addressing mode but the value of R15 is UNKNOWN.

If \texttt{n == 15 \&\& wback}, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as \texttt{NOP}.
- The instruction executes without writeback of the base address.
- The instruction executes with writeback to the PC. The instruction is handled as described in \textit{Using R15 on page K1-6391}.

\textbf{Notes for all encodings}

For more information about the \texttt{CONSTRAINED UNPREDICTABLE} behavior of this instruction, see \textit{Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors}.

\textbf{Assembler symbols}

\begin{itemize}
  \item \texttt{IA} \hspace{1cm} Is an optional suffix for the Increment After form.
  \item \texttt{<c>} \hspace{1cm} See \textit{Standard assembler syntax fields on page F2-3100}.
  \item \texttt{<q>} \hspace{1cm} See \textit{Standard assembler syntax fields on page F2-3100}.
  \item \texttt{<Rn>} \hspace{1cm} Is the general-purpose base register, encoded in the "Rn" field.
  \item \texttt{!} \hspace{1cm} The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.
\end{itemize}
For encoding A1: is a list of one or more registers to be stored, separated by commas and surrounded by { and }.

The PC can be in the list. However, ARM deprecates the use of instructions that include the PC in the list.

If base register writeback is specified, and the base register is not the lowest-numbered register in the list, such an instruction stores an UNKNOWN value for the base register.

For encoding T1: is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R7, encoded in the "register_list" field. If the base register is not the lowest-numbered register in the list, such an instruction stores an UNKNOWN value for the base register.

For encoding T2: is a list of one or more registers to be stored, separated by commas and surrounded by { and }.

The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain the LR. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    for i = 0 to 14
        if registers<i> == '1' then
            if i == n && wback && i != LowestSetBit(registers) then
                MemA[address,4] = bits(32) UNKNOWN;  // Only possible for encodings T1 and A1
            else
                MemA[address,4] = R[i];
                address = address + 4;
        if registers<15> == '1' then  // Only possible for encoding A1
            MemA[address,4] = PCStoreValue();
        if wback then R[n] = R[n] + 4*BitCount(registers);
```
F5.1.219 STM (User registers)

In an EL1 mode other than System mode, Store Multiple (User registers) stores multiple User mode registers to consecutive memory locations using an address from a base register. The PE reads the base register value normally, using the current mode to determine the correct Banked version of the register. This instruction cannot writeback to the base register.

Store Multiple (User registers) is UNDEFINED in Hyp mode, and CONSTRAINED UNPREDICTABLE in User or System modes.

ARMv8.2 permits the deprecation of some Store Multiple ordering behaviors in AArch32 state, for more information see ARMv8.2-LSMAOC.

STMDB{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
STMFD{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Full Descending stack

Decode for this encoding

```plaintext
n = UInt(Rn); registers = register_list; wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
```

CONstrained UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers stored.

T1

```
|15 14 13 12|11 10 9 8|7 6 5 4|3 0|15 14 13 12|
|----|-------|----|---|----|----|---|
|1 1 1 | 0 1 0 | 0 1 0 | W 0 | Rn | 0 | M[0] |
| register_list | register_list<13> |
```

T1 variant

STMDB{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
STMFD{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Full Descending stack
Decode for this encoding

\[ n = \text{UInt}(\text{Rn}); \text{ registers} = \text{P:M:register_list}; w\text{back} = (W == \text{'1'}); \]
\[ \text{if } n == 15 || \text{BitCount}(\text{registers}) < 2 \text{ then UNPREDICTABLE}; \]
\[ \text{if } w\text{back} && \text{registers}<n> == \text{'1'} \text{ then UNPREDICTABLE}; \]
\[ \text{if } \text{registers}<13> == \text{'1'} \text{ then UNPREDICTABLE}; \]
\[ \text{if } \text{registers}<15> == \text{'1'} \text{ then UNPREDICTABLE}; \]

**CONSTRAINED UNPREDICTABLE behavior**

If \( \text{BitCount}(\text{registers}) < 1 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as \( \text{NOP} \).
- The instruction operates as an \( \text{STM} \) with the same addressing mode but targeting an unspecified set of registers. These registers might include \( \text{R15} \). If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers stored.

If \( w\text{back} && \text{registers}<n> == \text{'1'} \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as \( \text{NOP} \).
- The store instruction executes but the value stored for the base register is UNKNOWN.

If \( \text{BitCount}(\text{registers}) == 1 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as \( \text{NOP} \).
- The instruction executes as described, with no change to its behavior and no additional side effects.
- The instruction operates as an \( \text{STM} \) with the same addressing mode but targeting an unspecified set of registers. These registers might include \( \text{R15} \).

If \( \text{registers}<13> == \text{'1'} \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as \( \text{NOP} \).
- The instruction executes as described, with no change to its behavior and no additional side effects.
- The store instruction performs all of the stores using the specified addressing mode but the value of \( \text{R13} \) is UNKNOWN.

If \( \text{registers}<15> == \text{'1'} \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as \( \text{NOP} \).
- The store instruction performs all of the stores using the specified addressing mode but the value of \( \text{R15} \) is UNKNOWN.

**Notes for all encodings**

For more information about the **CONSTRAINED UNPREDICTABLE** behavior of this instruction, see *Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<
See Standard assembler syntax fields on page F2-3100.

>
See Standard assembler syntax fields on page F2-3100.

&Rn
Is the general-purpose base register, encoded in the "Rn" field.

!
The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.

<registers>
For encoding A1: is a list of one or more registers to be stored, separated by commas and surrounded by { and }.

The PC can be in the list. However, ARM deprecates the use of instructions that include the PC in the list.

If base register writeback is specified, and the base register is not the lowest-numbered register in the list, such an instruction stores an UNKNOWN value for the base register.

For encoding T1: is a list of one or more registers to be stored, separated by commas and surrounded by { and }.

The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain the LR. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0.

Operation for all encodings

if ConditionPassed() then
  EncodingSpecificOperations();
  address = R[n] - 4*BitCount(registers);
  for i = 0 to 14
    if registers<i> == '1' then
      if i == n && wback && i != LowestSetBit(registers) then
        MemA[address,4] = bits(32) UNKNOWN;  // Only possible for encoding A1
      else
        MemA[address,4] = R[i];
      address = address + 4;
    if registers<i> == '1' then  // Only possible for encoding A1
      MemA[address,4] = PCStoreValue();
    if wback then R[n] = R[n] - 4*BitCount(registers);
F5.1.222   STMIB, STMFA

Store Multiple Increment Before (Full Ascending) stores multiple registers to consecutive memory locations using an address from a base register. The consecutive memory locations start just above this address, and the address of the last of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also Encoding of lists of general-purpose registers and the PC on page F2-3107.

ARMv8.2 permits the deprecation of some Store Multiple ordering behaviors in AArch32 state, for more information see ARMv8.2-LSMAOC. For details of related system instructions see STM (User registers).

STMIB{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
STMFA{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Full Ascending stack

Decode for this encoding

n = UInt(Rn); registers = register_list; wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;

CONSTRANGED UNPREDICATABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

If n == 15 && wback, then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The instruction executes without writeback of the base address.
• The instruction uses the addressing mode described in the equivalent immediate offset instruction.

Notes for all encodings

For more information about the CONSTRANGED UNPREDICATABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICATABLE behaviors.

Assembler symbols

<
See Standard assembler syntax fields on page F2-3100.
<
See Standard assembler syntax fields on page F2-3100.
<Rn>
Is the general-purpose base register, encoded in the "Rn" field.
The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.

<registers> Is a list of one or more registers to be stored, separated by commas and surrounded by { and }.
The PC can be in the list. However, ARM deprecates the use of instructions that include the PC in the list.
If base register writeback is specified, and the base register is not the lowest-numbered register in the list, such an instruction stores an UNKNOWN value for the base register.

**Operation**

if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] + 4;
    for i = 0 to 14
        if registers<i> == '1' then
            if i == n && wback && i != LowestSetBit(registers) then
                MemA[address,4] = bits(32) UNKNOWN;
            else
                MemA[address,4] = R[i];
            address = address + 4;
        if registers<15> == '1' then
            MemA[address,4] = PCStoreValue();
        if wback then R[n] = R[n] + 4*BitCount(registers);
F5.1.223   STR (immediate)

Store Register (immediate) calculates an address from a base register value and an immediate offset, and stores a word from a register to memory. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see Memory accesses on page F2-3106.

This instruction is used by the alias PUSH (single register). See Alias conditions on page F5-3765 for details of when each alias is preferred.

        data = R[t];
    MemU[address,4] = data;
    if wback then R[n] = offset_addr;
```
F5.1.225 STRB (immediate)

Store Register Byte (immediate) calculates an address from a base register value and an immediate offset, and stores a byte from a register to memory. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see Memory accesses on page F2-3106.

A1

```
<table>
<thead>
<tr>
<th>31 28</th>
<th>27 26 25 24</th>
<th>23 22 21 20</th>
<th>19 16</th>
<th>15 12</th>
<th>11</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>!=111</td>
<td>0 1 0</td>
<td>P</td>
<td>U 1</td>
<td>W 0</td>
<td>Rn</td>
<td>Rt</td>
</tr>
</tbody>
</table>
```

**Offset variant**

Applies when \( P == 1 && W == 0 \).

\[
\text{STRB}\{<c>\}{<q>} <Rt>, [<Rn> {, #{+/-}<imm>}]
\]

**Post-indexed variant**

Applies when \( P == 0 && W == 0 \).

\[
\text{STRB}\{<c>\}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
\]

**Pre-indexed variant**

Applies when \( P == 1 && W == 1 \).

\[
\text{STRB}\{<c>\}{<q>} <Rt>, [<Rn>], #{+/-}<imm>!
\]

**Decode for all variants of this encoding**

\[
\text{if } P == '0' && W == '1' \text{ then SEE "STRBT";}
\]

\[
t = \text{UInt}(Rt); \quad n = \text{UInt}(Rn); \quad \text{imm32} = \text{ZeroExtend}(\text{imm12}, 32);
\]

\[
\text{index } = (P == '1'); \quad \text{add} = (U == '1'); \quad \text{wback} = (P == '0') || (W == '1');
\]

\[
\text{if } t == 15 \text{ then UNPREDICTABLE;}
\]

\[
\text{if wback && (n == 15 || n == t) then UNPREDICTABLE;}
\]

**CONstrained UNPREDICtABLE behavior**

If \( t == 15 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If \( \text{wback} && n == t \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If \( \text{wback} && n == 15 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
• The instruction uses the addressing mode described in the equivalent immediate offset instruction.

**T1**

```
<table>
<thead>
<tr>
<th>15 14 13 12</th>
<th>11 10</th>
<th>9 8</th>

\( \text{index} = (P == '1'); \ \text{add} = (U == '1'); \ \text{wback} = (W == '1'); \)
if \( t == 15 || (\text{wback} \&\& n == t) \) then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13

CONSTRAINED UNPREDICTABLE behavior

If \( t == 15 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If \( \text{wback} \&\& n == t \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If \( \text{wback} \&\& n == 15 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

- \(<c>\) See Standard assembler syntax fields on page F2-3100.
- \(<q>\) See Standard assembler syntax fields on page F2-3100.
- \(<Rt>\) Is the general-purpose register to be transferred, encoded in the "Rt" field.
- \(<Rn>\) For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated.
  
  For encoding T1, T2 and T3: is the general-purpose base register, encoded in the "Rn" field.
+/– Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when \( U = 0 \)
+ when \( U = 1 \)

+ Specifies the offset is added to the base register.

\(<\text{imm}>\) For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.
For encoding T1: is an optional 5-bit unsigned immediate byte offset, in the range 0 to 31, defaulting to 0 and encoded in the "imm5" field.
For encoding T2: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.
For encoding T3: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

**Operation for all encodings**

```c
if CurrentInstrSet() == InstrSet_A32 then
    if ConditionPassed() then
        EncodingSpecificOperations();
        offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
        address = if index then offset_addr else R[n];
        MemU[address,1] = R[t]<7:0>;
        if wback then R[n] = offset_addr;
    else
        if ConditionPassed() then
            EncodingSpecificOperations();
            offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
            address = if index then offset_addr else R[n];
            MemU[address,1] = R[t]<7:0>;
            if wback then R[n] = offset_addr;
```
F5.1.226  STRB (register)

Store Register Byte (register) calculates an address from a base register value and an offset register value, and stores a byte from a register to memory. The offset register value can optionally be shifted. For information about memory accesses see Memory accesses on page F2-3106.

if t == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13

**CONSTRAINED UNPREDICTABLE behavior**

If t == 15, then one of the following behaviors must occur:

• The instruction is UNDEFINED.

• The instruction executes as NOP.

• The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

**Assembler symbols**

• See Standard assembler syntax fields on page F2-3100.
<Rn> For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated.
For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.

+/− Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when U = 0
+ when U = 1

+ Specifies the index register is added to the base register.

<Rm> Is the general-purpose index register, encoded in the "Rm" field.

<shift> The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see Shifts applied to a register on page F2-3104.

<imm> If present, the size of the left shift to apply to the value from <Rm>, in the range 1-3. <imm> is encoded in imm2. If absent, no shift is specified and imm2 is encoded as 0b00.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if index then offset_addr else R[n];
    MemU[address,1] = R[t]<7:0>;
    if wback then R[n] = offset_addr;
F5.1.227 STRBT

Store Register Byte Unprivileged stores a byte from a register to memory. For information about memory accesses see Memory accesses on page F2-3106.

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

STRBT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or an optionally-shifted register value.

    if postindex then R[n] = offset_addr;

CONSTRAINED UNPREDICTABLE behavior

If PSTATE_EL == EL2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as STRB (immediate).
F5.1.228   STRD (immediate)

Store Register Dual (immediate) calculates an address from a base register value and an immediate offset, and stores two words from two registers to memory. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see Memory accesses on page F2-3106.

## Offset variant

Applies when $\text{P} == 1 \&\& \text{W} == 0$.

\[
\text{STRD}\{<c>\}{<q>} \ <\text{Rt}, \ <\text{Rt2}, [\text{Rn}\{, \#\{+/-\}<\text{imm}\}]}\]

## Post-indexed variant

Applies when $\text{P} == 0 \&\& \text{W} == 0$.

\[
\text{STRD}\{<c>\}{<q>} \ <\text{Rt}, <\text{Rt2}, [\text{Rn}], \#\{+/-\}<\text{imm}\}
\]

## Pre-indexed variant

Applies when $\text{P} == 1 \&\& \text{W} == 1$.

\[
\text{STRD}\{<c>\}{<q>} \ <\text{Rt}, <\text{Rt2}, [\text{Rn}, \#\{+/-\}<\text{imm}\]}
\]

### Decode for all variants of this encoding

\[
\begin{align*}
\text{if } \text{Rt}\&\& == 1' \text{ then UNPREDICTABLE;}
\text{t} &= \text{UInt(Rt);} \quad \text{t2} = \text{t+1;} \quad \text{n} = \text{UInt(Rn);} \quad \text{imm}32 = \text{ZeroExtend(imm4H:imm4L, 32);} \\
\text{index} = (\text{P} == 1'); \quad \text{add} = (\text{U} == 1'); \quad \text{wback} = (\text{P} == 0') || (\text{W} == 1'); \\
\text{if } \text{P} == 0' \&\& \text{W} == 1' \text{ then UNPREDICTABLE;} \\
\text{if } \text{wback} \&\& (\text{n} == 15 || \text{n} == \text{t} || \text{n} == \text{t2}) \text{ then UNPREDICTABLE;} \\
\text{if } \text{t2} == 15 \text{ then UNPREDICTABLE;}
\end{align*}
\]

### CONSTRANGED UNPREDICTABLE behavior

If $t == 15 || t2 == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If wback && (n == t || n == t2), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If wback && n == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

If \( R_t<0> == '1' \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: \( t<0> = '0' \).
- The instruction executes with the additional decode: \( t_2 = 1 \).
- The instruction executes as described, with no change to its behavior and no additional side-effects. This does not apply when \( R_t == '1111' \).

If \( P == '0' \) \&\& \( W == '1' \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as an LDRD using one of offset, post-indexed, or pre-indexed addressing.

### T1

\( \text{STRD}<c>{<q>} <R_t>, <R_t2>, [<R_n>, #<+-><imm>]}! \)

#### Decode for all variants of this encoding

if \( P == '0' \) \&\& \( W == '0' \) then SEE "Related encodings";

\[ t = \text{UInt}(R_t); \quad t_2 = \text{UInt}(R_t2); \quad n = \text{UInt}(R_n); \quad \text{imm32} = \text{ZeroExtend}(\text{imm8}:'00', 32); \]

index = (P == '1'); add = (U == '1'); wback = (W == '1');

if wback \&\& (n == t || n == t2) then UNPREDICTABLE;

if n == 15 || t == 15 || t2 == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13

### CONSTRAINED UNPREDICTABLE behavior

If \( t = 15 \) \&\& \( t_2 = 15 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.
If \( w_{back} && (n == t || n == t2) \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If \( w_{back} && n == 15 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

\(<c>\)

See Standard assembler syntax fields on page F2-3100.

\(<q>\)

See Standard assembler syntax fields on page F2-3100.

\(<Rt>\)

For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. This register must be even-numbered and not R14.

For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.

\(<Rt2>\)

For encoding A1: is the second general-purpose register to be transferred. This register must be \(<R(t+1)>\).

For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.

\(<Rn>\)

For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated.

For encoding T1: is the general-purpose base register, encoded in the "Rn" field.

\(+/-\)

Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when \( U = 0 \)
- when \( U = 1 \)

\(<imm>\)

For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is the unsigned immediate byte offset, a multiple of 4, in the range 0 to 1020, defaulting to 0 if omitted, and encoded in the "imm8" field as \(<imm>/4\).

Operation for all encodings

\[ \text{if ConditionPassed() then} \]

\[ \text{EncodingSpecificOperations();} \]

\[ \text{offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);} \]

\[ \text{address = if index then offset_addr else R[n];} \]

\[ \text{if address == Align(address, 8) then} \]

\[ \text{bits(64) data;} \]
if BigEndian() then
  data<63:32> = R[t];
  data<31:0> = R[t2];
else
  data<31:0> = R[t];
  data<63:32> = R[t2];
  MemA[address,8] = data;
else
  MemA[address,4] = R[t];
  MemA[address+4,4] = R[t2];
if wback then R[n] = offset_addr;
F5.1.229   STRD (register)

Store Register Dual (register) calculates an address from a base register value and a register offset, and stores two words from two registers to memory. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see Memory accesses on page F2-3106.

A1

| 31 | 28|27 26 25 24|23 22 21 20|19 | 16|15 |12|11 10 9 8 |7 6 5 4 |3 |0 |

  if wback then R[n] = offset_addr;
F5.1.230  STREX

Store Register Exclusive calculates an address from a base register value and an immediate offset, stores a word from a register to the calculated address if the PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

For more information about support for shared memory see Synchronization and semaphores on page E2-3045. For information about memory accesses see Memory accesses on page F2-3106.

A1

decode for this encoding

\[
d = \text{ UInt}(Rd); \quad t = \text{ UInt}(Rt); \quad n = \text{ UInt}(Rn); \quad \text{imm32} = \text{Zeros}(32); // \text{Zero offset}
\]

if \(d == 15 || t == 15 || n == 15\) then UNPREDICTABLE;

if \(d == n || d == t\) then UNPREDICTABLE;

CONSTRANGED UNPREDICTABLE behavior

If \(d == t\), then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The store instruction executes but the value stored is UNKNOWN.

If \(d == n\), then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The instruction performs the store to an UNKNOWN address.

T1

decode for this encoding

\[
d = \text{ UInt}(Rd); \quad t = \text{ UInt}(Rt); \quad n = \text{ UInt}(Rn); \quad \text{imm32} = \text{ZeroExtend}(\text{imm8}:'00', 32);
\]

if \(d == 15 || t == 15 || n == 15\) then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13

if \(d == n || d == t\) then UNPREDICTABLE;
**CONSTRAINED UNPREDICTABLE behavior**

If \( d = t \), then one of the following behaviors must occur:

- The instruction is **UNDEFINED**.
- The instruction executes as **NOP**.
- The store instruction executes but the value stored is **UNKNOWN**.

If \( d = n \), then one of the following behaviors must occur:

- The instruction is **UNDEFINED**.
- The instruction executes as **NOP**.
- The instruction performs the store to an **UNKNOWN** address.

**Notes for all encodings**

For more information about the **CONSTRAINED UNPREDICTABLE behavior** of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

**Assembler symbols**

\(<c>\quad \text{See Standard assembler syntax fields on page F2-3100}\). 
\(<q>\quad \text{See Standard assembler syntax fields on page F2-3100}\). 
\(<Rd>\quad \text{Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:}\)

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>

</tr>
<tr>
<td>1</td>
<td>If the operation fails to update memory.</td>
</tr>
</tbody>
</table>

\(<Rt>\quad \text{Is the general-purpose register to be transferred, encoded in the "Rt" field.}\)

\(<Rn>\quad \text{Is the general-purpose base register, encoded in the "Rn" field.}\)

\(<\text{imm}>\quad \text{For encoding A1: the immediate offset added to the value of } <Rn> \text{ to calculate the address. } <\text{imm}> \text{ can only be 0 or omitted.}\)

For encoding T1: the immediate offset added to the value of \(<Rn>\) to calculate the address. \(<\text{imm}>\) can be omitted, meaning an offset of 0. Values are multiples of 4 in the range 0-1020.

**Aborts and alignment**

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- \(<Rd>\) is not updated.

A non word-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If AArch32.ExclusiveMonitorsPass() returns **TRUE**, the exception is generated.
- Otherwise, it is **IMPLEMENTATION DEFINED** whether the exception is generated.

If AArch32.ExclusiveMonitorsPass() returns **FALSE** and the memory address, if accessed, would generate a synchronous Data Abort exception, it is **IMPLEMENTATION DEFINED** whether the exception is generated.
Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] + imm32;
    if AArch32.ExclusiveMonitorsPass(address,4) then
        MemA[address,4] = R[t];
        R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- \( <Rd> \) is not updated.

A non doubleword-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If AArch32.ExclusiveMonitorsPass() returns TRUE, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If AArch32.ExclusiveMonitorsPass() returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    // Create doubleword to store such that R[t] will be stored at address and R[t2] at address+4.
    value = if BigEndian() then R[t]:R[t2] else R[t2]:R[t];
    if AArch32.ExclusiveMonitorsPass(address,8) then
        MemA[address,8] = value;  R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');
F5.1.233   STREXH

Store Register Exclusive Halfword derives an address from a base register value, stores a halfword from a register to the derived address if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

For more information about support for shared memory see Synchronization and semaphores on page E2-3045. For information about memory accesses see Memory accesses on page F2-3106.

  if `PSTATE.EL == EL2` then UNPREDICTABLE; // Hyp mode
  EncodingSpecificOperations();
  offset = if register_form then \( R[m] \) else imm32;
  offset_addr = if add then \( R[n] + offset \) else \( R[n] - offset \);
  address = if postindex then \( R[n] + offset \) else \( offset_addr \);
  MemU_unpriv[address,2] = \( R[t]<15:0> \);
  if postindex then \( R[n] = offset_addr \);

**CONSTRAINED UNPREDICTABLE behavior**

If `PSTATE.EL == EL2`, then one of the following behaviors must occur:

- The instruction is **UNDEFINED**.
• The instruction executes as **NOP**.
• The instruction executes as **STRH** (immediate).
F5.1.237   STRT

Store Register Unprivileged stores a word from a register to memory. For information about memory accesses see Memory accesses on page F2-3106.

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

STRT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or an optionally-shifted register value.

A1 variant

STRT{<c>}{<q>} <Rt>, [Rn] {, #{+/-}<imm>}

Decode for this encoding

t = UInt(Rt); n = UInt(Rn); postindex = TRUE; add = (U == '1');
register_form = FALSE; imm32 = ZeroExtend(imm12, 32);
if n == 15 || n == t then UNPREDICTABLE;

CONSTRANDED UNPREDICTABLE behavior

If n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If n == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

\text{register\_form} = \text{FALSE}; \quad \text{imm32} = \text{ZeroExtend}(\text{imm8}, 32);
\]
\[
\text{if} \ t == 15 \text{ then UNPREDICTABLE;} // ARMv8-A removes UNPREDICTABLE for R13
\]

CONSTRAINED UNPREDICTABLE behavior

If \( t == 15 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

\(<c>\) \(\quad\) See Standard assembler syntax fields on page F2-3100.
See Standard assembler syntax fields on page F2-3100.

For encoding A1 and A2: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated.

For encoding T1: is the general-purpose register to be transferred, encoded in the "Rt" field.

Is the general-purpose base register, encoded in the "Rn" field.

For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when $U = 0$
+ when $U = 1$

For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when $U = 0$
+ when $U = 1$

Is the general-purpose index register, encoded in the "Rm" field.

The shift to apply to the value read from $Rm$. If absent, no shift is applied. Otherwise, see Shifts applied to a register on page F2-3104.

Specifies the offset is added to the base register.

For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.

For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

Operation for all encodings

```
if ConditionPassed() then
  if PSTATE.EL == EL2 then UNPREDICTABLE;                   // Hyp mode
  EncodingSpecificOperations();
  offset = if register_form then Shift($Rm$, shift_t, shift_n, PSTATE.C) else imm32;
  offset_addr = if add then ($Rn$ + offset) else ($Rn$ - offset);
  address = if postindex then $Rn$ else offset_addr;
  if t == 15 then  // Only possible for encodings A1 and A2
    data = PCStoreValue();
  else
    data = $Rt$;
    MemU_unpriv[address,4] = data;
  if postindex then $Rn$ = offset_addr;
```

**CONSTRAINED UNPREDICTABLE behavior**

If PSTATE.EL == EL2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as STR (immediate).
F5.1.238  SUB (immediate, from PC)

Subtract from PC subtracts an immediate value from the Align(PC, 4) value to form a PC-relative address, and writes the result to the destination register. ARM recommends that, where possible, software avoids using this alias. This instruction is an alias of the ADR instruction. This means that:

- The encodings in this description are named to match the encodings of ADR.
- The description of ADR gives the operational pseudocode for this instruction.

```

**A2 variant**

SUB{<c>}{<q>} <Rd>, PC, #<const>

is equivalent to

ADR{<c>}{<q>} <Rd>, <label>

and is the preferred disassembly when imm12 == '000000000000'.

**T2**

```
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | 15 | 14 | 12 | 11 | 8 | 7 | | | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 1 | 1 | 1 | 1 | 0 | i | 1 | 0 | 1 | 0 | 1 | 0 | 1 | 1 | 1 | 1 | 0 | imm3 | Rd | | | imm8 |
```

**T2 variant**

SUB{<c>}{<q>} <Rd>, PC, #<imm12>

is equivalent to

ADR{<c>}{<q>} <Rd>, <label>

and is the preferred disassembly when i:imm3:imm8 == '000000000000'.

**Assembler symbols**

- `<c>`  See Standard assembler syntax fields on page F2-3100.
- `<q>`  See Standard assembler syntax fields on page F2-3100.
- `<Rd>`  For encoding A2: is the general-purpose destination register, encoded in the "Rd" field. If the PC is used, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field.

- `<label>`  For encoding A1 and A2: the label of an instruction or literal data item whose address is to be loaded into `<Rd>`. The assembler calculates the required value of the offset from the Align(PC, 4) value of the ADR instruction to this label.

If the offset is zero or positive, encoding A1 is used, with imm32 equal to the offset.
If the offset is negative, encoding A2 is used, with `imm32` equal to the size of the offset. That is, the use of encoding A2 indicates that the required offset is minus the value of `imm32`. Permitted values of the size of the offset are any of the constants described in Modified immediate constants in A32 instructions on page F2-3117.

For encoding T1: the label of an instruction or literal data item whose address is to be loaded into `<Rd>`. The assembler calculates the required value of the offset from the Align(\(\text{PC} \), 4) value of the ADR instruction to this label. Permitted values of the size of the offset are multiples of 4 in the range 0 to 1020.

For encoding T2 and T3: the label of an instruction or literal data item whose address is to be loaded into `<Rd>`. The assembler calculates the required value of the offset from the Align(\(\text{PC} \), 4) value of the ADR instruction to this label.

If the offset is zero or positive, encoding T3 is used, with `imm32` equal to the offset. If the offset is negative, encoding T2 is used, with `imm32` equal to the size of the offset. That is, the use of encoding T2 indicates that the required offset is minus the value of `imm32`. Permitted values of the size of the offset are 0-4095.

<imm12> Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.
<const> An immediate value. See Modified immediate constants in A32 instructions on page F2-3117 for the range of values.

**Operation for all encodings**

The description of ADR gives the operational pseudocode for this instruction.
F5.1.239 SUB, SUBS (immediate)

Subtract (immediate) subtracts an immediate value from a register value, and writes the result to the destination register.

If the destination register is not the PC, the SUBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The SUB variant of the instruction is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.

- The SUBS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See Illegal return events from AArch32 state on page G1-4646.
  - The instruction is UNDEFINED in Hyp mode, except for encoding T5 with <imm8> set to zero, which is the encoding for the ERET instruction, see ERET.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

F5 T32 and A32 Base Instruction Set Instruction Descriptions
F5.1 Alphabetical list of T32 and A32 base instruction set instructions

F5.1.240 SUB, SUBS (register)

Subtract (register) subtracts an optionally-shifted register value from a register value, and writes the result to the destination register.

If the destination register is not the PC, the SUBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. However, when the destination register is the PC:

- The SUB variant of the instruction is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
- The SUBS variant of the instruction performs an exception return without the use of the stack. ARM deprecates use of this instruction. However, in this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See Illegal return events from AArch32 state on page G1-4646.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.
Assembler symbols

<c>
See Standard assembler syntax fields on page F2-3100.

<q>
See Standard assembler syntax fields on page F2-3100.

<Rd>
For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

• For the SUB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.

• For the SUBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1 and T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn>
For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. If the SP is used, see SUB, SUBS (SP minus register).

For encoding T1: is the first general-purpose source register, encoded in the "Rn" field.

For encoding T2: is the first general-purpose source register, encoded in the "Rn" field. If the SP is used, see SUB, SUBS (SP minus register).

<Rm>
For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

<shift>
Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

- LSL when type = 00
- LSR when type = 01
- ASR when type = 10
- ROR when type = 11

<amount>
For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], NOT(shifted), '1');
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;

F5.1.241   SUB, SUBS (register-shifted register)

Subtract (register-shifted register) subtracts a register-shifted register value from a register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

A1

|   | 31 | 28|27|26|25|24|23|22|21|20|19|16|15|12|11| 8 | 7 | 6 | 5 | 4 | 3 | 0 |

\text{shift_t} = \text{DecodeRegShift(type)};
\]

\[
\text{if } d == 15 || n == 15 || m == 15 || s == 15 \text{ then UNPREDICTABLE;}
\]

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

\(<c>\) See \textit{Standard assembler syntax fields on page F2-3100}.

\(<q>\) See \textit{Standard assembler syntax fields on page F2-3100}.

\(<Rd>\) Is the general-purpose destination register, encoded in the "Rd" field.

\(<Rn>\) Is the first general-purpose source register, encoded in the "Rn" field.

\(<Rm>\) Is the second general-purpose source register, encoded in the "Rm" field.

\(<\text{type}>\) Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

\[
\begin{align*}
\text{LSL} & \quad \text{when type} = 00 \\
\text{LSR} & \quad \text{when type} = 01 \\
\text{ASR} & \quad \text{when type} = 10 \\
\text{ROR} & \quad \text{when type} = 11
\end{align*}
\]

\(<Rs>\) Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.
Operation

if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], NOT(shifted), '1');
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzcv;
SUB, SUBS (SP minus immediate)

Subtract from SP (immediate) subtracts an immediate value from the SP value, and writes the result to the destination register.

If the destination register is not the PC, the SUBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The SUB variant of the instruction is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
- The SUBS variant of the instruction performs an exception return without the use of the stack. ARM deprecates use of this instruction. However, in this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See Illegal return events from AArch32 state on page G1-4646.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1

Architectural Constraints on UNPREDICTABLE behaviors.

**Assembler symbols**

\(<c>\) See *Standard assembler syntax fields* on page F2-3100.

\(<q>\) See *Standard assembler syntax fields* on page F2-3100.

\(<\text{imm7}>\) Is the unsigned immediate, a multiple of 4, in the range 0 to 508, encoded in the "\text{imm7}" field as \(<\text{imm7}>/4\).

\(<\text{Rd}>\) For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP. If the PC is used:

* For the SUB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2983.
• For the SUBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. ARM deprecates use of this instruction unless <Rn> is the LR.

For encoding T2 and T3: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP.

<imm12> Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.

<const> For encoding A1: an immediate value. See Modified immediate constants in A32 instructions on page F2-3117 for the range of values.

For encoding T2: an immediate value. See Modified immediate constants in T32 instructions on page F2-3116 for the range of values.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcv) = AddWithCarry(SP, NOT(imm32), '1');
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
F5.1.243 SUB, SUBS (SP minus register)

Subtract from SP (register) subtracts an optionally-shifted register value from the SP value, and writes the result to the destination register.

If the destination register is not the PC, the SUBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The SUB variant of the instruction is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2983.
- The SUBS variant of the instruction performs an exception return without the use of the stack. ARM deprecates use of this instruction. However, in this case:
  — The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  — The PE checks SPSR_<current_mode> for an illegal return event. See Illegal return events from AArch32 state on page G1-4646.
  — The instruction is UNDEFINED in Hyp mode.
  — The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

  For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP.

- **<Rm>**
  For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.
For encoding T1: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

- LSL when type = 00
- LSR when type = 01
- ASR when type = 10
- ROR when type = 11

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(SP, NOT(shifted), '1');
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
F5.1.244   SVC

Supervisor Call causes a Supervisor Call exception. For more information, see Supervisor Call (SVC) exception on page G1-4665.

Note

SVC was previously called SWI, Software Interrupt, and this name is still found in some documentation.

Software can use this instruction as a call to an operating system to provide a service.

In the following cases, the Supervisor Call exception generated by the SVC instruction is taken to Hyp mode:

- If the SVC is executed in Hyp mode.
- If HCR.TGE is set to 1, and the SVC is executed in Non-secure User mode. For more information, see Supervisor Call exception, when the value of HCR.TGE is 1 on page G1-4639.

In these cases, the HSR identifies that the exception entry was caused by a Supervisor Call exception, EC value 0x11, see Use of the HSR on page G4-4958. The immediate field in the HSR:

- If the SVC is unconditional:
  - For the T32 instruction, is the zero-extended value of the imm8 field.
  - For the A32 instruction, is the least-significant 16 bits the imm24 field.
- If the SVC is conditional, is UNKNOWN.

Assembler symbols

\(<c>\) See Standard assembler syntax fields on page F2-3100.
See *Standard assembler syntax fields* on page F2-3100.

For encoding A1: is a 24-bit unsigned immediate, in the range 0 to 16777215, encoded in the "imm24" field. This value is for assembly and disassembly only. SVC handlers in some systems interpret imm24 in software, for example to determine the required service.

For encoding T1: is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field. This value is for assembly and disassembly only. SVC handlers in some systems interpret imm8 in software, for example to determine the required service.

**Operation for all encodings**

```c
if ConditionPassed() then
    EncodingSpecificOperations();
    AArch32.CallSupervisor(imm32<15:0>);
```

```
F5.1.245   SXTAB

Signed Extend and Add Byte extracts an 8-bit value from a register, sign-extends it to 32 bits, adds the result to the value in another register, and writes the final result to the destination register. The instruction can specify a rotation by 0, 8, 16, or 24 bits before extracting the 8-bit value.

- `<q>` See Standard assembler syntax fields on page F2-3100.
- `<Rn>` Is the general-purpose base register holding the address of the table of branch lengths, encoded in the "Rn" field. The PC can be used. If it is, the table immediately follows this instruction.
- `<Rm>` For the byte variant: is the general-purpose index register, encoded in the "Rm" field. This register contains an integer pointing to a single byte in the table. The offset in the table is the value of the index.
  For the halfword variant: is the general-purpose index register, encoded in the "Rm" field. This register contains an integer pointing to a halfword in the table. The offset in the table is twice the value of the index.

**Operation**

if ConditionPassed() then
    EncodingSpecificOperations();
    if is\_tbh then
        halfwords = UInt(MemU[R[n]+LSL(R[m],1), 2]);
    else
        halfwords = UInt(MemU[R[n]+R[m], 1]);
    BranchWritePC(PC + 2*halfwords);
F5.1.252   TEQ (immediate)

Test Equivalence (immediate) performs a bitwise exclusive OR operation on a register value and an immediate value. It updates the condition flags based on the result, and discards the result.

\[ \text{if } n == 15 \land m == 15 \text{ then UNPREDICTABLE; } // \text{ARMv8-A removes UNPREDICTABLE for R13} \]

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1
Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

\[ \langle c\rangle \]

See Standard assembler syntax fields on page F2-3100.
See *Standard assembler syntax fields* on page F2-3100.

**<Rn>**

For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For encoding T1: is the first general-purpose source register, encoded in the "Rn" field.

**<Rm>**

For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T1: is the second general-purpose source register, encoded in the "Rm" field.

**<shift>**

Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

- **LSL** when type = 00
- **LSR** when type = 01
- **ASR** when type = 10
- **ROR** when type = 11

**<amount>**

For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

### Operation for all encodings

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] EOR shifted;
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result);
    PSTATE.C = carry;
    // PSTATE.V unchanged
```
F5.1.254  TEQ (register-shifted register)

Test Equivalence (register-shifted register) performs a bitwise exclusive OR operation on a register value and a register-shifted register value. It updates the condition flags based on the result, and discards the result.

A1

\[
\begin{array}{cccc|ccccccc}
|31| 28|26|25|24|23|22|21|20|19|16|15|14|13|12|11| 8 | 7 | 6 | 5 | 4 | 3 | 0 |
\hline
\text{cond} & 1 & 1 & 1 & 1 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 1 & 1 & Rn & 0 & 0 & 0 & 0 & Rs & 0 & \text{type} & 1 & Rm
\end{array}
\]

A1 variant

TEQ{<c>}{<q>} <Rn>, <Rm>, <type> <Rs>

Decode for this encoding

\[
n = \text{UInt}(Rn); \ m = \text{UInt}(Rm); \ s = \text{UInt}(Rs);
\]
\[
\text{shift}_t = \text{DecodeRegShift}(\text{type});
\]
\[
\text{if } n = 15 \ || \ m = 15 \ || \ s = 15 \text{ then UNPREDICTABLE;}
\]

Notes for all encodings

For more information about the CONSTRANDED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

<\text{c}>  See Standard assembler syntax fields on page F2-3100.
<\text{q}>  See Standard assembler syntax fields on page F2-3100.
<Rn>  Is the first general-purpose source register, encoded in the "Rn" field.
<Rm>  Is the second general-purpose source register, encoded in the "Rm" field.
<\text{type}>  Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:
LSL  when type = 00
LSR  when type = 01
ASR  when type = 10
ROR  when type = 11
<\text{Rs}>  Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

if ConditionPassed() then

\[
\text{EncodingSpecificOperations();
shift_n = \text{UInt}(R[s]<7:0>);
\text{shifted, carry) = Shift.CR(R[m], shift_t, shift_n, PSTATE.C);
result = R[n] \text{ EOR shifted;
PSTATE.N = result<31>;
PSTATE.Z = IsZeroBit(result);
PSTATE.C = carry;
// PSTATE.V unchanged}
\]
### F5.1.255 TST (immediate)

Test (immediate) performs a bitwise AND operation on a register value and an immediate value. It updates the condition flags based on the result, and discards the result.

\texttt{TST\{<c>\}{<q>\} <Rn>, <Rm>, <type> <Rs>}

\textit{Decode for this encoding}

\begin{verbatim}
n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
shift_t = DecodeRegShift(type);
if n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
\end{verbatim}

\textit{Notes for all encodings}

For more information about the \texttt{CONSTRAINED UNPREDICTABLE} behavior of this instruction, see Appendix K1 \textit{Architectural Constraints on UNPREDICTABLE behaviors}.

\textit{Assembler symbols}

\texttt{<c>}

See Standard assembler syntax fields on page F2-3100.

\texttt{<q>}

See Standard assembler syntax fields on page F2-3100.

\texttt{<Rn>}

Is the first general-purpose source register, encoded in the "Rn" field.

\texttt{<Rm>}

Is the second general-purpose source register, encoded in the "Rm" field.

\texttt{<type>}

Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

- \texttt{LSL} when \texttt{type} = 00
- \texttt{LSR} when \texttt{type} = 01
- \texttt{ASR} when \texttt{type} = 10
- \texttt{ROR} when \texttt{type} = 11

\texttt{<Rs>}

Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

\textit{Operation}

\begin{verbatim}
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] AND shifted;
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result);
    PSTATE.C = carry;
    // PSTATE.V unchanged
\end{verbatim}
F5.1.258   UADD16

Unsigned Add 16 performs two 16-bit unsigned integer additions, and writes the results to the destination register. It sets PSTATE.GE according to the results of the additions.

A1

```
| 31 28|27 26 24|23 22 21 20|19 16|15 10 9 8 7 5 4 3 0 |

\]

\[
<{}width> \quad \text{Is the width of the field, in the range 1 to 32-<{}lsb>, encoded in the "widthm1" field as <{}width>-1.}
\]
Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    msbit = lsb\text{it} + \text{width\text{-}minus\text{1}};
    if msbit \leq 31 then
        R[d] = \text{ZeroExtend}(R[n]<msbit:\text{lsbit}>, 32);
    else
        \text{UNPREDICTABLE};

CONSTRAINED UNPREDICTABLE behavior

If msbit > 31, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.
F5.1.262   UDF

Permanently Undefined generates an Undefined Instruction exception.

The encodings for UDF used in this section are defined as permanently UNDEFINED in the ARMv8-A architecture. However:

• With the T32 instruction set, ARM deprecates using the UDF instruction in an IT block.
• In the A32 instruction set, UDF is not conditional.

\]

// imm32 is for assembly and disassembly only, and is ignored by hardware.

T1

|15 14 13 12|11 10 9 8 7 |0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
|1|1|0|1|1|1|0|imm8|

**T1 variant**

UDF{<c>}{<q>} {#}<imm>

**Decode for this encoding**

\[
\text{imm32} = \text{ZeroExtend}(\text{imm8}, 32);
\]

// imm32 is for assembly and disassembly only, and is ignored by hardware.

T2

|15 14 13 12|11 10 9 8 7 6 5 4 |3 |0 |15 14 13 12|11| 0 |0 | |
|1|1|1|1|0|1|1|1|1|1|imm4|1|0|1|0|imm12|

**T2 variant**

UDF{<c>}.W {#}<imm> // <imm> can be represented in T1
UDF{<c>}{<q>} {#}<imm>

**Decode for this encoding**

\[
\text{imm32} = \text{ZeroExtend}(\text{imm4}:\text{imm12}, 32);
\]

// imm32 is for assembly and disassembly only, and is ignored by hardware.
Assembler symbols

<\( c \)>
For encoding A1: see Standard assembler syntax fields on page F2-3100. <\( c \)>
must be AL or omitted.
For encoding T1 and T2: see Standard assembler syntax fields on page F2-3100. ARM deprecates
using any <\( c \)>
value other than AL.

<\( p \)>
See Standard assembler syntax fields on page F2-3100.

<\( \text{imm} \)>
For encoding A1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the
"imm12:imm4" field. The PE ignores the value of this constant.
For encoding T1: is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field.
The PE ignores the value of this constant.
For encoding T2: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the
"imm4:imm12" field. The PE ignores the value of this constant.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    UNDEFINED;
F5.1.263  UDIV

Unsigned Divide divides a 32-bit unsigned integer register value by a 32-bit unsigned integer register value, and writes the result to the destination register. The condition flags are not affected.

See Divide instructions on page F1-3069 for more information about this instruction.

A1

```
|31| 28|27|26|25|24|23|22|21|20|19|16|15|12|11| 8| 7| 6| 5| 4| 3| 0 |
| 1| 1| 1| 1| 0| 0| 1| 1 | Rd | 1|1|1|1|1|1|1 | Rm | 0| 0| 0| 1|Rn |
```

**A1 variant**

UDIV{<c>}{<q>} {<Rd>,} <Rn>, <Rm>

**Decode for this encoding**

\[
d = \text{UInt}(Rd); \quad n = \text{UInt}(Rn); \quad m = \text{UInt}(Rm); \quad a = \text{UInt}(Ra);
\]

\[
\text{if } d == 15 \quad \text{|| } n == 15 \quad \text{|| } m == 15 \quad \text{|| } a != 15 \text{ then UNPREDICTABLE;}
\]

**CONSTRAINED UNPREDICTABLE behavior**

If Ra != '1111', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as described, with no change to its behavior and no additional side effects.
- The instruction performs a divide and the register specified by Ra becomes UNKNOWN.

T1

```
|15|14|13|12|11|10| 9| 8| 7| 6| 5| 4| 3| 0|15|12|11| 8| 7| 6| 5| 4| 3| 0 |

d = UInt(Rd);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE;

**T1 variant**

UXTB16{<c>{<q> {<Rd>,} <Rm> {, ROR #<amount>}}

**Decode for this encoding**

d = UInt(Rd);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE;  // ARMv8-A removes UNPREDICTABLE for R13

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

**Assembler symbols**

- `<c>`  See Standard assembler syntax fields on page F2-3100.
- `<q>`  See Standard assembler syntax fields on page F2-3100.
- `<Rd>`  Is the general-purpose destination register, encoded in the "Rd" field.
- `<Rm>`  For encoding A1: is the general-purpose source register, encoded in the "Rm" field.
  For encoding T1: is the second general-purpose source register, encoded in the "Rm" field.
- `<amount>`  Is the rotate amount, encoded in the "rotate" field. It can have the following values:
  - (omitted) when rotate = 00
  - 8 when rotate = 01
  - 16 when rotate = 10
  - 24 when rotate = 11
Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    rotated = ROR(R[m], rotation);
    R[d]<15:0> = ZeroExtend(rotated<7:0>, 16);
    R[d]<31:16> = ZeroExtend(rotated<23:16>, 16);
### F5.1.291 UXTH

Unsigned Extend Halfword extracts a 16-bit value from a register, zero-extends it to 32 bits, and writes the result to the destination register. The instruction can specify a rotation by 0, 8, 16, or 24 bits before extracting the 16-bit value.

    EncodingSpecificOperations();
    rotated = ROR(R[m], rotation);
    R[d] = ZeroExtend(rotated<15:0>, 32);
F5.1.292   WFE

Wait For Event is a hint instruction that indicates that the PE can enter a low-power state and remain there until a wakeup event occurs. Wakeup events include the event signaled as a result of executing the SEV instruction on any PE in the multiprocessor system. For more information, see *Wait For Event and Send Event* on page G1-4688.

As described in *Wait For Event and Send Event* on page G1-4688, the execution of a `WFE` instruction that would otherwise cause entry to a low-power state can be trapped to a higher Exception level, see:

- *Traps to Undefined mode of EL0 execution of WFE and WFI instructions* on page G1-4705.
- *Traps to Hyp mode of Non-secure EL0 and EL1 execution of WFE and WFI instructions* on page G1-4721.
- *Traps to Monitor mode of the execution of WFE and WFI instructions in modes other than Monitor mode* on page G1-4731.

    WaitForInterrupt();
F5.1.294  YIELD

YIELD is a hint instruction. Software with a multithreading capability can use a YIELD instruction to indicate to the PE that it is performing a task, for example a spin-lock, that could be swapped out to improve overall system performance. The PE can use this hint to suspend and resume multiple software threads if it supports the capability.

For more information about the recommended use of this instruction see The Yield instruction on page F1-3075.

if ConditionPassed() then
    EncodingSpecificOperations();
    Hint_Yield();
F5.2 Encoding and use of banked register transfer instructions

Software executing at EL1 or higher can use the MRS (banked register) and MSR (banked register) instructions to transfer values between the general-purpose registers and Special-purpose registers. One particular use of these instructions is for a hypervisor to save or restore the register values of a Guest OS. The following sections give more information about these instructions:

- **Register arguments in the banked register transfer instructions.**
- **Usage restrictions on the banked register transfer instructions** on page F5-3929.
- **Encoding the register argument in the banked register transfer instructions** on page F5-3930.
- **Pseudocode support for the banked register transfer instructions** on page F5-3931.

For descriptions of the instructions see *MRS (Banked register)* on page F5-3531 and *MSR (Banked register)* on page F5-3535.

F5.2.1 Register arguments in the banked register transfer instructions

Figure F5-1 shows the banked general-purpose registers and Special-purpose registers:

![Banking of general-purpose and Special-purpose registers](image)

For the general-purpose registers, if no other register is shown, the current mode register is the _usr register. So, for example, the full set of current mode registers, including the registers that are not banked:

- For Hyp mode, is \{R0_usr - R12_usr, SP_hyp, LR_usr, SPSR_hyp, ELR_hyp\}.
- For Abort mode, is \{R0_usr - R12_usr, SP_abt, LR_abt, SPSR_abt\}.

Figure F5-1 is based on Figure G1-2 on page G1-4607, that shows the complete set of general-purpose registers and Special-purpose registers accessible in each mode.

**Note**

- System mode uses the same set of registers as User mode. Neither of these modes can access an SPSR, except that System mode can use the MRS (banked register) and MSR (banked register) instructions to access some SPSRs, as described in *Usage restrictions on the banked register transfer instructions* on page F5-3929.
- General-purpose registers R0-R7, that are not banked, cannot be accessed using the MRS (banked register) and MSR (banked register) instructions.
- In addition to the registers shown in Figure F5-1, the DLR and DSPSR are AArch32 System registers that map onto the AArch64 Special-purpose registers DLR_EL0 and DSPSR_EL0. However, DLR and DSPSR are not accessible using the MRS (banked register) and MSR (banked register) instructions.

Software using an MRS (banked register) or MSR (banked register) instruction specifies one of these registers using a name shown in Figure F5-1, or an alternative name for SP or LR. These registers can be grouped as follows:

**R8-R12** Each of these registers has two banked copies, _usr and _fiq, for example R8_usr and R8_fiq.
There is a banked copy of SP for every mode except System mode. For example, SP_svc is the SP for Supervisor mode.

**LR**

There is a banked copy of LR for every mode except System mode and Hyp mode. For example, LR_svc is the LR for Supervisor mode.

**SPSR**

There is a banked copy of SPSR for every mode except System mode and User mode.

**ELR_hyp**

Except for the operations provided by MRS (banked register) and MSR (banked register), ELR_hyp is accessible only from Hyp mode. It is not banked.

### F5.2.2 Usage restrictions on the banked register transfer instructions

MRS (banked register) and MSR (banked register) instructions are CONSTRAINED UNPREDICTABLE if any of the following applies:

- The instruction is executed in User mode.
- The instruction accesses a banked register that is not implemented, or that either:
  - Is not accessible from the current Privilege level and Security state.
  - Can be accessed from the current mode by using a different instruction.

*MRS (banked register) and MSR (banked register) on page K1-6411* describes the permitted CONSTRAINED UNPREDICTABLE behavior.

An MRS (banked register) instruction or an MSR (banked register) instruction executed:

- At Non-secure EL1 cannot access any Hyp mode banked registers.
- At Non-secure EL1 or EL2 cannot access any Monitor mode banked registers.
- In a Secure mode other than Monitor mode cannot access any Hyp banked registers.

This means that the banked registers that MRS (banked register) and MSR (banked register) instructions cannot access are:

**From Monitor mode**

- The current mode registers R8_usr-R12_usr, SP_mon, LR_mon, and SPSR_mon.

**From Hyp mode**

- The Monitor mode registers SP_mon, LR_mon, and SPSR_mon.
- The current mode registers R8_usr-R12_usr, SP_hyp, LR_usr, and SPSR_hyp.

Note: MRS (banked register) and MSR (banked register) instructions can access the current mode register ELR_hyp.

**From FIQ mode**

- From Non-secure EL1, the Monitor mode registers SP_mon, LR_mon, and SPSR_mon.
- The Hyp mode registers SP_hyp, SPSR_hyp, and ELR_hyp.
- The current mode registers R8_fiq-R12_fiq, SP_fiq, LR_fiq, and SPSR_fiq.

**From System mode**

- From Non-secure EL1, the Monitor mode registers SP_mon, LR_mon, and SPSR_mon.
- The Hyp mode registers SP_hyp, SPSR_hyp, and ELR_hyp.
- The current mode registers R8_usr-R12_usr, SP_usr, and LR_usr.

**From Supervisor mode, Abort mode, Undefined mode, and IRQ mode**

- From Non-secure EL1, the Monitor mode registers SP_mon, LR_mon, and SPSR_mon.
- The Hyp mode registers SP_hyp, SPSR_hyp, and ELR_hyp.
- The current mode registers R8_usr-R12_usr, SP_<current_mode>, LR_<current_mode>, and SPSR_<current_mode>.
If EL3 is using AArch64, all MRS (banked register) and MSR (banked register) accesses to the Monitor mode registers from Secure EL1 modes are trapped to EL3. See *Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32* on page D1-1944.

For more information, see:

- *Encoding the register argument in the banked register transfer instructions.*
- *Pseudocode support for the banked register transfer instructions* on page F5-3931.
- *MRS (Banked register)* on page F5-3531.
- *MSR (Banked register)* on page F5-3535.

---

**Note**

CONSTRAINED UNPREDICTABLE behavior must not give access to registers that are not accessible from the current Privilege level and Security state.

---

**F5.2.3 Encoding the register argument in the banked register transfer instructions**

The MRS (banked register) and MSR (banked register) instructions include a 5-bit field, SYSm, and an R bit, that together encode the register argument for the instruction.

When the R bit is set to 0, the argument is a register other than a banked copy of the SPSR, and Table F5-1 shows how the SYSm field defines the required register argument. In this table, CONST. UNPREDICTABLE indicates that behavior is CONSTRAINED UNPREDICTABLE.

<table>
<thead>
<tr>
<th>SYSm&lt;2:0&gt;</th>
<th>SYSm&lt;4:3&gt;</th>
<th>0b00</th>

<td>CONST. UNPREDICTABLE</td>
<td>CONST. UNPREDICTABLE</td>
<td>SP_und</td>
<td>SP_hyp</td>
<td></td>
</tr>
</tbody>
</table>

When the R bit is set to 1, the argument is a banked copy of the SPSR, and Table F5-2 shows how the SYSm field defines the required register argument. In this table, CONST. UNPREDICTABLE indicates that behavior is CONSTRAINED UNPREDICTABLE.

<table>

</tr>
</tbody>
</table>
The pseudocode functions `BankedRegisterAccessValid()` and `SPSRaccessValid()` check the validity of `MRS` (banked register) and `MSR` (banked register) accesses. That is, they filter the accesses that are CONSTRAINED UNPREDICTABLE either because:

- They attempt to access a register that Usage restrictions on the banked register transfer instructions on page F5-3929 shows is not accessible.

- They use an SYSm<4:0> encoding that Encoding the register argument in the banked register transfer instructions on page F5-3930 shows as CONSTRAINED UNPREDICTABLE.

`BankedRegisterAccessValid()` applies to accesses to the banked general-purpose registers, or to `ELR_hyp`, and `SPSRaccessValid()` applies to accesses to the SPSRs.
F5 T32 and A32 Base Instruction Set Instruction Descriptions

F5.2 Encoding and use of banked register transfer instructions
Chapter F6
T32 and A32 Advanced SIMD and Floating-point Instruction Descriptions

This chapter describes each instruction. It contains the following sections:

• Alphabetical list of Advanced SIMD and floating-point instructions on page F6-3934.

Note
Some headings in this chapter use the term floating-point register. This is an abbreviated description, and means a register in the Advanced SIMD and floating-point register file.
F6.1 Alphabetical list of Advanced SIMD and floating-point instructions

This section lists every Advanced SIMD and floating-point instruction in the T32 and A32 instruction sets. For details of the format used see Format of instruction descriptions on page F2-3096.

This section is formatted so that each instruction description starts on a new page.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations(); CheckCryptoEnabled32();
    Q[d>>1] = AESMixColumns(Q[m>>1]);
### F6.1.5 FLDM*X (FLDMDBX, FLDMIAX)

FLDMDBX is the Decrement Before variant of this instruction, and FLDMIAX is the Increment After variant. FLDM*X loads multiple SIMD&FP registers from consecutive locations in the Advanced SIMD and floating-point register file using an address from a general-purpose register.

ARM deprecates use of FLDMDBX and FLDMIAX, except for disassembly purposes, and reassembly of disassembled code.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-4697.

#### Decrement Before variant

Applies when $P == 1 \&\& U == 0 \&\& W == 1$.

**FLDMDBX{<c>}{<q>} <Rn>!, <dreglist>**

#### Increment After variant

Applies when $P == 0 \&\& U == 1$.

**FLDMIAX{<c>}{<q>} <Rn>{!}, <dreglist>**

#### Decode for all variants of this encoding

```c
if P == '0' \&\& U == '0' \&\& W == '0' then SEE "Related encodings";
if P == '1' \&\& W == '0' then SEE "VLDR";
if P == U \&\& W == '1' then UNDEFINED;
```

// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (08 with !)

```c
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (08 with !)
```

```c
single_regs = FALSE; add = (U == '1'); wback = (W == '1');
```

```c
d = UInt(D:Vd); n = UInt(Rn);imm32 = ZeroExtend(imm8:'00', 32);
```

```c
regs = UInt(imm8) DIV 2; // If UInt(imm8) is odd, see "FLDM-X".
```

```c
if n == 15 \&\& (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || |regs > 16 || (d+regs) > 32 then UNPREDICTABLE;
if imm8<0> == '1' \&\& (d+regs) > 16 then UNPREDICTABLE;
```

#### CONSTRAINED UNPREDICTABLE behavior

If regs == 0, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as a VLDM with the same addressing mode but loads no registers.

If regs > 16 || (d+regs) > 16, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.
Decrement Before variant

Applies when \( P == 1 \) \&\& \( U == 0 \) \&\& \( W == 1 \).

\[ \text{FLDMDBX}\{<c>\}{<q>} <Rn>!, <dreglist> \]

Increment After variant

Applies when \( P == 0 \) \&\& \( U == 1 \).

\[ \text{FLDMIAX}\{<c>\}{<q>} <Rn>\{!\}, <dreglist> \]

Decode for all variants of this encoding

\[
\begin{align*}
\text{if } P &= '0' \&\& U = '0' \&\& W = '0' \text{ then see "Related encodings";} \\
\text{if } P &= '1' \&\& W = '0' \text{ then see "VLDR";} \\
\text{if } P &= U \&\& W = '1' \text{ then UNDEFINED;} \\
\text{// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)} \\
single\text{regs} &= \text{FALSE}; \quad \text{add} = (U == '1'); \quad \text{wback} = (W == '1'); \\
d &= \text{UInt}(D;Vd); \quad n = \text{UInt}(Rn); \quad \text{imm32} = \text{ZeroExtend}(\text{imm8};'00', 32); \\
\text{regs} &= \text{UInt}(\text{imm8}) \text{ DIV } 2; \quad \text{// If UInt(imm8) is odd, see "FLDM*X".} \\
\text{if } n &= 15 \&\& \text{(wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;} \\
\text{if } \text{regs} &= 0 || \text{regs} > 16 || (d+regs) > 32 \text{ then UNPREDICTABLE;} \\
\text{if } \text{imm8<0>} &= '1' \&\& (d+regs) > 16 \text{ then UNPREDICTABLE;} \\
\end{align*}
\]

CONSTRUINED UNPREDICTABLE behavior

If \( \text{regs} == 0 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as a VLDM with the same addressing mode but loads no registers.

If \( \text{regs} > 16 \) || (\( d+\text{regs} \)) > 16, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings

For more information about the CONSTRUINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Related encodings: See Advanced SIMD and floating-point 64-bit move on page F3-3165 for the T32 instruction set, or Advanced SIMD and floating-point 64-bit move on page F4-3236 for the A32 instruction set.

Assembler symbols

- \(<c>\) See Standard assembler syntax fields on page F2-3100.
- \(<q>\) See Standard assembler syntax fields on page F2-3100.
<Rn> Is the general-purpose base register, encoded in the "Rn" field. If writeback is not specified, the PC can be used.

! Specifies base register writeback. Encoded in the "W" field as 1 if present, otherwise 0.

<dreglist> Is the list of consecutively numbered 64-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "D:Vd", and "imm8" is set to twice the number of registers in the list plus one. The list must contain at least one register, all registers must be in the range D0-D15, and must not contain more than 16 registers.

**Operation for all encodings**

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations();  CheckVFPEncabled(TRUE);
    address = if add then R[n] else R[n]-imm32;
    for r = 0 to regs-1
        if single_regs then
            S[d+r] = MemA[address,4];  address = address+4;
        else
            word1 = MemA[address,4];  word2 = MemA[address+4,4];  address = address+8;
            // Combine the word-aligned words in the correct order for current endianness.
            D[d+r] = if BigEndian() then word1:word2 else word2:word1;
        if wback then R[n] = if add then R[n]+imm32 else R[n]-imm32;
```
F6.1.6   FSTMDBX, FSTMIAX

FSTMX stores multiple SIMD&FP registers from the Advanced SIMD and floating-point register file to consecutive locations in using an address from a general-purpose register.

ARM deprecates use of FLDMDBX and FLDMIAX, except for disassembly purposes, and reassembly of disassembled code.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

Decrement Before variant

Applies when \( P = 1 \land U = 0 \land W = 1 \).

\[
\text{FSTMDBX<q>}<\text{cond}><\text{op}>(Rn), \text{<dreglist>}
\]

Increment After variant

Applies when \( P = 0 \land U = 1 \).

\[
\text{FSTMIAX<q>}<\text{cond}>(Rn){!}, \text{<dreglist>}
\]

Decode for all variants of this encoding

\[
\begin{align*}
\text{if } P &= '0' \land U &= '0' \land W &= '0' \text{ then see "Related encodings";} \\
\text{if } P &= '1' \land W &= '0' \text{ then see "VSTR";} \\
\text{if } P &= U \land W &= '1' \text{ then UNDEFINED;} \\
\text{// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !) } \\
single_{\text{regs}} &= \text{FALSE}; \quad \text{add} = (U == '1'); \quad \text{wback} = (W == '1'); \\
d &= \text{UInt}(D:Vd); \quad n = \text{UInt}(Rn); \quad \text{imm32} = \text{ZeroExtend}('00', 32); \\
\text{regs} &= \text{UInt}(\text{imm8}) \text{ DIV 2}; \quad \text{// If UInt(imm8) is odd, see "FSTMX".} \\
\text{if } n &= 15 \land \text{wback} \land \text{CurrentInstrSet}() != \text{InstrSet_A32} \text{ then UNPREDICTABLE;} \\
\text{if } \text{regs} &= 0 \land (d+\text{regs}) > 16 \land (d+\text{regs}) > 32 \text{ then UNPREDICTABLE;} \\
\text{if } \text{imm8<0>} &= '1' \land (d+\text{regs}) > 16 \text{ then UNPREDICTABLE;}
\end{align*}
\]

CONSTRAINED UNPREDICTABLE behavior

If \( \text{regs} = 0 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as a VSTM with the same addressing mode but stores no registers.

If \( \text{regs} > 16 \land (d+\text{regs}) > 16 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

F6.1.17 VABA

Vector Absolute Difference and Accumulate subtracts the elements of one vector from the corresponding elements of another vector, and accumulates the absolute values of the results into the elements of the destination vector.

Operand and result elements are all integers of the same length.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

64-bit SIMD vector variant

                when 64 D[d] = FPAbs(D[m]);
F6.1.23 VACGE

Vector Absolute Compare Greater Than or Equal takes the absolute value of each element in a vector, and compares it with the absolute value of the corresponding element of a second vector. If the first is greater than or equal to the second, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

The operands and result can be quadword or doubleword vectors. They must all be the same size.

The operand vector elements are floating-point numbers. The result vector elements are the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPRTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

This instruction is used by the pseudo-instruction VACLE. The pseudo-instruction is never the preferred disassembly.

**Half-precision scalar variant**

Applies when size == 01.

VADD{<c>}{<q>}.F16 {<Sd>,} <Sn>, <Sm>

**Single-precision scalar variant**

Applies when size == 10.

VADD{<c>}{<q>}.F32 {<Sd>,} <Sn>, <Sm>

**Double-precision scalar variant**

Applies when size == 11.

VADD{<c>}{<q>}.F64 {<Dd>,} <Dn>, <Dm>

**Decode for all variants of this encoding**

if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
if size == '01' && InITBlock() then UNPREDICTABLE;
advsimd = FALSE;
case size of
  when '01' esize = 16; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
  when '10' esize = 32; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
  when '11' esize = 64; d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);

**CONSTRAINED UNPREDICTABLE behavior**

If size == '01' && InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

**Assembler symbols**

- **<Dm>** Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            Elem[D[d+r],e,esize] = Elem[D[n+r],e,esize] + Elem[D[m+r],e,esize];
```
F6.1.29 VADDHN

Vector Add and Narrow, returning High Half adds corresponding elements in two quadword vectors, and places the most significant half of each result in a doubleword vector. The results are truncated. For rounded results, see VRADDHN.

The operand elements can be 16-bit, 32-bit, or 64-bit integers. There is no distinction between signed and unsigned integers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

A1 variant

\[ \text{VADDHN}\{<c>\}\{<q>\}.<dt> <Dd>, <Qn>, <Qm> \]

Decode for this encoding

```plaintext
if size == '11' then SEE "Related encodings";
if Vn<0> == '1' || Vm<0> == '1' then UNDEFINED;
size = 8 << UInt(size); elements = 64 DIV esize;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
```

T1 variant

\[ \text{VADDHN}\{<c>\}\{<q>\}.<dt> <Dd>, <Qn>, <Qm> \]

Decode for this encoding

```plaintext
if size == '11' then SEE "Related encodings";
if Vn<0> == '1' || Vm<0> == '1' then UNDEFINED;
size = 8 << UInt(size); elements = 64 DIV esize;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
```

Notes for all encodings

Related encodings: See Advanced SIMD data-processing on page F3-3155 for the T32 instruction set, or Advanced SIMD data-processing on page F4-3240 for the A32 instruction set.

Assembler symbols

\(<c>\) For encoding A1: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.

For encoding T1: see Standard assembler syntax fields on page F2-3100.

\(<q>\) See Standard assembler syntax fields on page F2-3100.
<dt> Is the data type for the elements of the operands, encoded in the "size" field. It can have the following values:
  I16 when size = 00
  I32 when size = 01
  I64 when size = 10

<dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

    result = op1 + Int(Elem[Din[m],e,esize],unsigned);
    Elem[Q[d>>1],e,2*esize] = result<2*esize-1:0>;
```

```
F6.1.32  VAND (immediate)

Vector Bitwise AND (immediate) performs a bitwise AND between a register value and an immediate value, and returns the result into the destination vector.

This instruction is a pseudo-instruction of the VBIC (immediate) instruction. This means that:

- The encodings in this description are named to match the encodings of VBIC (immediate).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VBIC (immediate) gives the operational pseudocode for this instruction.

A1

VAND{<c>}{<q>}.I16 {<Dd>,} <Dd>, #<imm>

is equivalent to

VBIC{<c>}{<q>}.I16 <Dd>, #~<imm>

and is never the preferred disassembly.

64-bit SIMD vector variant

Applies when Q == 0.

VAND{<c>}{<q>}.I16 {<Dd>,} <Dd>, #<imm>

is equivalent to

VBIC{<c>}{<q>}.I16 <Dd>, #~<imm>

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when Q == 1.

VAND{<c>}{<q>}.I16 {<Qd>,} <Qd>, #<imm>

is equivalent to

VBIC{<c>}{<q>}.I16 <Qd>, #~<imm>

and is never the preferred disassembly.

A2

VAND{<c>}{<q>}.I32 {<Dd>,} <Dd>, #<imm>

is equivalent to

VBIC{<c>}{<q>}.I32 <Dd>, #~<imm>

and is never the preferred disassembly.

64-bit SIMD vector variant

Applies when Q == 0.

VAND{<c>}{<q>}.I32 {<Dd>,} <Dd>, #<imm>

is equivalent to

VBIC{<c>}{<q>}.I32 <Dd>, #~<imm>

and is never the preferred disassembly.
**128-bit SIMD vector variant**

Applies when \( Q = 1 \).

\[
\text{VAND}\{\text{c}\}\{\text{q}\}.\text{I32}\ \{\text{Qd},\} \&\text{Qd}, \#\text{imm}\]
\]

is equivalent to

\[
\text{VBIC}\{\text{c}\}\{\text{q}\}.\text{I32}\ \&\text{Qd}, \#\sim\text{imm}
\]

and is never the preferred disassembly.

**T1**

</table>
```

cmode

**128-bit SIMD vector variant**

Applies when \( Q = 1 \).

\[
\text{VAND}\{\text{c}\}\{\text{q}\}.\text{I16}\ \{\text{Qd},\} \&\text{Qd}, \#\text{imm}\]
\]

is equivalent to

\[
\text{VBIC}\{\text{c}\}\{\text{q}\}.\text{I16}\ \&\text{Qd}, \#\sim\text{imm}
\]

and is never the preferred disassembly.

**64-bit SIMD vector variant**

Applies when \( Q = 0 \).

\[
\text{VAND}\{\text{c}\}\{\text{q}\}.\text{I32}\ \{\text{Dd},\} \&\text{Dd}, \#\text{imm}\]
\]

is equivalent to

\[
\text{VBIC}\{\text{c}\}\{\text{q}\}.\text{I32}\ \&\text{Dd}, \#\sim\text{imm}
\]

and is never the preferred disassembly.

**128-bit SIMD vector variant**

Applies when \( Q = 1 \).
VAND{<c>}{<q>}.I32 {<Qd>}, <Qd>, #<imm>
is equivalent to
VBIC{<c>}{<q>}.I32 <Qd>, #~<imm>
and is never the preferred disassembly.

Assembler symbols

{<c>}      For encoding A1 and A2: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.
            For encoding T1 and T2: see Standard assembler syntax fields on page F2-3100.
{<op>}     See Standard assembler syntax fields on page F2-3100.
{<Qd>}     Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
{<Dd>}     Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
{<imm>}    Is a constant of the specified type that is replicated to fill the destination register. For details of the range of constants available and the encoding of {<imm>}, see Modified immediate constants in T32 and A32 Advanced SIMD instructions on page F2-3118.

Operation for all encodings

The description of VBIC (immediate) gives the operational pseudocode for this instruction.
F6.1.33  VAND (register)

Vector Bitwise AND (register) performs a bitwise AND operation between two registers, and places the result in the destination register.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

64-bit SIMD vector variant

Applies when Q == 0.

VAND{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VAND{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>

Decode for all variants of this encoding

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;

d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;

Assembler symbols

For encoding A1: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.

For encoding T1: see Standard assembler syntax fields on page F2-3100.
See *Standard assembler syntax fields* on page F2-3100.

An optional data type. It is ignored by assemblers, and does not affect the encoding.

Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>∗2.

Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>∗2.

Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>∗2.

Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

**Operation for all encodings**

```c
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[n+r] AND D[m+r];
```
F6.1.34 VBIC (Immediate)

Vector Bitwise Bit Clear (Immediate) performs a bitwise AND between a register value and the complement of an immediate value, and returns the result into the destination vector.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

This instruction is used by the pseudo-instruction VAND (Immediate). The pseudo-instruction is never the preferred disassembly.

Notes for all encodings
Related encodings: See Advanced SIMD one register and modified immediate on page F3-3164 for the T32 instruction set, or Advanced SIMD one register and modified immediate on page F4-3249 for the A32 instruction set.

Assembler symbols

For encoding A1 and A2: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.
For encoding T1 and T2: see Standard assembler syntax fields on page F2-3100.

<q> See Standard assembler syntax fields on page F2-3100.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<imm> Is a constant of the specified type that is replicated to fill the destination register. For details of the range of constants available and the encoding of <imm>, see Modified immediate constants in T32 and A32 Advanced SIMD instructions on page F2-3118.

The I8, I64, and F32 data types are permitted as pseudo-instructions, if the immediate can be represented by this instruction, and are encoded using a permitted encoding of the I16 or I32 data type.

**Operation for all encodings**

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[r] AND NOT(imm64);
F6.1.35 VBIC (register)

Vector Bitwise Bit Clear (register) performs a bitwise AND between a register value and the complement of a register value, and places the result in the destination register.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

F6.1.39 VCADD

Vector Complex Add.

This instruction operates on complex numbers that are represented in SIMD&FP registers as pairs of elements, with the more significant element holding the imaginary part of the number and the less significant element holding the real part of the number. Each element holds a floating-point value. It performs the following computation on the corresponding complex number element pairs from the two source registers:

- Considering the complex number from the second source register on an Argand diagram, the number is rotated counterclockwise by 90 or 270 degrees.
- The rotated complex number is added to the complex number from the first source register.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

**CONstrained UNPREDICTABLE behavior**

If sz == '1' && InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

**Assembler symbols**

- For encoding A1 and A2: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.
  
  For encoding T1 and T2: see Standard assembler syntax fields on page F2-3100.

- See Standard assembler syntax fields on page F2-3100.

- For encoding A1 and T1: is the data type for the elements of the operands, encoded in the "U:size" field. It can have the following values:
  
  - **S8** when U = 0, size = 00
  - **S16** when U = 0, size = 01
  - **S32** when U = 0, size = 10
  - **U8** when U = 1, size = 00
  - **U16** when U = 1, size = 01
  - **U32** when U = 1, size = 10

  For encoding A2 and T2: is the data type for the elements of the vectors, encoded in the "sz" field. It can have the following values:
  
  - **F32** when sz = 0
  - **F16** when sz = 1

- Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

- Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

- Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

- Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

- Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

- Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

**Operation for all encodings**

```python
enumeration VCGEtype {VCGEtype_signed, VCGEtype_unsigned, VCGEtype_fp};

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[D[n+r],e,esize]; op2 = Elem[D[m+r],e,esize];
            case type of
                when VCGEtype_signed  test_passed = (SInt(op1) >= SInt(op2));
```

```
```
when VCGEtype_unsigned  test_passed = (UInt(op1) >= UInt(op2));
when VCGEtype_fp        test_passed = FPCompareGE(op1, op2, StandardFPSCRValue());
Elem[D[d+r],e,esize] = if test_passed then Ones(esize) else Zeros(esize);
F6.1.44   VCGT (Immediate #0)

Vector Compare Greater Than Zero takes each element in a vector, and compares it with zero. If it is greater than zero, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

The operand vector elements are the same type, and are signed integers or floating-point numbers. The result vector elements are fields the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

### F6.1.47 VCLE (register)

Vector Compare Less Than or Equal takes each element in a vector, and compares it with the corresponding element of a second vector. If the first is less than or equal to the second, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

This instruction is a pseudo-instruction of the VCGE (register) instruction. This means that:

- The encodings in this description are named to match the encodings of VCGE (register).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VCGE (register) gives the operational pseudocode for this instruction.

**Assembler symbols**

- `<Qm>`: Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.
- `<Dn>`: Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- `<Qm>`: Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as `<Qm>*2`.
- `<Qn>`: Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as `<Qn>*2`.
- `<c>`: For encoding A1 and A2: see *Standard assembler syntax fields on page F2-3100*. This encoding must be unconditional.
- `<q>`: See *Standard assembler syntax fields on page F2-3100*.
- `<dt>`: For encoding A1 and T1: is the data type for the elements of the operands, encoded in the "U:size" field. It can have the following values:
  - S8: when U = 0, size = 00
  - S16: when U = 0, size = 01
  - S32: when U = 0, size = 10
  - U8: when U = 1, size = 00
  - U16: when U = 1, size = 01
  - U32: when U = 1, size = 10
- `<Qd>`: Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as `<Qd>*2`.
- `<Dd>`: Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

**Operation for all encodings**

The description of `VCGE (register)` gives the operational pseudocode for this instruction.
F6.1.48 VCLS

Vector Count Leading Sign Bits counts the number of consecutive bits following the topmost bit, that are the same as the topmost bit, in each element in a vector, and places the results in a second vector. The count does not include the topmost bit itself.

The operand vector elements can be any one of 8-bit, 16-bit, or 32-bit signed integers.

The result vector elements are the same data type as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

A1

64-bit SIMD vector variant

esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;

Assembler symbols

<q>
For encoding A1: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.
For encoding T1: see Standard assembler syntax fields on page F2-3100.

<dt>
Is the data type for the elements of the operands, encoded in the "size" field. It can have the following values:
S8  when size = 00
S16 when size = 01
S32 when size = 10
The encoding size = 11 is reserved.

<Qd>
Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm>
Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd>
Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<dm>
Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            Elem[D[d+r],e,esize] = CountLeadingSignBits(Elem[D[m+r],e,esize]<esize-1:0>);
F6.1.49   VCLT (immediate #0)

Vector Compare Less Than Zero takes each element in a vector, and compares it with zero. If it is less than zero, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

The operand vector elements are the same type, and are signed integers or floating-point numbers. The result vector elements are fields the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;

**CONSTRAINED UNPREDICTABLE behavior**

If F == '1' && size == '01' && InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

**Assembler symbols**

- For encoding A1: see *Standard assembler syntax fields on page F2-3100*. This encoding must be unconditional.
- For encoding T1: see *Standard assembler syntax fields on page F2-3100*.

- See *Standard assembler syntax fields on page F2-3100*.

- Is the data type for the elements of the operands, encoded in the "F:size" field. It can have the following values:

  - **S8** when F = 0, size = 00
  - **S16** when F = 0, size = 01
  - **S32** when F = 0, size = 10
  - **F16** when F = 1, size = 01
  - **F32** when F = 1, size = 10

- Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

- Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

- Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

- Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

**Operation for all encodings**

if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            if floating_point then
                bits(esize) zero = FPZero('0');
                test_passed = FPCompareGT(zero, Elem[D[r]+e,esize], StandardFPSCRValue());
            else
                test_passed = (SInt(Elem[D[r]+e,esize]) < 0);
                Elem[D[r]+e,esize] = if test_passed then Ones(esize) else Zeros(esize);
F6.1.50 VCLT (register)

Vector Compare Less Than takes each element in a vector, and compares it with the corresponding element of a second vector. If the first is less than the second, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

This instruction is a pseudo-instruction of the VCGT (register) instruction. This means that:

- The encodings in this description are named to match the encodings of VCGT (register).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VCGT (register) gives the operational pseudocode for this instruction.

F6.1.52   VCMLA

Vector Complex Multiply Accumulate.

This instruction operates on complex numbers that are represented in SIMD&FP registers as pairs of elements, with the more significant element holding the imaginary part of the number and the less significant element holding the real part of the number. Each element holds a floating-point value. It performs the following computation on the corresponding complex number element pairs from the two source registers and the destination register:

- Considering the complex number from the second source register on an Argand diagram, the number is rotated counterclockwise by 0, 90, 180, or 270 degrees.
- The two elements of the transformed complex number are multiplied by:
  - The real element of the complex number from the first source register, if the transformation was a rotation by 0 or 180 degrees.
  - The imaginary element of the complex number from the first source register, if the transformation was a rotation by 90 or 270 degrees.
- The complex number resulting from that multiplication is added to the complex number from the destination register.

The multiplication and addition operations are performed as a fused multiply-add, without any intermediate rounding.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

F6.1.53  VCMLA (by element)

Vector Complex Multiply Accumulate (by element).

This instruction operates on complex numbers that are represented in SIMD&FP registers as pairs of elements, with
the more significant element holding the imaginary part of the number and the less significant element holding the
real part of the number. Each element holds a floating-point value. It performs the following computation on
complex numbers from the first source register and the destination register with the specified complex number from
the second source register:

- Considering the complex number from the second source register on an Argand diagram, the number is
  rotated counterclockwise by 0, 90, 180, or 270 degrees.
- The two elements of the transformed complex number are multiplied by:
  - The real element of the complex number from the first source register, if the transformation was a
    rotation by 0 or 180 degrees.
  - The imaginary element of the complex number from the first source register, if the transformation was
    a rotation by 90 or 270 degrees.
- The complex number resulting from that multiplication is added to the complex number from the destination
  register.

The multiplication and addition operations are performed as a fused multiply-add, without any intermediate
rounding.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which
the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For
more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

F6.1.54  VCMP

Vector Compare compares two floating-point registers, or one floating-point register and zero. It writes the result to the FPSCR flags. These are normally transferred to the PSTATE. {N, Z, C, V} Condition flags by a subsequent VMRS instruction.

It raises an Invalid Operation exception only if either operand is a signaling NaN.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

<
See Standard assembler syntax fields on page F2-3100.

<
See Standard assembler syntax fields on page F2-3100.

<
Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

<
Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.

<
Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<
Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

NaNs

The IEEE 754 standard specifies that the result of a comparison is precisely one of <, ==, > or unordered. If either or both of the operands are NaNs, they are unordered, and all three of (Operand1 < Operand2), (Operand1 == Operand2) and (Operand1 > Operand2) are false. This results in the FPSCR flags being set as N=0, Z=0, C=1 and V=1.

VCMPE raises an Invalid Operation exception if either operand is any type of NaN, and is suitable for testing for <, <=, >, >=, and other predicates that raise an exception when the operands are unordered.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
    bits(4) nzcv;
    case esize of
        when 16

Half-precision scalar variant
Applies when size == 01.
VCMPE{<c>}{<q>}.F16 <Sd>, <Sm>

Single-precision scalar variant
Applies when size == 10.
VCMPE{<c>}{<q>}.F32 <Sd>, <Sm>

Double-precision scalar variant
Applies when size == 11.
VCMPE{<c>}{<q>}.F64 <Dd>, <Sm>
**Decode for all variants of this encoding**

```plaintext
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
if size == '01' && InITBlock() then UNPREDICTABLE;
quiet_nan_exc = (E == '1'); with_zero = FALSE;
case size of
  when '01' esize = 16; d = UInt(Vd:D); m = UInt(Vm:M);
  when '10' esize = 32; d = UInt(Vd:D); m = UInt(Vm:M);
  when '11' esize = 64; d = UInt(D:Vd); m = UInt(M:Vm);
```

**CONSTRANGED UNPREDICTABLE behavior**

If size == '01' && InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

VCMPE{<c>}{<q>}.F32 <Sd>, #0.0

**Double-precision scalar variant**

Applies when size == 11.

VCMPE{<c>}{<q>}.F64 <Dd>, #0.0

---

**Decode for all variants of this encoding**

```plaintext
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
if size == '01' && InITBlock() then UNPREDICTABLE;
quiet_nan_exc = (E == '1'); with_zero = TRUE;
case size of
  when '01' esize = 16; d = UInt(Vd:D); m = UInt(Vm:M);
  when '10' esize = 32; d = UInt(Vd:D); m = UInt(Vm:M);
  when '11' esize = 64; d = UInt(D:Vd); m = UInt(M:Vm);
```

**CONSTRANGED UNPREDICTABLE behavior**

If size == '01' && InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.
Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols

<->  See Standard assembler syntax fields on page F2-3100.

<op>  See Standard assembler syntax fields on page F2-3100.

<5d>  Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

<5m>  Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.

<6d>  Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<6m>  Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

NaNs

The IEEE 754 standard specifies that the result of a comparison is precisely one of <, ==, > or unordered. If either or both of the operands are NaNs, they are unordered, and all three of (Operand1 < Operand2), (Operand1 == Operand2) and (Operand1 > Operand2) are false. This results in the FPSCR flags being set as N=0, Z=0, C=1 and V=1.

VCMPE raises an Invalid Operation exception if either operand is any type of NaN, and is suitable for testing for <, <=, >, >=, and other predicates that raise an exception when the operands are unordered.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();  CheckVFPEnabled(TRUE);
    bits(4) nzcv;
    case esize of
        when 16
            bits(16) op16 = if with_zero then FPZero('0') else S[m]<15:0>;
            nzcv = FPCompare(S[d]<15:0>, op16, quiet_nan_exc, FPSCR);
        when 32
            bits(32) op32 = if with_zero then FPZero('0') else S[m];
            nzcv = FPCompare(S[d], op32, quiet_nan_exc, FPSCR);
        when 64
            bits(64) op64 = if with_zero then FPZero('0') else D[m];
            nzcv = FPCompare(D[d], op64, quiet_nan_exc, FPSCR);
    FPSCR.<N,Z,C,V> = nzcv;
F6.1.56 VCNT

Vector Count Set Bits counts the number of bits that are one in each element in a vector, and places the results in a second vector.

The operand vector elements must be 8-bit fields.

The result vector elements are 8-bit integers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

F6.1.59   VCVT (between floating-point and integer, Advanced SIMD)

Vector Convert between floating-point and integer converts each element in a vector from floating-point to integer, or from integer to floating-point, and places the results in a second vector.

The vector elements are the same type, and are floating-point numbers or integers. Signed and unsigned integers are distinct.

The floating-point to integer operation uses the Round towards Zero rounding mode. The integer to floating-point operation uses the Round to Nearest rounding mode.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

**Constrained Unpredictable behavior**

If `size` == '01' && InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

**Assembler symbols**

- `<c>` For encoding A1: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.
  
  For encoding T1: see Standard assembler syntax fields on page F2-3100.

- `<q>` See Standard assembler syntax fields on page F2-3100.

- `<dt1>` Is the data type for the elements of the destination vector, encoded in the "size:op" field. It can have the following values:
  
  - F16 when size = 01, op = 0x
  - S16 when size = 01, op = 10
  - U16 when size = 01, op = 11
  - F32 when size = 10, op = 0x
  - S32 when size = 10, op = 10
  - U32 when size = 10, op = 11

- `<dt2>` Is the data type for the elements of the source vector, encoded in the "size:op" field. It can have the following values:
  
  - S16 when size = 01, op = 00
  - U16 when size = 01, op = 01
  - F16 when size = 01, op = 1x
  - S32 when size = 10, op = 00
  - U32 when size = 10, op = 01
  - F32 when size = 10, op = 1x

- `<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as `<Qd>*2.

- `<Qm>` Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as `<Qm>*2.

- `<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

- `<Dm>` Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.
Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    bits(esize) result;
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[D[m+r],e,esize];
            if to_integer then
                result = FPtoFixed(op1, 0, unsigned, StandardFPSCRValue(), FPRounding_ZERO);
            else
                result = FixedToFP(op1, 0, unsigned, StandardFPSCRValue(), FPRounding_TIEEVEN);
            Elem[D[d+r],e,esize] = result;
F6.1.60  VCVT (floating-point to integer, floating-point)

Convert floating-point to integer with Round towards Zero converts a value in a register from floating-point to a 32-bit integer, using the Round towards Zero rounding mode, and places the result in a second register.

VCVT (between floating-point and fixed-point, floating-point) describes conversions between floating-point and 16-bit integers.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

F6.1.61 VCVT (integer to floating-point, floating-point)

Convert integer to floating-point converts a 32-bit integer to floating-point using the rounding mode specified by the FPSCR, and places the result in a second register.

VCVT (between floating-point and fixed-point, floating-point) describes conversions between floating-point and 16-bit integers.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

F6.1.62 VCVT (between floating-point and fixed-point, Advanced SIMD)

Vector Convert between floating-point and fixed-point converts each element in a vector from floating-point to fixed-point, or from fixed-point to floating-point, and places the results in a second vector.

The vector elements are the same type, and are floating-point numbers or integers. Signed and unsigned integers are distinct.

The floating-point to fixed-point operation uses the Round towards Zero rounding mode. The fixed-point to floating-point operation uses the Round to Nearest rounding mode.

Depending on settings in the CPACR, NSACR, and HCPTDR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

Related encodings: See Advanced SIMD one register and modified immediate on page F3-3164 for the T32 instruction set, or Advanced SIMD one register and modified immediate on page F4-3249 for the A32 instruction set.

**Assembler symbols**

- `<c>`
  For encoding A1: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.
  For encoding T1: see Standard assembler syntax fields on page F2-3100.

- `<q>`
  See Standard assembler syntax fields on page F2-3100.

- `<dt1>`
  Is the data type for the elements of the destination vector, encoded in the "op:U" field. It can have the following values:
  - F16 when op = 00, U = x
  - S16 when op = 01, U = 0
  - U16 when op = 01, U = 1
  - F32 when op = 10, U = x
  - S32 when op = 11, U = 0
  - U32 when op = 11, U = 1

- `<dt2>`
  Is the data type for the elements of the source vector, encoded in the "op:U" field. It can have the following values:
  - S16 when op = 00, U = 0
  - U16 when op = 00, U = 1
  - F16 when op = 01, U = x
  - S32 when op = 10, U = 0
  - U32 when op = 10, U = 1
  - F32 when op = 11, U = x

- `<Qd>`
  Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as `<Qd>*2.`

- `<Qm>`
  Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as `<Qm>*2.`

- `<Dd>`
  Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

- `<Dm>`
  Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.
<fbits> The number of fraction bits in the fixed point number, in the range 1 to 32 for 32-bit elements, or in the range 1 to 16 for 16-bit elements:

- 
  
  (64 - <fbits>) is encoded in imm6.

An assembler can permit an <fbits> value of 0. This is encoded as floating-point to integer or integer to floating-point instruction, see VCVT (between floating-point and integer, Advanced SIMD).

**Operation for all encodings**

```c
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    bits(esize) result;
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[D[m+r],e,esize];
            if to_fixed then
                result = FPToFixed(op1, frac_bits, unsigned, StandardFPSCRValue(), FPRounding_ZERO);
            else
                result = FixedToFP(op1, frac_bits, unsigned, StandardFPSCRValue(), FPRounding_TIEEVEN);
            Elem[D[d+r],e,esize] = result;
```
F6.1.63 VCVT (between floating-point and fixed-point, floating-point)

Convert between floating-point and fixed-point converts a value in a register from floating-point to fixed-point, or from fixed-point to floating-point. Software can specify the fixed-point value as either signed or unsigned.

The fixed-point value can be 16-bit or 32-bit. Conversions from fixed-point values take their operand from the low-order bits of the source register and ignore any remaining bits. Signed conversions to fixed-point values sign-extend the result value to the destination register width. Unsigned conversions to fixed-point values zero-extend the result value to the destination register width.

The floating-point to fixed-point operation uses the Round towards Zero rounding mode. The fixed-point to floating-point operation uses the Round to Nearest rounding mode.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

S32 when U = 0, sx = 1
U16 when U = 1, sx = 0
U32 when U = 1, sx = 1

<Sdm>
Is the 32-bit name of the SIMD&FP destination and source register, encoded in the "Vd:D" field.

<DDm>
Is the 64-bit name of the SIMD&FP destination and source register, encoded in the "D:Vd" field.

<fbits>
The number of fraction bits in the fixed-point number:

• If <dt> is S16 or U16, <fbits> must be in the range 0-16. (16 - <fbits> ) is encoded in [imm4, i]
• If <dt> is S32 or U32, <fbits> must be in the range 1-32. (32 - <fbits> ) is encoded in [imm4, i].

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
if to_fixed then
    bits(size) result;

        when 32
result = FPToFixed(S[d], frac_bits, unsigned, FPSCR, FPRounding.ZERO);
S[d] = Extend(result, 32, unsigned);
when 64
result = FPToFixed(D[d], frac_bits, unsigned, FPSCR, FPRounding.ZERO);
D[d] = Extend(result, 64, unsigned);
else
    case fp_size of
        when 16
            bits(16) fp16 = FixedToFP(S[d]<size-1:0>, frac_bits, unsigned, FPSCR, FPRounding.TIEEVEN);
            S[d] = Zeros(16):fp16;
        when 32
            S[d] = FixedToFP(S[d]<size-1:0>, frac_bits, unsigned, FPSCR, FPRounding.TIEEVEN);
        when 64
            D[d] = FixedToFP(D[d]<size-1:0>, frac_bits, unsigned, FPSCR, FPRounding.TIEEVEN);
F6.1.64  VCVTA (Advanced SIMD)

Vector Convert floating-point to integer with Round to Nearest with Ties to Away converts each element in a vector from floating-point to integer using the Round to Nearest with Ties to Away rounding mode, and places the results in a second vector.

The operand vector elements are floating-point numbers.

The result vector elements are 32-bit integers. Signed and unsigned integers are distinct.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

  when '11' esize = 64; m = UInt(M:Vm);
CONSTRANDED UNPREDICTABLE behavior

If InITBlock(), then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as if it passes the Condition code check.
• The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

<op> See Standard assembler syntax fields on page F2-3100.
<dt> Is the data type for the elements of the destination, encoded in the "op" field. It can have the following values:
U32 when op = 0
S32 when op = 1

<Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

<Sm> Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
case esize of
  when 16
    S[d] = FPToFixed(S[m]<15:0>, 0, unsigned, FPSCR, rounding);
  when 32
    S[d] = FPToFixed(S[m], 0, unsigned, FPSCR, rounding);
  when 64
    S[d] = FPToFixed(D[m], 0, unsigned, FPSCR, rounding);
F6.1.69   VCVTN (Advanced SIMD)

Vector Convert floating-point to integer with Round to Nearest converts each element in a vector from floating-point to integer using the Round to Nearest rounding mode, and places the results in a second vector.

The operand vector elements are floating-point numbers.

The result vector elements are 32-bit integers. Signed and unsigned integers are distinct.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

F6.1.74  VCVTT

Convert to or from a half-precision value in the top half of a single-precision register does one of the following:

- Converts the half-precision value in the top half of a single-precision register to single-precision and writes the result to a single-precision register.
- Converts the half-precision value in the top half of a single-precision register to double-precision and writes the result to a double-precision register.
- Converts the single-precision value in a single-precision register to half-precision and writes the result into the top half of a single-precision register, preserving the other half of the destination register.
- Converts the double-precision value in a double-precision register to half-precision and writes the result into the top half of a single-precision register, preserving the other half of the destination register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

F6.1.76 VDUP (general-purpose register)

Duplicate general-purpose register to vector duplicates an element from a general-purpose register into every
element of the destination vector.

The destination vector elements can be 8-bit, 16-bit, or 32-bit fields. The source element is the least significant 8,
16, or 32 bits of the general-purpose register. There is no distinction between data types.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which
the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For
more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

VEOR{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>

Decode for all variants of this encoding

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;

d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;

Assembler symbols

<>

For encoding A1: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.
For encoding T1: see *Standard assembler syntax fields on page F2-3100.*

<op> 

See *Standard assembler syntax fields on page F2-3100.*

<dt> 

An optional data type. It is ignored by assemblers, and does not affect the encoding.

<Qd> 

Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> 

Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> 

Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> 

Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> 

Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> 

Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

**Operation for all encodings**

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[n+r] EOR D[m+r];
```
F6.1.79   VEXT (byte elements)

Vector Extract extracts elements from the bottom end of the second operand vector and the top end of the first, concatenates them and places the result in the destination vector.

The elements of the vectors are treated as being 8-bit fields. There is no distinction between data types.

The following figure shows the operation of VEXT doubleword operation for imm = 3.

```
    7 6 5 4 3 2 1 0
Vm | | | | | | | |
    7 6 5 4 3 2 1 0
Vn | | | | | | | |
    7 6 5 4 3 2 1 0
Vd | | | | | | | |
```

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

This instruction is used by the pseudo-instruction VEXT (multibyte elements). The pseudo-instruction is never the preferred disassembly.

\end{align*}
\]
F6.1.80  VEXT (multibyte elements)

Vector Extract extracts elements from the bottom end of the second operand vector and the top end of the first, concatenates them and places the result in the destination vector.

This instruction is a pseudo-instruction of the VEXT (byte elements) instruction. This means that:

- The encodings in this description are named to match the encodings of VEXT (byte elements).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VEXT (byte elements) gives the operational pseudocode for this instruction.

**A1**

**64-bit SIMD vector variant**

Applies when \( Q = 0 \).

\[
\text{VEXT}\{<c>\}{<q>}.<\text{size}> \{<Dd>,\} <Dn>, <Dm>, #<\text{imm}>
\]

is equivalent to

\[
\text{VEXT}\{<c>\}{<q>}.8 \{<Dd>,\} <Dn>, <Dm>, #<\text{imm}(\text{size}/8)>
\]

and is never the preferred disassembly.
128-bit SIMD vector variant

Applies when Q == 1.

\texttt{VEXT\{<c>\}{<q>}.<size> {<Qd>,} <Qn>, <Qm>, #<imm>}

is equivalent to

\texttt{VEXT\{<c>\}{<q>}.8 {<Qd>,} <Qn>, <Qm>, #imm*(size/8)}

and is never the preferred disassembly.

Assembler symbols

\texttt{<c>}

For encoding A1: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.

For encoding T1: see Standard assembler syntax fields on page F2-3100.

\texttt{<q>}

See Standard assembler syntax fields on page F2-3100.

\texttt{<size>}

For the 64-bit SIMD vector variant: is the size of the operation, and can be one of 16 or 32.

For the 128-bit SIMD vector variant: is the size of the operation, and can be one of 16, 32 or 64.

\texttt{<Qd>}

Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

\texttt{<Qn>}

Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

\texttt{<Qm>}

Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

\texttt{<Dd>}

Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

\texttt{<Dn>}

Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

\texttt{<Dm>}

Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

\texttt{<imm>}

For the 64-bit SIMD vector variant: is the location of the extracted result in the concatenation of the operands, as a number of bytes from the least significant end, in the range 0 to (128/<size>-1).

For the 128-bit SIMD vector variant: is the location of the extracted result in the concatenation of the operands, as a number of bytes from the least significant end, in the range 0 to (64/<size>-1).

Operation for all encodings

The description of \texttt{VEXT (byte elements)} gives the operational pseudocode for this instruction.
F6.1.81   VFMA

Vector Fused Multiply Accumulate multiplies corresponding elements of two vectors, and accumulates the results into the elements of the destination vector. The instruction does not round the result of the multiply before the accumulation.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

A1

64-bit SIMD vector variant

Applies when Q == 0.

\[ VFMA\{<c>{<q>}<dt> <Dd>, <Dn>, <Dm> \]

128-bit SIMD vector variant

Applies when Q == 1.

\[ VFMA\{<c>{<q>}{<dt> <Qd>, <Qn>, <Qm> \]

Decode for all variants of this encoding

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' ||Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
advsimd = TRUE; op1_neg = (op == '1');
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
regs = if Q == '0' then 1 else 2;

A2

Half-precision scalar variant

Applies when size == 01.

\[ VFMA\{<c>{<q>}.F16 <Sd>, <Sn>, <Sm> \]

Single-precision scalar variant

Applies when size == 10.

\[ VFMA\{<c>{<q>}.F32 <Sd>, <Sn>, <Sm> \]

Double-precision scalar variant

Applies when size == 11.

\[ VFMA\{<c>{<q>}.F64 <Dd>, <Dn>, <Dm> \]
Decode for all variants of this encoding

if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;

### F6.1.82 VFMAL (vector)

Vector Floating-point Multiply-Add Long to accumulator (vector). This instruction multiplies corresponding values in the vectors in the two source SIMD&FP registers, and accumulates the product to the corresponding vector element of the destination SIMD&FP register. The instruction does not round the result of the multiply before the accumulation.

Depending on settings in the CPACR, NSACR, HCPTCR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support on page G1-4697.*

From ARMv8.2, this is an optional instruction.

--- Note ---

ID_ISAR6.FHM indicates whether this instruction is supported.

## F6.1.83 VFMAL (by scalar)

Vector Floating-point Multiply-Add Long to accumulator (by scalar). This instruction multiplies the vector elements in the first source SIMD&FP register by the specified value in the second source SIMD&FP register, and accumulates the product to the corresponding vector element of the destination SIMD&FP register. The instruction does not round the result of the multiply before the accumulation.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-4697.

From ARMv8.2, this is an optional instruction.

---

**Note**

ID_ISAR6.FHM indicates whether this instruction is supported.

```

F6.1.85 VFMSL (vector)

Vector Floating-point Multiply-Subtract Long from accumulator (vector). This instruction negates the values in the vector of one SIMD&FP register, multiplies these with the corresponding values in another vector, and accumulates the product to the corresponding vector element of the destination SIMD&FP register. The instruction does not round the result of the multiply before the accumulation.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

From ARMv8.2, this is an optional instruction.

--- Note ---
ID_ISAR6.FHM indicates whether this instruction is supported.

F6.1.87  VFNMA

Vector Fused Negate Multiply Accumulate negates one floating-point register value and multiplies it by another floating-point register value, adds the negation of the floating-point value in the destination register to the product, and writes the result back to the destination register. The instruction does not round the result of the multiply before the addition.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

Elem[D+d+r],e,esize] = result<esize:1>;
F6.1.91 VINS

Vector move Insertion. This instruction copies the lower 16 bits of the 32-bit source SIMD&FP register into the upper 16 bits of the 32-bit destination SIMD&FP register, while preserving the values in the remaining bits.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

if InITBlock() then UNPREDICTABLE;
if !HaveFP16Ext() then UNDEFINED;
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
d = UInt(Vd:D); m = UInt(Vm:M);

**CONSTRAINED UNPREDICTABLE behavior**

If InITBlock(), then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as if it passes the Condition code check.
• The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

**Assembler symbols**

<q> See *Standard assembler syntax fields* on page F2-3100.

<Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
<Sm> Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.

**Operation for all encodings**

if ConditionPassed() then
    EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
    \[ S[d] = S[m]<15:0> : S[d]<15:0>; \]
F6.1.92   VJCVT

Javascript Convert to signed fixed-point, rounding toward Zero. This instruction converts the double-precision floating-point value in the SIMD&FP source register to a 32-bit signed integer using the Round towards Zero rounding mode, and writes the result to the general-purpose destination register. If the result is too large to be accommodated as a signed 32-bit integer, then the result is the integer modulo 2^32, as held in a 32-bit signed integer.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols
<>
For encoding A1, A2 and A3: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.
For encoding T1, T2 and T3: see Standard assembler syntax fields on page F2-3100.

<ap>
See Standard assembler syntax fields on page F2-3100.

<size>
Is the data size, encoded in the "size" field. It can have the following values:
8when size = 00
16 when size = 01
32 when size = 10

<list>
Is a list containing the single 64-bit name of the SIMD&FP register holding the element.
The list must be { <Dd>[<index>] }.
The register <Dd> is encoded in the "D:Vd" field.
The permitted values and encoding of <index> depend on <size>:
<size> == 8  <index> is in the range 0 to 7, encoded in the "index_align<3:1>" field.
<size> == 16 <index> is in the range 0 to 3, encoded in the "index_align<3:2>" field.
<size> == 32 <index> is 0 or 1, encoded in the "index_align<3>" field.

<align>
Is the general-purpose base register, encoded in the "Rn" field.

When <size> == 8, <align> must be omitted, otherwise it is the optional alignment.
Whenever <align> is omitted, the standard alignment is used, see *Unaligned data access* on page E2-3027, and the encoding depends on <size>:

<align> == 8
Encoded in the "index_align<0>" field as 0.

<align> == 16
Encoded in the "index_align<1:0>" field as 0b00.

<align> == 32
Encoded in the "index_align<2:0>" field as 0b000.

Whenever <align> is present, the permitted values and encoding depend on <size>:

<align> == 16
<align> is 16, meaning 16-bit alignment, encoded in the
"index_align<1:0>" field as 0b01.

<align> == 32
<align> is 32, meaning 32-bit alignment, encoded in the
"index_align<2:0>" field as 0b011.

<Rm>
Is the general-purpose index register containing an offset applied after the access, encoded in the
"Rm" field.

For more information about the variants of this instruction, see *The Advanced SIMD addressing mode* on page F2-3122.

**Operation for all encodings**

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings
For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors, and particularly VLD1 (single element to all lanes) on page K1-6404.

Assembler symbols
\(<c>\)  
For encoding A1: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.
For encoding T1: see Standard assembler syntax fields on page F2-3100.

\(<q>\)  
See Standard assembler syntax fields on page F2-3100.

\(<\text{size}>\)  
Is the data size, encoded in the "size" field. It can have the following values:
  8 \hspace{1em} \text{when size} = 00
  16 \hspace{1em} \text{when size} = 01
  32 \hspace{1em} \text{when size} = 10
The encoding size = 11 is reserved.

\(<\text{list}>\)  
Is a list containing the 64-bit names of the SIMD&FP registers. 
The list must be one of:
\[
\{ <Dd>[] \} \hspace{1em} \text{Encoded in the "T" field as 0.} \]
{ <Dd>[], <Dd+1>[]} Encoded in the "T" field as 1.

The register <Dd> is encoded in the "D:Vd" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

<align> When <size> == 8, <align> must be omitted, otherwise it is the optional alignment.

Whenever <align> is omitted, the standard alignment is used, see Unaligned data access on page E2-3027, and is encoded in the "a" field as 0.

Whenever <align> is present, the permitted values and encoding depend on <size>:
- <size> == 16 <align> is 16, meaning 16-bit alignment, encoded in the "a" field as 1.
- <size> == 32 <align> is 32, meaning 32-bit alignment, encoded in the "a" field as 1.

: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see The Advanced SIMD addressing mode on page F2-3122.

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see The Advanced SIMD addressing mode on page F2-3122.

- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors, and particularly VLDI (multiple single elements) on page K1-6404.

Related encodings: See Advanced SIMD element or structure load/store on page F3-3178 for the T32 instruction set, or Advanced SIMD element or structure load/store on page F4-3252 for the A32 instruction set.

**Assembler symbols**

\(<c>\) For encoding A1, A2, A3 and A4: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.
For encoding T1, T2, T3 and T4: see Standard assembler syntax fields on page F2-3100.

See Standard assembler syntax fields on page F2-3100.

<size>
Is the data size, encoded in the "size" field. It can have the following values:

<table>
<thead>
<tr>
<th>Size</th>
<th>Encoding</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>size = 00</td>
</tr>
<tr>
<td>16</td>
<td>size = 01</td>
</tr>
<tr>
<td>32</td>
<td>size = 10</td>
</tr>
<tr>
<td>64</td>
<td>size = 11</td>
</tr>
</tbody>
</table>

<list>
Is a list containing the 64-bit names of the SIMD&FP registers.
The list must be one of:

- { <Dd> } Single register. Selects the A1 and T1 encodings of the instruction.
- { <Dd>, <Dd+1> } Two single-spaced registers. Selects the A2 and T2 encodings of the instruction.
- { <Dd>, <Dd+1>, <Dd+2> } Three single-spaced registers. Selects the A3 and T3 encodings of the instruction.
- { <Dd>, <Dd+1>, <Dd+2>, <Dd+3> } Four single-spaced registers. Selects the A4 and T4 encodings of the instruction.

The register <Dd> is encoded in the "D:Vd" field.

<Rn>
Is the general-purpose base register, encoded in the "Rn" field.

<align>
Is the optional alignment.
Whenever <align> is omitted, the standard alignment is used, see Unaligned data access on page E2-3027, and is encoded in the "align" field as 0b00.
Whenever <align> is present, the permitted values are:

<table>
<thead>
<tr>
<th>Alignment</th>
<th>Encoding</th>
</tr>
</thead>
<tbody>
<tr>
<td>64</td>
<td>64-bit alignment, encoded in the &quot;align&quot; field as 0b01</td>
</tr>
<tr>
<td>128</td>
<td>128-bit alignment, encoded in the &quot;align&quot; field as 0b10. Available only if &lt;list&gt; contains two or four registers.</td>
</tr>
<tr>
<td>256</td>
<td>256-bit alignment, encoded in the &quot;align&quot; field as 0b11. Available only if &lt;list&gt; contains four registers.</td>
</tr>
</tbody>
</table>

: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see The Advanced SIMD addressing mode on page F2-3122.

<Rm>
Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see The Advanced SIMD addressing mode on page F2-3122.

Operation for all encodings

```c
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n];  iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    for r = 0 to regs-1
        for e = 0 to elements-1
            bits(ebytes*8) data;
            if ebytes != 8 then
                data = MemU[address,ebytes];
            else
                - = AArch32.CheckAlignment(address, ebytes, AccType_NORMAL, iswrite);
```
data<31:0> = if BigEndian() then MemU[address+4,4] else MemU[address,4];
data<63:32> = if BigEndian() then MemU[address,4] else MemU[address+4,4];
Elem[D[d+r],e] = data;
adddress = address + ebytes;
if wback then
  if register_index then
    R[n] = R[n] + R[m];
  else
    R[n] = R[n] + 8*regs;
### F6.1.96 VLD2 (single 2-element structure to one lane)

Load single 2-element structure to one lane of two registers loads one 2-element structure from memory into corresponding elements of two registers. Elements of the registers that are not loaded are unchanged. For details of the addressing mode see The Advanced SIMD addressing mode on page F2-3122.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors, and particularly VLD2 (single 2-element structure to one lane) on page K1-6404.

Assembler symbols

<op> For encoding A1, A2 and A3: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.

For encoding T1, T2 and T3: see Standard assembler syntax fields on page F2-3100.

<size> Is the data size, encoded in the "size" field. It can have the following values:

<table>
<thead>
<tr>
<th>size</th>
<th>value</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>when size = 00</td>
</tr>
<tr>
<td>16</td>
<td>when size = 01</td>
</tr>
<tr>
<td>32</td>
<td>when size = 10</td>
</tr>
</tbody>
</table>

<list> Is a list containing the 64-bit names of the two SIMD&FP registers holding the element.
The list must be one of:

{ <Dd>[<index>], <Dd+1>[<index>] }  
Single-spaced registers, encoded as "spacing" = 0.

{ <Dd>[<index>], <Dd+2>[<index>] }  
Double-spaced registers, encoded as "spacing" = 1. Not permitted when <size> == 8.

The encoding of "spacing" depends on <size>:

<size> == 16  "spacing" is encoded in the "index_align<1>" field.
<size> == 32  "spacing" is encoded in the "index_align<2>" field.

The register <Dd> is encoded in the "D:Vd" field.
The permitted values and encoding of `<index>` depend on `<size>`:

- `<size> == 8`  
  `<index>` is in the range 0 to 7, encoded in the "index_align<3:1>" field.
- `<size> == 16`  
  `<index>` is in the range 0 to 3, encoded in the "index_align<3:2>" field.
- `<size> == 32`  
  `<index>` is 0 or 1, encoded in the "index_align<3>" field.

 `<Rn>`  
 Is the general-purpose base register, encoded in the "Rn" field.

 `<align>`  
 Is the optional alignment.

Whenever `<align>` is omitted, the standard alignment is used, see Unaligned data access on page E2-3027, and the encoding depends on `<size>`:

- `<size> == 8`  
  Encoded in the "index_align<0>" field as 0.
- `<size> == 16`  
  Encoded in the "index_align<0>" field as 0.
- `<size> == 32`  
  Encoded in the "index_align<1:0>" field as 0b00.

Whenever `<align>` is present, the permitted values and encoding depend on `<size>`:

- `<size> == 8`  
  `<align>` is 16, meaning 16-bit alignment, encoded in the "index_align<0>" field as 1.
- `<size> == 16`  
  `<align>` is 32, meaning 32-bit alignment, encoded in the "index_align<0>" field as 1.
- `<size> == 32`  
  `<align>` is 64, meaning 64-bit alignment, encoded in the "index_align<1:0>" field as 0b01.

  : is the preferred separator before the `<align>` value, but the alignment can be specified as @<align>, see The Advanced SIMD addressing mode on page F2-3122.

 `<Rm>`  
 Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see The Advanced SIMD addressing mode on page F2-3122.

**Operation for all encodings**

```c
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    address = R[n];  iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    Elem[0][d], index = MemU[address, ebytes];
    Elem[0][d2], index = MemU[address+ebytes, ebytes];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 2*ebytes;
```
VLD2 (single 2-element structure to all lanes)

Load single 2-element structure and replicate to all lanes of two registers loads one 2-element structure from memory into all lanes of two registers. For details of the addressing mode see *The Advanced SIMD addressing mode* on page F2-3122.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-4697.

\(<\text{size}>\) Is the data size, encoded in the "size" field. It can have the following values:
- 8 when \( \text{size} = 00 \)
- 16 when \( \text{size} = 01 \)
- 32 when \( \text{size} = 10 \)

The encoding \( \text{size} = 11 \) is reserved.

\(<\text{list}>\) Is a list containing the 64-bit names of the SIMD&FP registers.
The list must be one of:
- \{ \(<\text{Dd}>, \,<\text{Dd}+1>\) \} Two single-spaced registers. Selects the A1 and T1 encodings of the instruction, and encoded in the "type" field as \( 0b1000 \).
- \{ \(<\text{Dd}>, \,<\text{Dd}+2>\) \} Two double-spaced registers. Selects the A1 and T1 encodings of the instruction, and encoded in the "type" field as \( 0b1001 \).
- \{ \(<\text{Dd}>, \,<\text{Dd}+1>, \,<\text{Dd}+2>, \,<\text{Dd}+3>\) \} Three single-spaced registers. Selects the A2 and T2 encodings of the instruction.
The register \( \text{Dd} \) is encoded in the "D:Vd" field.

\(<\text{Rn}>\) Is the general-purpose base register, encoded in the "Rn" field.

\(<\text{align}>\) Is the optional alignment.
Whenever \(<\text{align}>\) is omitted, the standard alignment is used, see *Unaligned data access* on page E2-3027, and is encoded in the "align" field as \( 0b00 \).
Whenever \(<\text{align}>\) is present, the permitted values are:
- 64 64-bit alignment, encoded in the "align" field as \( 0b10 \).
- 128 128-bit alignment, encoded in the "align" field as \( 0b11 \).
- 256 256-bit alignment, encoded in the "align" field as \( 0b11 \). Available only if \(<\text{list}>\) contains four registers.
is the preferred separator before the \texttt{<align> value, but the alignment can be specified as @<align>, see }\textit{The Advanced SIMD addressing mode on page F2-3122.}

\texttt{<Rm>} Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see \textit{The Advanced SIMD addressing mode on page F2-3122.}

\textbf{Operation for all encodings}

\begin{verbatim}
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n]; iswrite = FALSE;

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors, and particularly VLD3 (single 3-element structure to one lane) on page K1-6405.

**Assembler symbols**

- `<c>` For encoding A1, A2 and A3: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.
  For encoding T1, T2 and T3: see Standard assembler syntax fields on page F2-3100.
- `<q>` See Standard assembler syntax fields on page F2-3100.
- `<size>` Is the data size, encoded in the "size" field. It can have the following values:
  - 8 when size = 00
  - 16 when size = 01
  - 32 when size = 10
- `<list>` Is a list containing the 64-bit names of the three SIMD&FP registers holding the element.
  The list must be one of:
  - \{ <Dd>[<index>], <Dd+1>[<index>>, <Dd+2>[<index>] \}
    Single-spaced registers, encoded as "spacing" = 0.
  - \{ <Dd>[<index>], <Dd+2>[<index>], <Dd+4>[<index>] \}
    Double-spaced registers, encoded as "spacing" = 1. Not permitted when <size> == 8.

The encoding of "spacing" depends on `<size>`:

- `<size>` == 8 "spacing" is encoded in the "index_align<0>" field.
- `<size>` == 16 "spacing" is encoded in the "index_align<1>" field, and "index_align<0>" is set to 0.
- `<size>` == 32 "spacing" is encoded in the "index_align<2>" field, and "index_align<1:0>" is set to 0b00.
The register \( \langle Dd \rangle \) is encoded in the "D:Vd" field.
The permitted values and encoding of \( \langle \text{index} \rangle \) depend on \( \langle \text{size} \rangle \):

- \( \langle \text{size} \rangle = 8 \):
  \( \langle \text{index} \rangle \) is in the range 0 to 7, encoded in the "index_align<3:1>" field.
- \( \langle \text{size} \rangle = 16 \):
  \( \langle \text{index} \rangle \) is in the range 0 to 3, encoded in the "index_align<3:2>" field.
- \( \langle \text{size} \rangle = 32 \):
  \( \langle \text{index} \rangle \) is 0 or 1, encoded in the "index_align<3>" field.

- \( \langle Rn \rangle \) is the general-purpose base register, encoded in the "Rn" field.
- \( \langle Rm \rangle \) is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *The Advanced SIMD addressing mode* on page F2-3122.

**Alignment**

Standard alignment rules apply, see *Alignment support on page B2-109*.

**Operation for all encodings**

```c
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n];
    Elem[D[d], index] = MemU[address,ebytes];
    Elem[D[d2], index] = MemU[address+ebytes,ebytes];
    Elem[D[d3], index] = MemU[address+2*ebytes,ebytes];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 3*ebytes;
```
F6.1.100  VLD3 (single 3-element structure to all lanes)

Load single 3-element structure and replicate to all lanes of three registers loads one 3-element structure from memory into all lanes of three registers. For details of the addressing mode see The Advanced SIMD addressing mode on page F2-3122.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

\[
\text{if } n = 15 || d3 > 31 \text{ then UNPREDICTABLE;}
\]

CONSTRAI NED UNPREDICTABLE behavior

If \( d3 > 31 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

```

**CONSTRAINED UNPREDICTABLE behavior**

If d3 > 31, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors, and particularly VLD3 (multiple 3-element structures) on page K1-6405.

Related encodings: See Advanced SIMD element or structure load/store on page F3-3178 for the T32 instruction set, or Advanced SIMD element or structure load/store on page F4-3252 for the A32 instruction set.
Assembler symbols

For encoding A1: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.

For encoding T1: see Standard assembler syntax fields on page F2-3100.

See Standard assembler syntax fields on page F2-3100.

Is the data size, encoded in the "size" field. It can have the following values:

<table>
<thead>
<tr>
<th>Size</th>
<th>Encoding</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>size = 00</td>
</tr>
<tr>
<td>16</td>
<td>size = 01</td>
</tr>
<tr>
<td>32</td>
<td>size = 10</td>
</tr>
</tbody>
</table>

The encoding size = 11 is reserved.

Is a list containing the 64-bit names of the SIMD&FP registers.

The list must be one of:

- \{ <Dd>, <Dd+1>, <Dd+2> \}
  Single-spaced registers, encoded in the "type" field as 0b0100.
- \{ <Dd>, <Dd+2>, <Dd+4> \}
  Double-spaced registers, encoded in the "type" field as 0b0101.

The register <Dd> is encoded in the "D:Vd" field.

Is the general-purpose base register, encoded in the "Rn" field.

Is the optional alignment.

Whenever <align> is omitted, the standard alignment is used, see Unaligned data access on page E2-3027, and is encoded in the "align" field as 0b00.

Whenever <align> is present, the only permitted values is 64, meaning 64-bit alignment, encoded in the "align" field as 0b01.

: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see The Advanced SIMD addressing mode on page F2-3122.

Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about <Rn>, !, and <Rm>, see The Advanced SIMD addressing mode on page F2-3122.

Operation for all encodings

### Decode for all variants of this encoding

- If \( \text{size} == '11' \) then see "VLD4 (single 4-element structure to all lanes)";
- If \( \text{index}_\text{align}<1:0> == '11' \) then UNDEFINED;
- \( \text{bytes} = 4; \text{index} = \text{UINT}(\text{index}_\text{align}<1:0>) \);
- \( \text{inc} = \text{if} \text{index}_\text{align}<2> == '0' \text{ then} 1 \text{ else} 2 \);
- \( \text{alignment} = \text{if} \text{index}_\text{align}<1:0> == '00' \text{ then} 1 \text{ else} 4 \text{ << \text{UINT}(\text{index}_\text{align}<1:0>)} \);
- \( d = \text{UINT}(D:Vd); d2 = d + \text{inc}; d3 = d2 + \text{inc}; d4 = d3 + \text{inc}; n = \text{UINT}(Rn); m = \text{UINT}(Rm); \)
- \( wback = (m != 15); \text{register}_\text{index} = (m != 15 \&\& m != 13); \)
- If \( n == 15 || d4 > 31 \) then UNPREDICTABLE;

### CONSTRAINED UNPREDICTABLE behavior

If \( d4 > 31 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors, and particularly VLD4 (single 4-element structure to one lane) on page K1-6405.

### Assembler symbols

- \(<c>\): For encoding A1, A2 and A3: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.
  
  For encoding T1, T2 and T3: see Standard assembler syntax fields on page F2-3100.

- \(<q>\): See Standard assembler syntax fields on page F2-3100.

- \(<\text{size}>\): Is the data size, encoded in the "size" field. It can have the following values:
  
  - 8 when \( \text{size} == 00 \)
  - 16 when \( \text{size} == 01 \)
  - 32 when \( \text{size} == 10 \)

- \(<\text{list}>\): Is a list containing the 64-bit names of the four SIMD&FP registers holding the element.
  
  The list must be one of:
  
  - \{ <Dd>[<index>], <Dd+1>[<index>], <Dd+2>[<index>], <Dd+3>[<index>] \}
    
    Single-spaced registers, encoded as "spacing" = 0.
  
  - \{ <Dd>[<index>], <Dd+2>[<index>], <Dd+4>[<index>], <Dd+6>[<index>] \}
    
    Double-spaced registers, encoded as "spacing" = 1. Not permitted when \( \text{size} == 8 \).

  The encoding of "spacing" depends on \(<\text{size}>\):
  
  - \(<\text{size}> == 16 \) "spacing" is encoded in the "index_align<1>" field.
  - \(<\text{size}> == 32 \) "spacing" is encoded in the "index_align<2>" field.

  The register \(<\text{Dd}>\) is encoded in the "D:Vd" field.
The permitted values and encoding of \(<index>\) depend on \(<size>\):

- \(<size> == 8\):
  - \(<index>\) is in the range 0 to 7, encoded in the "index_align<3:1>" field.

- \(<size> == 16\):
  - \(<index>\) is in the range 0 to 3, encoded in the "index_align<3:2>" field.

- \(<size> == 32\):
  - \(<index>\) is 0 or 1, encoded in the "index_align<3>" field.

\(<Rn>\)
Is the general-purpose base register, encoded in the "Rn" field.

\(<align>\)
Is the optional alignment.
Whenever \(<align>\) is omitted, the standard alignment is used, see Unaligned data access on page E2-3027, and the encoding depends on \(<size>\):

- \(<size> == 8\):
  - Encoded in the "index_align<0>" field as 0.
- \(<size> == 16\):
  - Encoded in the "index_align<0>" field as 0.
- \(<size> == 32\):
  - Encoded in the "index_align<1:0>" field as \(0b00\).

Whenever \(<align>\) is present, the permitted values and encoding depend on \(<size>\):

- \(<size> == 8\):
  - \(<align>\) is 32, meaning 32-bit alignment, encoded in the "index_align<0>" field as 1.

- \(<size> == 16\):
  - \(<align>\) is 64, meaning 64-bit alignment, encoded in the "index_align<0>" field as 1.

- \(<size> == 32\):
  - \(<align>\) can be 64 or 128. 64-bit alignment is encoded in the "index_align<1:0>" field as \(0b01\), and 128-bit alignment is encoded in the "index_align<1:0>" field as \(0b10\).

: the preferred separator before the \(<align>\) value, but the alignment can be specified as \(@<align>\), see The Advanced SIMD addressing mode on page F2-3122.

\(<Rm>\)
Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see The Advanced SIMD addressing mode on page F2-3122.

**Operation for all encodings**

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMSEnabled();
  address = R[n]; iswrite = FALSE;
  - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
  Elem[D[d], index] = MemU[address,ebytes];
  Elem[D[d2],index] = MemU[address+ebytes,ebytes];
  Elem[D[d3],index] = MemU[address+2*ebytes,ebytes];
  Elem[D[d4],index] = MemU[address+3*ebytes,ebytes];
  if wback then
    if register_index then
      R[n] = R[n] + R[m];
    else
      R[n] = R[n] + 4*ebytes;
F6.1.103  VLD4 (single 4-element structure to all lanes)

Load single 4-element structure and replicate to all lanes of four registers loads one 4-element structure from memory into all lanes of four registers. For details of the addressing mode see The Advanced SIMD addressing mode on page F2-3122.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

\text{if } n == 15 || d4 > 31 \text{ then UNPREDICTABLE;}
\end{align*}
\]

CONSTRANGED UNPREDICTABLE behavior
If $d4 > 31$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings

For more information about the CONSTRANGED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors, and particularly \textit{VLD4 (single 4-element structure to all lanes)} on page K1-6406.

Assembler symbols

\(<c>\quad\)
For encoding A1: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.
For encoding T1: see Standard assembler syntax fields on page F2-3100.
See Standard assembler syntax fields on page F2-3100.

<size>
Is the data size, encoded in the "size" field. It can have the following values:

- 8 when size = 00
- 16 when size = 01
- 32 when size = 1x

<list>
Is a list containing the 64-bit names of four SIMD&FP registers.
The list must be one of:

{ <Dd>[], <Dd+1>[], <Dd+2>[], <Dd+3>[] }  
Single-spaced registers, encoded in the "T" field as 0.

{ <Dd>[], <Dd+2>[], <Dd+4>[], <Dd+6>[] }  
Double-spaced registers, encoded in the "T" field as 1.

The register <Dd> is encoded in the "D:Vd" field.

<Rn>
Is the general-purpose base register, encoded in the "Rn" field.

<align>
Is the optional alignment.
Whenever <align> is omitted, the standard alignment is used, see Unaligned data access on page E2-3027, and is encoded in the "a" field as 0.
Whenever <align> is present, the permitted values and encoding depend on <size>:

- <size> == 8  <align> is 32, meaning 32-bit alignment, encoded in the "a" field as 1.
- <size> == 16 <align> is 64, meaning 64-bit alignment, encoded in the "a" field as 1.
- <size> == 32 <align> can be 64 or 128. 64-bit alignment is encoded in the "a:size<0>" field as 0b10, and 128-bit alignment is encoded in the "a:size<0>" field as 0b11.

: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see The Advanced SIMD addressing mode on page F2-3122.

<Rm>
Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see The Advanced SIMD addressing mode on page F2-3122.

Operation for all encodings

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  address = R[n]; iswrite = FALSE;
  - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
  D[d] = Replicate(MemU[address,ebytes]);
  D[d2] = Replicate(MemU[address+ebytes,ebytes]);
  D[d3] = Replicate(MemU[address+2*ebytes,ebytes]);
  D[d4] = Replicate(MemU[address+3*ebytes,ebytes]);
  if wback then
    if register_index then
      R[n] = R[n] + R[m];
    else
      R[n] = R[n] + 4*ebytes;
}
F6.1.104   VLD4 (multiple 4-element structures)

Load multiple 4-element structures to four registers loads multiple 4-element structures from memory into four
registers, with de-interleaving. For more information, see Element and structure load/store instructions on
page F1-3080. Every element of each register is loaded. For details of the addressing mode see The Advanced SIMD
addressing mode on page F2-3122.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which
the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For
more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

  n = UInt(Rn);

**CONSTRAINED UNPREDICTABLE behavior**

If `size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

**Assembler symbols**

- `<c>` See *Standard assembler syntax fields* on page F2-3100.
- `<q>` See *Standard assembler syntax fields* on page F2-3100.
- `.64` Is an optional data size specifier for 64-bit memory accesses that can be used in the assembler source code, but is otherwise ignored.
- `<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- `.32` Is an optional data size specifier for 32-bit memory accesses that can be used in the assembler source code, but is otherwise ignored.
- `<Sd>` Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
<label> The label of the literal data item to be loaded.

For the single-precision scalar or double-precision scalar variants: the assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. Permitted values are multiples of 4 in the range -1020 to 1020.

For the half-precision scalar variant: the assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. Permitted values are multiples of 2 in the range -510 to 510.

If the offset is zero or positive, \( \text{imm32} \) is equal to the offset and \( \text{add} = \text{TRUE} \).

If the offset is negative, \( \text{imm32} \) is equal to minus the offset and \( \text{add} = \text{FALSE} \).

\( +/- \) Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- \( \text{when } U = 0 \)
- \( \text{when } U = 1 \)

\(<\text{imm}>\) For the single-precision scalar or double-precision scalar variants: is the optional unsigned immediate byte offset, a multiple of 4, in the range 0 to 1020, defaulting to 0, and encoded in the "imm8" field as \( <\text{imm}>/4 \).

For the half-precision scalar variant: is the optional unsigned immediate byte offset, a multiple of 2, in the range 0 to 510, defaulting to 0, and encoded in the "imm8" field as \( <\text{imm}>/2 \).

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see Use of labels in UAL instruction syntax on page F1-3059.

**Operation for all encodings**

if ConditionPassed() then
  EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
  base = if \( n == 15 \) then Align(PC,4) else R[\( n \)];
  address = if add then (base + \text{imm32}) else (base - \text{imm32})
  case esize of
    when 16

F6.1.113   VMINNM

This instruction determines the floating point minimum number.

It handles NaNs in consistence with the IEEE754-2008 specification. It returns the numerical operand when one operand is numerical and the other is a quiet NaN, but otherwise the result is identical to floating-point VMIN.

This instruction is not conditional.

Notes for all encodings

Related encodings: See Advanced SIMD data-processing on page F3-3155 for the T32 instruction set, or Advanced SIMD data-processing on page F4-3240 for the A32 instruction set.

Assembler symbols

<c>  For encoding A1: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.
For encoding T1: see *Standard assembler syntax fields* on page F2-3100.

See *Standard assembler syntax fields* on page F2-3100.

Is the data type for the scalar and the elements of the operand vector, encoded in the "U:size" field. It can have the following values:

- **S16** when $U = 0$, size = 01
- **S32** when $U = 0$, size = 10
- **U16** when $U = 1$, size = 01
- **U32** when $U = 1$, size = 10

Is the 128-bit name of the SIMD&FP register holding the accumulate vector, encoded in the "D:Vd" field as $<Qd>*2$.

Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

Is the 64-bit name of the second SIMD&FP source register holding the scalar. If $<dt>$ is S16 or U16, $Dm$ is restricted to D0-D7. $Dm$ is encoded in "Vm<2:0>", and $x$ is encoded in "M:Vm<3>". If $<dt>$ is S32 or U32, $Dm$ is restricted to D0-D15. $Dm$ is encoded in "Vm", and $x$ is encoded in "M".

**Operation for all encodings**

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    op2 = Elem[Din[m],index,esize];  op2val = Int(op2, unsigned);
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[Din[n+r],e,esize];  op1val = Int(op1, unsigned);
            if floating_point then
                fp_addend = if add then FPMul(op1,op2,StandardFPSCRValue()) else
                                FPNeg(FPMul(op1,op2,StandardFPSCRValue()));
                Elem[D[d+r],e,esize] = FPAdd(Elem[Din[d+r],e,esize], fp_addend, StandardFPSCRValue());
            else
                addend = if add then op1val*op2val else -op1val*op2val;
                if long_destination then
                    Elem[Q[d>>1],e,2*esize] = Elem[Qin[d>>1],e,2*esize] + addend;
                else
                    Elem[D[d+r],e,esize] = Elem[Din[d+r],e,esize] + addend;
```
F6.1.119   **VMLS (floating-point)**

Vector Multiply Subtract multiplies corresponding elements in two vectors, subtracts the products from corresponding elements of the destination vector, and places the results in the destination vector.

--- **Note** ---

ARM recommends that software does not use the `VMLS` instruction in the Round towards Plus Infinity and Round towards Minus Infinity rounding modes, because the rounding of the product and of the sum can change the result of the instruction in opposite directions, defeating the purpose of these rounding modes.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support on page G1-4697.*

  - For encoding T1: see *Standard assembler syntax fields on page F2-3100*.
- See *Standard assembler syntax fields on page F2-3100*.

- Is the data type for the scalar and the elements of the operand vector, encoded in the "F:size" field. It can have the following values:
  - I16 when F = 0, size = 01
  - I32 when F = 0, size = 10
  - F16 when F = 1, size = 01
  - F32 when F = 1, size = 10

- Is the 128-bit name of the SIMD&FP register holding the accumulate vector, encoded in the "D:Vd" field as <Qd>*2.

- Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

- Is the 64-bit name of the SIMD&FP register holding the accumulate vector, encoded in the "D:Vd" field.

- Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

- Is the 64-bit name of the second SIMD&FP source register holding the scalar. If <dt> is I16 or F16, Dm is restricted to D0-D7. Dm is encoded in "Vm<2:0>"; x is encoded in "M:Vm<3>". If <dt> is I32 or F32, Dm is restricted to D0-D15. Dm is encoded in "Vm", and x is encoded in "M".

**Operation for all encodings**

if ConditionPassed() then
  EncodingSpecificOperations();  CheckAdvSIMDEnabled();
  op2 = Elem[Din[m],index,esize];  op2val = Int(op2, unsigned);
  for r = 0 to regs-1
for e = 0 to elements-1
    op1 = Elem[Din[n+r],e,esize];  op1val = Int(op1, unsigned);

**Notes for all encodings**

Related encodings: See *Advanced SIMD one register and modified immediate* on page F3-3164 for the T32 instruction set, or *Advanced SIMD one register and modified immediate* on page F4-3249 for the A32 instruction set.

**Assembler symbols**

\(<c>\) For encoding A1, A3, A4 and A5: see *Standard assembler syntax fields* on page F2-3100. This encoding must be unconditional.
For encoding A2, T1, T2, T3, T4 and T5: see *Standard assembler syntax fields* on page F2-3100.

\(<q>\) See *Standard assembler syntax fields* on page F2-3100.

\(<dt>\) The data type, encoded in the "cmode" field. It can have the following values:
I32 when cmode = 110x
I8 when cmode = 1110
F32 when cmode = 1111

\(<Qd>\) Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as \(<Qd>\)*2.

\(<Dd>\) Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

\(<Sd>\) Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

\(<\text{imm}>\) For encoding A1, A3, A4, A5, T1, T3, T4 and T5: is a constant of the specified type that is replicated to fill the destination register. For details of the range of constants available and the encoding of \(<\text{imm}>\), see *Modified immediate constants in T32 and A32 Advanced SIMD instructions* on page F2-3118.
For encoding A2 and T2: is a signed floating-point constant with 3-bit exponent and normalized 4 bits of precision, encoded in "\text{imm4H:imm4L}". For details of the range of constants available and the encoding of \(<\text{imm}>\), see *Modified immediate constants in T32 and A32 floating-point instructions* on page F2-3119.

**Operation for all encodings**

\end{array}
\]

64-bit SIMD vector variant

Applies when \( Q = 0 \).

\[
\text{VMOV}\{<c>\}{<q>}{.<dt>} \{<Dd>, \ <Dm>\}
\]

is equivalent to

\[
\text{VORR}\{<c>\}{<q>}{.<dt>} \{<Dd>, \ <Dm>, \ <Dm>\}
\]

and is the preferred disassembly when \( N:Vn = M:Vm \).

128-bit SIMD vector variant

Applies when \( Q = 1 \).

\[
\text{VMOV}\{<c>\}{<q>}{.<dt>} \{<Qd>, \ <Qm>\}
\]
is equivalent to

\[
VORR\{<c>\}{<q>\{,<dt>\}}\ <Qd>, <Qm>, <Qm>
\]

and is the preferred disassembly when \(N:Vn = M:Vm\).

**Assembler symbols**

\(<c>\)  For encoding A1: see *Standard assembler syntax fields on page F2-3100*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields on page F2-3100*.

\(<q>\)  See *Standard assembler syntax fields on page F2-3100*.

\(<dt>\)  An optional data type. \(<dt>\) must not be F64, but it is otherwise ignored.

\(<Qd>\)  Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as \(<Qd>*2\).

\(<Qm>\)  Is the 128-bit name of the SIMD&FP source register, encoded in the "N:Vn" and "M:Vm" field as \(<Qm>*2\).

\(<Dd>\)  Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

\(<Dm>\)  Is the 64-bit name of the SIMD&FP source register, encoded in the "N:Vn" and "M:Vm" field.

**Operation for all encodings**

The description of \(VORR\text{ (register)}\) gives the operational pseudocode for this instruction.
F6.1.129  VMOV (general-purpose register to scalar)

Copy a general-purpose register to a vector element copies a byte, halfword, or word from a general-purpose register into an Advanced SIMD scalar.

On a Floating-point-only system, this instruction transfers one word to the upper or lower half of a double-precision floating-point register from a general-purpose register. This is an identical operation to the Advanced SIMD single word transfer.

For more information about scalars see *Advanced SIMD scalars on page F2-3127.*

Depending on settings in the CPACR, NSACR, HCPTR, and FPXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support on page G1-4697.*

### A1 variant

VMOV{<c>}{<q>}{.<size>} <Dd[x]>,<Rt>

**Decode for this encoding**

```plaintext
case opc1:opc2 of
  when '1xxx'  advsimd = TRUE;  esize = 8;  index = UInt(opc1<0>:opc2);
  when '0xx1'  advsimd = TRUE;  esize = 16;  index = UInt(opc1<0>:opc2<1>);
  when '0x00'  advsimd = FALSE;  esize = 32;  index = UInt(opc1<0>);
  when '0x10'  UNDEFINED;
d = UInt(D:Vd);  t = UInt(Rt);
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### T1 variant

VMOV{<c>}{<q>}{.<size>} <Dd[x]>,<Rt>

**Decode for this encoding**

```plaintext
case opc1:opc2 of
  when '1xxx'  advsimd = TRUE;  esize = 8;  index = UInt(opc1<0>:opc2);
  when '0xx1'  advsimd = TRUE;  esize = 16;  index = UInt(opc1<0>:opc2<1>);
  when '0x00'  advsimd = FALSE;  esize = 32;  index = UInt(opc1<0>);
  when '0x10'  UNDEFINED;
d = UInt(D:Vd);  t = UInt(Rt);
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.*
Assembler symbols

<e> See Standard assembler syntax fields on page F2-3100.

<q> See Standard assembler syntax fields on page F2-3100.

<size> The data size. It must be one of:

8  Encoded as opc1<1> = 1. [x] is encoded in opc1<0>, opc2.<br>
16 Encoded as opc1<1> = 0, opc2<0> = 1. [x] is encoded in opc1<0>, opc2<1>.<br>
32 Encoded as opc1<1> = 0, opc2 = 0b00. [x] is encoded in opc1<0>.<br>
omitted Equivalent to 32.

<Od[x]> The scalar. The register <Od> is encoded in D:Vd. For details of how [x] is encoded, see the description of <size>.

<Rt> The source general-purpose register.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDOrVFPEnabled(TRUE, advsimd);
    Elem[D[d],index,esize] = R[t]<esize-1:0>;

F6.1.130 VMOV (between general-purpose register and single-precision)

Copy a general-purpose register to or from a 32-bit SIMD&FP register. This instruction transfers the value held in a 32-bit SIMD&FP register to a general-purpose register, or the value held in a general-purpose register to a 32-bit SIMD&FP register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.
Assembler symbols

<\textit{Rt}> Is the general-purpose register that <\textit{Sn}> will be transferred to or from, encoded in the "Rt" field.

<\textit{Sn}> Is the 32-bit name of the SIMD&FP register to be transferred, encoded in the "Vn:N" field.

<\text符\text{c}> See Standard assembler syntax fields on page F2-3100.

<\text符\text{q}> See Standard assembler syntax fields on page F2-3100.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
    if to_arm_register then
        \text{R}[t] = \text{S}[n];
    else
        \text{S}[n] = \text{R}[t];
F6.1.131 VMOV (scalar to general-purpose register)

Copy a vector element to a general-purpose register with sign or zero extension copies a byte, halfword, or word from an Advanced SIMD scalar to a general-purpose register. Bytes and halfwords can be either zero-extended or sign-extended.

On a Floating-point-only system, this instruction transfers one word from the upper or lower half of a double-precision floating-point register to a general-purpose register. This is an identical operation to the Advanced SIMD single word transfer.

For more information about scalars see Advanced SIMD scalars on page F2-3127.

Depending on settings in the CPACR, NSACR, HCPTR, and FPXEC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

Operation for all encodings

if ConditionPassed() then
  EncodingSpecificOperations();  CheckAdvSIMDOrVFPEnabled(TRUE, advsimd);
  if unsigned then
    R[t] = ZeroExtend(Elem[D[n],index,esize], 32);
  else
    R[t] = SignExtend(Elem[D[n],index,esize], 32);
F6.1.132 VMOV (between two general-purpose registers and two single-precision registers)

Copy two general-purpose registers to a pair of 32-bit SIMD&FP registers transfers the contents of two consecutively numbered single-precision Floating-point registers to two general-purpose registers, or the contents of two general-purpose registers to a pair of single-precision Floating-point registers. The general-purpose registers do not have to be contiguous.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

A1

From general-purpose registers variant

Applies when op == 0.

VMOV{<c>}{<q>} <Sm>, <Sm1>, <Rt>, <Rt2>

To general-purpose registers variant

Applies when op == 1.

VMOV{<c>}{<q>} <Rt>, <Rt2>, <Sm>, <Sm1>

Decode for all variants of this encoding

to_arm_registers = (op == '1');  t = UInt(Rt);  t2 = UInt(Rt2);  m = UInt(Vm:M);
if t == 15 || t2 == 15 || m == 31 then UNPREDICTABLE;
if to_arm_registers && t == t2 then UNPREDICTABLE;

CONSTRANIED UNPREDICTABLE behavior

If to_arm_registers && t == t2, then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The value in the destination register is UNKNOWN.

If m == 31, then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
• One or more of the single-precision registers become UNKNOWN for a move to the single-precision register. The general-purpose registers listed in the instruction become UNKNOWN for a move from the single-precision registers. This behavior does not affect any other general-purpose registers.

T1
**From general-purpose registers variant**

Applies when \( \text{op} = 0 \).

\[
\text{VMOV}{\{<c>\}}{\{<q>\}} <\text{Sm}>, <\text{Sm1}>, <\text{Rt}>, <\text{Rt2}>
\]

**To general-purpose registers variant**

Applies when \( \text{op} = 1 \).

\[
\text{VMOV}{\{<c>\}}{\{<q>\}} <\text{Rt}>, <\text{Rt2}>, <\text{Sm}>, <\text{Sm1}>
\]

**Decode for all variants of this encoding**

\[
\text{to\_arm\_registers} = (\text{op} == '1'); \quad t = \text{UInt}(\text{Rt}); \quad t2 = \text{UInt}(\text{Rt2}); \quad m = \text{UInt}(\text{Vm:M});
\]

\[
\begin{align*}
\text{if } t &= 15 || t2 = 15 || m = 31 \text{ then UNPREDICTABLE;} \\
\text{if } \text{to\_arm\_registers} && t &= t2 \text{ then UNPREDICTABLE;}
\end{align*}
\]

**CONSTRAINED UNPREDICTABLE behavior**

If \( \text{to\_arm\_registers} \&\& t = t2 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as \text{NOP}.
- The value in the destination register is UNKNOWN.

If \( m = 31 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as \text{NOP}.
- One or more of the single-precision registers become UNKNOWN for a move to the single-precision register. The general-purpose registers listed in the instruction become UNKNOWN for a move from the single-precision registers. This behavior does not affect any other general-purpose registers.

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors, and particularly \text{VMOV (between two general-purpose registers and two single-precision registers)} on page K1-6406.

**Assembler symbols**

   \[ S[d] = \text{Zeros}(16) : S[m]<31:16>; \]
F6.1.136 VMRS

Move SIMD&FP Special register to general-purpose register moves the value of an Advanced SIMD and floating-point System register to a general-purpose register. When the specified System register is the FPSCR, a form of the instruction transfers the FPSCR. {N, Z, C, V} condition flags to the APSR. {N, Z, C, V} condition flags.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

When these settings permit the execution of floating-point and Advanced SIMD instructions, if the specified floating-point System register is not the FPSCR, the instruction is UNDEFINED if executed in User mode.

In an implementation that includes EL2, when HCR.TID0 is set to 1, any VMRS access to FPSID from a Non-secure EL1 mode that would be permitted if HCR.TID0 was set to 0 generates a Hyp Trap exception. For more information, see ID group 0, Primary device identification registers on page G1-4719.

For simplicity, the VMRS pseudocode does not show the possible trap to Hyp mode.

F6.1.137  VMSR

Move general-purpose register to SIMD&FP Special register moves the value of a general-purpose register to a floating-point System register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

When these settings permit the execution of floating-point and Advanced SIMD instructions:

- If the specified floating-point System register is not the FPSCR, the instruction is UNDEFINED if executed in User mode.
- If the specified floating-point System register is the FPEXC and the instruction is executed in a mode other than User mode the instruction is ignored.

A1

```
|31|28|27|26|25|24|23|22|21|20|19|16|15|12|11|10|9|8|7|6|5|4|3|2|1|0|

cond
```

A1 variant

VMSR{<c>{<q>} <spec_reg>, <Rt>

Decode for this encoding

t = UInt(Rt);
if reg != '000x' && reg != '1000' then UNPREDICTABLE;
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13

CONSTRANED UNPREDICTABLE behavior

If reg != '000x' && reg != '1000', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction transfers the value in the general-purpose register to one of the allocated registers accessible using VMSR at the same Exception level.

T1

```
|15|14|13|12|11|10|9|8|7|6|5|4|3|0|15|12|11|10|9|8|7|6|5|4|3|2|1|0|
| 1| 1| 1| 0| 1| 1| 1| 0|1|1|1|0| reg| | Rt| 1| 0| 1|0|0|0|1|0|0|0|0|0|
```

T1 variant

VMSR{<c>}{<q>} <spec_reg>, <Rt>

Decode for this encoding

t = UInt(Rt);
if reg != '000x' && reg != '1000' then UNPREDICTABLE;
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
CONstrained Unpredictable behavior

If \( \text{reg} \neq '000x' \text{ \&\& \ } \text{reg} \neq '1000' \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as \textit{NOP}.
- The instruction transfers the value in the general-purpose register to one of the allocated registers accessible using \textit{VMSR} at the same Exception level.

Notes for all encodings

For more information about the \textit{CONstrained UNPREDICTable} behavior of this instruction, see Appendix K1 \textit{Architectural Constraints on UNPREDICTable behaviors}.

Assembler symbols

- \texttt{<c>}
  See \textit{Standard assembler syntax fields} on page F2-3100.
- \texttt{<q>}
  See \textit{Standard assembler syntax fields} on page F2-3100.
- \texttt{<spec_reg>}
  Is the destination Advanced SIMD and floating-point System register, encoded in the "reg" field. It can have the following values:
  
  \begin{align*}
  \text{FPSID} \quad & \text{when } \text{reg} = 0000 \\
  \text{FPSCR} \quad & \text{when } \text{reg} = 0001 \\
  \text{FPEXC} \quad & \text{when } \text{reg} = 1000 \\
  \end{align*}

  The following encodings are UNPREDICTABLE:
  
  \begin{itemize}
  \item \text{reg} = 001x.
  \item \text{reg} = 01xx.
  \item \text{reg} = 1001.
  \item \text{reg} = 101x.
  \item \text{reg} = 11xx.
  \end{itemize}

- \texttt{<Rt>}
  Is the general-purpose source register, encoded in the "Rt" field.

Operation for all encodings

\begin{verbatim}
if ConditionPassed() then
  EncodingSpecificOperations();
  if reg == '0001' then // FPSCR
    CheckVFPEnabled(TRUE);
    FPSCR = R[t];
  elsif PSTATE.EL == EL0 then
    UNDEFINED;          // Non-FPSCR registers accessible only at PL1 or above
  else
    CheckVFPEnabled(FALSE); // Non-FPSCR registers are not affected by FPEXC.EN
    case reg of
      when '0000' // VMSR access to FPSID is ignored
        when '1000' FPEXC = R[t];
      otherwise Unreachable(); // Dealt with above or in encoding-specific pseudocode
  end case
end if
\end{verbatim}
F6.1.138 VMUL (floating-point)

Vector Multiply multiplies corresponding elements in two vectors, and places the results in the destination vector.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

**CONSTRAINED UNPREDICTABLE behavior**

If F == '1' && size == '01' && InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

**Notes for all encodings**

Related encodings: See *Advanced SIMD data-processing* on page F3-3155 for the T32 instruction set, or *Advanced SIMD data-processing* on page F4-3240 for the A32 instruction set.

**Assembler symbols**

- `<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-3100. This encoding must be unconditional.  
  For encoding T1: see *Standard assembler syntax fields* on page F2-3100.
- `<q>` See *Standard assembler syntax fields* on page F2-3100.
- `<dt>` Is the data type for the scalar and the elements of the operand vector, encoded in the "F:size" field. It can have the following values:
  - I16 when F = 0, size = 01
  - I32 when F = 0, size = 10
  - F16 when F = 1, size = 01
  - F32 when F = 1, size = 10
- `<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as `<Qd>\times 2`.
- `<Qn>` Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as `<Qn>\times 2`.
- `<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- `<Dn>` Is the 64-bit name of the first SIMD&FP source register, encoded in the "D:Vd" field.
- `<Dm>` Is the 64-bit name of the second SIMD&FP source register. When `<dt>` is I16 or F16, this is encoded in the "V<2>:\times 2" field. Otherwise it is encoded in the "V<3>:\times 2" field.
- `<index>` Is the element index. When `<dt>` is I16 or F16, this is in the range 0 to 3 and is encoded in the "M:V<3>:\times 2" field. Otherwise it is in the range 0 to 1 and is encoded in the "M" field.

**Operation for all encodings**

if ConditionPassed() then
  EncodingSpecificOperations();  CheckAdvSIMDEnabled();

else
   Elem[D[d+r],e,esize] = (op1val*op2val)<<esize-1:0;
F6.1.141 VMULL (integer and polynomial)

Vector Multiply Long multiplies corresponding elements in two vectors. The destination vector elements are twice as long as the elements that are multiplied.

For information about multiplying polynomials see *Polynomial arithmetic over \{0, 1\}* on page A1-49.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-4697.

**CONSTRAINED UNPREDICTABLE behavior**

If \( \text{op} = '1' \) \&\& \( \text{size} = '10' \) \&\& \( \text{InITBlock()} \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Related encodings: See Advanced SIMD data-processing on page F3-3155 for the T32 instruction set, or Advanced SIMD data-processing on page F4-3240 for the A32 instruction set.

**Assembler symbols**

\(<c>\) For encoding A1: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.

For encoding T1: see Standard assembler syntax fields on page F2-3100.

\(<q>\) See Standard assembler syntax fields on page F2-3100.

\(<dt>\) Is the data type for the elements of the operands, encoded in the "op:U:size" field. It can have the following values:

- \(S8\) when \(\text{op} = 0, U = 0, size = 00\)
- \(S16\) when \(\text{op} = 0, U = 0, size = 01\)
- \(S32\) when \(\text{op} = 0, U = 0, size = 10\)
- \(U8\) when \(\text{op} = 0, U = 1, size = 00\)
- \(U16\) when \(\text{op} = 0, U = 1, size = 01\)
- \(U32\) when \(\text{op} = 0, U = 1, size = 10\)
- \(P8\) when \(\text{op} = 1, U = 0, size = 00\)
- \(P64\) when \(\text{op} = 1, U = 0, size = 10\)

\(<Qd>\) Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as \(<Qd>\)*2.

\(<Dn>\) Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

\(<Dm>\) Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

**Operation for all encodings**

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[Din[m+r],e,esize]; op1val = Int(op1, unsigned);
            op2 = Elem[Din[m+r],e,esize]; op2val = Int(op2, unsigned);
            if polynomial then
                product = PolynomialMult(op1,op2);
            else
                product = (op1val*op2val)<<2*esize-1:0;
            if long_destination then
                Elem[Q[d>>1],e,2*esize] = product;
            else
                Elem[D[d+r],e,esize] = product<esize-1:0>;
```
F6.1.142 VMULL (by scalar)

Vector Multiply Long multiplies each element in a vector by a scalar, and places the results in a second vector. The destination vector elements are twice as long as the elements that are multiplied.

For more information about scalars see Advanced SIMD scalars on page F2-3127.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

      when 64  D[d] = FPNeg(D[m]);
    end
  end
F6.1.146 VNMLA

Vector Negate Multiply Accumulate multiplies together two floating-point register values, adds the negation of the floating-point value in the destination register to the negation of the product, and writes the result back to the destination register.

--- Note ---

ARM recommends that software does not use the VNMLA instruction in the Round towards Plus Infinity and Round towards Minus Infinity rounding modes, because the rounding of the product and of the sum can change the result of the instruction in opposite directions, defeating the purpose of these rounding modes.

---

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

F6.1.149   VORN (immediate)

Vector Bitwise OR NOT (immediate) performs a bitwise OR between a register value and the complement of an
immediate value, and returns the result into the destination vector

This instruction is a pseudo-instruction of the VORR (immediate) instruction. This means that:

• The encodings in this description are named to match the encodings of VORR (immediate).
• The assembler syntax is used only for assembly, and is not used on disassembly.
• The description of VORR (immediate) gives the operational pseudocode for this instruction.

A1

\[
\begin{array}{cccccccccccccccccccc}

if sz == '1' & InITBlock() then UNPREDICTABLE;
case sz of
  when '0' esize = 32; elements = 2;
  when '1' esize = 16; elements = 4;
  d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);

CONSTRAINED UNPREDICTABLE behavior

If sz == '1' & InITBlock(), then one of the following behaviors must occur:

- The instruction is Undefined.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.
Assembler symbols

For encoding A1: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.

For encoding T1: see Standard assembler syntax fields on page F2-3100.

See Standard assembler syntax fields on page F2-3100.

Is the data type for the elements of the vectors, encoded in the "sz" field. It can have the following values:

- F32 when \( sz = 0 \)
- F16 when \( sz = 1 \)

Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    bits(64) dest;
    h = elements DIV 2;
    for e = 0 to h-1
        Elem[dest,e,esize] = FPAdd(Elem[D[n],2*e,esize], Elem[D[n],2*e+1,esize], StandardFPSCRValue());
        Elem[dest,e+h,esize] = FPAdd(Elem[D[m],2*e,esize], Elem[D[m],2*e+1,esize], StandardFPSCRValue());
    D[d] = dest;
```

F6.1.155   VPADD (integer)

Vector Pairwise Add (integer) adds adjacent pairs of elements of two vectors, and places the results in the destination vector.

The operands and result are doubleword vectors.

The operand and result elements must all be the same type, and can be 8-bit, 16-bit, or 32-bit integers. There is no distinction between signed and unsigned integers.

The following figure shows the operation of VPADD doubleword operation for data type I16.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    bits(64) dest;
    h = elements DIV 2;
    for e = 0 to h-1
        Elem[dest,e,esize] = Elem[D[n],2*e,esize] + Elem[D[n],2*e+1,esize];
        Elem[dest,e+h,esize] = Elem[D[m],2*e,esize] + Elem[D[m],2*e+1,esize];
    D[d] = dest;
```

F6.1.156   VPADDL

Vector Pairwise Add Long adds adjacent pairs of elements of two vectors, and places the results in the destination vector.

The vectors can be doubleword or quadword. The operand elements can be 8-bit, 16-bit, or 32-bit integers. The result elements are twice the length of the operand elements.

The following figure shows the operation of VPADDL doubleword operation for data type S16.

 Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

        result = if maximum then Max(op1,op2) else Min(op1,op2);
        Elem[dest,e+h,esize] = result<esize-1:0>;
    D[d] = dest;
```
F6.1.161 VPOP

Pop SIMD&FP registers from Stack loads multiple consecutive Advanced SIMD and floating-point register file registers from the stack.

This instruction is an alias of the VLDMA, VLDMA, VLDMA instruction. This means that:

- The encodings in this description are named to match the encodings of VLDMA, VLDMA, VLDMA.
- The description of VLDMA, VLDMA, VLDMA gives the operational pseudocode for this instruction.

<th>0</th>
</tr>
</thead>
</table>
```

Increment After variant

VPOP{<c>}{<q>}{.<size>} <dreglist>

is equivalent to

VLDMA{<c>}{<q>}{.<size>} SP!, <dreglist>

and is always the preferred disassembly.
### Increment After variant

\`VPOP{<c>}{<q>}{.<size>} <sreglist>`

is equivalent to

\`VLDM{<c>}{<q>}{.<size>} SP!, <sreglist>`

and is always the preferred disassembly.

### Assembler symbols

- `<c>`
  - See [Standard assembler syntax fields on page F2-3100](#).
- `<q>`
  - See [Standard assembler syntax fields on page F2-3100](#).
- `<size>`
  - An optional data size specifier. If present, it must be equal to the size in bits, 32 or 64, of the registers being transferred.
- `<sreglist>`
  - Is the list of consecutively numbered 32-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "Vd:D", and "imm8" is set to the number of registers in the list. The list must contain at least one register.
- `<dreglist>`
  - Is the list of consecutively numbered 64-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "D:Vd", and "imm8" is set to twice the number of registers in the list. The list must contain at least one register, and must not contain more than 16 registers.

### Operation for all encodings

The description of `VLDM`, `VLDMDB`, `VLDMIA` gives the operational pseudocode for this instruction.
F6.1.162  VPUSH

Push SIMD&FP registers to Stack stores multiple consecutive registers from the Advanced SIMD and floating-point register file to the stack

This instruction is an alias of the VSTM, VSTMDB, VSTMIA instruction. This means that:

- The encodings in this description are named to match the encodings of VSTM, VSTMDB, VSTMIA.
- The description of VSTM, VSTMDB, VSTMIA gives the operational pseudocode for this instruction.

F6.1.163   VQABS

Vector Saturating Absolute takes the absolute value of each element in a vector, and places the results in the destination vector.

If any of the results overflow, they are saturated. The cumulative saturation bit, FPSCR.QC, is set if saturation occurs. For details see Pseudocode description of saturation on page E1-2981.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

Assembler symbols

<c>
For encoding A1 and A2: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.

For encoding T1 and T2: see Standard assembler syntax fields on page F2-3100.

<op>
See Standard assembler syntax fields on page F2-3100.

<dt>
Is the data type for the elements of the operands, encoded in the "size" field. It can have the following values:

S16  when size = 01
S32  when size = 10

<Qd>
Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Dn>
Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm>
For encoding A1 and T1: is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.
For encoding A2 and T2: is the 64-bit name of the second SIMD&FP source register, encoded in the "Vm<2:0>" field when <dt> is S16, otherwise the "Vm" field.

<index>
Is the element index in the range 0 to 3, encoded in the "M:Vm<3>" field when <dt> is S16, otherwise in range 0 to 1, encoded in the "M" field.
Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    if scalar_form then op2 = SInt(Elem[Din[m], index, esize]);
    for e = 0 to elements-1
        if !scalar_form then op2 = SInt(Elem[Din[m], e, esize]);
        op1 = SInt(Elem[Din[n], e, esize]);
        // The following only saturates if both op1 and op2 equal -(2^(esize-1))
        (product, sat1) = SignedSatQ(2*op1*op2, 2*esize);
        if add then
            result = SInt(Elem[Qin[d>>1], e, 2*esize]) + SInt(product);
        else
            result = SInt(Elem[Qin[d>>1], e, 2*esize]) - SInt(product);
        (Elem[Q[d>>1], e, 2*esize], sat2) = SignedSatQ(result, 2*esize);
        if sat1 || sat2 then FPSCR.QC = '1';
F6.1.166  VQDMLSL

Vector Saturating Doubling Multiply Subtract Long multiplies corresponding elements in two doubleword vectors, subtracts double the products from corresponding elements of a quadword vector, and places the results in the same quadword vector.

The second operand can be a scalar instead of a vector. For more information about scalars see Advanced SIMD scalars on page F2-3127.

If any of the results overflow, they are saturated. The cumulative saturation bit, FPSCR.QC, is set if saturation occurs. For details see Pseudocode description of saturation on page E1-2981.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

        Elem[Q[d>>1],e,2*esize] = product;
        if sat then FPSCR.QC = '1';
## F6.1.169  VQMOVN, VQMOVUN

Vector Saturating Move and Narrow copies each element of the operand vector to the corresponding element of the destination vector.

The operand is a quadword vector. The elements can be any one of:

- 16-bit, 32-bit, or 64-bit signed integers.
- 16-bit, 32-bit, or 64-bit unsigned integers.

The result is a doubleword vector. The elements are half the length of the operand vector elements. If the operand is unsigned, the results are unsigned. If the operand is signed, the results can be signed or unsigned.

If any of the results overflow, they are saturated. The cumulative saturation bit, FPSCR.QC, is set if saturation occurs. For details see *Pseudocode description of saturation* on page E1-2981.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-4697.

This instruction is used by the pseudo-instructions VQRSHRN (zero), VQRSHRUN (zero), VQSHRN (zero), and VQSHRUN (zero). The pseudo-instruction is never the preferred disassembly.

if size == '01' then esize = 16; elements = 4; m = UInt(Vm<2:0>); index = UInt(M:Vm<3>);
if size == '10' then esize = 32; elements = 2; m = UInt(Vm); index = UInt(M);

CONSTRAINED UNPREDICTABLE behavior

If InITBlock(), then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as if it passes the Condition code check.
• The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Notes for all encodings

Related encodings: See Advanced SIMD data-processing on page F3-3155 for the T32 instruction set, or Advanced SIMD data-processing on page F4-3240 for the A32 instruction set.

Assembler symbols

<q> See Standard assembler syntax fields on page F2-3100.
<dt> Is the data type for the elements of the operands, encoded in the "size" field. It can have the following values:
S16   when size = '01
S32   when size = '10
<Qd> Is the 128-bit name of the SIMD&FP register holding the accumulate vector, encoded in the "D:Vd" field as <Qd>*2.
<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
<Dd> Is the 64-bit name of the SIMD&FP register holding the accumulate vector, encoded in the "D:Vd" field.
<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
<Dm> Is the 64-bit name of the second SIMD&FP source register holding the scalar. If <dt> is S16, Dm is restricted to D0-D7. Dm is encoded in "Vm<2:0>"; and x is encoded in "M:Vm<3>". If <dt> is S32, Dm is restricted to D0-D15. Dm is encoded in "Vm", and x is encoded in "M".
<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.
Operation for all encodings

EncodingSpecificOperations(); CheckAdvSIMDEnabled();
round_const = 1 << (esize-1);
if scalar_form then op2 = SInt(Elem[D[m],index,esize]);
for r = 0 to regs-1
  for e = 0 to elements-1
    op1 = SInt(Elem[D[n+r],e,esize]);
    op3 = SInt(Elem[D[d+r],e,esize]) << esize;
    if !scalar_form then op2 = SInt(Elem[D[m+r],e,esize]);
    (result, sat) = SignedSatQ((op3 - 2*(op1*op2) + round_const) >> esize, esize);
    Elem[D[d+r],e,esize] = result;
    if sat then FPSCR.QC = '1';
F6.1.173   VQRDMULH

Vector Saturating Rounding Doubling Multiply Returning High Half multiplies corresponding elements in two vectors, doubles the results, and places the most significant half of the final results in the destination vector. The results are rounded. For truncated results see VQDMULH.

The second operand can be a scalar instead of a vector. For more information about scalars see Advanced SIMD scalars on page F2-3127.

If any of the results overflow, they are saturated. The cumulative saturation bit, FPSCR.QC, is set if saturation occurs. For details see Pseudocode description of saturation on page E1-2981.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

F6.1.174 VQRSHL

Vector Saturating Rounding Shift Left takes each element in a vector, shifts them by a value from the least significant byte of the corresponding element of a second vector, and places the results in the destination vector. If the shift value is positive, the operation is a left shift. Otherwise, it is a right shift.

For truncated results see VQSHL (register).

The first operand and result elements are the same data type, and can be any one of:

- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

The second operand is a signed integer of the same size.

If any of the results overflow, they are saturated. The cumulative saturation bit, FPSCR.QC, is set if saturation occurs. For details see Pseudocode description of saturation on page E1-2981.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

         if sat then FPSCR.QC = '1';
F6.1.175 VQRSHRN (zero)

Vector Saturating Rounding Shift Right, Narrow takes each element in a quadword vector of integers, right shifts them by an immediate value, and places the signed rounded results in a doubleword vector.

This instruction is a pseudo-instruction of the VQMOVN, VQMOVUN instruction. This means that:

- The encodings in this description are named to match the encodings of VQMOVN, VQMOVUN.
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VQMOVN, VQMOVUN gives the operational pseudocode for this instruction.

A1

Signed result variant

VQRSHRN{<c>}{<q>}.<dt> <Dd>, <Qm>, #0

is equivalent to

VQMOVN{<c>}{<q>}.<dt> <Dd>, <Qm>

and is never the preferred disassembly.

T1

Signed result variant

VQRSHRN{<c>}{<q>}.<dt> <Dd>, <Qm>, #0

is equivalent to

VQMOVN{<c>}{<q>}.<dt> <Dd>, <Qm>

and is never the preferred disassembly.

Assembler symbols

- `<c>` For encoding A1: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.
  
  For encoding T1: see Standard assembler syntax fields on page F2-3100.

- `<q>` See Standard assembler syntax fields on page F2-3100.

- `<dt>` Is the data type for the elements of the operand, encoded in the "op<0>:size" field. It can have the following values:
  
  S16 when op<0> = 0, size = 00
  S32 when op<0> = 0, size = 01
  S64 when op<0> = 0, size = 10
  U16 when op<0> = 1, size = 00
The following encodings are reserved:

- \( \text{op}_<0> = 0, \text{size} = 11 \)
- \( \text{op}_<0> = 1, \text{size} = 11 \)

\(<D_d>\) is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

\(<Q_m>\) is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as \(<Q_m>*2\).

**Operation for all encodings**

The description of **VQMOVN, VQMOVUN** gives the operational pseudocode for this instruction.
F6.1.176  **VQRSHRN, VQRSHRUN**

Vector Saturating Rounding Shift Right, Narrow takes each element in a quadword vector of integers, right shifts them by an immediate value, and places the rounded results in a doubleword vector.

For truncated results, see VQSHL (register).

The operand elements must all be the same size, and can be any one of:

- 16-bit, 32-bit, or 64-bit signed integers.
- 16-bit, 32-bit, or 64-bit unsigned integers.

The result elements are half the width of the operand elements. If the operand elements are signed, the results can be either signed or unsigned. If the operand elements are unsigned, the result elements must also be unsigned.

If any of the results overflow, they are saturated. The cumulative saturation bit, FPSCR.QC, is set if saturation occurs. For details see Pseudocode description of saturation on page E1-2981.

Depending on settings in the CPACR, NSACR, and HCPR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

**Unsigned result variant**

VQRSHRUN\{<c>\}{<q>}.<dt> <Dd>, <Qm>, #0

is equivalent to

VQMOVUN\{<c>\}{<q>}.<dt> <Dd>, <Qm>

and is never the preferred disassembly.

**Assembler symbols**

\(<c>\)  For encoding A1: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.

For encoding T1: see Standard assembler syntax fields on page F2-3100.

\(<q>\)  See Standard assembler syntax fields on page F2-3100.

\(<dt>\)  Is the data type for the elements of the operand, encoded in the "size" field. It can have the following values:

- S16 when size = 00
- S32 when size = 01
- S64 when size = 10

The encoding size = 11 is reserved.
<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

**Operation for all encodings**

The description of VQMOVN, VQMOVUN gives the operational pseudocode for this instruction.
F6.1.178   VQSHL, VQSHLU (immediate)

Vector Saturating Shift Left (immediate) takes each element in a vector of integers, left shifts them by an immediate value, and places the results in a second vector.

The operand elements must all be the same size, and can be any one of:

• 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
• 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

The result elements are the same size as the operand elements. If the operand elements are signed, the results can be either signed or unsigned. If the operand elements are unsigned, the result elements must also be unsigned.

If any of the results overflow, they are saturated. The cumulative saturation bit, FPSCR.QC, is set if saturation occurs. For details see Pseudocode description of saturation on page E1-2981.

Depending on settings in the CPACR, NSACR, and HCPR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

### Notes for all encodings
Related encodings: See *Advanced SIMD one register and modified immediate* on page F3-3164 for the T32 instruction set, or *Advanced SIMD one register and modified immediate* on page F4-3249 for the A32 instruction set.

### Assembler symbols

- `<>` For encoding A1: see *Standard assembler syntax fields* on page F2-3100. This encoding must be unconditional.
  For encoding T1: see *Standard assembler syntax fields* on page F2-3100.
- `<op>` See *Standard assembler syntax fields* on page F2-3100.
- `<type>` Is the data type for the elements of the vectors, encoded in the "U" field. It can have the following values:
  S when U = 0
  U when U = 1
<size> Is the data size for the elements of the vectors, encoded in the "L:imm6<5:3>" field. It can have the following values:
- 8 when \( L = 0, \text{imm6}<5:3> = 001 \)
- 16 when \( L = 0, \text{imm6}<5:3> = 01x \)
- 32 when \( L = 0, \text{imm6}<5:3> = 1xx \)
- 64 when \( L = 1, \text{imm6}<5:3> = xxx \)

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

<imm> Is an immediate value, in the range 0 to <size>-1, encoded in the "imm6" field.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            operand = Int(Elem[D[m+r],e,esize], src_unsigned);
            (result, sat) = SatQ(operand << shift_amount, esize, dest_unsigned);
            Elem[D[d+r],e,esize] = result;
            if sat then FPSCR.QC = '1';

F6.1.179 VQSHL (register)

Vector Saturating Shift Left (register) takes each element in a vector, shifts them by a value from the least significant byte of the corresponding element of a second vector, and places the results in the destination vector. If the shift value is positive, the operation is a left shift. Otherwise, it is a right shift.

The results are truncated. For rounded results, see VQRSHL.

The first operand and result elements are the same data type, and can be any one of:

- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

The second operand is a signed integer of the same size.

If any of the results overflow, they are saturated. The cumulative saturation bit, FPSCR.QC, is set if saturation occurs. For details see Pseudocode description of saturation on page E1-2981.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  for r = 0 to regs-1
    for e = 0 to elements-1
      diff = Int(Elem[D[n+r],e,esize], unsigned) - Int(Elem[D[m+r],e,esize], unsigned);
      (Elem[D[r]+e,esize], sat) = SatQ(diff, esize, unsigned);
      if sat then FPSCR.QC = '1';

F6.1.184  VRADDHN

Vector Rounding Add and Narrow, returning High Half adds corresponding elements in two quadword vectors, and places the most significant half of each result in a doubleword vector. The results are rounded. For truncated results, see VADDH.

The operand elements can be 16-bit, 32-bit, or 64-bit integers. There is no distinction between signed and unsigned integers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-4697.

    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    round_const = 1 << (esize-1);
    for e = 0 to elements-1
        result = Elem[Qin[n>>1],e,2*esize] + Elem[Qin[m>>1],e,2*esize] + round_const;
        Elem[D[d],e,esize] = result<2*esize-1:esize>;
```

F6.1.185 VRECPE

Vector Reciprocal Estimate finds an approximate reciprocal of each element in the operand vector, and places the results in the destination vector.

The operand and result elements are the same type, and can be floating-point numbers or unsigned integers.

For details of the operation performed by this instruction see Floating-point reciprocal square root estimate and step on page E1-2999.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

F6.1.189   VREV64

Vector Reverse in doublewords reverses the order of 8-bit, 16-bit, or 32-bit elements in each doubleword of the
vector, and places the result in the corresponding destination vector.

There is no distinction between data types, other than size.

The following figure shows the operation of VREV64 doubleword operations.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which
the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For
more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

  when 64
    D[d] = FPRoundInt(D[m], FPSCR, rounding, exact);
F6.1.204   VRSHL

Vector Rounding Shift Left takes each element in a vector, shifts them by a value from the least significant byte of the corresponding element of a second vector, and places the results in the destination vector. If the shift value is positive, the operation is a left shift. If the shift value is negative, it is a rounding right shift. For a truncating shift, see VSHL.

The first operand and result elements are the same data type, and can be any one of:

- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

The second operand is always a signed integer of the same size.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

- U64 when U = 1, size = 11

<dQd>
Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<dQm>
Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<dQn>
Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<dD>
Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<dM>
Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

<dN>
Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

**Operation for all encodings**

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            shift = SInt(Elem[D[n+r],e,esize]<7:0>);
            round_const = 1 << (-shift-1); // 0 for left shift, 2^(n-1) for right shift
            result = (Int(Elem[D[m+r],e,esize], unsigned) + round_const) << shift;
            Elem[D[d+r],e,esize] = result<esize-1:0>;
```
F6.1.205 VRSHR

Vector Rounding Shift Right takes each element in a vector, right shifts them by an immediate value, and places the rounded results in the destination vector. For truncated results, see VSHR.

The operand and result elements must be the same size, and can be any one of:

- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

Depending on settings in the CPACR, NSACR, and HCPR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

and is never the preferred disassembly.

**Assembler symbols**

- `<c>` For encoding A1: see *Standard assembler syntax fields on page F2-3100*. This encoding must be unconditional.
  
  For encoding T1: see *Standard assembler syntax fields on page F2-3100*.

- `<q>` See *Standard assembler syntax fields on page F2-3100*.

- `<dt>` Is the data type for the elements of the vectors, and must be one of: S8, S16, S32, S64, U8, U16, U32 or U64.

- `<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as `<Qd>*2.

- `<Qm>` Is the 128-bit name of the SIMD&FP source register, encoded in the "N:Vn" and "M:Vm" field as `<Qm>*2.

- `<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

- `<Dm>` Is the 64-bit name of the SIMD&FP source register, encoded in the "N:Vn" and "M:Vm" field.

**Operation for all encodings**

The description of *VORR (register)* gives the operational pseudocode for this instruction.
Vector Rounding Shift Right and Narrow takes each element in a vector, right shifts them by an immediate value, and places the rounded results in the destination vector. For truncated results, see VSHRN.

The operand elements can be 16-bit, 32-bit, or 64-bit integers. There is no distinction between signed and unsigned integers. The destination elements are half the size of the source elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

Notes for all encodings

Related encodings: See Advanced SIMD one register and modified immediate on page F3-3164 for the T32 instruction set, or Advanced SIMD one register and modified immediate on page F4-3249 for the A32 instruction set.
Assembler symbols

**<c>**
For encoding A1: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.

For encoding T1: see Standard assembler syntax fields on page F2-3100.

**<q>**
See Standard assembler syntax fields on page F2-3100.

**<size>**
Is the data size for the elements of the vectors, encoded in the "imm6<5:3>" field. It can have the following values:

- 16 when \( \text{imm6}<5:3> = 001 \)
- 32 when \( \text{imm6}<5:3> = 01x \)
- 64 when \( \text{imm6}<5:3> = 1xx \)

**<Dd>**
Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

**<Qm>**
Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as \(<Qm>\times 2\).

**<imm>**
Is an immediate value, in the range 1 to \(<\text{size}>/2\), encoded in the "imm6" field as \(<\text{size}>/2 - <\text{imm}>\).

Operation for all encodings

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    round_const = 1 << (shift_amount-1);
    for e = 0 to elements-1
        result = LSR(Elem[Qin[m>>1],e,2*esize] + round_const, shift_amount);
        Elem[D[d],e,esize] = result<esize-1:0>;
```
F6.1.208 VRSHRN (zero)

Vector Rounding Shift Right and Narrow takes each element in a vector, right shifts them by an immediate value, and places the rounded results in the destination vector.

This instruction is a pseudo-instruction of the VMOVN instruction. This means that:

- The encodings in this description are named to match the encodings of VMOVN.
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VMOVN gives the operational pseudocode for this instruction.

If size == '01' && InITBlock(), then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as if it passes the Condition code check.
• The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assember symbols

<c> For encoding A1: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.
For encoding T1: see Standard assembler syntax fields on page F2-3100.

<q> See Standard assembler syntax fields on page F2-3100.

<dt> Is the data type for the elements of the vectors, encoded in the "sz" field. It can have the following values:
F32 when sz = 0
F16 when sz = 1

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Newton-Raphson iteration

For details of the operation performed and how it can be used in a Newton-Raphson iteration to calculate the reciprocal of the square root of a number, see Floating-point reciprocal estimate and step on page E1-2999.

Operation for all encodings

if ConditionPassed() then
  EncodingSpecificOperations();  CheckAdvSIMDEnabled();
  for r = 0 to regs-1
    for e = 0 to elements-1
      Elem[D[d+r],e,esize] = FPRSqrtStep(Elem[D[n+r],e,esize], Elem[D[m+r],e,esize]);
F6.1.211   VRSRA

Vector Rounding Shift Right and Accumulate takes each element in a vector, right shifts them by an immediate value, and accumulates the rounded results into the destination vector. For truncated results, see VSRA.

The operand and result elements must all be the same type, and can be any one of:
- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

A1

64-bit SIMD vector variant

Applies when !(imm6 == 000xxx && L == 0) && Q == 0.

VRSRA{<c>}{<q>}.<type><size> {<Dd>,} <Dm>, #<imm>

128-bit SIMD vector variant

Notes for all encodings

Related encodings: See Advanced SIMD one register and modified immediate on page F3-3164 for the T32 instruction set, or Advanced SIMD one register and modified immediate on page F4-3249 for the A32 instruction set.

Assembler symbols

<<> For encoding A1: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.
   For encoding T1: see Standard assembler syntax fields on page F2-3100.

<q> See Standard assembler syntax fields on page F2-3100.

<type> Is the data type for the elements of the vectors, encoded in the "U" field. It can have the following values:
    S when U = 0
    U when U = 1

<size> Is the data size for the elements of the vectors, encoded in the "L:imm6<5:3>" field. It can have the following values:
    8 when L = 0, imm6<5:3> = 001
    16 when L = 0, imm6<5:3> = 01x
    32 when L = 0, imm6<5:3> = 1xx
    64 when L = 1, imm6<5:3> = xxx

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

<imm> Is an immediate value, in the range 1 to <size>, encoded in the "imm6" field as <size> - <imm>.

Operation for all encodings

if ConditionPassed() then
  EncodingSpecificOperations();  CheckAdvSIMD Enabled();
  round_const = 1 << (shift_amount - 1);
  for r = 0 to regs-1
    for e = 0 to elements-1
      result = (Int(Elem[D+m+r],e,esize], unsigned) + round_const) >> shift_amount;
      Elem[D+d+r],e,esize] = Elem[D+d+r],e,esize] + result;
F6.1.212  VRSUBHN

Vector Rounding Subtract and Narrow, returning High Half subtracts the elements of one quadword vector from the corresponding elements of another quadword vector, takes the most significant half of each result, and places the final results in a doubleword vector. The results are rounded. For truncated results, see VSUBHN.

The operand elements can be 16-bit, 32-bit, or 64-bit integers. There is no distinction between signed and unsigned integers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

Applies when cc == 11 && size == 10.
VSELGT.F32 <Sd>, <Sn>, <Sm> // Not permitted in IT block

VSELVS, double-prec variant
Applies when cc == 01 && size == 11.
VSELVS.F64 <Dd>, <Dn>, <Dm> // Not permitted in IT block

VSELVS, half-prec variant
Applies when cc == 01 && size == 01.
VSELVS.F16 <Sd>, <Sn>, <Sm> // Not permitted in IT block

VSELVS, single-prec variant
Applies when cc == 01 && size == 10.
VSELVS.F32 <Sd>, <Sn>, <Sm> // Not permitted in IT block

Decode for all variants of this encoding
if InITBlock() then UNPREDICTABLE;
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
case size of
  when '01' esize = 16; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
  when '10' esize = 32; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
  when '11' esize = 64; d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
cond = cc:(cc<1> EOR cc<0>):'0';

CONSTRAINED UNPREDICTABLE behavior
If InITBlock(), then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as if it passes the Condition code check.
• The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

<Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

<Sn> Is the 32-bit name of the first SIMD&FP source register, encoded in the "Vn:N" field.

<Sm> Is the 32-bit name of the second SIMD&FP source register, encoded in the "Vm:M" field.

**Operation for all encodings**

```c
EncodingSpecificOperations(); CheckVFPEnabled(TRUE);

case esize of
    when 16
        S[d] = Zeros(16) : (if ConditionHolds(cond) then S[n] else S[m])<15:0>;
    when 32
        S[d] = if ConditionHolds(cond) then S[n] else S[m];
    when 64
        D[d] = if ConditionHolds(cond) then D[n] else D[m];
```
F6.1.216  VSHL (Immediate)

Vector Shift Left (Immediate) takes each element in a vector of integers, left shifts them by an immediate value, and places the results in the destination vector.

Bits shifted out of the left of each element are lost.

The elements must all be the same size, and can be 8-bit, 16-bit, 32-bit, or 64-bit integers. There is no distinction between signed and unsigned integers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

Assembler symbols

<e>  For encoding A1: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.
     For encoding T1: see Standard assembler syntax fields on page F2-3100.
<q>  See Standard assembler syntax fields on page F2-3100.
<size>  Is the data size for the elements of the vectors, encoded in the "L:imm6<5:3>" field. It can have the following values:
         8     when L = 0, imm6<5:3> = 001
         16    when L = 0, imm6<5:3> = 01x
         32    when L = 0, imm6<5:3> = 1xx
         64    when L = 1, imm6<5:3> = xxx
<qD>  Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <qD>*2.
<qM>  Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <qM>*2.
<d>  Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<m>  Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.
<imm> Is an immediate value, in the range 0 to <size>-1, encoded in the "imm6" field.

Operation for all encodings

if ConditionPassed() then
  EncodingSpecificOperations();  CheckAdvSIMDEnabled();
for r = 0 to regs-1
  for e = 0 to elements-1
    Elem[D+d+r],e,esize] = LSL(Elem[D+m+r],e,esize], shift_amount);
F6.1.217  VSHL (register)

Vector Shift Left (register) takes each element in a vector, shifts them by a value from the least significant byte of the corresponding element of a second vector, and places the results in the destination vector. If the shift value is positive, the operation is a left shift. If the shift value is negative, it is a truncating right shift.

For a rounding shift, see VRSHL.

The first operand and result elements are the same data type, and can be any one of:

- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

The second operand is always a signed integer of the same size.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

            result = Int(Elem[D[m+r],e,esize], unsigned) << shift;
            Elem[D[d+r],e,esize] = result<esize-1:0>;
```

```
F6.1.218 VSHLL

Vector Shift Left Long takes each element in a doubleword vector, left shifts them by an immediate value, and places the results in a quadword vector.

The operand elements can be:

- 8-bit, 16-bit, or 32-bit signed integers.
- 8-bit, 16-bit, or 32-bit unsigned integers.
- 8-bit, 16-bit, or 32-bit untyped integers, maximum shift only.

The result elements are twice the length of the operand elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

Assembler symbols

<>

For encoding A1 and A2: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.
For encoding T1 and T2: see Standard assembler syntax fields on page F2-3100.

<>

See Standard assembler syntax fields on page F2-3100.

<type>

The data type for the elements of the operand. It must be one of:

S  Signed. In encoding T1/A1, encoded as U = 0.
U  Unsigned. In encoding T1/A1, encoded as U = 1.
I  Untyped integer, Available only in encoding T2/A2.
The data size for the elements of the operand. The following table shows the permitted values and their encodings:

<table>
<thead>
<tr>
<th>size</th>
<th>Encoding T1/A1</th>
<th>Encoding T2/A2</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>Encoded as imm6&lt;5:3&gt; = 0b001</td>
<td>Encoded as size = 0b00</td>
</tr>
<tr>
<td>16</td>
<td>Encoded as imm6&lt;5:4&gt; = 0b01</td>
<td>Encoded as size = 0b01</td>
</tr>
<tr>
<td>32</td>
<td>Encoded as imm6&lt;5&gt; = 1</td>
<td>Encoded as size = 0b10</td>
</tr>
</tbody>
</table>

<qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <qd>*2.

<dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

<imm> The immediate value. <imm> must lie in the range 1 to <size>, and:

- If <size> == <imm>, the encoding is T2/A2.
- Otherwise, the encoding is T1/A1, and:
  - If <size> == 8, <imm> is encoded in imm6<2:0>.
  - If <size> == 16, <imm> is encoded in imm6<3:0>.
  - If <size> == 32, <imm> is encoded in imm6<4:0>.

Operation for all encodings

  EncodingSpecificOperations();  CheckAdvSIMDEnabled();
  for r = 0 to regs-1
    for e = 0 to elements-1
      result = Int(\Elem[D[m+r],e,esize], unsigned) >> shift_amount;
      \Elem[D+d+r],e,esize] = result-esize-1:0;
F6.1.220 VSHR (zero)

Vector Shift Right copies the contents of one SIMD register to another.

This instruction is a pseudo-instruction of the VORR (register) instruction. This means that:

- The encodings in this description are named to match the encodings of VORR (register).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VORR (register) gives the operational pseudocode for this instruction.

**A1**

11110010 0x0 0x0 D 10 Vn Vd 0 0 0 1 N Q M 1 Vm

### 64-bit SIMD vector variant

Applies when Q == 0.

VSHR{<c>}{<q>}.<dt> <Dd>, <Dm>, #0

is equivalent to

VORR{<c>}{<q>}{.<dt>} <Dd>, <Dm>, <Dm>

and is never the preferred disassembly.

VSHR{<c>}{<q>}.<dt> <Qd>, <Qm>, #0

is equivalent to

VORR{<c>}{<q>}{<dt>} <Qd>, <Qm>, <Qm>

and is never the preferred disassembly.

Assembler symbols

- `<c>` For encoding A1: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.
  For encoding T1: see Standard assembler syntax fields on page F2-3100.
- `<q>` See Standard assembler syntax fields on page F2-3100.
- `<dt>` Is the data type for the elements of the vectors, and must be one of: S8, S16, S32, S64, U8, U16, U32 or U64.
- `<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as `<Qd>*2.
- `<Qm>` Is the 128-bit name of the SIMD&FP source register, encoded in the "N:Vn" and "M:Vm" field as `<Qm>*2.
- `<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- `<Dm>` Is the 64-bit name of the SIMD&FP source register, encoded in the "N:Vn" and "M:Vm" field.

Operation for all encodings

The description of VORR (register) gives the operational pseudocode for this instruction.
F6.1.221 VSHRN

Vector Shift Right Narrow takes each element in a vector, right shifts them by an immediate value, and places the truncated results in the destination vector. For rounded results, see VRSHRN.

The operand elements can be 16-bit, 32-bit, or 64-bit integers. There is no distinction between signed and unsigned integers. The destination elements are half the size of the source elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

  d = UInt(D:Vd);  m = UInt(M:Vm);

Notes for all encodings

Related encodings: See Advanced SIMD one register and modified immediate on page F3-3164 for the T32 instruction set, or Advanced SIMD one register and modified immediate on page F4-3249 for the A32 instruction set.
Assembler symbols

**<>**
For encoding A1: see *Standard assembler syntax fields on page F2-3100*. This encoding must be unconditional.
For encoding T1: see *Standard assembler syntax fields on page F2-3100*.

**<>**
See *Standard assembler syntax fields on page F2-3100*.

**<size>**
Is the data size for the elements of the vectors, encoded in the "imm6<5:3>" field. It can have the following values:
- 16 when imm6<5:3> = 001
- 32 when imm6<5:3> = 01x
- 64 when imm6<5:3> = 1xx

**<Dd>**
Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

**<Qm>**
Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

**<imm>**
Is an immediate value, in the range 1 to <size>/2, encoded in the "imm6" field as <size>/2 - <imm>.

Operation for all encodings

```c
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for e = 0 to elements-1
        result = LSR(Elem[Qin[m>>1],e,2*esize], shift_amount);
        Elem[D[d],e,esize] = result<esize-1:0>;
```
F6.1.222   VSHRN (zero)

Vector Shift Right Narrow takes each element in a vector, right shifts them by an immediate value, and places the
truncated results in the destination vector.

This instruction is a pseudo-instruction of the VMOVN instruction. This means that:

- The encodings in this description are named to match the encodings of VMOVN.
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VMOVN gives the operational pseudocode for this instruction.

    for e = 0 to elements-1
      result = Int(Elem[D[m+r],e,esize], unsigned) >> shift_amount;
      Elem[D[d+r],e,esize] = Elem[D[d+r],e,esize] + result;
F6.1.226   VSRI

Vector Shift Right and Insert takes each element in the operand vector, right shifts them by an immediate value, and
inserts the results in the destination vector. Bits shifted out of the right of each element are lost.

The elements must all be the same size, and can be 8-bit, 16-bit, 32-bit, or 64-bit. There is no distinction between
data types.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which
the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For
more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

\]

Notes for all encodings
For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors.

Assembler symbols
\(<c>\) For encoding A1, A2 and A3: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.

For encoding T1, T2 and T3: see Standard assembler syntax fields on page F2-3100.

\(<q>\) See Standard assembler syntax fields on page F2-3100.

\(<size>\) Is the data size, encoded in the "size" field. It can have the following values:
- 8 when size = 00
- 16 when size = 01
- 32 when size = 10

\(<list>\) Is a list containing the single 64-bit name of the SIMD&FP register holding the element.
The list must be { <Dd>[<index>] }.
The register <Dd> is encoded in the "D:Vd" field.
The permitted values and encoding of <index> depend on <size>:
- \(<size> == 8\) <index> is in the range 0 to 7, encoded in the "index_align<3:1>" field.
- \(<size> == 16\) <index> is in the range 0 to 3, encoded in the "index_align<3:2>" field.
- \(<size> == 32\) <index> is 0 or 1, encoded in the "index_align<3>" field.

\(<Rn>\) Is the general-purpose base register, encoded in the "Rn" field.

\(<align>\) When \(<size> == 8\), <align> must be omitted, otherwise it is the optional alignment.
Whenever `<align>` is omitted, the standard alignment is used, see *Unaligned data access on page E2-3027*, and the encoding depends on `<size>`:

- `<size>` == 8: Encoded in the "index_align<0>" field as 0.
- `<size>` == 16: Encoded in the "index_align<1:0>" field as `0b00`.
- `<size>` == 32: Encoded in the "index_align<2:0>" field as `0b000`.

Whenever `<align>` is present, the permitted values and encoding depend on `<size>`:

- `<size>` == 16: `<align>` is 16, meaning 16-bit alignment, encoded in the "index_align<1:0>" field as `0b01`.
- `<size>` == 32: `<align>` is 32, meaning 32-bit alignment, encoded in the "index_align<2:0>" field as `0b011`.

`:` is the preferred separator before the `<align>` value, but the alignment can be specified as `@<align>`, see *The Advanced SIMD addressing mode on page F2-3122*.

`<Rm>` is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *The Advanced SIMD addressing mode on page F2-3122*.

**Operation for all encodings**

```c
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n]; iswrite = TRUE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    MemU[address,ebytes] = Elem[D[d],index];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + ebytes;
```
F6.1.228 VST1 (multiple single elements)

Store multiple single elements from one, two, three, or four registers stores elements to memory from one, two, three, or four registers, without interleaving. Every element of each register is stored. For details of the addressing mode see The Advanced SIMD addressing mode on page F2-3122.

Depending on settings in the CPACR, NSACR, and HCPRTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors, and particularly \( \text{VST1 (multiple single elements)} \) on page K1-6406.
Related encodings: See *Advanced SIMD element or structure load/store* on page F3-3178 for the T32 instruction set, or *Advanced SIMD element or structure load/store* on page F4-3252 for the A32 instruction set.

**Assembler symbols**

<
 For encoding A1, A2, A3 and A4: see *Standard assembler syntax fields* on page F2-3100. This encoding must be unconditional.

For encoding T1, T2, T3 and T4: see *Standard assembler syntax fields* on page F2-3100.

<q>
See *Standard assembler syntax fields* on page F2-3100.

<size>
Is the data size, encoded in the "size" field. It can have the following values:

- 8 when size = 00
- 16 when size = 01
- 32 when size = 10
- 64 when size = 11

<list>
Is a list containing the 64-bit names of the SIMD&FP registers.

The list must be one of:

- \{ <Dd> \}
  Single register. Selects the A1 and T1 encodings of the instruction.

- \{ <Dd>, <Dd+1> \}
  Two single-spaced registers. Selects the A2 and T2 encodings of the instruction.

- \{ <Dd>, <Dd+1>, <Dd+2> \}
  Three single-spaced registers. Selects the A3 and T3 encodings of the instruction.

- \{ <Dd>, <Dd+1>, <Dd+2>, <Dd+3> \}
  Four single-spaced registers. Selects the A4 and T4 encodings of the instruction.

The register <Dd> is encoded in the "D:Vd" field.

<Rn>
Is the general-purpose base register, encoded in the "Rn" field.

<align>
Is the optional alignment.

Whenever <align> is omitted, the standard alignment is used, see *Unaligned data access* on page E2-3027, and is encoded in the "align" field as 0b00.

Whenever <align> is present, the permitted values are:

- 64 64-bit alignment, encoded in the "align" field as 0b01.
- 128 128-bit alignment, encoded in the "align" field as 0b10. Available only if <list> contains two or four registers.
- 256 256-bit alignment, encoded in the "align" field as 0b11. Available only if <list> contains four registers.

: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see *The Advanced SIMD addressing mode* on page F2-3122.

<Rm>
Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about <Rn>, !, and <Rm>, see *The Advanced SIMD addressing mode* on page F2-3122.

**Operation for all encodings**

```c
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    address = R[n];  iswrite = TRUE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    for r = 0 to regs-1
```

```c
```
for e = 0 to elements-1
  if ebytes != 8 then
    MemU[address,ebytes] = Elem[D[d+r],e];
  else
    - = AArch32.CheckAlignment(address, ebytes, AccType_NORMAL, iswrite);
    bits(64) data = Elem[D[d+r],e];
    MemU[address,4] = if BigEndian() then data<63:32> else data<31:0>;
    MemU[address+4,4] = if BigEndian() then data<31:0> else data<63:32>;
    address = address + ebytes;
  if wback then
    if register_index then
      R[n] = R[n] + R[m];
    else
      R[n] = R[n] + 8*regs;
F6.1.229 VST2 (single 2-element structure from one lane)

Store single 2-element structure from one lane of two registers stores one 2-element structure to memory from corresponding elements of two registers. For details of the addressing mode see The Advanced SIMD addressing mode on page F2-3122.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.

- The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors, and particularly VST2 (single 2-element structure from one lane) on page K1-6407.

Assembler symbols

\(<c>\) For encoding A1, A2 and A3: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.
For encoding T1, T2 and T3: see Standard assembler syntax fields on page F2-3100.

\(<q>\) See Standard assembler syntax fields on page F2-3100.

\(<\text{size}>\) Is the data size, encoded in the "size" field. It can have the following values:

- 8 when \( \text{size} = 00 \)
- 16 when \( \text{size} = 01 \)
- 32 when \( \text{size} = 10 \)

\(<\text{list}>\) Is a list containing the 64-bit names of the two SIMD&FP registers holding the element. The list must be one of:

\[
\{<Dd>[<index>],<Dd+1>[<index>]\}
\]

Single-spaced registers, encoded as "spacing" = 0.

\[
\{<Dd>[<index>],<Dd+2>[<index>]\}
\]

Double-spaced registers, encoded as "spacing" = 1. Not permitted when \( \text{size} == 8 \).
The encoding of "spacing" depends on <size>:
<size> == 16  "spacing" is encoded in the "index_align<1>" field.
<size> == 32  "spacing" is encoded in the "index_align<2>" field.
The register <Dd> is encoded in the "D:Vd" field.
The permitted values and encoding of <index> depend on <size>:
<size> == 8  <index> is in the range 0 to 7, encoded in the "index_align<3:1>" field.
<size> == 16 <index> is in the range 0 to 3, encoded in the "index_align<3:2>" field.
<size> == 32 <index> is 0 or 1, encoded in the "index_align<3>" field.

<align> Is the optional alignment.
Whenever <align> is omitted, the standard alignment is used, see Unaligned data access on page E2-3027, and the encoding depends on <size>:
<size> == 8  Encoded in the "index_align<0>" field as 0.
<size> == 16 Encoded in the "index_align<0>" field as 0.
<size> == 32 Encoded in the "index_align<1:0>" field as 00.
Whenever <align> is present, the permitted values and encoding depend on <size>:
<size> == 8  <align> is 16, meaning 16-bit alignment, encoded in the "index_align<0>" field as 1.
<size> == 16 <align> is 32, meaning 32-bit alignment, encoded in the "index_align<0>" field as 1.
<size> == 32 <align> is 64, meaning 64-bit alignment, encoded in the "index_align<1:0>" field as 0b01.

: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see The Advanced SIMD addressing mode on page F2-3122.

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rn" field.

For more information about the variants of this instruction, see The Advanced SIMD addressing mode on page F2-3122.

**Operation for all encodings**

    MemU[address, ebytes] = Elem[D[d], index];
    MemU[address+ebytes, ebytes] = Elem[D[d2], index];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 2*ebytes;
```
F6.1.230  **VST2 (multiple 2-element structures)**

Store multiple 2-element structures from two or four registers stores multiple 2-element structures from two or four registers to memory, with interleaving. For more information, see *Element and structure load/store instructions on page F1-3080*. Every element of each register is saved. For details of the addressing mode see *The Advanced SIMD addressing mode on page F2-3122*.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support on page G1-4697*.

**Offset variant**

Applies when $Rm = 1111$.

\[
\text{VST2}\{<c>\}{<q>}.<\text{size}> \text{ <list>, [<Rn>{:<align}>]}
\]

```
CONSTRAINED UNPREDICTABLE behavior

If d2+regs > 32, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors, and particularly VST2 (multiple 2-element structures) on page K1-6406.

Related encodings: See Advanced SIMD element or structure load/store on page F3-3178 for the T32 instruction set, or Advanced SIMD element or structure load/store on page F4-3252 for the A32 instruction set.

Assembler symbols

<> For encoding A1 and A2: see Standard assembler syntax fields on page F2-3100. This encoding must be unconditional.

For encoding T1 and T2: see Standard assembler syntax fields on page F2-3100.

<q> See Standard assembler syntax fields on page F2-3100.

<size> Is the data size, encoded in the "size" field. It can have the following values:

- 8 when size = 00
- 16 when size = 01
- 32 when size = 10

The encoding size = 11 is reserved.

$list> Is a list containing the 64-bit names of the SIMD&FP registers. The list must be one of:

- \{ <Dd>, <Dd+1> \} Two single-spaced registers. Selects the A1 and T1 encodings of the instruction, and encoded in the "type" field as 0b1000.
- \{ <Dd>, <Dd+2> \} Two double-spaced registers. Selects the A1 and T1 encodings of the instruction, and encoded in the "type" field as 0b1001.
- \{ <Dd>, <Dd+1>, <Dd+2>, <Dd+3> \} Three single-spaced registers. Selects the A2 and T2 encodings of the instruction.

The register <Dd> is encoded in the "D:Vd" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

<align> Is the optional alignment.

Whenever <align> is omitted, the standard alignment is used, see Unaligned data access on page E2-3027, and is encoded in the "align" field as 0b00.

Whenever <align> is present, the permitted values are:

- 64 64-bit alignment, encoded in the "align" field as 0b01.
- 128 128-bit alignment, encoded in the "align" field as 0b10.
256-bit alignment, encoded in the "align" field as 0b11. Available only if <list> contains four registers.

: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see The Advanced SIMD addressing mode on page F2-3122.

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see The Advanced SIMD addressing mode on page F2-3122.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n]; iswrite = TRUE;
    @ = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    for r = 0 to regs-1
        for e = 0 to elements-1
            MemU[address, ebytes] = Elem[D[d+r], e];
            MemU[address+ebytes, ebytes] = Elem[D[d2+r], e];
            address = address + 2*ebytes;
        if wback then
            if register_index then
                R[n] = R[n] + R[m];
            else
                R[n] = R[n] + 16*regs;
F6.1.231 VST3 (single 3-element structure from one lane)

Store single 3-element structure from one lane of three registers stores one 3-element structure to memory from corresponding elements of three registers. For details of the addressing mode see The Advanced SIMD addressing mode on page F2-3122.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-4697.
