LES-PRE-20349

In this document, where the term ARM is used to refer to the company it means "Arm or any of its subsidiaries as appropriate".

--- Note ---
• The term ARM can refer to versions of the ARM architecture, for example ARMv8 refers to version 8 of the ARM architecture. The context makes it clear when the term is used in this way.
• This document describes only the ARMv8-A architecture profile. For the behaviors required by the previous version of this architecture profile, ARMv7-A, see the "ARM® Architecture Reference Manual, ARMv7-A and ARMv7-R edition".

Confidentiality Status

This document is Non-Confidential. The right to use, copy and disclose this document may be subject to license restrictions in accordance with the terms of the agreement entered into by ARM and the party that ARM delivered this document to.

Product Status

The information in this document is final, that is for a developed product.

Limitations of this issue

This issue of the ARMv8 Architecture Reference Manual contains many improvements and corrections. Validation of this document has identified the following issues that ARM will address in future issues:

• Appendix K12 ARM Pseudocode Definition requires further review and update. Since this appendix is informative, rather than being part of the architecture specification, this does not affect the quality status of this release.
Contents

ARM Architecture Reference Manual ARMv8, for ARMv8-A architecture profile

Preface
About this manual ................................................................. xvi
Using this manual ............................................................................. xviii
Conventions ........................................................................................ xxiv
Additional reading .............................................................................. xxvi
Feedback .............................................................................................. xxvii

Part A ARMv8 Architecture Introduction and Overview

Chapter A1 Introduction to the ARMv8 Architecture
A1.1 About the ARM architecture .................................................. A1-32
A1.2 Architecture profiles ............................................................ A1-34
A1.3 ARMv8 architectural concepts ............................................. A1-36
A1.4 Supported data types ............................................................ A1-40
A1.5 Advanced SIMD and floating-point support ....................... A1-50
A1.6 The ARM memory model ..................................................... A1-56
A1.7 ARMv8 architecture extensions ........................................... A1-57

Part B The AArch64 Application Level Architecture

Chapter B1 The AArch64 Application Level Programmers’ Model
B1.1 About the Application level programmers’ model .................. B1-76
B1.2 Registers in AArch64 Execution state .................................. B1-77
B1.3 Software control features and EL0 ...................................... B1-82
### Chapter B2 The AArch64 Application Level Memory Model

- **B2.1 About the ARM memory model** ................................................................. B2-86
- **B2.2 Atomicity in the ARM architecture** ......................................................... B2-88
- **B2.3 Definition of the ARMv8 memory model** ................................................ B2-92
- **B2.4 Caches and memory hierarchy** ............................................................... B2-104
- **B2.5 Alignment support** ................................................................................. B2-109
- **B2.6 Endian support** ....................................................................................... B2-111
- **B2.7 Memory types and attributes** ................................................................. B2-114
- **B2.8 Mismatched memory attributes** .............................................................. B2-125
- **B2.9 Synchronization and semaphores** ......................................................... B2-128

### Part C The AArch64 Instruction Set

#### Chapter C1 The A64 Instruction Set

- **C1.1 About the A64 instruction set** ................................................................. C1-142
- **C1.2 Structure of the A64 assembler language** .............................................. C1-143
- **C1.3 Address generation** .............................................................................. C1-149
- **C1.4 Instruction aliases** .................................................................................. C1-152

#### Chapter C2 About the A64 Instruction Descriptions

- **C2.1 Understanding the A64 instruction descriptions** .................................... C2-154
- **C2.2 General information about the A64 instruction descriptions** ................. C2-157

#### Chapter C3 A64 Instruction Set Overview

- **C3.1 Branches, Exception generating, and System instructions** ....................... C3-162
- **C3.2 Loads and stores** .................................................................................. C3-169
- **C3.3 Data processing - immediate** ................................................................. C3-185
- **C3.4 Data processing - register** .................................................................... C3-190
- **C3.5 Data processing - SIMD and floating-point** ........................................ C3-198

#### Chapter C4 A64 Instruction Set Encoding

- **C4.1 A64 instruction set encoding** ................................................................. C4-224

#### Chapter C5 The A64 System Instruction Class

- **C5.1 The System instruction class encoding space** ........................................ C5-328
- **C5.2 Special-purpose registers** ................................................................. C5-339
- **C5.3 A64 System instructions for cache maintenance** .................................. C5-409
- **C5.4 A64 system instructions for address translation** ..................................... C5-432
- **C5.5 A64 System instructions for TLB maintenance** ..................................... C5-459

#### Chapter C6 A64 Base Instruction Descriptions

- **C6.1 About the A64 base instructions** ............................................................ C6-524
- **C6.2 Alphabetical list of A64 base instructions** ............................................ C6-526

#### Chapter C7 A64 Advanced SIMD and Floating-point Instruction Descriptions

- **C7.1 About the A64 SIMD and floating-point instructions** ............................ C7-1006
- **C7.2 Alphabetical list of A64 Advanced SIMD and floating-point instructions** C7-1008

### Part D The AArch64 System Level Architecture

#### Chapter D1 The AArch64 System Level Programmers’ Model

- **D1.1 Exception levels** .................................................................................... D1-1850
- **D1.2 Exception terminology** .......................................................................... D1-1851
- **D1.3 Execution state** .................................................................................... D1-1853
- **D1.4 Security state** ....................................................................................... D1-1854
## Part F  The AArch32 Instruction Sets

### Chapter F1  The AArch32 Instruction Sets Overview
- F1.1  Support for instructions in different versions of the ARM architecture .......... F1-3058
- F1.2  Unified Assembler Language ................................................................. F1-3059
- F1.3  Branch instructions .................................................................................. F1-3061
- F1.4  Data-processing instructions ..................................................................... F1-3062
- F1.5  PSTATE and banked register access instructions ...................................... F1-3070
- F1.6  Load/store instructions ............................................................................... F1-3071
- F1.7  Load/store multiple instructions ............................................................... F1-3074
- F1.8  Miscellaneous instructions ...................................................................... F1-3075
- F1.9  Exception-generating and exception-handling instructions ..................... F1-3077
- F1.10 System register access instructions ......................................................... F1-3079
- F1.11 Advanced SIMD and floating-point load/store instructions .................... F1-3080
- F1.12 Advanced SIMD and floating-point register transfer instructions .......... F1-3082
- F1.13 Advanced SIMD data-processing instructions ........................................ F1-3083
- F1.14 Floating-point data-processing instructions ........................................... F1-3093

### Chapter F2  About the T32 and A32 Instruction Descriptions
- F2.1  Format of instruction descriptions ............................................................. F2-3096
- F2.2  Standard assembler syntax fields ............................................................... F2-3100
- F2.3  Conditional execution ............................................................................... F2-3101
- F2.4  Shifts applied to a register ......................................................................... F2-3104
- F2.5  Memory accesses ...................................................................................... F2-3106
- F2.6  Encoding of lists of general-purpose registers and the PC ....................... F2-3107
- F2.7  General information about the T32 and A32 instruction descriptions ....... F2-3108
- F2.8  Additional pseudocode support for instruction descriptions .................. F2-3121
- F2.9  Additional information about Advanced SIMD and floating-point instructions .. F2-3122

### Chapter F3  T32 Instruction Set Encoding
- F3.1  T32 instruction set encoding ...................................................................... F3-3130
- F3.2  About the T32 Advanced SIMD and floating-point instructions and their encoding ...... F3-3196

### Chapter F4  A32 Instruction Set Encoding
- F4.1  A32 instruction set encoding ...................................................................... F4-3198
- F4.2  About the A32 Advanced SIMD and floating-point instructions and their encoding ...... F4-3256

### Chapter F5  T32 and A32 Base Instruction Set Instruction Descriptions
- F5.1  Alphabetical list of T32 and A32 base instruction set instructions ............... F5-3258
- F5.2  Encoding and use of banked register transfer instructions ....................... F5-3928

### Chapter F6  T32 and A32 Advanced SIMD and Floating-point Instruction Descriptions
- F6.1  Alphabetical list of Advanced SIMD and floating-point instructions .......... F6-3934

## Part G  The AArch32 System Level Architecture

### Chapter G1  The AArch32 System Level Programmers’ Model
- G1.1  About the AArch32 System level programmers’ model ............................. G1-4590
- G1.2  Exception levels ....................................................................................... G1-4591
- G1.3  Exception terminology ............................................................................ G1-4592
- G1.4  Execution state ....................................................................................... G1-4594
- G1.5  Instruction Set state ................................................................................ G1-4596
Chapter G2 AArch32 Self-hosted Debug

G2.1 About self-hosted debug ............................................................................. G2-4738
G2.2 The debug exception enable controls .......................................................... G2-4742
G2.3 Routing debug exceptions .......................................................................... G2-4743
G2.4 Enabling debug exceptions from the current Privilege level and Security state ... G2-4745
G2.5 The effect of powerdown on debug exceptions ............................................. G2-4747
G2.6 Summary of permitted routing and enabling of debug exceptions .................. G2-4748
G2.7 Pseudocode description of debug exceptions .............................................. G2-4750
G2.8 Breakpoint Instruction exceptions ............................................................... G2-4751
G2.9 Breakpoint exceptions ................................................................................. G2-4754
G2.10 Watchpoint exceptions ............................................................................. G2-4781
G2.11 Vector Catch exceptions ........................................................................... G2-4795
G2.12 Synchronization and debug exceptions ..................................................... G2-4803

Chapter G3 The AArch32 System Level Memory Model

G3.1 About the memory system architecture .......................................................... G3-4806
G3.2 Address space ............................................................................................ G3-4807
G3.3 Mixed-endian support ................................................................................. G3-4808
G3.4 AArch32 cache and branch predictor support .............................................. G3-4809
G3.5 System register support for IMPLEMENTATION DEFINED memory features ... G3-4834
G3.6 External aborts ............................................................................................ G3-4835
G3.7 Memory barrier instructions ...................................................................... G3-4837
G3.8 Pseudocode description of general memory system instructions .................. G3-4838

Chapter G4 The AArch32 Virtual Memory System Architecture

G4.1 About VMSAv8-32 ...................................................................................... G4-4842
G4.2 The effects of disabling address translation stages on VMSAv8-32 behavior .... G4-4850
G4.3 Translation tables ....................................................................................... G4-4854
G4.4 The VMSAv8-32 Short-descriptor translation table format ................................ G4-4859
G4.5 The VMSAv8-32 Long-descriptor translation table format .............................. G4-4868
G4.6 Memory access control .............................................................................. G4-4888
G4.7 Memory region attributes .......................................................................... G4-4899
G4.8 Translation Lookaside Buffers (TLBs) .......................................................... G4-4911
G4.9 TLB maintenance requirements .................................................................. G4-4915
G4.10 Caches in VMSAv8-32 .............................................................................. G4-4929
G4.11 VMSAv8-32 memory aborts ...................................................................... G4-4932
G4.12 Exception reporting in a VMSAv8-32 implementation .................................... G4-4944
G4.13 Address translation instructions .................................................................. G4-4963
G4.14 Pseudocode description of VMSAv8-32 memory system operations .............. G4-4970
G4.15 About the System registers for VMSAv8-32 ............................................... G4-4972
G4.16 Functional grouping of VMSAv8-32 System registers ................................. G4-4977
Part K  Appendixes

Appendix K1  Architectural Constraints on UNPREDICTABLE behaviors
K1.1  AArch32 CONSTRAINED UNPREDICTABLE behaviors ......................... K1-6390
K1.2  AArch64 CONSTRAINED UNPREDICTABLE behaviors .......................... K1-6413

Appendix K2  Recommended External Debug Interface
K2.1  About the recommended external debug interface ................................. K2-6430
K2.2  PMUEVENT bus ......................................................................................... K2-6434
K2.3  Recommended authentication interface .................................................... K2-6435
K2.4  Management registers and CoreSight compliance .................................. K2-6436

Appendix K3  Recommendations for Performance Monitors Event Numbers for IMPLEMENTATION DEFINED Events
K3.1  ARM recommendations for IMPLEMENTATION DEFINED event numbers ... K3-6448
K3.2  Summary of events for exceptions taken to an Exception level using AArch64 ......... K3-6462

Appendix K4  Recommendations for reporting memory attributes on an interconnect
K4.1  ARM recommendations for reporting memory attributes on an interconnect .. K4-6466

Appendix K5  Additional Information for Implementations of the Generic Timer
K5.1  Providing a complete set of features in a system level implementation ........ K5-6468
K5.2  Gray-count scheme for timer distribution scheme ................................. K5-6470

Appendix K6  Legacy Instruction Syntax for AArch32 Instruction Sets
K6.1  Legacy Instruction Syntax ........................................................................ K6-6472

Appendix K7  Address translation examples
K7.1  AArch64 Address translation examples .................................................. K7-6480
K7.2  AArch32 Address translation examples .................................................. K7-6493

Appendix K8  Example OS Save and Restore Sequences
K8.1  Save Debug registers ................................................................................ K8-6504
K8.2  Restore Debug registers .......................................................................... K8-6506

Appendix K9  Recommended Upload and Download Processes for External Debug
K9.1  Using memory access mode in AArch64 state ........................................ K9-6510

Appendix K10  Software Usage Examples
K10.1  Use of the Advanced SIMD complex number instructions .................... K10-6514
K10.2  Use of the ARMv8.2 extensions to the Cryptographic Extension ................ K10-6516

Appendix K11  Barrier Litmus Tests
K11.1  Introduction ......................................................................................... K11-6524
K11.2  Load-Acquire, Store-Release and barriers ............................................. K11-6527
K11.3  Load-Acquire Exclusive, Store-Release Exclusive and barriers .............. K11-6531
K11.4  Using a mailbox to send an interrupt ................................................... K11-6536
K11.5  Cache and TLB maintenance instructions and barriers ......................... K11-6537
K11.6  ARMv7 compatible approaches for ordering, using DMB and DSB barriers . K11-6549
Appendix K12  ARM Pseudocode Definition
K12.1 About the ARM pseudocode ................................................................. K12-6564
K12.2 Pseudocode for instruction descriptions ......................................... K12-6565
K12.3 Data types ......................................................................................... K12-6567
K12.4 Operators ......................................................................................... K12-6572
K12.5 Statements and control structures .................................................. K12-6578
K12.6 Built-in functions ............................................................................. K12-6583
K12.7 Miscellaneous helper procedures and functions .............................. K12-6586
K12.8 ARM pseudocode definition index .................................................. K12-6588

Appendix K13  Registers Index
K13.1 Introduction and register disambiguation ......................................... K13-6592
K13.2 Alphabetical index of AArch64 registers and system instructions ........ K13-6597
K13.3 Functional index of AArch64 registers and system instructions ........... K13-6607
K13.4 Alphabetical index of AArch32 registers and system instructions ........ K13-6618
K13.5 Functional index of AArch32 registers and system instructions .......... K13-6626
K13.6 Alphabetical index of memory-mapped registers ............................... K13-6636
K13.7 Functional index of memory-mapped registers ................................. K13-6641

Glossary
Preface

This preface introduces the *ARM Architecture Reference Manual, ARMv8, for ARMv8-A architecture profile*. It contains the following sections:

- *About this manual* on page xvi.
- *Using this manual* on page xviii.
- *Conventions* on page xxiv.
- *Additional reading* on page xxvi.
- *Feedback* on page xxvii.

--- Note ---

This document describes only the ARMv8-A architecture profile. For the behaviors required by the ARMv7-A and ARMv7-R architecture profiles, see the *ARM® Architecture Reference Manual, ARMv7-A and ARMv7-R edition*. 

---
About this manual

This manual describes the ARM® architecture v8, ARMv8. The architecture describes the operation of an ARMv8-A Processing element (PE), and this manual includes descriptions of:

- The two Execution states, AArch64 and AArch32.
- The instruction sets:
  - In AArch32 state, the A32 and T32 instruction sets, that are compatible with earlier versions of the ARM architecture.
  - In AArch64 state, the A64 instruction set.
- The states that determine how a PE operates, including the current Exception level and Security state, and in AArch32 state the PE mode.
- The Exception model.
- The interprocessing model, that supports transitioning between AArch64 state and AArch32 state.
- The memory model, that defines memory ordering and memory management. This manual covers a single architecture profile, ARMv8-A, that defines a Virtual Memory System Architecture (VMSA).
- The programmers’ model, and its interfaces to System registers that control most PE and memory system features, and provide status information.
- The Advanced SIMD and floating-point instructions, that provide high-performance:
  - Single-precision, half-precision, and double-precision floating-point operations.
  - Conversions between double-precision, single-precision, and half-precision floating-point values.
  - Integer, single-precision floating-point, half-precision floating-point, and in A64, double-precision vector operations in all instruction sets.
  - Single-precision, half-precision, and double-precision floating-point vector operations in the A64 instruction set.
- The security model, that provides two security states to support secure applications.
- The virtualization model, that support the virtualization of Non-secure operation.
- The Debug architecture, that provides software access to debug features.

This manual gives the assembler syntax for the instructions it describes, meaning that it describes instructions in textual form. However, this manual is not a tutorial for ARM assembler language, nor does it describe ARM assembler language, except at a very basic level. To make effective use of ARM assembler language, read the documentation supplied with the assembler being used.

This manual is organized into parts:

**Part A** Provides an introduction to the ARMv8-A architecture, and an overview of the AArch64 and AArch32 Execution states.

**Part B** Describes the application level view of the AArch64 Execution state, meaning the view from EL0. It describes the application level view of the programmers’ model and the memory model.

**Part C** Describes the A64 instruction set, that is available in the AArch64 Execution state. The descriptions for each instruction also include the precise effects of each instruction when executed at EL0, described as unprivileged execution, including any restrictions on its use, and how the effects of the instruction differ at higher Exception levels. This information is of primary importance to authors and users of compilers, assemblers, and other programs that generate ARM machine code.

**Part D** Describes the system level view of the AArch64 Execution state. It includes details of the System registers, most of which are not accessible from EL0, and the system level view of the programmers’ model and the memory model. This part includes the description of self-hosted debug.
Part E  Describes the application level view of the AArch32 Execution state, meaning the view from the EL0. It describes the application level view of the programmers’ model and the memory model.

Note

In AArch32 state, execution at EL0 is execution in User mode.

Part F  Describes the T32 and A32 instruction sets, that are available in the AArch32 Execution state. These instruction sets are backwards-compatible with earlier versions of the ARM architecture. This part describes the precise effects of each instruction when executed in User mode, described as unprivileged execution or execution at EL0, including any restrictions on its use, and how the effects of the instruction differ at higher Exception levels. This information is of primary importance to authors and users of compilers, assemblers, and other programs that generate ARM machine code.

Note

User mode is the only mode where software execution is unprivileged.

Part G  Describes the system level view of the AArch32 Execution state, that is generally compatible with earlier versions of the ARM architecture. This part includes details of the System registers, most of which are not accessible from EL0, and the instruction interface to those registers. It also describes the system level view of the programmers’ model and the memory model.

Part H  Describes the Debug architecture for external debug. This provides configuration, breakpoint and watchpoint support, and a Debug Communications Channel (DCC) to a debug host.

Part I  Describes additional features of the architecture that are not closely coupled to a processing element (PE), and therefore are accessed through memory-mapped interfaces. Some of these features are optional.

Part J  Provides pseudocode that describes various features of the ARMv8 architecture.

Part K, Appendixes  Provide additional information. Some appendixes give information that is not part of the ARMv8 architectural requirements. The cover page of each appendix indicates its status.

Glossary  Defines terms used in this document that have a specialized meaning.

Note

Terms that are generally well understood in the microelectronics industry are not included in the Glossary.
Using this manual

The information in this manual is organized into parts, as described in this section.

Part A, Introduction and Architecture Overview

Part A gives an overview of the ARMv8-A architecture profile, including its relationship to the other ARM PE architectures. It introduces the terminology used to describe the architecture, and gives an overview of the Executions states, AArch64 and AArch32. It contains the following chapter:

Chapter A1 Introduction to the ARMv8 Architecture
Read this for an introduction to the ARMv8 architecture.

Part B, The AArch64 Application Level Architecture

Part B describes the AArch64 state application level view of the architecture. It contains the following chapters:

Chapter B1 The AArch64 Application Level Programmers’ Model
Read this for an application level description of the programmers’ model for software executing in AArch64 state. It describes execution at EL0 when EL0 is using AArch64 state.

Chapter B2 The AArch64 Application Level Memory Model
Read this for an application level description of the memory model for software executing in AArch64 state. It describes the memory model for execution in EL0 when EL0 is using AArch64 state. It includes information about ARM memory types, attributes, and memory access controls.

Part C, The A64 Instruction Set

Part C describes the A64 instruction set, that is used in AArch64 state. It contains the following chapters:

Chapter C1 The A64 Instruction Set
Read this for a description of the A64 instruction set and common instruction operation details.

Chapter C2 About the A64 Instruction Descriptions
Read this to understand the format of the A64 instruction descriptions.

Chapter C3 A64 Instruction Set Overview
Read this for an overview of the individual A64 instructions, that are divided into five functional groups.

Chapter C4 A64 Instruction Set Encoding
Read this for a description of the A64 instruction set encoding.

Chapter C5 The A64 System Instruction Class
Read this for a description of the AArch64 system instructions and register descriptions, and the system instruction class encoding space.

Chapter C6 A64 Base Instruction Descriptions
Read this for information on key aspects of the A64 base instructions and for descriptions of the individual instructions, which are listed in alphabetical order.

Chapter C7 A64 Advanced SIMD and Floating-point Instruction Descriptions
Read this for information on key aspects of the A64 Advanced SIMD and floating-point instructions and for descriptions of the individual instructions, which are listed in alphabetical order.
Part D, The AArch64 System Level Architecture

Part D describes the AArch64 state system level view of the architecture. It contains the following chapters:

Chapter D1 The AArch64 System Level Programmers’ Model
Read this for a description of the AArch64 state system level view of the programmers’ model.

Chapter D2 AArch64 Self-hosted Debug
Read this for an introduction to, and a description of, self-hosted debug in AArch64 state.

Chapter D3 The AArch64 System Level Memory Model
Read this for a description of the AArch64 state system level view of the general features of the memory system.

Chapter D4 The AArch64 Virtual Memory System Architecture
Read this for a system level view of the AArch64 Virtual Memory System Architecture (VMSA), the memory system architecture of an ARMv8 implementation that is executing in AArch64 state.

Chapter D5 The Performance Monitors Extension
Read this for a description of an implementation of the ARM Performance Monitors, that are an optional non-invasive debug component.

Chapter D6 The Statistical Profiling Extension
Read this for a description of an implementation of the Statistical Profiling Extension, that is an optional AArch64 state non-invasive debug component.

Chapter D7 Statistical Profiling Extension Sample Record Specification
Read this for a description the sample records generated by the Statistical Profiling Extension.

Chapter D8 The Generic Timer in AArch64 state
Read this for a description of the AArch64 view of an implementation of the ARM Generic Timer.

Chapter D9 AArch64 System Register Encoding
Read this for a description of the description of the encoding of the AArch64 System registers, and the other uses of the AArch64 System registers encoding space.

Chapter D10 AArch64 System Register Descriptions
Read this for an introduction to, and description of, each of the AArch64 System registers.

Part E, The AArch32 Application Level Architecture

Part E describes the AArch32 state application level view of the architecture. It contains the following chapters:

Chapter E1 The AArch32 Application Level Programmers’ Model
Read this for an application level description of the programmers’ model for software executing in AArch32 state. It describes execution at EL0 when EL0 is using AArch32 state.

Chapter E2 The AArch32 Application Level Memory Model
Read this for an application level description of the memory model for software executing in AArch32 state. It describes the memory model for execution in EL0 when EL0 is using AArch32 state. It includes information about ARM memory types, attributes, and memory access controls.
Part F, The AArch32 Instruction Sets

Part F describes the T32 and A32 instruction sets, that are used in AArch32 state. It contains the following chapters:

Chapter F1 The AArch32 Instruction Sets Overview
Read this for an overview of the T32 and A32 instruction sets.

Chapter F2 About the T32 and A32 Instruction Descriptions
Read this to understand the format of the T32 and A32 instruction descriptions.

Chapter F3 T32 Instruction Set Encoding
Read this for a description of the T32 instruction set encoding. This includes the T32 encoding of the Advanced SIMD and floating-point instructions.

Chapter F4 A32 Instruction Set Encoding
Read this for a description of the A32 instruction set encoding. This includes the A32 encoding of the Advanced SIMD and floating-point instructions.

Chapter F5 T32 and A32 Base Instruction Set Instruction Descriptions
Read this for a description of each of the T32 and A32 base instructions.

Chapter F6 T32 and A32 Advanced SIMD and Floating-point Instruction Descriptions
Read this for a description of each of the T32 and A32 Advanced SIMD and floating-point instructions.

Part G, The AArch32 System Level Architecture

Part G describes the AArch32 state system level view of the architecture. It contains the following chapters:

Chapter G1 The AArch32 System Level Programmers’ Model
Read this for a description of the AArch32 state system level view of the programmers’ model for execution in an Exception level that is using AArch32.

Chapter G2 AArch32 Self-hosted Debug
Read this for an introduction to, and a description of, self-hosted debug in AArch64 state.

Chapter G3 The AArch32 System Level Memory Model
Read this for a system level view of the general features of the memory system.

Chapter G4 The AArch32 Virtual Memory System Architecture
Read this for a description of the AArch32 Virtual Memory System Architecture (VMSA).

Chapter G5 The Generic Timer in AArch32 state
Read this for a description of the AArch32 view of an implementation of the ARM Generic Timer.

Chapter G6 AArch32 System Register Encoding
Read this for a description of the description of the encoding of the AArch32 System registers, including the System instructions that are part of the the AArch32 System registers encoding space.

Chapter G7 AArch32 System Register Descriptions
Read this for a description of each of the AArch32 System registers.
Part H, External Debug

Part H describes the architecture for external debug. It contains the following chapters:

**Chapter H1 About External Debug**
Read this for an introduction to external debug, and a definition of the scope of this part of the manual.

**Chapter H2 Debug State**
Read this for a description of debug state, which the PE might enter as the result of a Halting debug event.

**Chapter H3 Halting Debug Events**
Read this for a description of the external debug events referred to as Halting debug events.

**Chapter H4 The Debug Communication Channel and Instruction Transfer Register**
Read this for a description of the communication between a debugger and the PE debug logic using the Debug Communications Channel and the Instruction Transfer register.

**Chapter H5 The Embedded Cross-Trigger Interface**
Read this for a description of the embedded cross-trigger interface.

**Chapter H6 Debug Reset and Powerdown Support**
Read this for a description of reset and powerdown support in the Debug architecture.

**Chapter H7 The PC Sample-based Profiling Extension**
Read this for a description of the PC Sample-based Profiling Extension that is an OPTIONAL extension to an ARMv8 implementation.

**Chapter H8 About the External Debug Registers**
Read this for some additional information about the external debug registers.

**Chapter H9 External Debug Register Descriptions**
Read this for a description of each external debug register.

Part I, Memory-mapped Components of the ARMv8 Architecture

Part I describes the memory-mapped components in the architecture. It contains the following chapters:

**Chapter I1 Requirements for Memory-mapped Components**
Read this for descriptions of some general requirements for memory-mapped components within a system that complies with the ARMv8 Architecture.

**Chapter I2 System Level Implementation of the Generic Timer**
Read this for a definition of a system level implementation of the Generic Timer.

**Chapter I3 Recommended External Interface to the Performance Monitors**
Read this for a description of the recommended memory-mapped and external debug interfaces to the Performance Monitors.

**Chapter I4 External System Control Register Descriptions**
Read this for a description of each memory-mapped system control register.
Part J, Architectural Pseudocode

Part J contains pseudocode that describes various features of the ARM architecture. It contains the following chapter:

**Chapter J1 ARMv8 Pseudocode**

Read this for the pseudocode definitions that describe various features of the ARMv8 architecture, for operation in AArch64 state and in AArch32 state.

Part K, Appendixes

This manual contains the following appendixes:

**Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors**

Read this for a description of the architecturally-required constraints on UNPREDICTABLE behaviors in the ARMv8 architecture, including AArch32 behaviors that were UNPREDICTABLE in previous versions of the architecture.

**Appendix K2 Recommended External Debug Interface**

Read this for a description of the recommended external debug interface.

---

**Note**

This description is not part of the ARM architecture specification. It is included here as supplementary information, for the convenience of developers and users who might require this information.

**Appendix K3 Recommendations for Performance Monitors Event Numbers for IMPLEMENTATION DEFINED Events**

Read this for a description of ARM recommendations for the use of the IMPLEMENTATION DEFINED event numbers.

---

**Note**

This description is not part of the ARM architecture specification. It is included here as supplementary information, for the convenience of developers and users who might require this information.

**Appendix K4 Recommendations for reporting memory attributes on an interconnect**

Read this for the ARM recommendations about how the architectural memory attributes are reported on an interconnect.

**Appendix K5 Additional Information for Implementations of the Generic Timer**

Read this for additional information about implementations of the ARM Generic Timer. This information does not form part of the architectural definition of the Generic Timer.

**Appendix K6 Legacy Instruction Syntax for AArch32 Instruction Sets**

Read this for information about the pre-UAL syntax of the AArch32 instruction sets, which can still be valid for the A32 instruction set.

**Appendix K7 Address translation examples**

Read this for examples of translation table lookups using the translation regimes described in Chapter D4 The AArch64 Virtual Memory System Architecture and Chapter G4 The AArch32 Virtual Memory System Architecture.
Appendix K8 Example OS Save and Restore Sequences
Read this for software examples that perform the OS Save and Restore sequences for an ARMv8 debug implementation.

Note
Chapter H6 Debug Reset and Powerdown Support describes the OS Save and Restore mechanism.

Appendix K9 Recommended Upload and Download Processes for External Debug
Read this for information about implementing and using the ARM architecture.

Note
This description is not part of the ARM architecture specification. It is included here as supplementary information, for the convenience of developers and users who might require this information.

Appendix K10 Software Usage Examples
Read this for software examples that help understanding of some aspects of the Arm architecture.

Note
This description is not part of the ARM architecture specification. It is included here as supplementary information, for the convenience of developers and users who might require this information.

Appendix K11 Barrier Litmus Tests
Read this for examples of the use of barrier instructions provided by the ARMv8 architecture.

Note
This description is not part of the ARM architecture specification. It is included here as supplementary information, for the convenience of developers and users who might require this information.

Appendix K12 ARM Pseudocode Definition
Read this for definitions of the AArch32 pseudocode.

Appendix K13 Registers Index
Read this for an alphabetic and functional index of AArch32 and AArch64 registers, and memory-mapped registers.

Glossary
Defines terms used in this document that have a specialized meaning.

Note
Terms that are generally well understood in the microelectronics industry are not included in the Glossary.
Conventions

The following sections describe conventions that this book can use:

- **Typographic conventions.**
- **Signals** on page xxv.
- **Numbers** on page xxv.
- **Pseudocode descriptions** on page xxv.
- **Assembler syntax descriptions** on page xxv.

### Typographic conventions

The typographical conventions are:

- **italic** Introduces special terminology, and denotes citations.
- **bold** Denotes signal names, and is used for terms in descriptive lists, where appropriate.
- **monospace** Used for assembler syntax descriptions, pseudocode, and source code examples.
  Also used in the main text for instruction mnemonics and for references to other items appearing in assembler syntax descriptions, pseudocode, and source code examples.

  **SMALL CAPITALS**
  
  Used in body text for a few terms that have specific technical meanings, and are defined in the Glossary.

- **Colored text** Indicates a link. This can be:
  - A URL, for example http://infocenter.arm.com.
  - A cross-reference, that includes the page number of the referenced information if it is not on the current page, for example, Assembler syntax descriptions on page xxv.
  - A link, to a chapter or appendix, or to a glossary entry, or to the section of the document that defines the colored term, for example Simple sequential execution or SCTLR.

- **{ and }** Braces, { and }, have two distinct uses:
  - **Optional items**
    In syntax descriptions braces enclose optional items. In the following example they indicate that the <shift> parameter is optional:
    ```plaintext
    ADD <Wd|WSP>, <Wn|WSP>, #<imm>{, <shift>}
    ```
    Similarly they can be used in generalized field descriptions, for example TCR_ELx.{I}PS refers to a field in the TCR_ELx registers that is called either IPS or PS.
  - **Sets of items**
    Braces can be used to enclose sets. For example, HCR_EL2.{E2H, TGE} refers to a set of two register fields, HCR_EL2.E2H and HCR_EL2.TGE

- **Notes**

  Notes are formatted as:

  ______ Note ________

  This is a Note.

  ________

  In this Manual, Notes are used only to provide additional information, usually to help understanding of the text. While a Note may repeat architectural information given elsewhere in the Manual, a Note never provides any part of the definition of the architecture.
Signals

In general this specification does not define hardware signals, but it does include some signal examples and recommendations. The signal conventions are:

**Signal level**

The level of an asserted signal depends on whether the signal is active-HIGH or active-LOW. Asserted means:

- HIGH for active-HIGH signals.
- LOW for active-LOW signals.

**Lower-case n**

At the start or end of a signal name denotes an active-LOW signal.

Numbers

Numbers are normally written in decimal. Binary numbers are preceded by `0b`, and hexadecimal numbers by `0x`. In both cases, the prefix and the associated value are written in a monospace font, for example `0xFFFF0000`. To improve readability, long numbers can be written with an underscore separator between every four characters, for example `0xFFFF_0000_0000_0000`. Ignore any underscores when interpreting the value of a number.

Pseudocode descriptions

This manual uses a form of pseudocode to provide precise descriptions of the specified functionality. This pseudocode is written in monospace font, and is described in Appendix K12 ARM Pseudocode Definition.

Assembler syntax descriptions

This manual contains numerous syntax descriptions for assembler instructions and for components of assembler instructions. These are shown in a monospace font, and use the conventions described in Structure of the A64 assembler language on page C1-143, Appendix K12 ARM Pseudocode Definition, and Pseudocode operators and keywords on page K12-5648.
Additional reading

This section lists relevant publications from ARM and third parties.

See the Infocenter, http://infocenter.arm.com, for access to ARM documentation.

ARM publications

• ARM® AMBA® 4 ATB Protocol Specification, ATBv1.0 and ATBv1.1, (ARM IHI 0032B).
• ARM® Architecture Reference Manual Supplement, ARMv8, for the ARMv8-R AArch32 architecture profile (ARM DDI 0568).
• ARM® Debug Interface Architecture Specification, ADIv6.0 (ARM IHI 0074).
• ARM® Debug Interface Architecture Specification, ADIv5.0 to ADIv5.2 (ARM IHI 0031).
• ARM® Embedded Trace Macrocell Architecture Specification, ETMv4 (ARM IHI 0064).
• ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).
• ARM® CoreSight™ Architecture Specification (ARM IHI 0029).
• ARM® Procedure Call Standard for the ARM 64-bit Architecture (ARM IHI 0055).
• ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile (ARM DDI 0587).

Other publications

The following publications are referred to in this manual, or provide more information:

• SM3 Cryptographic Hash Algorithm, China Internet Network Information Center (CNNIC).
• SM4 Block Cipher Algorithm, China Internet Network Information Center (CNNIC).
• The QARMA Block Cipher Family, Roberto Avanzi, Qualcomm Product Security Initiative.

Feedback

ARM welcomes feedback on its documentation.

Feedback on this manual

If you have comments on the content of this manual, send e-mail to errata@arm.com. Give:

• The title.
• The number, ARM DDI 0487C.a.
• The page numbers to which your comments apply.
• A concise explanation of your comments.

ARM also welcomes general suggestions for additions and improvements.
Part A

ARMv8 Architecture Introduction and Overview
Chapter A1
Introduction to the ARMv8 Architecture

This chapter introduces the ARM architecture. It contains the following sections:

- About the ARM architecture on page A1-32.
- ARMv8 architectural concepts on page A1-36.
- Supported data types on page A1-40.
- The ARM memory model on page A1-56.
- ARMv8 architecture extensions on page A1-57.
A1.1 About the ARM architecture

The ARM architecture described in this Architecture Reference Manual defines the behavior of an abstract machine, referred to as a processing element, often abbreviated to PE. Implementations compliant with the ARM architecture must conform to the described behavior of the processing element. It is not intended to describe how to build an implementation of the PE, nor to limit the scope of such implementations beyond the defined behaviors.

Except where the architecture specifies differently, the programmer-visible behavior of an implementation that is compliant with the ARM architecture must be the same as a simple sequential execution of the program on the processing element. This programmer-visible behavior does not include the execution time of the program.

The ARM Architecture Reference Manual also describes rules for software to use the processing element.

The ARM architecture includes definitions of:

- An associated debug architecture, see:
  - Chapter D2 AArch64 Self-hosted Debug.
  - Chapter G2 AArch32 Self-hosted Debug.
  - Part H of this manual, External Debug on page 5689.

- Associated trace architectures that define trace macrocells that implementers can implement with the associated processor hardware. For more information, see the Embedded Trace Macrocell Architecture Specification.

The ARM architecture is a Reduced Instruction Set Computer (RISC) architecture with the following RISC architecture features:

- A large uniform register file.
- A load/store architecture, where data-processing operations only operate on register contents, not directly on memory contents.
- Simple addressing modes, with all load/store addresses determined from register contents and instruction fields only.

The architecture defines the interaction of the PE with memory, including caches, and includes a memory translation system. It also describes how multiple PEs interact with each other and with other observers in a system.

This document defines the ARMv8-A architecture profile. See Architecture profiles on page A1-34 for more information.

The ARM architecture supports implementations across a wide range of performance points. Implementation size, performance, and very low power consumption are key attributes of the ARM architecture.

An important feature of the ARMv8 architecture is backwards compatibility, combined with the freedom for optimal implementation in a wide range of standard and more specialized use cases. The ARMv8 architecture supports:

- A 64-bit Execution state, AArch64.
- A 32-bit Execution state, AArch32, that is compatible with previous versions of the ARM architecture.

Note

- The AArch32 Execution state is compatible with the ARMv7-A architecture profile, and enhances that profile to support some features included in the AArch64 Execution state.
- This document describes only the ARMv8-A architecture profile. For the behaviors required by the ARMv7-A and ARMv7-R architecture profiles, see the ARM® Architecture Reference Manual, ARMv7-A and ARMv7-R edition.

Features that are optional are explicitly defined as such in this Manual.

Note

The presence of an ID register field for a feature does not imply that the feature is optional.
Both Execution states support SIMD and floating-point instructions:

- **AArch32 state provides:**
  - SIMD instructions in the base instruction sets that operate on the 32-bit general-purpose registers.
  - Advanced SIMD instructions that operate on registers in the *SIMD and floating-point register* (SIMD&FP register) file.
  - Floating-point instructions that operate on registers in the SIMD&FP register file.

- **AArch64 state provides:**
  - Advanced SIMD instructions that operate on registers in the SIMD&FP register file.
  - Floating-point instructions that operate on registers in the SIMD&FP register file.

---

**Note**

See *Conventions on page xxiv* for information about conventions used in this manual, including the use of SMALL CAPITALS for particular terms that have ARM-specific meanings that are defined in the *Glossary*. 
A1.2 Architecture profiles

The ARM architecture has evolved significantly since its introduction, and ARM continues to develop it. Eight major versions of the architecture have been defined to date, denoted by the version numbers 1 to 8. Of these, the first three versions are now obsolete.

The generic names AArch64 and AArch32 describe the 64-bit and 32-bit Execution states:

**AArch64** Is the 64-bit Execution state, meaning addresses are held in 64-bit registers, and instructions in the base instruction set can use 64-bit registers for their processing. AArch64 state supports the A64 instruction set.

**AArch32** Is the 32-bit Execution state, meaning addresses are held in 32-bit registers, and instructions in the base instruction sets use 32-bit registers for their processing. AArch32 state supports the T32 and A32 instruction sets.

--- Note ---
The **Base instruction set** comprises the supported instructions other than the Advanced SIMD and floating-point instructions.

---

ARM defines three architecture profiles:

**A** Application profile, described in this manual:

- Supports a **Virtual Memory System Architecture** (VMSA) based on a **Memory Management Unit (MMU)**.

--- Note ---
An ARMv8-A implementation can be called an AArchv8-A implementation.

---

- Supports the A64, A32, and T32 instruction sets.

**R** Real-time profile:

- Supports a **Protected Memory System Architecture** (PMSA) based on a **Memory Protection Unit (MPU)**.
- Supports the A32 and T32 instruction sets.

**M** Microcontroller profile:

- Implements a programmers' model designed for low-latency interrupt processing, with hardware stacking of registers and support for writing interrupt handlers in high-level languages.
- Implements a variant of the R-profile PMSA.
- Supports a variant of the T32 instruction set.

--- Note ---
This Architecture Reference Manual describes only the ARMv8-A profile.

---

For information about the R and M architecture profiles, and earlier ARM architecture versions see:

- The *ARM® Architecture Reference Manual Supplement, ARMv8, for the ARMv8-R AArch32 architecture profile*.
- The *ARM®v8-M Architecture Reference Manual*.
- The *ARM®v7-M Architecture Reference Manual*.
- The *ARM®v6-M Architecture Reference Manual*. 
A1.2.1 Debug architecture version

The ARM Debug architecture is fully integrated with the architecture, and does not have a separate version number.
A1.3 ARMv8 architectural concepts

ARMv8 introduces major changes to the ARM architecture, while maintaining a high level of consistency with previous versions of the architecture. The ARMv8 Architecture Reference Manual includes significant changes in the terminology used to describe the architecture, and this section introduces both the ARMv8 architectural concepts and the associated terminology.

The following subsections describe key ARMv8 architectural concepts. Each section introduces the corresponding terms that are used to describe the architecture:

- Execution state.

A1.3.1 Execution state

The Execution state defines the PE execution environment, including:

- The supported register widths.
- The supported instruction sets.
- Significant aspects of:
  — The exception model.
  — The Virtual Memory System Architecture (VMSA).
  — The programmers’ model.

The Execution states are:

AArch64

The 64-bit Execution state. This Execution state:

- Provides 31 64-bit general-purpose registers, of which X30 is used as the procedure link register.
- Provides a 64-bit program counter (PC), stack pointers (SPs), and exception link registers (ELRs).
- Provides 32 128-bit registers for SIMD vector and scalar floating-point support.
- Provides a single instruction set, A64. For more information, see The ARM instruction sets on page A1-37.
- Defines the ARMv8 Exception model, with up to four Exception levels, EL0 - EL3, that provide an execution privilege hierarchy, see Exception levels on page D1-1850.
- Provides support for 64-bit virtual addressing. For more information, including the limits on address ranges, see Chapter D4 The AArch64 Virtual Memory System Architecture.
- Defines a number of Process state (PSTATE) elements that hold PE state. The A64 instruction set includes instructions that operate directly on various PSTATE elements.
- Names each System register using a suffix that indicates the lowest Exception level at which the register can be accessed.

AArch32

The 32-bit Execution state. This Execution state:

- Provides 13 32-bit general-purpose registers, and a 32-bit PC, SP, and link register (LR). The LR is used as both an ELR and a procedure link register.
  Some of these registers have multiple banked instances for use in different PE modes.
- Provides a single ELR, for exception returns from Hyp mode.
- Provides 32 64-bit registers for Advanced SIMD vector and scalar floating-point support.
- Provides two instruction sets, A32 and T32. For more information, see The ARM instruction sets on page A1-37.
- Supports the ARMv7-A exception model, based on PE modes, and maps this onto the ARMv8 Exception model, that is based on the Exception levels.
- Provides support for 32-bit virtual addressing.
• Defines a number of Process state (PSTATE) elements that hold PE state. The A32 and T32 instruction sets include instructions that operate directly on various PSTATE elements, and instructions that access PSTATE by using the Application Program Status Register (APSR) or the Current Program Status Register (CPSR).

Later subsections give more information about the different properties of the Execution states.

Transferring control between the AArch64 and AArch32 Execution states is known as interprocessing. The PE can move between Execution states only on a change of Exception level, and subject to the rules given in Interprocessing on page D1-1962. This means different software layers, such as an application, an operating system kernel, and a hypervisor, executing at different Exception levels, can execute in different Execution states.

A1.3.2 The ARM instruction sets

In ARMv8 the possible instruction sets depend on the Execution state:

AArch64 AArch64 state supports only a single instruction set, called A64. This is a fixed-length instruction set that uses 32-bit instruction encodings.

For information on the A64 instruction set, see Chapter C3 A64 Instruction Set Overview.

AArch32 AArch32 state supports the following instruction sets:

A32 This is a fixed-length instruction set that uses 32-bit instruction encodings.

T32 This is a variable-length instruction set that uses both 16-bit and 32-bit instruction encodings.

In previous documentation, these instruction sets were called the ARM and Thumb instruction sets. ARMv8 extends each of these instruction sets. In AArch32 state, the Instruction set state determines the instruction set that the PE executes.

For information on the A32 and T32 instruction sets, see Chapter F1 The AArch32 Instruction Sets Overview.

The ARMv8 instruction sets support SIMD and scalar floating-point instructions. See Advanced SIMD and floating-point support on page A1-50.

A1.3.3 System registers

System registers provide control and status information of architected features.

The System registers use a standard naming format: <register_name>.<bit_field_name> to identify specific registers as well as control and status bits within a register.

Bits can also be described by their numerical position in the form <register_name>[x:y] or the generic form bits[x:y].

In addition, in AArch64 state, most register names include the lowest Exception level that can access the register as a suffix to the register name:

• <register_name>_ELx, where x is 0, 1, 2, or 3.

For information about Exception levels, see Exception levels on page D1-1850.

The System registers comprise:

• The following registers that are described in this manual:
  — General system control registers.
  — Debug registers.
  — Generic Timer registers.
  — Optionally, Performance Monitor registers.
• Optionally, one or more of the following groups of registers that are defined in other ARM architecture specifications:
  — Trace System registers, as defined in the Embedded Trace Macrocell Architecture Specification, ETMv4.
  — Scalable Vector Extension System registers, as defined in the ARM® Architecture Reference Manual Supplement, The Scalable Vector Extension (SVE), for ARMv8-A.
  — Generic Interrupt Controller (GIC) System registers, see The ARM Generic Interrupt Controller System registers.

• RAS Extension System registers, as defined in the ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile. The RAS Extension is a mandatory extension to the ARMv8.2 architecture, and an optional extension to the ARMv8.0 and the ARMv8.1 architectures.

For information about the AArch64 System registers, see Chapter D10 AArch64 System Register Descriptions.
For information about the AArch32 System registers, see Chapter G7 AArch32 System Register Descriptions.

The ARM Generic Interrupt Controller System registers

From version 3 of the ARM Generic Interrupt Controller architecture, GICv3, the GIC architecture specification defines a System register interface to some of its functionality. The System register summaries in this manual include these registers, see:

• About the GIC System registers on page D9-2345, for more information about the AArch64 GIC System registers.
• About the GIC System registers on page G6-5009, for more information about the AArch32 GIC System registers.

These sections give only short overviews of the GIC System registers. For more information, including descriptions of the registers, see the ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Note
The programmers’ model for earlier versions of the GIC architecture is wholly memory-mapped.

A1.3.4 ARMv8 Debug

ARMv8 supports the following:

Self-hosted debug
In this model, the PE generates debug exceptions. Debug exceptions are part of the ARMv8 Exception model.

External debug
In this model, debug events cause the PE to enter Debug state. In Debug state, the PE is controlled by an external debugger.

All ARMv8 implementations support both models. The model chosen by a particular user depends on the debug requirements during different stages of the design and development life cycle of the product. For example, external debug might be used during debugging of the hardware implementation and OS bring-up, and self-hosted debug might be used during application development.

For more information about self-hosted debug:
• In AArch64 state, see Chapter D2 AArch64 Self-hosted Debug.
• In AArch32 state, see Chapter G2 AArch32 Self-hosted Debug.
For more information about external debug, see Part H *External Debug* on page 5689.
A1.4  **Supported data types**

The ARMv8 architecture supports the following integer data types:

- **Byte**  8 bits.
- **Halfword**  16 bits.
- **Word**  32 bits.
- **Doubleword**  64 bits.
- **Quadword**  128 bits.

The architecture also supports the following floating-point data types:

- Double-precision, see *Double-precision floating-point format* on page A1-47 for details.

It also supports:

- Vectors, where a register holds multiple elements, each of the same data type. See *Vector formats* on page A1-41 for details.

The ARMv8 architecture provides two register files:

- A general-purpose register file.
- A SIMD&FP register file.

In each of these, the possible register widths depend on the Execution state.

In AArch64 state:

- A general-purpose register file contains 64-bit registers:
  - Many instructions can access these registers as 64-bit registers or as 32-bit registers, using only the bottom 32 bits.
- A SIMD&FP register file contains 128-bit registers:
  - The quadword integer data types only apply to the SIMD&FP register file.
  - The floating-point data types only apply to the SIMD&FP register file.
  - While the AArch64 vector registers support 128-bit vectors, the effective vector length can be 64-bits or 128-bits depending on the A64 instruction encoding used, see *Instruction Mnemonics* on page C1-144.

For more information on the register files in AArch64 state, see *Registers in AArch64 Execution state* on page B1-77.

In AArch32 state:

- A general-purpose register file contains 32-bit registers:
  - Two 32-bit registers can support a doubleword.
  - Vector formatting is supported, see *Figure A1-4* on page A1-44.
- A SIMD&FP register file contains 64-bit registers:
  - AArch32 state does not support quadword integer or floating-point data types.

**Note**

Two consecutive 64-bit registers can be used as a 128-bit register.

For more information on the register files in AArch32 state, see *The general-purpose registers, and the PC, in AArch32 state* on page E1-2981.
A1.4.1 Vector formats

In an implementation that includes the SIMD instructions that operate on the SIMD&FP register file, a register can hold one or more packed elements, all of the same size and type. The combination of a register and a data type describes a vector of elements. The vector is considered to be an array of elements of the data type specified in the instruction. The number of elements in the vector is implied by the size of the data elements and the size of the register.

Vector indices are in the range 0 to (number of elements – 1). An index of 0 refers to the least significant end of the vector.

Vector formats in AArch64 state

In AArch64 state, the SIMD&FP registers can be referred to as Vn, where n is a value from 0 to 31.

The SIMD&FP registers support three data formats for loads, stores, and data-processing operations:

- A single, scalar, element in the least significant bits of the register.
- A 64-bit vector of byte, halfword, or word elements.
- A 128-bit vector of byte, halfword, word, or doubleword elements.

The element sizes are defined in Table A1-1 with the vector format described as:

- For a 128-bit vector: \( Vn\{.2D, .4S, .8H, .16B} \).
- For a 64-bit vector: \( Vn\{.1D, .2S, .4H, .8B} \).

<table>

<tr>
<td>.U&lt;size&gt;</td>
<td>Unsigned integer of &lt;size&gt; bits</td>
</tr>
</tbody>
</table>

*Polynomial arithmetic over \{0, 1\} on page A1-49* describes the polynomial data type.

The .F16 data type is the half-precision data type selected by the FPSCR.AHP bit, see *Half-precision floating-point formats* on page A1-44.

The .F32 data type is the ARM standard single-precision floating-point data type, see *Single-precision floating-point format* on page A1-46.
The instruction definitions use a data type specifier to define the data types appropriate to the operation. Figure A1-2 shows the hierarchy of the Advanced SIMD data types.

![Advanced SIMD data type hierarchy in AArch32 state](image)

† Output format only. See VMULL instruction description.
‡ Available only if the Cryptographic Extension is implemented. See VMULL instruction description.

**Figure A1-2 Advanced SIMD data type hierarchy in AArch32 state**

For example, a multiply instruction must distinguish between integer and floating-point data types.

An integer multiply instruction that generates a double-width (long) result must specify the input data types as signed or unsigned. However, some integer multiply instructions use modulo arithmetic, and therefore do not have to distinguish between signed and unsigned inputs.

Figure A1-3 on page A1-44 shows the Advanced SIMD vectors in AArch32 state.

--- Note ---

In AArch32 state, a pair of even and following odd numbered doubleword registers can be concatenated and treated as a single quadword register.
## A1.4 Supported data types

### A1.4.2 Half-precision floating-point formats

ARMv8 supports two half-precision floating-point formats:

- IEEE half-precision, as described in the IEEE 754-2008 standard.
- ARM alternative half-precision format.

Both formats can be used for conversions to and from other floating-point formats. FPCR.AHP controls the format in AArch64 state and FPSCR.AHP controls the format in AArch32 state. ARMv8.2-FP16 adds half-precision data-processing instructions, which always use the IEEE format. These instructions ignore the value of the relevant AHP field, and behave as if it has an *Effective value* of 0.

### Figure A1-3 Advanced SIMD vectors in AArch32 state

The AArch32 general-purpose registers support vectors formats for use by the SIMD instructions in the Base instruction set. Figure A1-4 shows these formats, that means that a general-purpose register can be treated as either 2 halfwords or 4 bytes.

<tr>
<td>[1] [0]</td>
<td>[3] [2] [1] [0]</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The description of IEEE half-precision includes ARM-specific details that are left open by the standard, and is only an introduction to the formats and to the values they can contain. For more information, especially on the handling of infinities, NaNs, and signed zeros, see the IEEE 754 standard.

For both half-precision floating-point formats, the layout of the 16-bit format is the same. The format is:

```
<table>
<thead>
<tr>
<th>15</th>
<th>14</th>
<th>10</th>
<th>9</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>S</td>
<td>exponent</td>
<td>fraction</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

The interpretation of the format depends on the value of the exponent field, bits[14:10] and on which half-precision format is being used.

### 0 < exponent < 0x1F

The value is a normalized number and is equal to:

\[ (-1)^S \times 2^{(\text{exponent}-15)} \times (1.\text{fraction}) \]

The minimum positive normalized number is \(2^{-14}\), or approximately \(6.104 \times 10^{-5}\).

The maximum positive normalized number is \((2 – 2^{-10}) \times 2^{15}\), or 65504.

Larger normalized numbers can be expressed using the alternative format when the exponent == 0x1F.

#### exponent == 0

The value is either a zero or a denormalized number, depending on the fraction bits:

- **fraction == 0**
  
  The value is a zero. There are two distinct zeros:
  
  +0 when S==0
  
  -0 when S==1.

- **fraction != 0**
  
  The value is a denormalized number and is equal to:
  
  \[ (-1)^S \times 2^{-14} \times (0.\text{fraction}) \]

  The minimum positive denormalized number is \(2^{-24}\), or approximately \(5.960 \times 10^{-8}\).

  Half-precision denormalized numbers are not flushed to zero by default. When ARMv8.2-FP16 is implemented, the FPCR.FZ16 bit controls whether Flush-to-Zero mode is enabled for half-precision data-processing instructions. For details, see Flush-to-zero on page A1-53.

### exponent == 0x1F

The value depends on which half-precision format is being used:

#### IEEE half-precision

The value is either an infinity or a Not a Number (NaN), depending on the fraction bits:

- **fraction == 0**
  
  The value is an infinity. There are two distinct infinities:
  
  +\(\infty\) when S==0. This represents all positive numbers that are too big to be represented accurately as a normalized number.
  
  -\(\infty\) when S==1. This represents all negative numbers with an absolute value that is too big to be represented accurately as a normalized number.

- **fraction != 0**
  
  The value is a NaN, and is either a quiet NaN or a signaling NaN.

  The two types of NaN are distinguished by their most significant fraction bit, bit[9]:

  - **bit[9] == 0** The NaN is a signaling NaN. The sign bit can take any value, and the remaining fraction bits can take any value except all zeros.
The NaN is a quiet NaN. The sign bit and remaining fraction bits can take any value.

**Alternative half-precision**

The value is a normalized number and is equal to:

\[-1^S \times 2^{16} \times (1.F)\]

The maximum positive normalized number is \((2-2^{-10}) \times 2^{16}\) or 131008.

### A1.4.3 Single-precision floating-point format

The single-precision floating-point format is as defined by the IEEE 754 standard.

This description includes ARM-specific details that are left open by the standard. It is only intended as an introduction to the formats and to the values they can contain. For full details, especially of the handling of infinities, NaNs, and signed zeros, see the IEEE 754 standard.

A single-precision value is a 32-bit word with the format:

```
<table>
<thead>
<tr>
<th>31 30</th>
<th>23 22</th>
<th></th>
<th></th>
<th></th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>S</td>
<td>exponent</td>
<td>fraction</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

The interpretation of the format depends on the value of the exponent field, bits[30:23]:

- **0 < exponent < 0xFF**
  - The value is a *normalized number* and is equal to:
    
    \[-1^S \times 2^{(\text{exponent} - 127)} \times (1.F)\]

    - The minimum positive normalized number is \(2^{-126}\), or approximately \(1.175 \times 10^{-38}\).
    - The maximum positive normalized number is \((2 - 2^{-23}) \times 2^{127}\), or approximately \(3.403 \times 10^{38}\).

- **exponent == 0**
  - The value is either a zero or a *denormalized number*, depending on the fraction bits:
    
    - **fraction == 0**
      - The value is a zero. There are two distinct zeros:
        - **+0** when S==0.
        - **–0** when S==1.

        These usually behave identically. In particular, the result is *equal if +0 and –0 are compared as floating-point numbers*. However, they yield different results in some circumstances. For example, the sign of the infinity produced as the result of dividing by zero depends on the sign of the zero. The two zeros can be distinguished from each other by performing an integer comparison of the two words.

    - **fraction != 0**
      - The value is a denormalized number and is equal to:
        
        \[-1^S \times 2^{-126} \times (0.F)\]

        The minimum positive denormalized number is \(2^{-149}\), or approximately \(1.401 \times 10^{-45}\).

        Denormalized numbers are always flushed to zero in Advanced SIMD processing in AArch32 state. They are optionally flushed to zero in floating-point processing and in Advanced SIMD processing in AArch64 state. For details, see *Flush-to-zero on page A1-53*.

- **exponent == 0xFF**
  - The value is either an *infinity* or a *Not a Number* (NaN), depending on the fraction bits:
    
    - **fraction == 0**
      - The value is an infinity. There are two distinct infinities:
        - **+infinity** when S==0. This represents all positive numbers that are too big to be represented accurately as a normalized number.
-infinity

When S==1. This represents all negative numbers with an absolute value that is too big to be represented accurately as a normalized number.

fraction ! = 0

The value is a NaN, and is either a quiet NaN or a signaling NaN.

The two types of NaN are distinguished by their most significant fraction bit, bit[22]:

bit[22] == 0

The NaN is a signaling NaN. The sign bit can take any value, and the remaining fraction bits can take any value except all zeros.

bit[22] == 1

The NaN is a quiet NaN. The sign bit and remaining fraction bits can take any value.

For details of the default NaN, see NaN handling and the Default NaN on page A1-54.

Note

NaNs with different sign or fraction bits are distinct NaNs, but this does not mean software can use floating-point comparison instructions to distinguish them. This is because the IEEE 754 standard specifies that a NaN compares as unordered with everything, including itself.

A1.4.4 Double-precision floating-point format

The double-precision floating-point format is as defined by the IEEE 754 standard. Double-precision floating-point is supported by both SIMD and floating-point instructions in AArch64 state, and only by floating-point instructions in AArch32 state.

This description includes implementation-specific details that are left open by the standard. It is only intended as an introduction to the formats and to the values they can contain. For full details, especially of the handling of infinities, NaNs, and signed zeros, see the IEEE 754 standard.

A double-precision value is a 64-bit doubleword, with the format:

```
| 63 62 52 51 32 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |
|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|
| S | exponent | fraction |
```

Double-precision values represent numbers, infinities, and NaNs in a similar way to single-precision values, with the interpretation of the format depending on the value of the exponent:

0 < exponent < 0x7FF

The value is a normalized number and is equal to:

\((-1)^S \times 2^{(exponent-1023)} \times (1.fraction)\)

The minimum positive normalized number is 2\(^{-1022}\), or approximately 2.225 \(\times\) 10\(^{-308}\).

The maximum positive normalized number is (2 – 2\(^{-52}\)) \(\times\) 2\(^{1023}\), or approximately 1.798 \(\times\) 10\(^{308}\).

exponent == 0

The value is either a zero or a denormalized number, depending on the fraction bits:

fraction == 0

The value is a zero. There are two distinct zeros that behave in the same way as the two single-precision zeros:

+0 when S==0

–0 when S==1.

fraction != 0

The value is a denormalized number and is equal to:

\((-1)^S \times 2^{-1022} \times (0.fraction)\)
The minimum positive denormalized number is \(2^{-1074}\), or approximately \(4.941 \times 10^{-324}\).

Optionally, denormalized numbers are flushed to zero in floating-point calculations. For details, see *Flush-to-zero* on page A1-53.

\[
\text{exponent} = 0x7FF
\]

The value is either an infinity or a NaN, depending on the fraction bits:

\[
\text{fraction} = 0
\]

The value is an infinity. As for single-precision, there are two infinities:

- **+infinity** When \(S=0\).
- **-infinity** When \(S=1\).

\[
\text{fraction} != 0
\]

The value is a NaN, and is either a **quiet NaN** or a **signaling NaN**.

The two types of NaN are distinguished by their most significant fraction bit, bit[51] of the doubleword:

\[
\text{bit}[51] = 0
\]

The NaN is a signaling NaN. The sign bit can take any value, and the remaining fraction bits can take any value except all zeros.

\[
\text{bit}[51] = 1
\]

The NaN is a quiet NaN. The sign bit and the remaining fraction bits can take any value.

For details of the default NaN, see *NaN handling and the Default NaN* on page A1-54.

---

**Note**

NaNs with different sign or fraction bits are distinct NaNs, but this does not mean software can use floating-point comparison instructions to distinguish them. This is because the IEEE 754 standard specifies that a NaN compares as unordered with everything, including itself.

---

### A1.4.5 Fixed-point format

Fixed-point formats are used only for conversions between floating-point and fixed-point values. They apply to general-purpose registers.

Fixed-point values can be signed or unsigned, and can be 16-bit or 32-bit. Conversion instructions take an argument that specifies the number of fraction bits in the fixed-point number. That is, it specifies the position of the binary point.

### A1.4.6 Conversion between floating-point and fixed-point values

ARMv8 supports the conversion of a scalar floating-point to or from a signed or unsigned fixed-point value in a general-purpose register.

The instruction argument \(#\text{fbits}\) indicates that the general-purpose register holds a fixed-point number with \(#\text{fbits}\) bits after the binary point, where \(#\text{fbits}\) is in the range 1 to 64 for a 64-bit general-purpose register, or 1 to 32 for a 32-bit general-purpose register.

More specifically:

- For a 64-bit register \(X_d\):
  - The integer part is \(X_d[63:#\text{fbits}]\).
  - The fractional part is \(X_d[#\text{fbits}-1:0]\).

- For a 32-bit register \(W_d\) or \(R_d\):
  - The integer part is \(W_d[31:#\text{fbits}]\) or \(R_d[31:#\text{fbits}]\).
  - The fractional part is \(W_d[#\text{fbits}-1:0]\) or \(R_d[#\text{fbits}-1:0]\).
These instructions can cause the following floating-point exceptions:

**Invalid Operation** When the floating-point input is NaN or Infinity or when a numerical value cannot be represented within the destination register.

**Inexact** When the numeric result differs from the input value.

**Input Denormal** When Flush-to-zero mode is enabled and the denormal input is replaced by a zero.

--- Note ---
An out of range fixed-point result is saturated to the destination size.

For more information, see *Floating-point exceptions and exception traps* on page D1-1899.

### A1.4.7 Polynomial arithmetic over \{0, 1\}

Some SIMD instructions that operate on SIMD&FP registers can operate on polynomials over \{0, 1\}, see *Supported data types* on page A1-40. The polynomial data type represents a polynomial in x of the form \(b_{n-1}x^{n-1} + \ldots + b_1x + b_0\) where \(b_k\) is bit\([k]\) of the value.

The coefficients 0 and 1 are manipulated using the rules of Boolean arithmetic:

- \(0 + 0 = 1 + 1 = 0\)
- \(0 + 1 = 1 + 0 = 1\)
- \(0 \times 0 = 0 \times 1 = 1 \times 0 = 0\)
- \(1 \times 1 = 1\).

That is:

- Adding two polynomials over \{0, 1\} is the same as a bitwise exclusive OR.
- Multiplying two polynomials over \{0, 1\} is the same as integer multiplication except that partial products are exclusive-ORed instead of being added.

A64, A32, and T32 provide instructions for performing polynomial multiplication of 8-bit values.

- For AArch32, see *VMUL (integer and polynomial)* on page F6-4300 and *VMULL (integer and polynomial)* on page F6-4305.
- For AArch64, see *PMUL on page C7-1449* and *PMULL, PMULL2 on page C7-1451*.

The Cryptographic Extension adds the ability to perform long polynomial multiplies of 64-bit values. See *PMULL, PMULL2 on page C7-1451*.

**Pseudocode description of polynomial multiplication**

In pseudocode, polynomial addition is described by the \text{EOR} operation on bitstrings.

Polynomial multiplication is described by the \text{PolynomialMult()} function defined in Chapter 11 *ARMv8 Pseudocode*. 
A1.5  **Advanced SIMD and floating-point support**

--- Note ---

In AArch32 state, the SIMD instructions that operate on SIMD&FP registers are always described as the Advanced SIMD instructions, to distinguish them from the SIMD instructions in the base instruction sets, that operate on the 32-bit general-purpose registers. The A64 instruction set does not provide any SIMD instructions that operate on the general-purpose registers, and therefore some AArch64 state descriptions use SIMD as a synonym for Advanced SIMD. Unless the context clearly indicates otherwise, this section describes the support for SIMD instructions that operate on SIMD&FP registers.

---

ARMv8 can support the following levels of support for Advanced SIMD and floating-point instructions:

- Full SIMD and floating-point support without exception trapping.
- Full SIMD and floating-point support with exception trapping.
- No floating-point or SIMD support. This option is licensed only for implementations targeting specialized markets.

--- Note ---

All systems that support standard operating systems with rich application environments provide hardware support for Advanced SIMD and floating-point. It is a requirement of the ARM Procedure Call Standard for AArch64, see Procedure Call Standard for the ARM 64-bit Architecture.

---

ARMv8 supports single-precision (32-bit) and double-precision (64-bit) floating-point data types and arithmetic as defined by the IEEE 754 floating-point standard. It also supports the half-precision (16-bit) floating-point data type for data storage, by supporting conversions between single-precision and half-precision data types and double-precision and half-precision data types. When ARMv8.2-FP16 is implemented, it also supports the half-precision floating-point data type for data-processing operations.

The SIMD instructions provide packed Single Instruction Multiple Data (SIMD) and single-element scalar operations, and support:

- Single-precision and double-precision arithmetic in AArch64 state.
- Single-precision arithmetic only in AArch32 state.
- When ARMv8.2-FP16 is implemented, half-precision arithmetic is supported in AArch64 and AArch32 states.

Floating-point support in AArch64 state SIMD is IEEE 754-2008 compliant with:

- Configurable rounding modes.
- Configurable Default NaN behavior.
- Configurable Flush-to-zero behavior.

Floating-point computation using AArch32 Advanced SIMD instructions remains unchanged from ARMv7. A32 and T32 Advanced SIMD floating-point always uses ARM standard floating-point arithmetic and performs IEEE 754 floating-point arithmetic with the following restrictions:

- Denormalized numbers are flushed to zero, see Flush-to-zero on page A1-53.
- Only default NaNs are supported, see NaN handling and the Default NaN on page A1-54.
- The Round to Nearest rounding mode is used.
- Untrapped floating-point exception handling is used for all floating-point exceptions.

If floating-point exception trapping is supported, floating-point exceptions, such as Overflow or Divide by Zero, can be handled without trapping. This applies to both SIMD and floating-point operations. When handled in this way, a floating-point exception causes a cumulative status register bit to be set to 1 and a default result to be produced by the operation. For more information about floating-point exceptions, see Floating-point exceptions and exception traps on page D1-1899.
In AArch64 state, the following registers control floating-point operation and return floating-point status information:

- The Floating-Point Control Register, FPCR, controls:
  - The half-precision format where applicable, FPCR.AHP bit.
  - Default NaN behavior, FPCR.DN bit.
  - Flush-to-zero behavior, FPCR.{FZ, FZ16} bits. If ARMv8.2-FP16 is not implemented, FPCR.FZ16 is RES0.
  - Rounding mode support, FPCR.Rmode field.
  - Len and Stride fields associated with execution in AArch32 state, and only supported for a context save and restore from AArch64 state. These fields are obsolete in ARMv8 and can be implemented as RAZ/WI. If they are implemented as RW and are programmed to a nonzero value, they make some AArch32 floating-point instructions UNDEFINED.
  - Floating-point exception trap controls, the FPCR.{IDE, IXE, UFE, OFE, DZE, IOE} bits, see Floating-point exceptions and exception traps on page D1-1899.

- The Floating-Point Status Register, FPSR, provides:
  - Cumulative floating-point exceptions flags, FPSR.{IDC, IXC, UFC, OFC, DZC, IOC and QC}.
  - The AArch32 floating-point comparison flags {N,Z,C,V}. These bits are RES0 if AArch32 floating-point is not implemented.

___ Note ___

In AArch64 state, the process state flags, PSTATE.{N,Z,C,V} are used for all data-processing compares and any associated conditional execution.

AArch32 state provides a single Floating-Point Status and Control Register, FPSCR, combining the FPCR and FPSR fields.

For system level information about the SIMD and floating-point support, see Advanced SIMD and floating-point support on page G1-4696.

### A1.5.1 Instruction support

The Advanced SIMD and floating-point instructions support:

- Load and store for single elements and vectors of multiple elements.

___ Note ___

Single elements are also referred to as scalar elements.

- Data processing on single and multiple elements for both integer and floating-point data types.
- When ARMv8.3-CompNum is implemented, complex number arithmetic.
- Floating-point conversion between different levels of precision.
- Conversion between floating-point, fixed-point integer, and integer data types.
- Floating-point rounding.

For more information on the SIMD and floating-point instructions in AArch64 state, see Chapter C3 A64 Instruction Set Overview.

For more information on the Advanced SIMD and floating-point instructions in AArch32 state, see Chapter F1 The AArch32 Instruction Sets Overview.
A1.5.2 Floating-point standards, and terminology

The ARM includes support for all the required features of ANSI/IEEE Std 754-2008, *IEEE Standard for Binary Floating-Point Arithmetic*, referred to as IEEE 754-2008. However, some terms in this manual are based on the 1985 version of this standard, referred to as IEEE 754-1985:

- ARM floating-point terminology generally uses the IEEE 754-1985 terms. This section summarizes how IEEE 754-2008 changes these terms.
- References to IEEE 754 that do not include the issue year apply to either issue of the standard.

Table A1-3 shows how the terminology in this manual differs from that used in IEEE 754-2008.

<table>
<thead>

a. Normalized number is used in preference to normal number, because of the other specific uses of normal in this manual.

A1.5.3 ARM standard floating-point input and output values

ARMv8 provides full IEEE 754 floating-point arithmetic support. In AArch32 state, floating-point operations performed using Advanced SIMD instructions are limited to ARM standard floating-point operation, regardless of the selected rounding mode in the FPSCR. Unlike AArch32, AArch64 SIMD floating point arithmetic is performed using the rounding mode selected by the FPCR.

ARM standard floating-point arithmetic supports the following input formats defined by the IEEE 754 floating-point standard:

- Zeros.
- Normalized numbers.
- Denormalized numbers are flushed to 0 before floating-point operations, see *Flush-to-zero* on page A1-53.
- NaNs.
- Infinities.

ARM standard floating-point arithmetic supports the Round to Nearest (roundTiesToEven) rounding mode defined by the IEEE 754 standard.

ARM standard floating-point arithmetic supports the following output result formats defined by the IEEE 754 standard:

- Zeros.
- Normalized numbers.
- Results that are less than the minimum normalized number are flushed to zero, see *Flush-to-zero* on page A1-53.
- NaNs produced in floating-point operations are always the default NaN, see *NaN handling and the Default NaN* on page A1-54.

- Infinities.

### A1.5.4 Flush-to-zero

The performance of floating-point processing can be reduced when doing calculations involving denormalized numbers and Underflow exceptions. In many algorithms, this performance can be recovered, without significantly affecting the accuracy of the final result, by replacing the denormalized operands and intermediate results with zeros. To permit this optimization, ARM floating-point implementations have a processing mode called *Flush-to-zero* mode. Single-precision and double-precision AArch32 Advanced SIMD floating-point instructions always use Flush-to-zero mode. When ARMv8.2-FP16 is implemented, Flush-to-Zero mode can be enabled for all half-precision data-processing instructions using the FPCR.FZ16 bit in AArch64 state and the FPSCR.FZ16 bit in AArch32 state.

Behavior in Flush-to-zero mode differs from standard IEEE 754 arithmetic in the following ways:

- All inputs to floating-point operations that are double-precision denormalized numbers or single-precision denormalized numbers are treated as though they were zero. This causes an Input Denormal floating-point exception, but does not cause an Inexact floating-point exception. The Input Denormal floating-point exception occurs only in Flush-to-zero mode.

**Note**

When ARMv8.2-FP16 is implemented, when in Flush-to-zero mode, a half-precision floating-point number that is flushed to zero does not generate an Input Denormal floating-point exception. This is because this situation is much less exceptional than for double-precision or single-precision denormalized numbers.

In AArch32 state, the FPSCR contains a cumulative exception bit FPSCR.IDC and optional trap enable bit FPSCR.IDE corresponding to the Input Denormal floating-point exception. In AArch64 state, the FPSCR contains a cumulative exception bit FPSR.IDC and optional trap enable bit FPCR.IDE corresponding to the Input Denormal floating-point exception.

The occurrence of all floating-point exceptions except Input Denormal is determined using the input values after flush-to-zero processing has occurred.

- The result of a floating-point operation is flushed to zero if the result of the operation before rounding satisfies the condition:

\[ 0 < \text{Abs}(\text{result}) < \text{MinNorm}, \]

where:

- MinNorm is \(2^{-14}\) for half-precision.
- MinNorm is \(2^{-126}\) for single-precision.
- MinNorm is \(2^{-1022}\) for double-precision.

This causes the FPSR.UFC bit to be set to 1, and prevents any Inexact floating-point exception from occurring for the operation.

Underflow floating-point exceptions occur only when a result is flushed to zero.

In all implementations Underflow floating-point exceptions that occur in Flush-to-zero mode are always treated as untrapped, even when the Underflow trap enable bit, FPCR.UFE, is set to 1.

- An Inexact floating-point exception does not occur if the result is flushed to zero, even though the final result of zero is not equivalent to the value that would be produced if the operation were performed with unbounded precision and exponent range.

When an input or a result is flushed to zero, the value of the sign bit of the zero is preserved. That is, the sign bit of the zero matches the sign bit of the input or result that is being flushed to zero.
Flush-to-zero mode has no effect on half-precision numbers that are inputs to floating-point operations, or results from floating-point operations. When ARMv8.2-FP16 is implemented and when Flush-to-zero mode is enabled, Flush-to-zero mode affects half-precision data-processing instructions, but has no effect on conversions between half-precision and single-precision or double-precision.

--- Note ---
Flush-to-zero mode is incompatible with the IEEE 754 standard, and must not be used when IEEE 754 compatibility is a requirement. Flush-to-zero mode must be used with care. Although it can improve performance on some algorithms, there are significant limitations on its use. These are application dependent:

- On many algorithms, it has no noticeable effect, because the algorithm does not normally use denormalized numbers.
- On other algorithms, it can cause exceptions to occur or seriously reduce the accuracy of the results of the algorithm.

A1.5.5 NaN handling and the Default NaN

The IEEE 754 standard specifies that:

- An operation that causes an Invalid Operation floating-point exception generates a quiet NaN as its result if that exception is untrapped.
- An operation involving a quiet NaN operand, but not a signaling NaN operand, returns an input NaN as its result.

The floating-point processing behavior when Default NaN mode is disabled adheres to this, with the following additions:

- If an untrapped Invalid Operation floating-point exception occurs, the quiet NaN result is derived from:
  - The first signaling NaN operand, if the exception occurs because at least one of the operands is a signaling NaN.
  - Otherwise, the default NaN.
- If an untrapped Invalid Operation floating-point exception does not occur, but at least one of the operands is a quiet NaN, the result is derived from the first quiet NaN operand.

Depending on the operation, the exact value of a derived quiet NaN result may differ in both sign and number of fraction bits from its source. For a quiet NaN result derived from signaling NaN operand, the most-significant fraction bit is set to 1.

--- Note ---
- In these descriptions, first operand relates to the left-to-right ordering of the arguments to the pseudocode function that describes the operation.
- The IEEE 754 standard specifies that the sign bit of a NaN has no significance.

The SIMD and floating-point processing behavior when Default NaN mode is enabled is that the Default NaN is the result of all floating-point operations that either:

- Cause untrapped Invalid Operation floating-point exceptions.
- Have one or more quiet NaN inputs, but no signaling NaN inputs.

Table A1-4 on page A1-55 shows the format of the default NaN for ARM floating-point operations.

Default NaN mode is selected for the floating-point processing by setting the FPCR.DN bit to 1.

Other aspects of the functionality of the Invalid Operation floating-point exception are not affected by Default NaN mode. These are that:

- If untrapped, it causes the FPSR.IOC bit to be set to 1.
- If trapped, it causes a user trap handler to be invoked.

A1.6 The ARM memory model

The ARM memory model supports:

- Generating an exception on an unaligned memory access.
- Restricting access by applications to specified areas of memory.
- Translating virtual addresses (VAs) provided by executing instructions to physical addresses (PAs).
- Altering the interpretation of multi-byte data between big-endian and little-endian.
- Controlling the order of accesses to memory.
- Controlling caches and address translation structures.
- Synchronizing access to shared memory by multiple PEs.

VA support depends on the Execution state, as follows:

**AArch64 state**

Supports 64-bit virtual addressing, with the Translation Control Register determining the supported VA range. Execution at EL1 and EL0 supports two independent VA ranges, each with its own translation controls.

**AArch32 state**

Supports 32-bit virtual addressing, with the Translation Control Register determining the supported VA range. For execution at EL1 and EL0, system software can split the VA range into two subranges, each with its own translation controls.

The supported PA space is IMPLEMENTATION DEFINED, and can be discovered by system software.

Regardless of the Execution state, the Virtual Memory System Architecture (VMSA) can translate VAs to blocks or pages of memory anywhere within the supported PA space.

For more information, see:

**For execution in AArch64 state**

- Chapter B2 The AArch64 Application Level Memory Model.
- Chapter D3 The AArch64 System Level Memory Model.
- Chapter D4 The AArch64 Virtual Memory System Architecture.

**For execution in AArch32 state**

- Chapter E2 The AArch32 Application Level Memory Model.
- Chapter G3 The AArch32 System Level Memory Model.
- Chapter G4 The AArch32 Virtual Memory System Architecture.
A1.7 **ARMv8 architecture extensions**

The original ARMv8-A architecture is called ARMv8.0. The following sections of this manual describe or summarize permitted extensions to ARMv8.0:

- The IVIPT Extension on page D4-2223.
- Chapter H7 The PC Sample-based Profiling Extension.

In addition to describing ARMv8.0, this manual describes the following architectural extensions:

**The ARMv8.1 architectural extension**

The ARMv8.1 architecture extension adds both:

- Architectural features. Some of these are mandatory, others are optional. Some features must be implemented together.
- Architectural requirements. These are mandatory.

An implementation is ARMv8.1 compliant when all of the following apply:

- It includes all of the ARMv8.1 architectural features that are mandatory. See Architectural features added by ARMv8.1 on page A1-59 for all of the ARMv8.1 architectural features.
- It includes all of the ARMv8.1 architectural requirements. Additional requirements of ARMv8.1 on page A1-61 lists these requirements.

For more information, see The ARMv8.1 architecture extension on page A1-59.

**The ARMv8.2 architectural extension**

The ARMv8.2 architecture extension is an extension to ARMv8.1. It adds both:

- Architectural features. Some of these are mandatory, others are optional. Some features must be implemented together.
- Architectural requirements. These are mandatory.

An implementation is ARMv8.2 compliant if all of the following apply:

- It is ARMv8.1 compliant.
- It includes all of the ARMv8.2 architectural features that are mandatory. See Architectural features added by ARMv8.2 on page A1-62 for all of the ARMv8.2 architectural features.
- It includes all of the ARMv8.2 architectural requirements. Additional requirements of ARMv8.2 on page A1-68 lists these requirements.

For more information, see The ARMv8.2 architecture extension on page A1-62.

**The ARMv8.3 architectural extension**

The ARMv8.3 architecture extension is an extension to ARMv8.2. It adds architectural features. Some of these are mandatory, others are optional. Some features must be implemented together.

An implementation is ARMv8.3 compliant if all of the following apply:

- It is ARMv8.2 compliant.
- It includes all of the ARMv8.3 architectural features that are mandatory.

For more information, see The ARMv8.3 architecture extension on page A1-68.

**The Statistical Profiling Extension**

SPE is an optional extension to ARMv8.2. That is, SPE requires the implementation of ARMv8.2.

For more information see The Statistical Profiling Extension on page A1-72.

**The Scalable Vector Extension (SVE)**

SVE is an optional extension to ARMv8.2. That is, SVE requires the implementation of ARMv8.2.

For more information see The Scalable Vector Extension (SVE) on page A1-72.
A1.7 ARMv8 architecture extensions

See also *Permitted implementation of subsets of ARMv8.x and ARMv8.(x+1) architectural features.*

A1.7.1 Permitted implementation of subsets of ARMv8.x and ARMv8.(x+1) architectural features

An ARMv8.x compliant implementation can include any arbitrary subset of the architectural features of ARMv8.(x+1), subject only to those constraints that require that certain features be implemented together.

An ARMv8.x compliant implementation cannot include any features of ARMv8.(x+2).

___ Note ___

The addition of ARMv8.(x+1) features to an ARMv8.x compliant implementation is only permitted if the implementer has a licence to ARMv8.(x+1) in addition to the licence to ARMv8.x.

A1.7.2 The ARMv8 Cryptographic Extension

The presence of the ARMv8.0 Cryptographic Extension in an implementation is subject to export license controls. The Cryptographic Extension is an extension of the SIMD support and operates on the vector register file. The ARMv8.0 implementation of the Extension provides instructions for the acceleration of encryption and decryption to support the following:

- AES.
- SHA1.
- SHA2-256 (SHA256).

The Cryptographic Extension also provides multiply instructions that operate on long polynomials.

The ARMv8.0 Cryptographic Extension provides this functionality in AArch64 state and AArch32 state, and an implementation that supports both AArch64 state and AArch32 state provides the same ARMv8.0 Cryptographic Extension functionality in both states. For more information see *The Cryptographic Extension on page C3-218 or The Cryptographic Extension in AArch32 state on page F1-3091.*

**ARMv8.2 extensions to the Cryptographic Extension**

From ARMv8.2, an implementation of the ARMv8.0 Cryptographic Extension can include either or both of:

- The AES functionality, including support for multiplication of 64-bit polynomials. The ID_AA64ISAR0_EL1.AES field indicates whether this functionality is supported.
- The SHA1 and SHA2-256 functionality. The ID_AA64ISAR0_EL1.{SHA2, SHA1} fields indicate whether this functionality is supported.

In addition, ARMv8.2 adds two optional extensions to the ARMv8 Cryptographic Extension, that provide cryptographic functionality in AArch64 state only. These two optional features are:

**ARMv8.2-SHA, SHA2-512 and SHA3 functionality**

In the A64 instruction set only, ARMv8.2-SHA adds Advanced SIMD instructions that support:

- SHA2-512 (SHA512).
- SHA3.

Implementation of ARMv8.2-SHA requires implementation of the ARMv8.0 Cryptographic Extension SHA-1 and SHA256 functionality.

The ID_AA64ISAR0_EL1.{SHA2, SHA1} fields identify the presence of ARMv8.2-SHA.

For more information see *ARMv8.2-SHA, SHA2-512 and SHA3 on page C3-219.*

**ARMv8.2-SM, SM3 and SM4 functionality**

In the A64 instruction set only, ARMv8.2-SM adds Advanced SIMD instructions that support the Chinese cryptography algorithms SM3 and SM4.

Implementation of ARMv8.2-SM is independent of the implementation of any SHA functionality.

The ID_AA64ISAR0_EL1.{SM3, SM4} fields identify the presence of ARMv8.2-SM.
Note
This means ARMv8.2-SM can be implemented without any other Cryptographic Extension features.

For more information see ARMv8.2-SM, SM3 and SM4 on page C3-220.

A1.7.3 The ARMv8.1 architecture extension

The ARMv8.1 architecture extension adds both architectural features and architectural requirements.

Architectural features added by ARMv8.1

An implementation of the ARMv8.1 extension must include all of the features that this section describes as mandatory. Such an implementation, when combined with the additional requirements of ARMv8.1, is also called an implementation of the ARMv8.1 architecture.

The ARMv8.1 architecture extension adds the following architectural features, which are identified by the architectural feature name and a short description of the feature:

ARMv8.1-Atomics, ARMv8.1 Atomic instructions

ARMv8.1-Atomics introduces a set of atomic instructions:

- Compare and Swap instructions, CAS and CASP.
- Atomic memory operation instructions, LD<OP> and ST<OP>, where <OP> is one of ADD, CLR, EOR, SET, SMAX, SMIN, UMAX, and UMIN.
- Swap instruction, SWP.

These instructions are only added to the A64 instruction set.

This feature is mandatory in ARMv8.1 implementations.

Implementations of ARMv8.1-VHE require the implementation of ARMv8.1-Atomics.

The ID_AA64ISAR0_EL1.Atomic field identifies the presence of ARMv8.1-Atomics.

For more information, see:
- Compare and Swap on page C3-181.
- Atomic memory operations on page C3-182.
- Swap on page C3-184.

ARMv8.1-SIMD, ARMv8.1 Advanced SIMD instructions

ARMv8.1-SIMD introduces Rounding Double Multiply Add/Subtract Advanced SIMD instructions. For more information, see:

For the A64 instruction set

- SQRDMLAH (by element) on page C7-1598.
- SQRDMLAH (vector) on page C7-1601.
- SQRDMLSH (by element) on page C7-1603.
- SQRDMLSH (vector) on page C7-1606.

For the T32 and A32 instruction sets

- VQRDMLAH on page F6-4378.
- VQRDMLSH on page F6-4382.

This feature is mandatory in ARMv8.1 implementations.

The following fields identify the presence of ARMv8.1-SIMD:

- ID_AA64ISAR0_EL1.RDM.
- ID_ISAR5_EL1.RDM.
- ID_ISAR5.RDM.
ARMv8.1-LOR, Limited ordering regions

Limited ordering regions allow large systems to perform special load-acquire and store-release instructions that provide order between the memory accesses to a region of the PA map as observed by a limited set of observers.

This feature is mandatory in ARMv8.1 implementations.
This feature is supported in AArch64 state only.

The ID_AA64MMFR1_EL1.LO field identifies the support for ARMv8.1-LOR.
For more information, see:
• Limited ordering regions on page B2-103.

ARMv8.1-HPD, Hierarchical permission disables

ARMv8.1-HPD introduces the facility to disable the hierarchical attributes, APTable, PXNTable, and UXNTable, in the translation tables. This disable has no effect on the NSTable bit.

This feature is mandatory in ARMv8.1 implementations.
This feature is added only to the VMSAv8-64 translation regimes. ARMv8.2 extends this to the AArch32 translation regimes, see ARMv8.2-AA32HPD.

The ID_AA64MMFR1_EL1.HPDS field identifies the support for ARMv8.1-HPD.

ARMv8.1-TTHM, Hardware management of the Access flag and dirty state

In ARMv8.0, all updates to the translation tables are performed by software. From ARMv8.1, for the VMSAv8-64 translation regimes only, hardware can perform updates to the translation tables in two contexts:
• Hardware management of the Access flag.
• Hardware management of dirty state, with updates to a dirty state bit in the translation tables.

The dirty state bit is introduced in ARMv8.1.

Hardware management of dirty state can only be enabled when hardware management of the Access flag is also enabled.

This feature is optional in ARMv8.1 implementations. It is IMPLEMENTATION DEFINED whether this is implemented.

The ID_AA64MMFR1_EL1.HAFDBS field identifies the support for ARMv8.1-TTHM.
For more information, see:
• The dirty state bit on page D4-2165.
• Hardware management of the Access flag and dirty state on page D4-2165.

ARMv8.1-PAN, Privileged access never

ARMv8.1-PAN adds a new bit to PSTATE. When the value of this PAN state bit is 1, any privileged data access from EL1 or EL2 to a virtual memory address that is accessible at EL0 generates a Permission fault.

This feature is mandatory in ARMv8.1 implementations.
This feature is supported in AArch64 and AArch32 states.

The following fields identify the support for ARMv8.1-PAN:
• ID_AA64MMFR1_EL1.PAN.
• ID_MMF3_EL1.PAN.
• ID_MMF3.PAN.

For more information, see:
• About PSTATE.PAN on page D4-2156.
• About the PAN bit on page G4-4891.
ARMv8.1-VMID16, 16-bit VMID

In an ARMv8.1 implementation, when EL2 is using AArch64, the VMID size is an IMPLEMENTATION DEFINED choice of 8 bits or 16 bits.

This feature is optional in ARMv8.1 implementations. It is IMPLEMENTATION DEFINED whether this is implemented.

When implemented, this feature is supported only when EL2 is using AArch64.

The ID_AA64MMFR1_EL1.VMIDBits field identifies the supported VMID size.

For more information, see:
- VMID size on page D4-2203.

ARMv8.1-VHE, Virtualization Host Extensions

ARMv8.1 introduces the Virtualization Host Extensions (VHE) that provide enhanced support for Type 2 hypervisors in Non-secure state.

This feature is mandatory in ARMv8.1 implementations.

An implementation that includes ARMv8.1-VHE requires ARMv8.1-Atomics to be implemented.

The ID_AA64MMFR1_EL1.VH field identifies the support for ARMv8.1-VHE.

The following fields indicate the presence of the Virtualization Host Extensions for debug, including the changes for the PC Sample-based Profiling Extension and the Performance Monitors Extension:
- ID_AA64DFR0_EL1.DebugVer.
- ID_DFR0_EL1.{CopSDbg, CopDbg}.

For more information, see:
- Virtualization Host Extensions on page D4-2183.

ARMv8.1-PMU, ARMv8.1 PMU Extension

ARMv8.1 makes the following enhancements to the Performance Monitors Extension:
- The event number space is extended to 16 bits to allow additional IMPLEMENTATION DEFINED event types, and the reserved space for future additions to the architecturally-defined event types is extended.
- The HPMD bit is added to MDCR_EL2. This bit disables event counting at EL2.
- The STALL_FRONTEND and STALL_BACKEND events are required to be implemented.

The Performance Monitors Extension is an OPTIONAL feature of an implementation, but ARM strongly recommends that ARMv8.1 implementations include either:
- Version 3 of the Performance Monitors Extension, PMUv3, with a 16-bit evtCount field.
- An IMPLEMENTATION DEFINED form of performance monitors.

The following fields identify the ARMv8.1-PMU:
- ID_AA64DFR0_EL1.PMUVer.
- ID_DFR0_EL1.PerfMon.
- ID_DFR0.PerfMon.

Additional requirements of ARMv8.1

The ARMv8.1 architecture includes some mandatory changes that are not associated with a feature. These are:

Changes to CRC32 instructions

All implementations of the ARMv8.1 architecture are required to implement the CRC32* instructions. These are optional in ARMv8.0.

The following fields identify the support for the CRC32* instructions:
- ID_AA64ISAR0_EL1.CRC32.
- ID_ISAR5_EL1.CRC32.
• ID_ISAR5.CRC32.

An implementation of the ARMv8.1 extension must comply with all of the additional requirements. Such an implementation, when combined with the mandatory architectural features of ARMv8.1, is also called an implementation of the ARMv8.1 architecture.

A1.7.4 The ARMv8.2 architecture extension

The ARMv8.2 architecture extension adds both architectural features and architectural requirements.

Architectural features added by ARMv8.2

An implementation of the ARMv8.2 extension must include all of the features that this section describes as mandatory. Such an implementation, when combined with the additional requirements of ARMv8.2, is also called an implementation of the ARMv8.2 architecture.

The ARMv8.2 architecture extension adds the following architectural features, which are identified by the architectural feature name and a short description of the feature:

ARMv8.2-A64ISA, ARMv8.2 changes to the A64 ISA

ARMv8.2-A64ISA adds the BFC instruction to the A64 instruction set as an alias of BFM. It also requires that the new BFC instruction and the A64 pseudo-instruction REV64 are implemented by assemblers.

________ Note ________

• In ARMv8.0 and ARMv8.1, the A64 pseudo-instruction REV64 is optional.
• Because this feature relates to support for an instruction alias and for a pseudo-instruction there are no corresponding feature ID register fields.

This change to the instruction set and assembler requirements is mandatory in an ARMv8.2 implementation.

For more information, see:

• BFC on page C6-563.
• REV64 on page C6-848.

ARMv8.2-ATS1E1, AT S1E1R and AT S1E1W instruction variants, taking account of PSTATE.PAN

ARMv8.2-ATS1E1 adds new variants of the AArch64 AT S1E1R and AT S1E1W instructions and the AArch32 AT S1CPR and AT S1CPW instructions. These new instructions factor in the PSTATE.PAN bit when determining whether or not the location will generate a permission fault for a privileged access, as is reported in the PAR. For more information, see:

For the AArch64 System instructions

• AT S1E1RP, Address Translate Stage 1 EL1 Read PAN on page C5-447.
• AT S1E1WP, Address Translate Stage 1 EL1 Write PAN on page C5-451.

For the AArch32 System instructions

• AT S1CPRP, Address Translate Stage 1 Current state PL1 Read PAN on page G7-5054.
• AT S1CPWP, Address Translate Stage 1 Current state PL1 Write PAN on page G7-5058.

This feature is mandatory in ARMv8.2 implementations.

These instructions are added to the A64 and A32/T32 instruction sets.

The following fields identify the presence of ARMv8.2-ATS1E1:

• ID_AA64MMFR1_EL1.PAN.
• ID_MMFR3_EL1.PAN.
• ID_MMFR3.PAN.
ARMv8.2-FP16, Half-precision floating-point data processing

ARMv8.2-FP16 supports:

- Half-precision data-processing instructions for Advanced SIMD and floating-point in both AArch64 and AArch32 states.
- The FPCR.FZ16 and FPSCR.FZ16 bits, that enable a Flush-to-zero mode for half-precision data-processing instructions.

This feature is optional in ARMv8.2 implementations, unless SVE is implemented, in which case ARMv8.2-FP16 is mandatory. When this feature is implemented it is implemented in both Advanced SIMD and floating-point, and in AArch64 and AArch32 states.

The following fields identify the presence of ARMv8.2-FP16:

- ID_AA64PFR0_EL1.{FP, AdvSIMD}.
- MVFR1_EL1.{FHP, SIMDHP}.
- MVFR1.{FHP, SIMDHP}.

For more information, see:

- Half-precision floating-point formats on page A1-44.
- Modified immediate constants in A64 instructions on page C2-158.

ARMv8.2-DotProd, SIMD Dot Product

ARMv8.2-DotProd provides instructions to perform the dot product of two 32-bit vectors, accumulating the result in a third 32-bit vector. This can be performed using signed or unsigned arithmetic.

This feature is optional in ARMv8.2 implementations.

These instructions are added to the A64 and A32/T32 instruction sets.

The following fields identify the presence of ARMv8.2-DotProd:

- ID_AA64ISAR0_EL1.DP.
- ID_ISAR6_EL1.DP.
- ID_ISAR6.DP.

For more information, see:

- SIMD dot product on page C3-217.
- Advanced SIMD dot product instructions on page F1-3089.

ARMv8.2-FHM, Floating-point multiplication variant

ARMv8.2-FHM adds new floating-point multiplication instructions.

These instructions are added to the A64 and A32/T32 instruction sets.

This feature is optional in ARMv8.2 implementations, and can only be implemented when ARMv8.2-FP16 is implemented.

The following fields identify the presence of ARMv8.2-FHM:

- ID_AA64ISAR0_EL1.FHM.
- ID_ISAR6_EL1.FHM.
- ID_ISAR6.FHM.

For more information, see:

- SIMD arithmetic on page C3-205.
- SIMD by element arithmetic on page C3-212.
- Advanced SIMD multiply instructions on page F1-3088.
ARMv8.2-LSMAOC, Load/Store Multiple atomicity and ordering controls

ARMv8.2-LSMAOC adds controls that disable legacy behavior of AArch32 Load Multiple and Store Multiple instructions, and provide a trap of one aspect of this legacy behavior.

Implementation of ARMv8.2-LSMAOC is optional. When implemented it provides:

- **LSMAOE fields** in the SCTLR_EL1, SCTLR_EL2, HSCTLR, and SCTLR registers. These fields can have the following effects on the behavior of AArch32 Load Multiple and Store Multiple instructions:
  - An interrupt can be taken between two memory accesses made by a single Load Multiple or Store Multiple instruction.
  - The memory accesses made by a single Load Multiple or Store Multiple instruction to Device memory with the non-Reordering attribute can be reordered.

- **nTLSMD fields** in the SCTLR_EL1, SCTLR_EL2, HSCTLR, and SCTLR registers. These fields can cause an access to Device-nGRE, Device-nGnRE, or Device-nGnRnE memory by an AArch32 Load Multiple and Store Multiple instruction to generate an Alignment fault.

Note

ARMv8.2 deprecates software dependence on the legacy behavior of AArch32 Load Multiple and Store Multiple instructions, and these fields disable this behavior.

The following fields identify the support for ARMv8.2-LSMAOC:

- **ID_AA64MMFR2_EL1.LSM**
- **ID_MMFR4_EL1.LSM**
- **ID_MMFR4.LSM**

For more information, see the register field descriptions and:

- *Generation of Alignment faults by Load/store multiple accesses to Device memory on page E2-3028.*
- *Multi-register loads and stores that access Device memory on page E2-3040.*
- *Taking an interrupt or other exception during a multiple-register load or store on page G1-4660.*

ARMv8.2-UAO, PSTATE override of Unprivileged Load/Store

ARMv8.2 adds a new bit to PSTATE. When the value of PSTATE.UAO is 1, and when executed at EL1 or at EL2 with HCR_EL2.{E2H, TGE} == {1, 1}, the memory accesses made by the Load/Store unprivileged instructions behave as if they were made by the Load/Store register instructions. See *Load/Store unprivileged* on page C3-173 and *Load/Store register* on page C3-169.

This feature is mandatory in ARMv8.2 implementations.

This feature is supported in AArch64 state only.

The **ID_AA64MMFR2_EL1.UAO** field identifies the support for ARMv8.2-UAO.

For more information, see:

- *About PSTATE.UAO on page D4-2157.*

ARMv8.2-DCPoP, Data cache clean to Point of Persistence

ARMv8.2-DCPoP introduces a mechanism to identify and manage persistent memory locations in a shared memory hierarchy, including adding the DC CVAP instruction.

This feature is mandatory in ARMv8.2 implementations.

This feature is supported in AArch64 state only.

The **ID_AA64ISAR1_EL1.DPB** field identifies the support for ARMv8.2-DCPoP.

For more information about ARMv8.2-DCPoP, see:

- *Memory hierarchy on page B2-105.*
ARMv8.2-VPIPT, VMID-aware PIPT instruction cache

ARMv8.2-VPIPT supports a new instruction cache type, described as the VMID-aware PIPT (VPIPT) instruction cache.

Note

ARMv8.2 adds VPIPT to the set of supported cache types, meaning an ARMv8.2 implementation is permitted to implement VPIPT caches, but is not required to do so.

This feature is supported in AArch64 and AArch32 states.

The CTR_EL0.L1Ip and CTR.L1Ip fields identify the support for ARMv8.2-VPIPT.

For more information, see:

• VPIPT (VMID-aware PIPT) instruction caches on page D4-2222.
• VPIPT (VMID-aware PIPT) instruction caches on page G4-4930.

ARMv8.2-AA32HPD, AArch32 Hierarchical permission disables

ARMv8.1-HPD introduced the ability to disable the hierarchical attributes, APTable, PXNTable, and UXNTable, in the VMSAv8-64 translation regimes. ARMv8.2-AA32HPD extends this functionality to the VMSAv8-32 translation regimes when those regimes are using the Long descriptor translation table format.

This feature is optional in ARMv8.2 implementations. It is IMPLEMENTATION DEFINED whether this is implemented.

The ID_MMFR4_EL1.HPDS and ID_MMFR4.HPDS fields identify the support for ARMv8.2-AA32HPD.

For more information, see:

• Attribute fields in VMSAv8-32 Long-descriptor translation table format descriptors on page G4-4872.

ARMv8.2-TTPBHA, Translation table page-based hardware attributes

ARMv8.2 provides a mechanism to allow operating systems or hypervisors to make up to four bits of translation table final-level descriptors available for IMPLEMENTATION DEFINED hardware use.

This functionality is available for all translation regimes in AArch64 state and for stages of translation in AArch32 state that use the Long descriptor translation table format.

ARMv8.2-TTPBHA is optional in ARMv8.2 implementations, but implementation of ARMv8.2-TTPBHA requires implementation of both:

• ARMv8.1-HPD.
• ARMv8.2-AA32HPD, if any Exception level higher than EL0 can use AArch32.

Note

For stage 1 translations, page-based hardware attributes can only be used for a stage of translation for which the Hierarchical permission disables field has a value of 1.

The following fields identify the support for ARMv8.2-TTPBHA:

• ID_AA64MMFR1_EL1.HPDS
• ID_MMFR4_EL1.HPDS
• ID_MMFR4.HPDS.

For more information, see:

• Memory attribute fields in the VMSAv8-64 translation table format descriptors on page D4-2148.
• Attribute fields in VMSAv8-32 Long-descriptor translation table format descriptors on page G4-4872.
ARMv8.2-LPA, Large PA and IPA support

ARMv8.2-LPA:

- Allows a larger intermediate physical address (IPA) and PA space of up to 52 bits when using the 64KB translation granule.
- Allows a level 1 block size where the block covers a 4TB address range for the 64KB translation granule if the implementation support 52 bits of PA.

This is an optional feature in ARMv8.2 implementations. It is IMPLEMENTATION DEFINED whether it is implemented.

This feature is supported in AArch64 state only.

The ID_AA64MMFR0_EL1.PARange field identifies the support for ARMv8.2-LPA.

For more information about ARMv8.2-LPA, see:

- VMSA address types and address spaces on page D4-2083.
- Address size configuration on page D4-2097.
- Extending addressing above 48 bits on page D4-2101.
- VMSAv8-64 translation table level 0, level 1, and level 2 descriptor formats on page D4-2143.
- ARMv8 translation table level 3 descriptor formats on page D4-2147.

ARMv8.2-LVA, Large VA support

ARMv8.2-LVA supports a larger VA space for each translation table base register of up to 52 bits when using the 64KB translation granule.

This feature is supported in AArch64 state only.

This is an optional feature in ARMv8.2 implementations. It is IMPLEMENTATION DEFINED whether it is implemented.

If ARMv8.2-LVA is implemented, then any implemented trace macrocell must be at least ETMv4.2.

The ID_AA64MMFR2_EL1.VARange field identifies the support for ARMv8.2-LVA.

For more information about ARMv8.2-LVA, see:

- VMSA address types and address spaces on page D4-2083.
- Address size configuration on page D4-2097.
- Extending addressing above 48 bits on page D4-2101.
- VMSAv8-64 translation table level 0, level 1, and level 2 descriptor formats on page D4-2143.
- ARMv8 translation table level 3 descriptor formats on page D4-2147.

ARMv8.2-TTCNP, Translation table Common not private translations

ARMv8.2-TTCNP permits multiple PEs in the same Inner Shareable domain to use the same translation tables for a given stage of address translation.

This feature is mandatory in ARMv8.2 implementations.

This facility is available for all VMSAv8-64 translation regimes and for VMSAv8-32 translation stages that use the Long descriptor translation table format.

The following fields identify the support for ARMv8.2-TTCNP:

- ID_AA64MMFR2_EL1.CnP.
- ID-MMFR4_EL1.CnP.
- ID-MMFR4.CnP.

For more information, see:

- Common not private translations on page D4-2202.
- Common not private translations in VMSAv8-32 on page G4-4919.
ARMv8.2-TTS2UXN, Translation table stage 2 Unprivileged Execute-never

ARMv8.2-TTS2UXN extends the stage 2 translation table access permissions to provide control of whether memory is executable at EL0 independent of whether it is executable at EL1.

This feature is mandatory in ARMv8.2 implementations.

This facility is available for stage 2 translation stages in VMSAv8-64 and VMSAv8-32.

The following fields identify the support for ARMv8.2-TTS2UXN:

- ID_AA64MMFR1_EL1.XNX.
- ID_MMFR4_EL1.XNX.
- ID_MMFR4.XNX.

For more information, see:

- Access permissions for instruction execution on page D4-2159.
- Access permissions for instruction execution on page G4-4892.

ARMv8.2-Debug, ARMv8.2 Debug

ARMv8.2-Debug covers a selection of mandatory changes, including:

- If the core power domain is powered up and DoubleLockStatus() == TRUE, EDPRSR.{DLK,SPD,PU} is only permitted to read {UNKNOWN, 0, 0}.
- The definition of External Catch debug events is extended to include reset entry.
- All CONSTRAINED UNPREDICTABLE cases that generate External Catch debug events are removed.
- Controls are added to EDECCR to control Exception Catch debug event generation on exception return.
- All IMPLEMENTATIONDEFINED control of external debug accesses to OSLAR_EL1 is removed.
- ExternalSecureNoninvasiveDebugEnabled() cannot override software controls of counting attributable events in Secure state.

The fields that identify the support for ARMv8.2-Debug are:

- ID_AA64DFR0_EL1.DebugVer and DBGDIDR.Version.
- ID_DFR0_EL1.{CopSDbg, CopDbg} and ID_DFR0.{CopSDbg, CopDbg}.
- EDDEVARCH.ARCHID.

For more information, see:

- Exception Catch debug events from ARMv8.2 on page H3-5751.
- EDPRSR.[DLK, SPD, PU] and the Core power domain on page H6-5801.
- Interaction with EL3 on page D5-2233.
- External access disabled on page H8-5824.

ARMv8.2-PCSample, PC Sample-based Profiling

In ARMv8.2, the control and implementation of the OPTIONAL PC Sample-based Profiling extension is moved from ED*SR Debug registers to PM*SR registers in the Performance Monitors address space. See Chapter H7 The PC Sample-based Profiling Extension.

This is an optional feature in ARMv8.2 implementations. It is IMPLEMENTATIONDEFINED whether it is implemented.

The following fields identify the support for ARMv8.2-PCSample:

- EDDEVID.PCSample.
- DBGDEVID.PCSample.
- EDDEVID1.PCSROffset.
- DBGDEVID1.PCSROffset.
- PMDEVID.PCSample.
ARMv8.2-IESB, Implicit error synchronization event

ARMv8.2-IESB adds an implicit error synchronization event at exception entry and return, controlled by the added SCTLR_ELx.IESB fields. An IESB field is added to the ESR_ELx syndrome registers.

The implicit error synchronization events affect the same synchronizable asynchronous events that are synchronized by the ESB instruction, see The Reliability, Availability, and Serviceability (RAS) Extension on page A1-70.

This feature is mandatory in ARMv8.2 implementations.

This feature is supported in AArch64 state only.

The ID_AA64MMFR2_EL1.IESB field identifies the support for ARMv8.2-IESB.

For more information, see:
• The ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile.

Extensions to the ARM Cryptographic Extensions

See the description of the ARMv8.2-SHA and ARMv8.2-SM features in ARMv8.2 extensions to the Cryptographic Extension on page A1-58.

Additional requirements of ARMv8.2

The ARMv8.2 architecture includes some mandatory changes that are not associated with a feature. These are:

Changes to ACTLR2 and HCTLR2 registers

In AArch32 state, the ACTLR2 and HACTLR2 registers become mandatory.

Implementation of RAS Extension

The RAS Extension must be implemented, see The Reliability, Availability, and Serviceability (RAS) Extension on page A1-70.

An implementation of the ARMv8.2 extension must comply with all of the additional requirements. Such an implementation, when combined with the mandatory architectural features of ARMv8.2, is also called an implementation of the ARMv8.2 architecture.

A1.7.5 The ARMv8.3 architecture extension

The ARMv8.3 architecture extension adds architectural features.

Architectural features added by ARMv8.3

An implementation of the ARMv8.3 extension must include all of the features that this section describes as mandatory. Such an implementation is also called an implementation of the ARMv8.2 architecture.

The ARMv8.3 architecture extension adds the following architectural features, which are identified by the architectural feature name and a short description of the feature:

**ARMv8.3-CompNum, SIMD complex number support**

ARMv8.3-CompNum introduces instructions for floating-point multiplication and addition of complex numbers.

These instructions are added to the A64 and A32/T32 instruction sets.

This feature is mandatory in ARMv8.3 implementations.

The half-precision versions of these instructions are implemented only if ARMv8.2-FP16 is implemented. Otherwise they are UNDEFINED.

The fields that identify the presence of ARMv8.3-CompNum are:

- ID_AA64ISAR1_EL1.FCMA.
- ID_ISAR5_EL1.VCMA.
• ID_ISAR5.VCMA.
  For more information, see:
  • SIMD complex number arithmetic on page C3-218.
  • Advanced SIMD complex number arithmetic instructions on page F1-3089.

ARMv8.3-JSConv, Javascript conversion instructions

ARMv8.3-JSConv introduces instructions that perform a conversion from a double-precision floating point value to a signed 32-bit integer, with rounding to zero. For more information, see:

For the A64 instruction set
  • FJCVTZS on page C7-1206.

For the A32/T32 instruction set
  • VJCVT on page F6-4153.

These instructions are added to the A64 and A32/T32 instruction sets. The feature is mandatory in ARMv8.3 implementations. The fields that identify the presence of ARMv8.3-JSConv are:
  • ID_AA64ISAR1_EL1.JSCVT
  • ID_ISAR6_EL1.JSCVT
  • ID_ISAR6.JSCVT.
  For more information, see:
  • Floating-point conversion on page C3-200.
  • About the A64 SIMD and floating-point instructions on page C7-1006.
  • Advanced SIMD and floating-point instructions on page E1-2990.
  • Floating-point data-processing instructions on page F1-3093.

ARMv8.3-RCPC, Weaker release consistency

ARMv8.3-RCPC introduces three instructions to support the weaker Release Consistency processor consistent (RCpc) model that enables the reordering of a Store-Release followed by a Load-Acquire to a different address:
  • LDAPR on page C6-655.
  • LDAPRB on page C6-657.
  • LDAPRH on page C6-658.

These instructions are added to the A64 instruction set. The feature is mandatory in ARMv8.3 implementations. The ID_AA64ISAR1_EL1.LRCPC field identifies the presence of ARMv8.3-RCPC. For more information, see:
  • Load-Acquire/Store-Release on page C3-174.

ARMv8.3-NV, Nested Virtualization

ARMv8.3-NV provides support for a Guest Hypervisor to run in Non-secure EL1 and ensures that the Guest Hypervisor is unaware that it is running at that Exception level. A Guest Hypervisor is supported regardless of the value of HCR_EL2.E2H.

This feature is supported in AArch64 state only. The feature is mandatory in ARMv8.3 implementations. The ID_AA64MMFR2_EL1.NV field identifies the support for ARMv8.3-NV. For more information, see Nested virtualization on page D4-2188.

ARMv8.3-CCIDX, Cache extended number of sets
ARMv8.3-CCIDX introduces the following registers to allow caches to be described with greater numbers of sets and greater associativity:

- A 64-bit format of CCSIDR_EL1.
- CCSIDR2_EL1.
- CCSIDR2.

This feature is supported in AArch64 and AArch32 states.

This feature is optional in ARMv8.3 implementations.

The following fields identify the support for ARMv8.3-CCIDX:

- ID_AA64MMFR2_EL1.CCIDX
- ID_MMFR4_EL1.CCIDX.
- ID_MMFR4.CCIDX.

For more information, see:

- Possible formats of the Cache Size Identification Register, CCSIDR_EL1 on page D3-2053.
- Possible formats of the Cache Size Identification Registers, CCSIDR and CCSIDR2 on page G3-4812.

**ARMv8.3-PAuth, Pointer Authentication**

ARMv8.3-PAuth adds functionality that supports address authentication of the contents of a register before that register is used as the target of an indirect branch, or as a load.

This feature is supported only in AArch64 state.

This feature is mandatory in ARMv8.3 implementations.

The fields that identify the support for ARMv8.3-PAuth are ID_AA64ISAR1_EL1.{GPI, GPA, API, APA}.

For more information, see Pointer authentication in AArch64 state on page D4-2086.

### A1.7.6 The Reliability, Availability, and Serviceability (RAS) Extension

The RAS Extension is a mandatory extension to the ARMv8.2 architecture, and an optional extension to the ARMv8.0 and the ARMv8.1 architectures.

The RAS Extension improves the dependability of a system by providing:

- Reliability, that is, the continuity of correct service.
- Availability, that is, the readiness for correct service.
- Serviceability, that is, the ability to undergo modifications and repairs.

ID_AA64PFR0_EL1.RAS in AArch64 state, and ID_PFR0.RAS in AArch32 state, indicate whether the RAS Extension is implemented.

The RAS Extension introduces a new barrier instruction, the Error Synchronization Barrier (ESB), to the A32, T32, and A64 instruction sets.

The RAS Extension introduces the following System registers:

- In AArch64 state:
  - DISR_EL1, Deferred Interrupt Status Register.
  - ERRIDR_EL1, Error Record ID Register.
  - ERRSELR_EL1, Error Record Select Register.
  - ERXADDR_EL1, Selected Error Record Address Register.
  - ERXCTLR_EL1, Selected Error Record Control Register.
  - ERXFRR_EL1, Selected Error Record Feature Register.
  - ERXMISC0_EL1, Selected Error Record Miscellaneous Register 0.
  - ERXMISC1_EL1, Selected Error Record Miscellaneous Register 1.
— ERXSTATUS_EL1, Selected Error Record Primary Status Register.
— VDISR_EL2, Virtual Deferred Interrupt Status Register.
— VSES_R_EL2, Virtual SError Exception Syndrome Register.

• In AArch32 state:
— DISR, Deferred Interrupt Status Register.
— ERRIDR, Error Record ID Register.
— ERRSELR, Error Record Select Register.
— ERXADDR, Selected Error Record Address Register.
— ERXADDR2, Selected Error Record Address Register 2.
— ERXCTLR, Selected Error Record Control Register.
— ERXCTLR2, Selected Error Record Control Register 2.
— ERXFR, Selected Error Record Feature Register.
— ERXFR2, Selected Error Record Feature Register 2.
— ERXMISC0, Selected Error Record Miscellaneous Register 0.
— ERXMISC1, Selected Error Record Miscellaneous Register 1.
— ERXMISC2, Selected Error Record Miscellaneous Register 2.
— ERXMISC3, Selected Error Record Miscellaneous Register 3.
— ERXSTATUS, Selected Error Record Primary Status Register.
— VDFSR, Virtual SError Exception Syndrome Register.
— VDISR, Virtual Deferred Interrupt Status Register.

In addition, the RAS Extension introduces a number of memory-mapped registers.

All registers that are exclusively associated with the RAS architecture are described in the ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile.

The RAS Extension modifies the following existing System registers:

• In AArch64 state:
  — HCR_EL2.
  — ID_AA64MMFR1_EL1.
  — ID_AA64PFR0_EL1.
  — ID_MMFR4_EL1.
  — ID_PFR0_EL1.
  — SCR_EL3.
  — ESR_ELx.
  — IFSR32_EL2.

• In AArch32 state:
  — HCR2.
  — ID_MMFR4.
  — ID_PFR0.
  — SCR.
  — DFSR.
  — IFSR.
  — HSR.
A1.7.7 The Statistical Profiling Extension

The Statistical Profiling Extension is an optional extension introduced by the ARMv8.2 architecture. Implementation of the Statistical Profiling Extension requires implementation of at least ARMv8.1 of the ARMv8-A architecture profile. The Statistical Profiling Extension is only supported in AArch64 state.

The Statistical Profiling Extension provides a non-invasive method of sampling software and hardware using randomized sampling of either architectural instructions, as defined by the instruction set architecture, or by microarchitectural operations.

ID_AA64DFR0_EL1.PMSVer indicates whether the Statistical Profiling Extension is implemented.

For more information see Chapter D6 The Statistical Profiling Extension.

A1.7.8 The Scalable Vector Extension (SVE)

The Scalable Vector Extension is an optional extension introduced by the ARMv8.2 architecture. SVE is supported in AArch64 state only.

The Scalable Vector Extension provides vector instructions that, primarily, support wider vectors than the ARM Advanced SIMD instruction set. The ARM® Architecture Reference Manual Supplement, The Scalable Vector Extension (SVE), for ARMv8-A describes the SVE.

ID_AA64PFR0_EL1.SVE indicates whether the Scalable Vector Extension is implemented.

The Scalable Vector Extension affects some AArch64 System registers, and those register changes are included in this issue of this Manual, where they are identified as SVE features. SVE also introduces new AArch64 System registers, however these do not appear in this manual. For more information about the new System registers introduced by SVE, please see the ARM® Architecture Reference Manual Supplement, The Scalable Vector Extension (SVE), for ARMv8-A.

The Scalable Vector Extension introduces the following System registers:
- ID_AA64ZFR0_EL1.
- ZCR_EL1, and an EL2 alias of this register, ZCR_EL12.
- ZCR_EL2.
- ZCR_EL3.

The Scalable Vector Extension modifies the following existing System registers:
- CPACR_EL1.
- CPTR_EL2.
- CPTR_EL3.
- ESR_ELx.
- ID_AA64PFR0_EL1.
- TCR_EL1.
- TCR_EL2.
Part B

The AArch64 Application Level Architecture
Chapter B1
The AArch64 Application Level Programmers’ Model

This chapter gives an application level view of the ARM programmers’ model. It contains the following sections:

• About the Application level programmers’ model on page B1-76.
• Registers in AArch64 Execution state on page B1-77.
• Software control features and EL0 on page B1-82.
B1.1 About the Application level programmers’ model

This chapter contains the programmers’ model information required for application development.

The information in this chapter is distinct from the system information required to service and support application execution under an operating system, or higher level of system software. However, some knowledge of the system information is needed to put the Application level programmers' model into context.

Depending on the implementation choices, the architecture supports multiple levels of execution privilege, indicated by different Exception levels that number upwards from EL0 to EL3. EL0 corresponds to the lowest privilege level and is often described as unprivileged. The Application level programmers’ model is the programmers’ model for software executing at EL0. For more information see Exception levels on page D1-1850.

System software determines the Exception level, and therefore the level of privilege, at which software runs. When an operating system supports execution at both EL1 and EL0, an application usually runs unprivileged at EL0. This:

- Permits the operating system to allocate system resources to an application in a unique or shared manner.
- Provides a degree of protection from other processes, and so helps protect the operating system from malfunctioning software.

This chapter indicates where some system level understanding is necessary, and where relevant it gives a reference to the system level description.

Execution at any Exception level above EL0 is often referred to as privileged execution.

For more information on the system level view of the architecture refer to Chapter D1 The AArch64 System Level Programmers’ Model.
B1.2 Registers in AArch64 Execution state

This section describes the registers and process state visible at EL0 when executing in the AArch64 state. It includes the following:

- Registers in AArch64 state
- Process state, PSTATE on page B1-79
- System registers on page B1-80

B1.2.1 Registers in AArch64 state

In the AArch64 application level view, an ARM processing element has:

R0-R30 31 general-purpose registers, R0 to R30. Each register can be accessed as:
- A 64-bit general-purpose register named X0 to X30.
- A 32-bit general-purpose register named W0 to W30.

See the register name mapping in Figure B1-1.

![Figure B1-1 General-purpose register naming](image)

The X30 general-purpose register is used as the procedure call link register.

--- Note ---

In instruction encodings, the value \(0b11111\) (31) is used to indicate the ZR (zero register). This indicates that the argument takes the value zero, but does not indicate that the ZR is implemented as a physical register.

---

SP A 64-bit dedicated Stack Pointer register. The least significant 32 bits of the stack-pointer can be accessed via the register name WSP.

The use of SP as an operand in an instruction, indicates the use of the current stack pointer.

--- Note ---

Stack pointer alignment to a 16-byte boundary is configurable at EL1. For more information see the Procedure Call Standard for the ARM 64-bit Architecture.

---

PC A 64-bit Program Counter holding the address of the current instruction.

Software cannot write directly to the PC. It can only be updated on a branch, exception entry or exception return.

--- Note ---

Attempting to execute an A64 instruction that is not word-aligned generates a PC alignment fault, see PC alignment checking on page D1-1868.

---

V0-V31 32 SIMD&FP registers, V0 to V31. Each register can be accessed as:
- A 128-bit register named Q0 to Q31.
- A 64-bit register named D0 to D31.
- A 32-bit register named S0 to S31.
- A 16-bit register named H0 to H31.
- An 8-bit register named B0 to B31.
• A 128-bit vector of elements.
• A 64-bit vector of elements.

Where the number of bits described by a register name does not occupy an entire SIMD&FP register, it refers to the least significant bits. See Figure B1-2.

For more information about data types and vector formats, see Supported data types on page A1-40.

**FPCR, FPSR**  Two SIMD and floating-point control and status registers, FPCR and FPSR.

See Registers for instruction processing and exception handling on page D1-1859 for more information on the registers.

**Pseudocode description of registers in AArch64 state**

In the pseudocode functions that access registers:
• The assignment form is used for register writes.
• The non-assignment for register reads.

The uses of the $X[]$ function are:
• Reading or writing X0-X30, using n to index the required register.
• Reading the zero register ZR, accessed as $X[31]$.

**Note**

The pseudocode use of $X[31]$ to represent the zero register does not indicate that hardware must implement this register.

The AArch64 $SP[]$ function is used to read or write the current SP.

The AArch64 $PC[]$ function is used to read the PC.

The AArch64 $V[]$ function is used to read or write the Advanced SIMD and floating-point registers V0-V31, using a parameter n to index the required register.

The AArch64 $Vpart[]$ function is used to read or write a part of one of V0-V31, using a parameter n to index the required register, and a parameter part to indicate the required part of the register, see the function description for more information.

The $SP[], PC[], V[],$ and $Vpart[]$ functions are defined in Chapter J1 ARMv8 Pseudocode.
B1.2.2 Process state, PSTATE

Process state or PSTATE is an abstraction of process state information. All of the instruction sets provide instructions that operate on elements of PSTATE.

The following PSTATE information is accessible at EL0:

The Condition flags

Flag-setting instructions set these. They are:

- **N**  
  Negative Condition flag. If the result of the instruction is regarded as a two's complement signed integer, the PE sets this to:
  - 1 if the result is negative.
  - 0 if the result is positive or zero.

- **Z**  
  Zero Condition flag. Set to:
  - 1 if the result of the instruction is zero.
  - 0 otherwise.
  A result of zero often indicates an equal result from a comparison.

- **C**  
  Carry Condition flag. Set to:
  - 1 if the instruction results in a carry condition, for example an unsigned overflow that is the result of an addition.
  - 0 otherwise.

- **V**  
  Overflow Condition flag. Set to:
  - 1 if the instruction results in an overflow condition, for example a signed overflow that is the result of an addition.
  - 0 otherwise.

Conditional instructions test the N, Z, C and V Condition flags, combining them with the Condition code for the instruction to determine whether the instruction must be executed. In this way, execution of the instruction is conditional on the result of a previous operation. For more information about conditional execution, see Condition flags and related instructions on page C6-525.

The exception masking bits

- **D**  
  Debug exception mask bit. When EL0 is enabled to modify the mask bits, this bit is visible and can be modified. However, this bit is architecturally ignored at EL0.

- **A**  
  SError interrupt mask bit.

- **I**  
  IRQ interrupt mask bit.

- **F**  
  FIQ interrupt mask bit.

For each bit, the values are:

- 0 Exception not masked.
- 1 Exception masked.

Access at EL0 using AArch64 state depends on SCTLR_EL1.UMA. See Traps to EL1 of EL0 accesses to the PSTATE. {D, A, I, F} interrupt masks on page D1-1914.

See Process state, PSTATE on page D1-1865 for the system level view of PSTATE.
Accessing PSTATE fields at EL0

At EL0 using AArch64 state, PSTATE fields can be accessed using Special-purpose registers that can be directly read using the MRS instruction and directly written using the MSR (register) instructions. Table B1-1 shows the Special-purpose registers that access the PSTATE fields that hold AArch64 state when the PE is at EL0 using AArch64. All other PSTATE fields do not have direct read and write access at EL0.

Table B1-1 Accessing PSTATE fields at EL0 using MRS and MSR (register)

<table>
<thead>
<tr>
<th>Special-purpose register</th>
<th>PSTATE fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>NZCV</td>
<td>N, Z, C, V</td>
</tr>
<tr>
<td>DAIF</td>
<td>D, A, I, F</td>
</tr>
</tbody>
</table>

Software can also use the MSR (immediate) instruction to directly write to PSTATE.{D, A, I, F}. Table B1-2 shows the MSR (immediate) operands that can directly write to PSTATE.{D, A, I, F} when the PE is at EL0 using AArch64 state.

Table B1-2 Accessing PSTATE.{D, A, I, F} at EL0 using MSR (immediate)

<table>
<thead>
<tr>
<th>Operand</th>
<th>PSTATE fields</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>DAIFSet</td>
<td>D, A, I, F</td>
<td>Directly sets any of the PSTATE.{D,A, I, F} bits to 1</td>
</tr>
<tr>
<td>DAIFClr</td>
<td>D, A, I, F</td>
<td>Directly clears any of the PSTATE.{D, A, I, F} bits to 0</td>
</tr>
</tbody>
</table>

However, access to the PSTATE.{D, A, I, F} fields at EL0 using AArch64 state depends on SCTLR_EL1.UMA. Traps to EL1 of EL0 accesses to the PSTATE.{D, A, I, F} interrupt masks on page D1-1914.

Writes to the PSTATE fields have side-effects on various aspects of the PE operation. All of these side-effects, are guaranteed:

• Not to be visible to earlier instructions in the execution stream.
• To be visible to later instructions in the execution stream.

B1.2.3 System registers

System registers provide support for execution control, status and general system configuration. The majority of the System registers are not accessible at EL0.

However, some System registers can be configured to allow access from software executing at EL0. Any access from EL0 to a System register with the access right disabled causes the instruction to behave as UNDEFINED. The registers that can be accessed from EL0 are:

Cache ID registers  The CTR_EL0 and DCZID_EL0 registers provide implementation parameters for EL0 cache management support.

Debug registers  A debug communications channel is supported by the MDCCSR_EL0, DBGDTR_EL0, DBGDTRRX_EL0 and DBGDTRTX_EL0 registers.

Performance Monitors registers  See Performance Monitors support on page B1-81.

Thread ID registers  The TPIDR_EL0 and TPIDRRO_EL0 registers are two thread ID registers with different access rights.

Timer registers  In ARMv8 the following operations are performed:

• Read access to the system counter clock frequency using CNTFRQ_EL0.
• Physical and virtual timer count registers, CNTPCT_EL0 and CNTVCT_EL0.
Physical up-count comparison, down-count value and timer control registers, 
\texttt{CNTP\_CVAL\_EL0}, \texttt{CNTP\_TVAL\_EL0}, and \texttt{CNTP\_CTL\_EL0}.

Virtual up-count comparison, down-count value and timer control registers, 
\texttt{CNTV\_CVAL\_EL0}, \texttt{CNTV\_TVAL\_EL0}, and \texttt{CNTV\_CTL\_EL0}.

Performance Monitors support

The ARMv8 architecture defines optional Performance Monitors.

The basic form of the Performance Monitors is:

- A 64-bit cycle counter.
- Up to a maximum of 32 \texttt{IMPLEMENTATION DEFINED} event counters, where the number is identified by the 
  \texttt{PMCR\_EL0.N} field.
- System register access to the cycle counter and event registers, and related controls for:
  - Enabling and resetting counters.
  - Flagging overflows.
  - Generating interrupts on overflow.

Software can enable the cycle counter independently of the event counters.

Software executing at EL1 or a higher Exception level, for example an operating system, can enable access to the 
counters from EL0. This allows an application to monitor its own performance with fine grain control without 
requiring operating system support. For example, an application might implement per-function performance 
monitoring.

For details on the features, configuration and control of the Performance Monitors, see \textit{Chapter D5 The 
Performance Monitors Extension}.

\textbf{EL0 access to Performance Monitors}

To allow application code to make use of the Performance Monitors, software executing at a higher Exception level 
must set the following bits in the \texttt{PMUSERENR\_EL0} System register:

\begin{description}
  \item [EN] When set to 1, access to all Performance Monitors registers is allowed at EL0, except for writes to 
          \texttt{PMUSERENR\_EL0}, and reads/writes of \texttt{PMINTENSET\_EL1} and \texttt{PMINTENCLR\_EL1}.
  \item [ER] When set to 1, read access to event counters is allowed at EL0. This includes read/write access to 
          \texttt{PMSELR\_EL0}, so that the event counter to read through \texttt{PMXEVNCNTR\_EL0} can be set.
  \item [CR] When set to 1, read access to \texttt{PMCCNTR\_EL0} is allowed at EL0.
  \item [SW] When set to 1, write access to \texttt{PMSWINC\_EL0} is allowed at EL0.
\end{description}

\textbf{Note}

Register \texttt{PMUSERENR\_EL0} is always read-only at EL0.
B1.3 Software control features and EL0

The following sections describe the EL0 view of the ARMv8 software control features:

- Exception handling
- Wait for Interrupt and Wait for Event
- The YIELD instruction
- Application level cache management on page B1-83
- Instructions relating to Debug on page B1-83

B1.3.1 Exception handling

In the ARM architecture, an exception causes a change of program flow. Execution of an exception handler starts, at an Exception level higher than EL0, from a defined vector that relates to the exception taken.

Exceptions include:

- Interrupts.
- Memory system aborts.
- Exceptions generated by attempting to execute an instruction that is UNDEFINED.
- System calls.
- Secure monitor or Hypervisor traps.
- Debug exceptions.

Most details of exception handling are not visible to application level software, and are described in Chapter D1 The AArch64 System Level Programmers’ Model.

The SVC instruction causes a Supervisor Call exception. This provides a mechanism for unprivileged software to make a system call to an operating system.

The BRK instruction generates a Breakpoint Instruction exception. This provides a mechanism for debugging software using debugger executing on the same PE, see Breakpoint Instruction exceptions on page D2-1993.

--- Note ---

The BRK instruction is supported only in the A64 instruction set. The equivalent instruction in the T32 and A32 instruction sets is BKPT.

B1.3.2 Wait for Interrupt and Wait for Event

Issuing a WFI instruction indicates that no further execution is required until a WFI wake-up event occurs, see Wait For Interrupt on page D1-1957. This permits entry to a low-power state.

Issuing a WFE instruction indicates that no further execution is required until a WFE wake-up event occurs, see Wait for Event mechanism and Send event on page D1-1954. This permits entry to a low-power state.

B1.3.3 The YIELD instruction

The YIELD instruction provides a hint that the task performed by a thread is of low importance so that it could yield, see YIELD on page C6-1003. This mechanism can be used to improve overall performance in a Symmetric Multithreading (SMT) or Symmetric Multiprocessing (SMP) system.

Examples of when the YIELD instruction might be used include a thread that is sitting in a spin-lock, or where the arbitration priority of the snoop bit in an SMP system is modified. The YIELD instruction permits binary compatibility between SMT and SMP systems.

The YIELD instruction is a NOP (No Operation) hint instruction.

The YIELD instruction has no effect in a single-threaded system, but developers of such systems can use the instruction to flag its intended use for future migration to a multiprocessor or multithreading system. Operating systems can use YIELD in places where a yield hint is wanted, knowing that it will be treated as a NOP if there is no implementation benefit.
B1.3.4 Application level cache management

A small number of cache management instructions can be enabled at EL0 from higher levels of privilege using the SCTLR_EL1 System register. Any access from EL0 to an operation with the access right disabled causes the instruction to behave as UNDEFINED.

About the available operations, see Application level access to functionality related to caches on page B2-106.

B1.3.5 Instructions relating to Debug

Exception handling on page B1-82 refers to the BRK instruction, which generates a Breakpoint Instruction exception. In addition, in both AArch64 state and AArch32 state, the HLT instruction causes the PE to halt execution and enter Debug state. This provides a mechanism for debugging software using a debugger that is external to the PE, see Chapter H1 About External Debug.

--- Note ---

In AArch32 state, previous versions of the architecture defined the DBG instruction, that could provide a hint to the debug system. In ARMv8, this instruction executes as a NOP. ARM deprecates the use of the DBG instruction.
B1 The AArch64 Application Level Programmers' Model
B1.3 Software control features and EL0
Chapter B2
The AArch64 Application Level Memory Model

This chapter gives an application level view of the memory model. It contains the following sections:

- *About the ARM memory model* on page B2-86.
- *Definition of the ARMv8 memory model* on page B2-92.
- *Caches and memory hierarchy* on page B2-104.
- *Endian support* on page B2-111.
- *Memory types and attributes* on page B2-114.
- *Synchronization and semaphores* on page B2-128.

Note
In this chapter, System register names usually link to the description of the register in Chapter D10 *AArch64 System Register Descriptions*, for example SCTLR_EL1.
B2.1 About the ARM memory model

The ARM architecture is a weakly ordered memory architecture that permits the observation and completion of memory accesses in a different order from the program order. The following sections of this chapter provide the complete definition of the ARMv8 memory model, this introduction is not intended to contradict the definition found in those sections. In general, the basic principles of the ARMv8 memory model are:

- To provide a memory model that has similar weaknesses to those found in the memory models used by high-level programming languages such as C or Java. For example, by permitting independent memory accesses to be re-ordered as seen by other observers.
- To avoid the requirement for multi-copy atomicity in the majority of memory types.
- The provision of instructions and memory barriers to compensate for the lack of multi-copy atomicity in the cases where it would be needed.
- The use of address, data, and control dependencies in the creation of order so as to avoid having excessive numbers of barriers or other explicit instructions in common situations where some order is required by the programmer or the compiler.

This section contains:
- Address space.
- Memory type overview.

B2.1.1 Address space

Address calculations are performed using 64-bit registers. However, supervisory software can configure the top eight address bits for use as a tag, as described in Address tagging in AArch64 state on page D4-2084. If this is done, address bits[63:56]:

- Are not considered when determining whether the address is valid.
- Are never propagated to the program counter.

Supervisory software determines the valid address range. Attempting to access an address that is not valid generates an MMU fault.

Simple sequential execution of instructions might overflow the valid address range. For more information, see Virtual address space overflow on page D3-2049.

Memory accesses use the Mem[] function. This function makes an access of the required type. If supervisory software configures the top eight address bits for use as a tag, the top eight address bits are ignored.

The AccType{} enumeration defines the different access types.

Note

- Chapter D3 The AArch64 System Level Memory Model and Chapter D4 The AArch64 Virtual Memory System Architecture include descriptions of memory system features that are transparent to the application, including memory access, address translation, memory maintenance instructions, and alignment checking and the associated fault handling. These chapters also include pseudocode descriptions of these operations.
- For information on the pseudocode that relates to memory accesses, see Basic memory access on page D3-2077, Unaligned memory access on page D3-2078, and Aligned memory access on page D3-2078.

B2.1.2 Memory type overview

ARMv8 provides the following mutually-exclusive memory types:

<table>
<thead>
<tr>
<th>Normal</th>
<th>This is generally used for bulk memory operations, both read/write and read-only operations.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device</td>
<td>The ARM architecture forbids Speculative reads of any type of Device memory. This means Device memory types are suitable attributes for read-sensitive Locations.</td>
</tr>
</tbody>
</table>

Locations of the memory map that are assigned to peripherals are usually assigned the Device memory attribute.

Device memory has additional attributes that have the following effects:

- They prevent aggregation of reads and writes, maintaining the number and size of the specified memory accesses. See Gathering on page B2-121.
- They preserve the access order and synchronization requirements, both for accesses to a single peripheral and where there is a synchronization requirement on the observability of one or more memory write and read accesses. See Reordering on page B2-122.
- They indicate whether a write can be acknowledged other than at the end point. See Early Write Acknowledgement on page B2-123.

For more information on Normal memory and Device memory, see Memory types and attributes on page B2-114.

Note

Earlier versions of the ARM architecture defined a single Device memory type and a Strongly-ordered memory type. A Note in Device memory on page B2-118 describes how these memory types map onto the ARMv8 memory types.
B2.2 Atomicity in the ARM architecture

Atomicity is a feature of memory accesses, described as atomic accesses. The ARM architecture description refers to two types of atomicity, single-copy atomicity and multi-copy atomicity. In the ARMv8 architecture, the atomicity requirements for memory accesses depend on the memory type, and whether the access is explicit or implicit. For more information, see:

- Requirements for single-copy atomicity.
- Properties of single-copy atomic accesses on page B2-89.
- Multi-copy atomicity on page B2-89.
- Requirements for multi-copy atomicity on page B2-90.
- Concurrent modification and execution of instructions on page B2-90.

For more information about the memory types, see Memory type overview on page B2-86.

B2.2.1 Requirements for single-copy atomicity

For explicit memory accesses generated from an Exception level the following rules apply:

- A read that is generated by a load instruction that loads a single general-purpose register and is aligned to the size of the read in the instruction is single-copy atomic.
- A write that is generated by a store instruction that stores a single general-purpose register and is aligned to the size of the write in the instruction is single-copy atomic.
- Reads that are generated by a Load Pair instruction that loads two general-purpose registers and are aligned to the size of the load to each register are treated as two single-copy atomic reads, one for each register being loaded.
- Writes that are generated by a Store pair instruction that stores two general-purpose registers and are aligned to the size of the store of each register are treated as two single-copy atomic writes, one for each register being stored.
- Load-Exclusive Pair instructions of two 32-bit quantities and Store-Exclusive Pair instructions of 32-bit quantities are single-copy atomic.
- When the Store-Exclusive of a Load-Exclusive/Store-Exclusive pair instruction using two 64-bit quantities succeeds, it causes a single-copy atomic update of the entire memory location being updated.

Note

To atomically load two 64-bit quantities, perform a Load-Exclusive pair/Store-Exclusive pair sequence of reading and writing the same value for which the Store-Exclusive pair succeeds, and use the read values from the Load-Exclusive pair.

- Where translation table walks generate a read of a translation table entry, this read is single-copy atomic.
- For the atomicity of instruction fetches, see Concurrent modification and execution of instructions on page B2-90.
- Reads to SIMD and floating-point registers of a single 64-bit or smaller quantity that is aligned to the size of the quantity being loaded are treated as single-copy atomic reads.
- Writes from SIMD and floating-point registers of a single 64-bit or smaller quantity that is aligned to the size of the quantity being stored are treated as single-copy atomic writes.
- Element or Structure Reads to SIMD and floating-point registers of 64-bit or smaller elements, where each element is aligned to the size of the element being loaded, have each element treated as a single-copy atomic read.
- Element or Structure Writes from SIMD and floating-point registers of 64-bit or smaller elements, where each element is aligned to the size of the element being stored, have each element treated as a single-copy atomic store.
• Reads to SIMD and floating-point registers of a 128-bit value that is 64-bit aligned in memory are treated as a pair of single-copy atomic 64-bit reads.

• Writes from SIMD and floating-point registers of a 128-bit value that is 64-bit aligned in memory are treated as a pair of single-copy atomic 64-bit writes.

All other memory accesses are regarded as streams of accesses to bytes, and no atomicity between accesses to different bytes is ensured by the architecture.

All accesses to any byte are single-copy atomic.

Note
In AArch64 state, no memory accesses from a DC ZVA have single-copy atomicity of any quantity greater than individual bytes.

If, according to these rules, an instruction is executed as a sequence of accesses, exceptions, including interrupts, can be taken during that sequence, regardless of the memory type being accessed. If any of these exceptions are returned from using their preferred return address, the instruction that generated the sequence of accesses is re-executed, and so any access performed before the exception was taken is repeated. See also Taking an interrupt or other exception during a multiple-register load or store on page D1-1909.

Note
The exception behavior for these multiple access instructions means that they are not suitable for use for writes to memory for the purpose of software synchronization.

B2.2.2 Properties of single-copy atomic accesses

A memory access instruction that is single-copy atomic has the following properties:

1. For a pair of overlapping single-copy atomic store instructions, all of the overlapping writes generated by one of the stores are Coherence-after the corresponding overlapping writes generated by the other store.

2. For a single-copy atomic load instruction \( L_1 \) that overlaps a single-copy atomic store instruction \( S_2 \), if one of the overlapping reads generated by \( L_1 \) Reads-from one of the overlapping writes generated by \( S_2 \), then none of the overlapping writes generated by \( S_2 \) are Coherence-after the corresponding overlapping reads generated by \( L_1 \).

For more information, see Definition of the ARMv8 memory model on page B2-92.

B2.2.3 Multi-copy atomicity

In a multiprocessing system, writes to a memory location are multi-copy atomic if the following conditions are both true:

• All writes to the same location are serialized, meaning they are observed in the same order by all observers, although some observers might not observe all of the writes.

• A read of a location does not return the value of a write until all observers observe that write.

Note
Writes that are not coherent are not multi-copy atomic.
B2.2.4 Requirements for multi-copy atomicity

For Normal memory, writes are not required to be multi-copy atomic.

For Device memory, writes are not required to be multi-copy atomic.

The ARMv8 memory model is Other-multi-copy atomic. For more information, see Ordering constraints on page B2-96.

B2.2.5 Concurrent modification and execution of instructions

The ARMv8 architecture limits the set of instructions that can be executed by one thread of execution as they are being modified by another thread of execution without requiring explicit synchronization.

Concurrent modification and execution of instructions can lead to the resulting instruction performing any behavior that can be achieved by executing any sequence of instructions that can be executed from the same Exception level, except where each of the instruction before modification and the instruction after modification is one of a B, BL, BRK, HVC, ISB, NOP, SMC, or SVC instruction.

For the B, BL, BRK, HVC, ISB, NOP, SMC, and SVC instructions the architecture guarantees that, after modification of the instruction, behavior is consistent with execution of either:

• The instruction originally fetched.
• A fetch of the modified instruction.

If one thread of execution changes a conditional branch instruction, such as B or BL, to another conditional instruction and the change affects both the condition field and the branch target, execution of the changed instruction by another thread of execution before the change is synchronized can lead to either:

• The old condition being associated with the new target address.
• The new condition being associated with the old target address.

These possibilities apply regardless of whether the condition, either before or after the change to the branch instruction, is the always condition.

For all other instructions, to avoid UNPREDICTABLE or CONSTRAINED UNPREDICTABLE behavior, instruction modifications must be explicitly synchronized before they are executed. The required synchronization is as follows:

1. No PE must be executing an instruction when another PE is modifying that instruction.
2. To ensure that the modified instructions are observable, a PE that is writing the instructions must issue the following sequence of instructions and operations:

   ; Coherency example for data and instruction accesses within the same Inner Shareable domain.
   ; Enter this code with \$t\$ containing a new 32-bit instruction,
   ; to be held in Cacheable space at a location pointed to by Xn.
   STR \$t\$, [Xn]
   DC CVAU, Xn ; Clean data cache by VA to point of unification (PoU)
   DSB ISH ; Ensure visibility of the data cleaned from cache
   IC IVAU, Xn ; Invalidate instruction cache by VA to PoU
   DSB ISH ; Ensure completion of the invalidations

---

**Note**

• The DC CVAU operation is not required if the area of memory is either Non-cacheable or Write-Through Cacheable.

• If the contents of physical memory differ between the mappings, changing the mapping of VAs to PAs can cause the instructions to be concurrently modified by one PE and executed by another PE. If the modifications affect instructions other than those listed as being acceptable for modification, synchronization must be used to avoid UNPREDICTABLE or CONSTRAINED UNPREDICTABLE behavior.
3. In a multiprocessor system, the IC IVAU is broadcast to all PEs within the Inner Shareable domain of the PE running this sequence. However, when the modified instructions are observable, each PE that is executing the modified instructions must issue the following instruction to ensure execution of the modified instructions:

\[
\text{ISB} \quad ; \quad \text{Synchronize fetched instruction stream}
\]

For more information about the required synchronization operation, see Synchronization and coherency issues between data and instruction accesses on page B2-107.

--- Note ---

For information about memory accesses caused by instruction fetches, see Ordering relations on page B2-95.

### B2.2.6 Possible implementation restrictions on using atomic instructions

In some implementations, and for some memory types, the properties of atomicity can be met only by functionality outside the PE. Some system implementations might not support atomic instructions for all regions of the memory. In particular, this can apply to:

- Any type of memory in the system that does not support hardware cache coherency.
- Device, Non-cacheable memory, or memory that is treated as Non-cacheable, in an implementation that does support hardware cache coherency.

In such implementations, it is defined by the system:

- Whether the atomic instructions are atomic in regard to other agents that access memory.
- If the atomic instructions are atomic in regard to other agents that access memory, which address ranges or memory types this applies to.

An implementation can choose which memory type is treated as Non-cacheable.

The memory types for which it is architecturally guaranteed that the atomic instructions will be atomic are:

- Inner Shareable, Inner Write-Back, Outer Write-Back Normal memory with Read allocation hints and Write allocation hints and not transient.
- Outer Shareable, Inner Write-Back, Outer Write-Back Normal memory with Read allocation hints and Write allocation hints and not transient.

If the atomic instructions are not atomic in regard to other agents that access memory, then performing an atomic instruction to such a location can have one or more of the following effects:

- The instruction generates a synchronous External abort.
- The instruction generates a System Error interrupt.
- The instruction generates an IMPLEMENTATION DEFINED MMU fault reported using the Data Abort Fault status code of ESR_ELx.DFSC = 110101.

For the Non-secure EL1&0 translation regime, if the atomic instruction is not supported because of the memory type that is defined in the first stage of translation, or the second stage of translation is not enabled, then this exception is a first stage abort and is taken to EL1. Otherwise, the exception is a second stage abort and is taken to EL2.

- The instruction is treated as a NOP.
- The instructions are performed, but there is no guarantee that the memory accesses were performed atomically in regard to other agents that access memory. In this case, the instruction might also generate a System Error interrupt.
B2.3 Definition of the ARMv8 memory model

This section describes observation and ordering in the ARMv8 memory model. It contains the following subsections:

- Locations.
- Ordering and observability on page B2-93.
- Ordering constraints on page B2-96.
- Completion and endpoint ordering on page B2-97.
- Memory barriers on page B2-98.
- Limited ordering regions on page B2-103.

For more information about endpoint ordering of memory accesses, see Reordering on page B2-122.

In the ARMv8 memory model, the Shareability memory attribute indicates the degree to which hardware must ensure memory coherency between a set of observers, see Memory types and attributes on page B2-114.

The ARMv8 architecture defines additional memory attributes and associated behaviors, which are defined in the system level section of this manual. See:

- Chapter D3 The AArch64 System Level Memory Model.
- Chapter D4 The AArch64 Virtual Memory System Architecture.

See also Mismatched memory attributes on page B2-125.

B2.3.1 Locations

The ARMv8 memory model provides a set of definitions that are used to constrain the permitted sequences of accesses to memory. The ARMv8 memory model defines:

- The ordering of observation of memory accesses between different observers.
- The ordering of arrival of memory accesses arriving at an endpoint.
- The mechanisms to control the ordering of observation of memory accesses and the arrival of memory accesses at an endpoint.

Locations, Memory effects, and Observers

The ARMv8 memory model provides the following definition of a Location in memory:

Location

A Location refers to a single byte in memory.

As part of its execution an instruction might generate a Memory effect. Observers in the system might observe the Memory effects of that instruction on a Location. The ARMv8 memory model provides the following definitions of a Memory effect and an Observer:

Memory effect

The Memory effects of an instruction are the read, write, or barrier effects of that instruction. For an instruction that accesses memory:

- A read effect is generated for each Location that is read by the instruction.
- A write effect is generated for each Location that is written by the instruction.

An instruction can generate both read and write effects.

The Memory effects of an instruction I1 are said to appear in program order before the Memory effects of instruction I2 if and only if I1 occurs before I2 in program order.

For the purposes of describing the ARMv8 memory model, all read and write effects access only Normal memory locations in a Common Shareability Domain. Where this section refers to a read, write, or memory barrier without any qualification, then it is referring to the corresponding Memory effect.
Observer

An Observer refers to either a processing element, or some other memory accessing agent that can generate reads from or writes to memory.

Common Shareability Domain

A Common Shareability Domain for a program is the smallest Shareability domain that contains all of the active Observers of the Memory effects generated by a program.

### B2.3.2 Ordering and observability

The ARMv8 memory model permits reordering of memory accesses. This section defines the constraints placed on the reordering of memory accesses using the following:

- Register value dependencies to establish order between instructions on a PE.
- Ordering constraints to establish order between accesses to a Location.

#### Register value dependencies

The ARMv8 memory model defines the following dependencies between instructions:

##### Register dependency

A Register dependency from a first data value \( V_1 \) to a second data value \( V_2 \) exists within a PE if and only if either:

- The register, excluding the AArch64 zero register (XZR or WZR), that is used to hold \( V_1 \) is used in the calculation of \( V_2 \).
- There is a Register dependency from \( V_1 \) to a third data value \( V_3 \) and there is a register dependency from \( V_3 \) to \( V_2 \).

##### Register data dependency

A Register data dependency from a first data value \( V_1 \) to a second data value \( V_2 \) exists within a PE if and only if either:

- The register, excluding the AArch64 zero register (XZR or WZR) and the AArch32 PC, that is used to hold \( V_1 \) and is used in the calculation of \( V_2 \), and the calculation between \( V_1 \) and \( V_2 \) does not consist of either:
  - A conditional branch whose condition is determined by \( V_1 \).
  - A conditional selection, move, or computation whose condition is determined by \( V_1 \), where the input data values for the selection, move, or computation do not have a data dependency on \( V_1 \).
- There is a Register data dependency from \( V_1 \) to a third data value \( V_3 \), and there is a Register dependency from \( V_3 \) to \( V_2 \).

##### Address dependency

An Address dependency from a read \( R_1 \) to a subsequent read \( R_2 \) exists if and only if there is a Register data dependency from the data value that is returned by \( R_1 \) to the address used by \( R_2 \).

An Address dependency from a read \( R_1 \) to a subsequent write \( W_2 \) exists if and only if there is a Register dependency from the data value that is returned by \( R_1 \) to the address used by \( W_2 \).

##### Data dependency

A Data dependency from a read \( R_1 \) to a subsequent write \( W_2 \) exists if and only if there is a Register dependency from the data value returned by \( R_1 \) to the data value written by \( W_2 \).
Control dependency

A Control dependency from a read R₁ to a subsequent instruction I₂ exists if and only if there is a Register dependency from the data value returned by R₁ to the data value used in the evaluation of a conditional branch or the determination of a synchronous exception on an instruction and I₂ is only executed as a result of one of the possible outcomes of that conditional branch or synchronous exception.

Ordering and observability at a Location

Memory effects on a Location are related by the following relations:

Reads-from

A Reads-from relation that couples reads and writes to the same Location such that each read is paired with a single write in the program. A read R₂ of a Location Reads-from a write W₁ to the same Location if and only if R₂ takes its data from W₁.

Note

The Reads-from relation represents a read being satisfied by a write and then returning the written data.

Coherence order

A Coherence order relation for each Location in the program that provides a total order on all writes from all coherent Observers to that Location, starting with a notional write of the initial value.

Note

The Coherence order of a Location represents the order in which writes to the Location arrive at memory.

Coherence-after

A write W₂ to a Location is Coherence-after another write W₁ to the same Location if and only if W₂ is sequenced after W₁ in the Coherence order of the Location.

A write W₂ to a Location is Coherence-after a read R₁ of the same location if and only if R₁ Reads-from a write W₃ to the same Location and W₂ is Coherence-after W₃.

Overlapping accesses

Two Memory effect overlap if and only if they access the same Location. Two instructions overlap if and only if one or more of their generated Memory effects overlap.

Observed-by

A read or a write RW₁ from an Observer is Observed-by a write W₂ from a different Observer if and only if W₂ is coherence-after RW₁.

A write W₁ from an Observer is Observed-by a read R₂ from a different Observer if and only if R₂ Reads-from W₁.

Note

The Observed-by relation only relates accesses generated by different Observers.

DMB FULL

A DMB FULL is a DMB with neither the LD or the ST qualifier.

Where this section refers to DMB without any qualification, then it is referring to all types of DMB. Unless a specific shareability domain is defined, a DMB applies to the Common Shareability Domain. All properties that apply to DMB also apply to the corresponding DSB.
Ordering relations

In addition to the ordering relations for a single Location, the ARMv8 memory model also provides ordering relations to describe the ordering of Memory effects to multiple Locations. These are as follows:

Dependency-ordered-before

A dependency creates externally-visible order between a read and another Memory effect generated by the same Observer. A read R₁ is Dependency-ordered-before a read or write RW₂ from the same Observer if and only if R₁ appears in program order before RW₂ and any of the following cases apply:

- There is an Address dependency or a Data dependency from R₁ to RW₂.
- RW₂ is a write W₂ and there is a Control dependency from R₁ to W₂.
- RW₂ is a read R₂ generated by an instruction appearing in program order after an instruction I₃ that generates a Context synchronization event, and there is a Control dependency from R₁ to I₃.
- RW₂ is a write W₂ appearing in program order after a read or a write RW₃ and there is an Address dependency from R₁ to RW₃.
- RW₂ is a write W₂ that is Coherence-after a write W₃ and there is a Control dependency or a Data dependency from R₁ to W₃.
- RW₂ is a read R₂ that Reads-from a write W₃ and there is an Address dependency or a Data dependency from R₁ to W₃.

Atomic-ordered-before

Load-Exclusive and Store-Exclusive instructions provide some ordering guarantees, even in the absence of dependencies. A read or a write RW₁ is Atomic-ordered-before a read or a write RW₂ from the same Observer if and only if RW₁ appears in program order before RW₂ and either of the following cases apply:

- RW₁ is a read R₁ and RW₂ is a write W₂ such that R₁ and W₂ are generated by an atomic instruction or a successful Load-Exclusive/Store-Exclusive instruction pair to the same Location.
- RW₁ is a write W₁ generated by an atomic instruction or a successful Store-Exclusive instruction and RW₂ is a read R₂ generated by an instruction with Acquire or AcquirePC semantics such that R₂ Reads-from W₁.

For more information, see Synchronization and semaphores on page B2-128.

Barrier-ordered-before

Barrier instructions order prior Memory effects before subsequent Memory effects generated by the same Observer. A read or a write RW₁ is Barrier-ordered-before a read or a write RW₂ from the same Observer if and only if RW₁ appears in program order before RW₂ and any of the following cases apply:

- RW₁ appears in program order before a DMB FULL or an atomic instruction with both Acquire and Release semantics that appears in program order before RW₂.
- RW₁ is a write W₁ generated by an instruction with Release semantics and RW₂ is a read R₂ generated by an instruction with Acquire semantics.
- RW₁ is a read R₁ and either:
  — R₁ appears in program order before a DMB LD that appears in program order before RW₂.
  — R₁ is generated by an instruction with Acquire or AcquirePC semantics.
- RW₂ is a write W₂ and either:
  — RW₁ is a write W₁ appearing in program order before a DMB ST that appears in program order before W₂.
  — W₂ is generated by an instruction with Release semantics.
— RW₁ appears in program order before a write W₃ generated by an instruction with Release semantics and W₂ is Coherence-after W₃.

### Ordered-before

An arbitrary pair of *Memory effects* is ordered if it can be linked by a chain of ordered accesses consistent with external observation. A read or a write RW₁ is *Ordered-before* a read or a write RW₂ if and only if any of the following cases apply:

- RW₁ is Observed-by RW₂.
- RW₁ is Dependency-ordered-before RW₂.
- RW₁ is Atomic-ordered-before RW₂.
- RW₁ is Barrier-ordered-before RW₂.
- RW₁ is Ordered-before a read or a write that is Ordered-before RW₂.

### B2.3.3 Ordering constraints

The ARMv8 memory model is described as being *Other-multi-copy atomic*. The definition of Other-multi-copy atomic is as follows:

**Other-multi-copy atomic**

In an *Other-multi-copy atomic* system, it is required that a write from an *Observer*, if observed by a different *Observer*, is then observed by all other *Observers* that access the *Location* coherently. It is, however, permitted for an *Observer* to observe its own writes prior to making them visible to other observers in the system.

The *Other-multi-copy atomic* property of the ARMv8 memory model is enforced by placing constraints on the possible executions of a program. Those executions that meet the constraints given by the ordering model are said to be *architecturally well-formed*. An implementation that is executing a program is only permitted to exhibit behavior consistent with an architecturally well-formed execution:

**Architecturally well-formed**

An architecturally well-formed execution must satisfy both of the following requirements:

#### Internal visibility requirement

For a read or a write RW₁ that appears in program order before a read or a write RW₂ to the same *Location*, the internal visibility requirement requires that exactly one of the following statements is true:

- RW₂ is a write W₂ that is Coherence-after RW₁.
- RW₁ is a write W₁ and RW₂ is a read R₂ such that either:
  - R₂ Reads-from W₁.
  - R₂ Reads-from another write that is Coherence-after W₁.
- RW₁ and RW₂ are both reads R₁ and R₂ such that R₁ Reads-from a write W₃ and either:
  - R₂ Reads-from W₃.
  - R₂ Reads-from another write that is Coherence-after W₃.

--- **Note**

If a Memory effect M₁ from an *Observer* appears in program order before a Memory effect M₂ from the same *Observer*, then M₁ will be seen to occur before M₂ by that *Observer*.
External visibility requirement

For a read or a write RW$_1$ from an Observer that is Ordered-before a read or a write RW$_2$ from a different Observer, the external visibility constraint requires that RW$_2$ is not Observed-by RW$_1$. This means that an Architecturally well-formed execution must not exhibit a cycle in the Ordered-before relation.

--- Note ---

If a Memory effect M$_1$ from an Observer is Ordered-before another Memory effect M$_2$, from a different Observer, then M$_1$ will be seen to occur before M$_2$ by all Observers in the system.

B2.3.4 Completion and endpoint ordering

Interaction between Observers in a system is not restricted to communication via shared variables in coherent memory. For example, an Observer could configure an interrupt controller to raise an interrupt on another Observer as a form of message passing. These interactions typically involve an additional agent, which defines the instruction sequence that is required to establish communication links between different Observers. When these forms of interaction are used in conjunction with shared variables, a DSB instruction can be used to enforce ordering between them.

For all memory, the completion rules are defined as:

- A read R$_1$ to a Location is complete for a shareability domain when all of the following are true:
  - Any write to the same Location by an Observer within the shareability domain will be Coherence-after R$_1$.
  - Any translation table walks associated with R$_1$ are complete for that shareability domain.

- A write W$_1$ to a Location is complete for a shareability domain when all of the following are true:
  - Any write to the same Location by an Observer within the shareability domain will be Coherence-after W$_1$.
  - Any read to the same Location by an Observer within the shareability domain will either Reads-from W$_1$ or Reads-from a write that is Coherence-after W$_1$.
  - Any translation table walks associated with the write are complete for that shareability domain.

- A translation table walk is complete for a shareability domain when the memory accesses, including the updates to translation table entries, associated with the translation table walk are complete for that shareability domain, and the TLB is updated.

- A cache maintenance instruction is complete for a shareability domain when the memory effects of the instruction are complete for that shareability domain, and any translation table walks that arise from the instruction are complete for that shareability domain.

- A TLB invalidate instruction is complete when all memory accesses using the TLB entries that have been invalidated are complete.

The completion of any cache or TLB maintenance instruction includes its completion on all PEs that are affected by both the instruction and the DSB operation that is required to guarantee visibility of the maintenance instruction.

--- Note ---

These completion rules mean that, for example, a cache maintenance instruction that operates by VA to the PoC completes only after memory at the PoC has been updated.

Additionally, for Device-nGnRnE memory, a read or write of a Location in a Memory-mapped peripheral that exhibits side-effects is complete only when the read or write both:

- Can begin to affect the state of the Memory-mapped peripheral.
- Can trigger all associated side-effects, whether they affect other peripheral devices, PEs, or memory.
Note

This requirement for Device-nGnRnE memory is consistent with the memory access having reached the peripheral endpoint.

Peripherals

This section defines a Memory-mapped peripheral and the total order of reads and writes to a peripheral which is defined as the Peripheral coherence order:

Memory-mapped peripheral

A Memory-mapped peripheral occupies a memory region of IMPLEMENTATION DEFINED size and can be accessed using load and store instructions. Memory effects to a Memory-mapped peripheral can have side-effects, such as causing the peripheral to perform an action. Values that are read from addresses within a Memory-mapped peripheral might not correspond to the last data value written to those addresses. As such, Memory effects to a Memory-mapped peripheral might not appear in the Reads-from or Coherence order relations.

Peripheral coherence order

The Peripheral coherence order of a Memory-mapped peripheral is a total order on all reads and writes to that peripheral.

Note

The Peripheral coherence order for a Memory-mapped peripheral signifies the order in which accesses arrive at the endpoint.

For a read or a write RW₁ and a read or a write RW₂ to the same peripheral, then RW₁ will appear in the Peripheral coherence order for the peripheral before RW₂ if either of the following cases apply:

- RW₁ and RW₂ are accesses using Non-cacheable or Device attributes and RW₁ is Ordered-before RW₂.
- RW₁ and RW₂ are accesses using Device-nGnRE or Device-nGnRnE attributes and RW₁ appears in program order before RW₂.

Out-of-band-ordered-before

A read or a write RW₁ is Out-of-band-ordered-before a read or a write RW₂ if and only if either of the following cases apply:

- RW₁ appears in program order before a DSB instruction that begins an IMPLEMENTATION DEFINED instruction sequence indirectly leading to the generation of RW₂.
- RW₁ is Ordered-before a read or a write RW₃ and RW₃ is Out-of-band-ordered-before RW₂.

If a Memory effect M₁ is Out-of-band-ordered-before a read or a write M₂, then M₁ is seen to occur before M₂ by all Observers.

B2.3.5 Memory barriers

Memory barrier is the general term applied to an instruction, or sequence of instructions, that forces synchronization events by a PE with respect to retiring Load/Store instructions. The memory barriers defined by the ARMv8 architecture provide a range of functionality, including:

- Ordering of Load/Store instructions.
- Completion of Load/Store instructions.
- Context synchronization.

The following subsections describe the ARMv8 memory barrier instructions:

- Instruction Synchronization Barrier (ISB) on page B2-99
- Data Memory Barrier (DMB) on page B2-99.
• Data Synchronization Barrier (DSB) on page B2-100.
• Shareability and access limitations on the data barrier operations on page B2-100.
• LoadLOAcquire, StoreLORelease on page B2-102.

Note

Depending on the required synchronization, a program might use memory barriers on their own, or it might use them in conjunction with cache maintenance and memory management instructions that in general are only available when software execution is at EL1 or higher.

DMB and DSB instructions affect reads and writes to the memory system generated by Load/Store instructions and data or unified cache maintenance instructions being executed by the PE. Instruction fetches or accesses caused by a hardware translation table access are not explicit accesses.

Instruction Synchronization Barrier (ISB)

An ISB instruction ensures that all instructions that come after the ISB instruction in program order are fetched from the cache or memory after the ISB instruction has completed. Using an ISB ensures that the effects of context-changing operations executed before the ISB are visible to the instructions fetched after the ISB instruction.

Examples of context-changing operations that require the insertion of an ISB instruction to ensure the effects of the operation are visible to instructions fetched after the ISB instruction are:
• Completed cache and TLB maintenance instructions.
• Changes to System registers.

Any context-changing operations appearing in program order after the ISB instruction only take effect after the ISB has been executed.

The pseudocode function for the operation of an ISB is InstructionSynchronizationBarrier().

See also Memory barriers on page D3-2079.

Data Memory Barrier (DMB)

The DMB instruction is a memory barrier instruction that ensures the relative order of memory accesses before the barrier with memory accesses after the barrier. The DMB instruction does not ensure the completion of any of the memory accesses for which it ensures relative order.

The full definition of the DMB is covered formally in the Definition of the ARMv8 memory model on page B2-92 and this introduction to the DMB instruction is not intended to contradict that section.

The basic principle of a DMB instruction is to introduce order between memory accesses that are specified to be affected by the DMB options supplied as arguments to the DMB instruction. The DMB instruction ensures that all affected memory accesses by the PE executing the DMB that appear in program order before the DMB and those which originate from a different PE, to the extent required by the DMB options, which have been Observed-by the PE before the DMB is executed, are Observed-by each PE, to the extent required by the DMB options, before any affected memory accesses that appear in program order after the DMB are Observed-by that PE.

The use of a DMB creates order between the Memory effects of instructions as described in the definition of Barrier-ordered-before.

DMB only affects memory accesses and the operation of data cache and unified cache maintenance instructions, see A64 Cache maintenance instructions on page D3-2062. It has no effect on the ordering of any other instructions executing on the PE. A DMB instruction intended to ensure the completion of cache maintenance instructions must have an access type of both loads and stores.

The pseudocode function for the operation of a DMB is DataMemoryBarrier().
Data Synchronization Barrier (DSB)

A DSB is a memory barrier that ensures that memory accesses that occur before the DSB have completed before the completion of the DSB instruction. In doing this, it acts as a stronger barrier than a DMB and all ordering that is created by a DMB with specific options is also generated by a DSB with the same options.

Execution of a DSB:

- At EL2 ensures that any memory accesses caused by Speculative translation table walks from the Non-secure EL1&0 translation regime have been observed.
- At EL3 ensures that any memory accesses caused by speculative translation table walks from any of the following translation regimes have been observed:
  - The EL2 or EL2&0 translation regime.
  - The Secure EL1&0 translation regime.
  - The Non-secure EL1&0 translation regime.

For more information, see Use of out-of-context translation regimes on page D4-2103.

A DSB completes when all of the following apply:

- All explicit memory accesses that are observed by PEe before the DSB is executed and are of the required access types, and are from observers in the same required shareability domain as PEe, are complete for the set of observers in the required shareability domain.
- If the required access types of the DSB is reads and writes, then all cache maintenance instructions and all TLB maintenance instructions issued by PEe before the DSB are complete for the required shareability domain.

In addition, no instruction that appears in program order after the DSB instruction can alter any state of the system or perform any part of its functionality other than:

- Being fetched from memory and decoded.
- Reading the general-purpose, SIMD and floating-point, Special-purpose, or System registers that are directly or indirectly read without causing side-effects until the DSB completes.

The pseudocode function for the operation of a DSB is DataSynchronizationBarrier().

See also Memory barriers on page D3-2079.

Shareability and access limitations on the data barrier operations

The DMB and DSB instructions take an argument that specifies:

- The shareability domain over which the instruction must operate. This is one of:
  - Full system.
  - Outer Shareable.
  - Inner Shareable.
  - Non-shareable.
- The accesses for which the instruction operates. This is one of:
  - Read and write accesses, both before and after the barrier instruction.
  - Write accesses only, before and after the barrier instruction.
  - Read accesses before the barrier instruction, and read and write accesses after the barrier instruction.

Note

This form of a DMB or DSB instruction can be described as a Load-Load/Store barrier.

For more information on whether an access is before or after a barrier instruction, see Data Memory Barrier (DMB) on page B2-99 or Data Synchronization Barrier (DSB).
Table B2-1 shows how these options are encoded in the `<option>` field of the instruction:

Table B2-1 Encoding of the DMB and DSB `<option>` parameter

| Accesses After the barrier | Shareability domain | | | | |
|---|---|---|---|---|
| Before the barrier | | Full system | Outer Shareable | Inner Shareable | Non-shareable |
| Reads and writes | SY | OSH | ISH | NSH |
| Writes | ST | OSHST | ISHST | NSHST |
| Reads | LD | OSHLD | ISHL | NSHL |

See the instruction descriptions for more information:
- DMB on page C6-628.
- DSB on page C6-631.

**Note**

ISB also supports an optional limitation argument that can only contain one value that corresponds to full system operation, see ISB on page C6-647.

### Load-Acquire, Load-AcquirePC, and Store-Release

ARMv8 provides a set of instructions with Acquire semantics for loads, and Release semantics for stores. These instructions support the Release Consistency sequentially consistent (RCsc) model. In addition, ARMv8.3-RCPC provides Load-AcquirePC instructions. The combination of Load-AcquirePC and Store-Release can be used to support the weaker Release Consistency processor consistent (RCpc) model.

The full definitions of the Load-Acquire and Load-AcquirePC instructions are covered formally in the Definition of the ARMv8 memory model on page B2-92. This introduction to the Load-Acquire and Load-AcquirePC instructions is not intended to contradict that section.

The basic principle of both Load-Acquire and Load-AcquirePC instructions is to introduce order between the memory access generated by the Load-Acquire or Load-AcquirePC instruction and the memory accesses appearing in program order after the Load-Acquire or Load-AcquirePC instruction, such that the memory access generated by the Load-Acquire or Load-AcquirePC instruction is Observed-by each PE, to the extent that the PE is required to observe the access coherently, before any of the memory accesses appearing in program order after the Load-Acquire or Load-AcquirePC instruction are Observed-by that PE, to the extent that the PE is required to observe the accesses coherently.

The use of a Load-Acquire or Load-AcquirePC instruction creates order between the Memory effects of instructions as described in the definition of Barrier-ordered-before.

The full definition of the Store-Release instruction is covered formally in the Definition of the ARMv8 memory model on page B2-92 and this introduction to the Store-Release instruction is not intended to contradict that section.

The basic principle of a Store-Release instruction is to introduce order between the memory accesses generated by the PE executing the Store-Release instruction, together with those which originate from a different PE, to the extent that the PE is required to observe them coherently, Observed-by the PE before executing the Store-release.

The use of a Store-Release instruction creates order between the Memory effects of instructions as described in the definition of Barrier-ordered-before.

Where a Load-Acquire appears in program order after a Store-Release, then the memory access generated by the Store-Release instruction is Observed-by each PE, to the extent that that PE is required to observe the access coherently, before the memory access generated by the Load-Acquire instruction are Observed-by that PE, to the extent that the PE is required to observe the access coherently. In addition, the use of a Load-Acquire,
Load-AcquirePC or a Store-Release instruction on accesses to a memory-mapped peripheral introduces order between the Memory effects of the instructions that access that peripheral, as described in the definition of Peripheral coherence order.

Load-Acquire, Load-AcquirePC and Store-Release, other than Load-Acquire Exclusive Pair and Store-Release-Exclusive Pair, access only a single data element. This access is single-copy atomic. The address of the data object must be aligned to the size of the data element being accessed, otherwise the access generates an Alignment fault.

Load-Acquire Exclusive Pair and Store-Release Exclusive Pair access two data elements. The address supplied to the instructions must be aligned to twice the size of the element being loaded, otherwise the access generates an Alignment fault.

A Store-Release Exclusive instruction only has the release semantics if the store is successful.

--- Note ---

- Each Load-Acquire Exclusive and Store-Release Exclusive instruction is essentially a variant of the equivalent Load-Exclusive or Store-Exclusive instruction. All usage restrictions and single-copy atomicity properties:
  - That apply to the Load-Exclusive instructions also apply to the Load-Acquire Exclusive instructions.
  - That apply to the Store-Exclusive instructions also apply to the Store-Release Exclusive instructions.
- The Load-Acquire, Load-AcquirePC, and Store-Release instructions can remove the requirement to use the explicit DM B instruction.

---

LoadLOAcquire, StoreLORelease

For each PE, the Non-secure physical memory map is divided into a set of LORegions using a table that is held within the PE. Any PA in the Non-secure memory map can be a member of one LORegion. If a PA is assigned to more than one LORegion, then an implementation might treat it as if it has been assigned to fewer LORegions than that have been specified. A PA in the Secure physical memory map cannot be a member of any LORegion. For more information, see Limited ordering regions on page B2-103.

ARMv8.1 provides a set of instructions with Acquire semantics for loads, and Release semantics for stores that apply in relation to the defined LORegions. The new variants of the Load-Acquire and Store-Release instructions are LoadLOAcquire and StoreLORelease. See LoadLOAcquire/StoreLORelease on page C3-175.

For all memory types, these instructions have the following ordering requirements:

- LoadLOAcquire has the same semantics as Load-Acquire except that the memory accesses affected lie within the same LORegion as the address of the memory access generated by the LoadLOAcquire instruction. See Load-Acquire, Load-AcquirePC, and Store-Release on page B2-101.
- StoreLORelease has the same semantics as Store-Release except that the memory accesses affected lie within the same LORegion as the address of the memory access generated by the StoreLORelease instruction. See Load-Acquire, Load-AcquirePC, and Store-Release on page B2-101.

In addition, for accesses to memory-mapped peripherals:

- LoadLOAcquire has the same semantics as Load-Acquire except that the affected Memory effects of instructions that access the peripheral lie within the same LORegion as the address of the memory access generated by the LoadLOAcquire instruction. See Load-Acquire, Load-AcquirePC, and Store-Release on page B2-101.
- StoreLORelease has the same semantics as Store-Release except that the affected Memory effects of instructions that access the peripheral lie within the same LORegion as the address of the memory access generated by the StoreLORelease instruction. See Load-Acquire, Load-AcquirePC, and Store-Release on page B2-101.
The LoadLOAcquire/StoreLORelease instructions can remove the requirement to use the explicit DMB instruction.

B2.3.6 Limited ordering regions

ARMv8.1 introduces limited ordering regions (LORegions), which allow large systems to perform special load-acquire and store-release instructions that provide order between the memory accesses to a region of the PA map as observed by a set of observers.

This feature is supported in AArch64 state only.

Specification of the LORegions

The LORegions are defined in the Non-secure physical memory map using a set of LORegion descriptors. The number of LORegion descriptors is IMPLEMENTATION DEFINED, and can be discovered by reading the LORID_EL1 register.

Each LORegion descriptor consists of:

- A tuple of the following values:
  - A Start Address.
  - An End Address.
  - An LORegion Number.
- Valid bit which indicates whether that LORegion descriptor is valid.

A memory location lies within the LORegion identified by the LORegion Number if the PA lies between the Start Address and the End Address, inclusive. The Start Address must be defined to be aligned to 64KB and the End Address must be defined as the top byte of a 64KB block of memory.

The LORegion descriptors are programmed using the LORSA_EL1, LOREA_EL1, LORN_EL1, and LORC_EL1 registers in the System register space. These registers are only supported in the Non-secure memory map.

If a LoadLOAcquire or a StoreLORelease does not match with any LORegion, then:

- The LoadLOAcquire will behave as a Load-Acquire, and will be ordered in the same way with respect to all accesses, independent of their LORegions.
- The StoreLORelease will behave as a Store-Release, and will be ordered in the same way with respect to all accesses, independent of their LORegions.

Note

If no LORegions are implemented, then the LoadLOAcquire and StoreLORelease will therefore behave as a Load-Acquire and Store-Release.

A new access type AccType_LIMITEDORDERED has been added for these limited ordering instructions to be identified.
B2.4 Caches and memory hierarchy

The implementation of a memory system depends heavily on the microarchitecture and therefore many details of the memory system are IMPLEMENTATION DEFINED. ARMv8 defines the application level interface to the memory system, including a hierarchical memory system with multiple levels of cache. This section describes an application level view of this system. It contains the subsections:

- Introduction to caches.
- Memory hierarchy on page B2-105.
- Application level access to functionality related to caches on page B2-106
- Implication of caches for the application programmer on page B2-106.
- Preloading caches on page B2-108.

B2.4.1 Introduction to caches

A cache is a block of high-speed memory that contains a number of entries, each consisting of:

- Main memory address information, commonly known as a tag.
- The associated data.

Caches increase the average speed of a memory access. Caching takes account of two principles of locality:

**Spatial locality**
An access to one Location is likely to be followed by accesses to adjacent Locations. Examples of this principle are:

- Sequential instruction execution.
- Accessing a data structure.

**Temporal locality**
An access to an area of memory is likely to be repeated in a short time period. An example of this principle is the execution of a software loop.

To minimize the quantity of control information stored, the spatial locality property groups several locations together under the same tag. This logical block is commonly known as a cache line. When data is loaded into a cache, access times for subsequent loads and stores are reduced, resulting in overall performance benefits. An access to information already in a cache is known as a cache hit, and other accesses are called cache misses.

Normally, caches are self-managing, with the updates occurring automatically. Whenever the PE accesses a cacheable memory location, the cache is checked. If the access is a cache hit, the access occurs in the cache. Otherwise, the access is made to memory. Typically, when making this access, a cache location is allocated and the cache line loaded from memory. ARMv8 permits different cache topologies and access policies, provided they comply with the memory coherency model described in this manual.

Caches introduce a number of potential problems, mainly because:

- Memory accesses can occur at times other than when the programmer would expect them.
- A data item can be held in multiple physical locations.
B2.4.2 Memory hierarchy

Typically memory close to a PE has very low latency, but is limited in size and expensive to implement. Further from the PE it is common to implement larger blocks of memory but these have increased latency. To optimize overall performance, an ARMv8 memory system can include multiple levels of cache in a hierarchical memory system that exploits this trade-off between size and latency. Figure B2-1 shows an example of such a system in an ARMv8-A system that supports virtual addressing.

![Figure B2-1 Multiple levels of cache in a memory hierarchy](image)

--- Note ---

In this manual, in a hierarchical memory system, Level 1 refers to the level closest to the processing element, as shown in Figure B2-1.

Instructions and data can be held in separate caches or in a unified cache. A cache hierarchy can have one or more levels of separate instruction and data caches, with one or more unified caches that are located at the levels closest to the main memory. Memory coherency for cache topologies can be defined using the conceptual points Point of Unification (PoU), Point of Coherency (PoC), and Point of Persistence (PoP).

--- Note ---

ARMv8 ARMv8.2-DCPoP adds architectural support for Point of Persistence.

For more information, including the definitions of PoU, PoC, and PoP, see About cache maintenance in AArch64 state on page D3-2058.

The cacheability and shareability memory attributes

Cacheability and shareability are two attributes that describe the memory hierarchy in a multiprocessing system:

**Cacheability**  This attribute defines whether memory locations are allowed to be allocated into a cache or not. Cacheability is defined independently for Inner and Outer Cacheability locations.

**Shareability**  This attribute defines whether memory locations are shareable between different agents in a system. Marking a memory location as shareable for a particular domain requires hardware to ensure that the location is coherent for all agents in that domain. Shareability is defined independently for Inner and Outer Shareability domains.

For more information about Cacheability and Shareability, see Memory types and attributes on page B2-114.
B2.4.3 Application level access to functionality related to caches

As indicated in About the Application level programmers’ model on page B1-76, the application level corresponds to execution at EL0. The architecture defines a set of cache maintenance instructions that software can use to manage cache coherency. Software executing at a higher Exception level can enable use of some of this functionality from EL0, as follows:

When the value of SCTL_EL1.UCI is 1

Software executing at EL0 can access:

- The data cache maintenance instructions, DC CVAU, DC CVAC, DC CVAP, and DC CVAC. See The data cache maintenance instruction (DC) on page D3-2063.
- The instruction cache maintenance instruction IC IVAU. See The instruction cache maintenance instruction (IC) on page D3-2063.

Attempted execution of these instructions might generate a Permission fault as described in Permission fault on page D4-2192.

When the value of SCTL_EL1.UCT is 1

Software executing at EL0 can access the cache type register. See CTR_EL0.

When the value of SCTL_EL1.DZE is 1

Software executing at EL0 can access the data cache zero instruction DC ZVA. See Data cache zero instruction on page D3-2071.

The SCTL_EL1.{UCI, UCT, DZE} control fields are only accessible by software executing at EL1 or higher. This functionality is UNDEFINED at EL0 when the value of the corresponding SCTL_EL1 control field is 0, see:

- Traps to EL1 of EL0 execution of cache maintenance instructions on page D1-1913.
- Traps to EL1 of EL0 accesses to the CTR_EL0 on page D1-1913.
- Traps to EL1 of EL0 execution of DC ZVA instructions on page D1-1914.

B2.4.4 Implication of caches for the application programmer

In normal operation, the caches are largely invisible to the application programmer. However they can become visible when there is a breakdown in the coherency of the caches. Such a breakdown can occur:

- When memory locations are updated by other agents in the system that do not use hardware management of coherency.
- When memory updates made from the application software must be made visible to other agents in the system, without the use of hardware management of coherency.

For example:

- In the absence of hardware management of coherency of DMA accesses, in a system with a DMA controller that reads memory locations that are held in the data cache of a PE, a breakdown of coherency occurs when the PE has written new data in the data cache, but the DMA controller reads the old data held in memory.
- In a Harvard cache implementation, where there are separate instruction and data caches, a breakdown of coherency occurs when new instruction data has been written into the data cache, but the instruction cache still contains the old instruction data.

Data coherency issues

Software can ensure the data coherency of caches in the following ways:

- By not using the caches in situations where coherency issues can arise. This can be achieved by:
  - Using Non-cacheable or, in some cases, Write-Through Cacheable memory.
  - Not enabling caches in the system.
- By using cache maintenance instructions to manage the coherency issues in software. See Application level access to functionality related to caches.
By using hardware coherency mechanisms to ensure the coherency of data accesses to memory for cacheable locations by observers within the different shareability domains, see Non-shareable Normal memory on page B2-116 and Shareable, Inner Shareable, and Outer Shareable Normal memory on page B2-115.

--- Note ---

The performance of these hardware coherency mechanisms is highly implementation-specific. In some implementations, the mechanism suppresses the ability to cache shareable locations. In other implementations, cache coherency hardware can hold data in caches while managing coherency between observers within the shareability domains.

--- Note ---

Not all these mechanisms are directly available to software operating at EL0 and might involve interaction with software operating at a higher Exception level.

Synchronization and coherency issues between data and instruction accesses

How far ahead of the current point of execution instructions are fetched from is IMPLEMENTATION DEFINED. Such prefetching can be either a fixed or a dynamically varying number of instructions, and can follow any or all possible future execution paths. For all types of memory:

- The PE might have fetched the instructions from memory at any time since the last Context synchronization event on that PE.

- Any instructions fetched in this way might be executed multiple times, if this is required by the execution of the program, without being refetched from memory. In the absence of a Context synchronization event, there is no limit on the number of times such an instruction might be executed without being refetched from memory.

The ARM architecture does not require the hardware to ensure coherency between instruction caches and memory, even for locations of shared memory.

If software requires coherency between instruction execution and memory, it must manage this coherency using Context synchronization events and cache maintenance instructions. The following code sequence can be used to allow a PE to execute code that the same PE has written.

; Coherency example for data and instruction accesses within the same Inner Shareable domain.
; Enter this code with <Wt> containing a new 32-bit instruction, to be held in Cacheable space at a location pointed to by Xn.
    STR Wt, [Xn]
    DC CVAU, Xn         ; Clean data cache by VA to point of unification (PoU)
    DSB ISH             ; Ensure visibility of the data cleaned from cache
    IC IVAU, Xn         ; Invalidate instruction cache by VA to PoU
    DSB ISH             ; Ensure completion of the invalidations
    ISB                 ; Synchronize the fetched instruction stream

--- Note ---

- For Non-cacheable or Write-Through accesses, the clean data cache by VA instruction is not required. However, the invalidate instruction cache instruction is required because the ARMv8-A AArch64 architecture allows Non-cacheable accesses to be held in an instruction cache. See Non-cacheable accesses and instruction caches on page D3-2057.

- This code can be used when the thread of execution modifying the code is the same thread of execution that is executing the code. The ARMv8 architecture limits the set of instructions that can be executed by one thread of execution as they are being modified by another thread of execution without requiring explicit synchronization. See Concurrent modification and execution of instructions on page B2-90.

- The system software controls whether these cache maintenance instructions are available to the application level by setting SCTLR_EL1.UCI.
— Note —

If this sequence is not executed between writing data to a location and executing the instruction at that location, the lack of coherency between instruction caches and memory means that the instructions that are executed might be the old instruction or the updated instruction, and which is used can arbitrarily vary during execution. It must not be assumed by software, before the synchronization sequence is executed, that once the updated instruction has been seen, the old instruction will not be seen again.

B2.4.5 Preloading caches

The ARM architecture provides memory system hints PRFM, LDNP, and STNP that software can use to communicate the expected use of memory locations to the hardware. The memory system can respond by taking actions that are expected to speed up the memory accesses if they occur. The effect of these memory system hints is IMPLEMENTATION DEFINED. Typically, implementations use this information to bring the data or instruction locations into caches.

The Preload instructions are hints, and so implementations can treat them as NOPs without affecting the functional behavior of the device. The instructions cannot generate synchronous Data Abort exceptions, but the resulting memory system operations might, under exceptional circumstances, generate an asynchronous External abort, which is taken using an SError interrupt exception. For more information, see ISS encoding for an exception from a Data Abort on page D10-2460.

PrefetchHint{} defines the prefetch hint types.

The Hint_Prefetch() function signals to the memory system that memory accesses of the type hint to or from the specified address are likely to occur in the near future. The memory system might take some action to speed up the memory accesses when they do occur, such as preloading the specified address into one or more caches as indicated by the innermost cache level target and non-temporal hint stream.

For more information on PRFM and Load/Store instructions that provide hints to the memory system, see Prefetch memory on page C3-180 and Load/Store SIMD and Floating-point Non-temporal pair on page C3-178.
B2.5 Alignment support

This section describes alignment support. It contains the following subsections:

- Instruction alignment.
- Alignment of data accesses.
- Unaligned data access restrictions on page B2-110.

B2.5.1 Instruction alignment

A64 instructions must be word-aligned.

Attempting to fetch an instruction from a misaligned location results in a PC alignment fault. See PC alignment checking on page D1-1868.

B2.5.2 Alignment of data accesses

An unaligned access to any type of Device memory causes an Alignment fault.

The alignment requirements for accesses to Normal memory are as follows:

- For all instructions that load or store a single or multiple registers, other than Load-Exclusive/Store-Exclusive and Load-Acquire/Store-Release, if the address that is accessed is not aligned to the size of the data element being accessed, then one of the following occurs:
  - An Alignment fault is generated.
  - An unaligned access is performed.

When the value of SCTLR_ELx.A at the current Exception level is 1, alignment checking is enabled, and unaligned accesses generate Alignment faults.

Note

- The SCTLR_EL1.A bit applies to software running at EL0 and at EL1, although it can only be accessed from EL1 and higher.
- Alignment checks are based on the size of the accessed elements, not the overall access size. This affects SIMD element and structure loads and stores, and also Load/Store pair instructions.
- These alignment checking rules mean the ARMv8 architecture introduces requirements for 64-bit and 128-bit alignment checking.

- All Load-Exclusive/Store-Exclusive, Load-Acquire/Store-Release, and Compare and Swap memory accesses that access a single element or a pair of elements generate an Alignment fault if the address being accessed is not aligned to the size of the data structure being accessed.

A failed alignment check results in an Alignment fault, which is taken as a Data Abort exception, that is taken as follows:

- For an access from Non-secure EL0 or EL1, if the Alignment fault is generated only because the translation tables identify the address being accessed as Device memory then:
  - If the first stage of address translation marks the address as Device memory then the exception is taken to EL1.
  - If only the second stage of address translation marks the address as Device memory then the exception is taken to EL2.

- Otherwise, the exception is taken to the lowest Exception level that can handle the exception, consistent with the basic requirement that the Exception level never decreases on taking an exception. Therefore:
  - Alignment faults taken from EL0 or EL1 are taken to EL1 unless redirected by HCR_EL2.TGE.
  - Alignment faults taken from EL2 are taken to EL2.
  - Alignment faults taken from EL3 are taken to EL3.
B2.5.3 Unaligned data access restrictions

The following points apply to unaligned data accesses in ARMv8:

- Accesses are not guaranteed to be single-copy atomic except at the byte access level, see *Atomicity in the ARM architecture* on page B2-88.

- Unaligned accesses typically take a number of additional cycles to complete compared to a naturally-aligned access.

- An operation that performs an unaligned access can abort on any memory access that it makes, and can abort on more than one access. This means that an unaligned access that occurs across a page boundary can generate an abort on either side of the boundary.
B2.6 Endian support

*General description of endianness in the ARM architecture* describes the relationship between endianness and memory addressing in the ARM architecture.

The following subsections then describe the endianness schemes supported by the architecture:

- Instruction endianness on page B2-112.
- Data endianness on page B2-112.

### B2.6.1 General description of endianness in the ARM architecture

This section only describes memory addressing and the effects of endianness for data elements up to quadwords of 128 bits. However, this description can be extended to apply to larger data elements.

For an address A, Figure B2-2 shows, for big-endian and little-endian memory systems, the relationship between:

- The quadword at address A.
- The doubleword at address A and A+8.
- The words at addresses A, A+4, A+8, and A+12.
- The halfwords at addresses A, A+2, A+4, A+6, A+8, A+10, A+12, and A+14.

The terms in Figure B2-2 have the following definitions:

- **B_A**: Byte at address A.
- **HW_A**: Halfword at address A.
- **MSByte**: Most significant byte.
- **LSByte**: Least significant byte.

#### Big-endian memory system

- `B_A` is the byte at address A.
- `HW_A` is the halfword at address A.
- `MSByte` is the most significant byte.
- `LSByte` is the least significant byte.

#### Little-endian memory system

<table>

</tbody>
</table>

**Figure B2-2 Endianness relationships**
The big-endian and little-endian mapping schemes determine the order in which the bytes of a quadword, doubleword, word, or halfword are interpreted. For example, a load of a word from address 0x1000 always results in an access to the bytes at memory locations 0x1000, 0x1001, 0x1002, and 0x1003. The endianness mapping scheme determines the significance of these 4 bytes.

### B2.6.2 Instruction endianness

In ARMv8-A, A64 instructions have a fixed length of 32 bits and are always little-endian.

### B2.6.3 Data endianness

SCTLR_EL1.E0E, configurable at EL1 or higher, determines the data endianness for execution at EL0.

The data size used for endianness conversions:

- Is the size of the data value that is loaded or stored for SIMD and floating-point register and general-purpose register loads and stores.
- Is the size of the data element that is loaded or stored for SIMD element and data structure loads and stores.

For more information, see Endianness in SIMD operations on page B2-113.

---

**Note**

This means the ARMv8 architecture introduces a requirement for 128-bit endian conversions.

---

**Instructions to reverse bytes in a general-purpose register or a SIMD and floating-point register**

An application or device driver might have to interface to memory-mapped peripheral registers or shared memory structures that are not the same endianness as the internal data structures. Similarly, the endianness of the operating system might not match that of the peripheral registers or shared memory. In these cases, the PE requires an efficient method to transform explicitly the endianness of the data.

Table B2-2 shows the instructions that provide this functionality:

**Table B2-2 Byte reversal instructions**

<table>
<thead>
<tr>
<th>Function</th>
<th>Instructions</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reverse bytes in 32-bit word or words</td>
<td>REV32</td>

<td>REV16</td>
<td>For use with SIMD and floating-point registers</td>
</tr>
</tbody>
</table>

a. Can operate on multiple words.
## Endianness in SIMD operations

SIMD element Load/Store instructions transfer vectors of elements between memory and the SIMD and floating-point register file. An instruction specifies both the length of the transfer and the size of the data elements being transferred. This information is used to load and store data correctly in both big-endian and little-endian systems.

For example:

```
LD1 {V0.4H}, [X1]
```

This loads a 64-bit register with four 16-bit values. The four elements appear in the register in array order, with the lowest indexed element fetched from the lowest address. The order of bytes in the elements depends on the endianness configuration, as shown in Figure B2-3. Therefore, the order of the elements in the registers is the same regardless of the endianness configuration.

![Figure B2-3 SIMD byte order example](image)

The `BigEndian()` pseudocode function determines the current endianness of the data.

The `BigEndianReverse()` pseudocode function reverses the endianness of a bitstring.

The `BigEndian()` and `BigEndianReverse()` functions are defined in Chapter J1 *ARMv8 Pseudocode*.

### B2.6.4 Endianness of memory-mapped peripherals

All memory-mapped peripherals defined in the ARM architecture must be little-endian.

Peripherals to which this requirement applies include:

- Memory-mapped register interfaces to a debugger, or to a cross-trigger interface, see Chapter H8 *About the External Debug Registers*.

- The memory-mapped register interface to the system level implementation of the Generic Timer, see Chapter I2 *System Level Implementation of the Generic Timer*.

- A memory-mapped register interface to the Performance Monitors, see Chapter I3 *Recommended External Interface to the Performance Monitors*.

- Memory-mapped register interfaces to an ARM Generic Interface Controller, see the *ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0*.

- The memory-mapped register interface to an ARM trace component. See, for example, the *ARM® Embedded Trace Macrocell Architecture Specification, ETMv4*. 
B2.7 Memory types and attributes

In ARMv8 the ordering of accesses for addresses in memory, referred to as the memory order model, is defined by the memory attributes. The following sections describe this model:

- Normal memory.
- Device memory on page B2-118.
- Memory access restrictions on page B2-124.

B2.7.1 Normal memory

The Normal memory type attribute applies to most memory in a system. It indicates that the hardware is permitted by the architecture to perform Speculative data read accesses to these locations, regardless of the access permissions for these locations.

The Normal memory type has the following properties:

- A write to a memory location with the Normal attribute completes in finite time. This means that it is globally observed for the shareability domain of the memory location in finite time. For a Non-cacheable location, the location is observed by all observers in finite time.

- A completed write to a memory location with the Normal attribute is globally observed for the shareability domain of the memory location in finite time without the need for explicit cache maintenance instructions or barriers. For a Non-cacheable location, the completed write is globally observed for all observers in finite time without the need for explicit cache maintenance instructions or barriers.

- Writes to a memory location with the Normal memory attribute that are Non-cacheable must reach the endpoint for that location in the memory system in finite time.

- Unaligned memory accesses can access Normal memory if the system is configured to generate such accesses.

- There is no requirement for the memory system beyond the PE to be able to identify the elements accessed by multi-register Load/Store instructions. See Multi-register loads and stores that access Normal memory on page B2-118.

Note

- The Normal memory attribute is appropriate for locations of memory that are idempotent, meaning that they exhibit all of the following properties:
  - Read accesses can be repeated with no side-effects.
  - Repeated read accesses return the last value written to the resource being read.
  - Read accesses can fetch additional memory locations with no side-effects.
  - Write accesses can be repeated with no side-effects if the contents of the location accessed are unchanged between the repeated writes or as the result of an exception, as described in this section.
  - Unaligned accesses can be supported.
  - Accesses can be merged before accessing the target memory system.

- An instruction that generates a sequence of accesses as described in Atomicity in the ARM architecture on page B2-88 might be abandoned as a result of an exception being taken during the sequence of accesses. On return from the exception the instruction is_restart, and therefore, one or more of the memory locations might be accessed multiple times. This can result in repeated write accesses to a location that has been changed between the write accesses.

The following sections describe the other attributes for Normal memory:

See also:

- *Multi-register loads and stores that access Normal memory* on page B2-118.
- *Memory barriers* on page B2-98. For accesses to Normal memory, a `DMB` instruction is required to ensure the required ordering.
- *Concurrent modification and execution of instructions* on page B2-90.

**Shareable Normal memory**

A Normal memory location has a Shareability attribute that is one of:

- Inner Shareable, meaning it applies across the Inner Shareable shareability domain.
- Outer Shareable, meaning it applies across both the Inner Shareable and the Outer Shareable shareability domains.
- Non-shareable.

The shareability attributes define the data coherency requirements of the location, that hardware must enforce. They do not affect the coherency requirements of instruction fetches, see *Synchronization and coherency issues between data and instruction accesses* on page B2-107.

--- **Note** ---

- System designers can use the shareability attribute to specify the locations in Normal memory for which coherency must be maintained. However, software developers must not assume that specifying a memory location as Non-shareable permits software to make assumptions about the incoherency of the location between different PEs in a shared memory system. Such assumptions are not portable between different multiprocessing implementations that might use the shareability attribute. Any multiprocessing implementation might implement caches that are shared, inherently, between different processing elements.
- This architecture assumes that all PEs that use the same operating system or hypervisor are in the same Inner Shareable shareability domain.

---

**Shareable, Inner Shareable, and Outer Shareable Normal memory**

The ARM architecture abstracts the system as a series of Inner and Outer Shareability domains.

Each Inner Shareability domain contains a set of observers that are data coherent for each member of that set for data accesses with the Inner Shareable attribute made by any member of that set.

Each Outer Shareability domain contains a set of observers that are data coherent for each member of that set for data accesses with the Outer Shareable attribute made by any member of that set.

The following properties also hold:

- Each observer is only a member of a single Inner Shareability domain.
- Each observer is only a member of a single Outer Shareability domain.
- All observers in an Inner Shareability domain are always members of the same Outer Shareability domain. This means that an Inner Shareability domain is a subset of an Outer Shareability domain, although it is not required to be a proper subset.
Note

- Because all data accesses to Non-cacheable locations are data coherent to all observers, Non-cacheable locations are always treated as Outer Shareable.
- The Inner Shareable domain is expected to be the set of PEs controlled by a single hypervisor or operating system.

The details of the use of the shareability attributes are system-specific. Example B2-1 shows how they might be used.

Example B2-1 Use of shareability attributes

In an implementation, a particular subsystem with two clusters of PEs has the requirement that:

- In each cluster, the data caches or unified caches of the PEs in the cluster are transparent for all data accesses to memory locations with the Inner Shareable attribute.
- However, between the two clusters, the caches:
  - Are not required to be coherent for data accesses that have only the Inner Shareable attribute.
  - Are coherent for data accesses that have the Outer Shareable attribute.

In this system, each cluster is in a different shareability domain for the Inner Shareable attribute, but all components of the subsystem are in the same shareability domain for the Outer Shareable attribute.

A system might implement two such subsystems. If the data caches or unified caches of one subsystem are not transparent to the accesses from the other subsystem, this system has two Outer Shareable shareability domains.

Having two levels of shareability means system designers can reduce the performance and power overhead for shared memory locations that do not need to be part of the Outer Shareable shareability domain.

For shareable Normal memory, the Load-Exclusive and Store-Exclusive synchronization primitives take account of the possibility of accesses by more than one observer in the same Shareability domain.

Non-shareable Normal memory

For Normal memory locations, the Non-shareable attribute identifies Normal memory that is likely to be accessed only by a single PE.

A location in Normal memory with the Non-shareable attribute does not require the hardware to make data accesses by different observers coherent, unless the memory is Non-cacheable. For a Non-shareable location, if other observers share the memory system, software must use cache maintenance instructions, if the presence of caches might lead to coherency issues when communicating between the observers. This cache maintenance requirement is in addition to the barrier operations that are required to ensure memory ordering.

For Non-shareable Normal memory, it is IMPLEMENTATION DEFINED whether the Load-Exclusive and Store-Exclusive synchronization primitives take account of the possibility of accesses by more than one observer.

Cacheability attributes for Normal memory

In addition to being Outer Shareable, Inner Shareable or Non-shareable, each region of Normal memory is assigned a Cacheability attribute that is one of:

- Write-Through Cacheable.
- Write-Back Cacheable.
- Non-cacheable.
Also, for Write-Through Cacheable and Write-Back Cacheable Normal memory regions:

- A region might be assigned cache allocation hints for read and write accesses.
- It is IMPLEMENTATION DEFINED whether the cache allocation hints can have an additional attribute of Transient or Non-transient.

For more information see Cacheability, cache allocation hints, and cache transient hints on page D3-2054.

A memory location can be marked as having different cacheability attributes, for example when using aliases in a VA to PA mapping:

- If the attributes differ only in the cache allocation hint, this does not affect the behavior of accesses to that location.
- For other cases, see Mismatched memory attributes on page B2-125.

The cacheability attributes provide a mechanism of coherency control with observers that lie outside the shareability domain of a region of memory. In some cases, the use of Write-Through Cacheable or Non-cacheable regions of memory might provide a better mechanism for controlling coherency than the use of hardware coherency mechanisms or the use of cache maintenance routines. To this end, the architecture requires the following properties for Non-cacheable or Write-Through Cacheable memory:

- A completed write to a memory location that is Non-cacheable or Write-Through Cacheable for a level of cache made by an observer accessing the memory system inside the level of cache is visible to all observers accessing the memory system outside the level of cache without the need of explicit cache maintenance.
- A completed write to a memory location that is Non-cacheable for a level of cache made by an observer accessing the memory system outside the level of cache is visible to all observers accessing the memory system inside the level of cache without the need of explicit cache maintenance.
- For accesses to Normal memory that is Non-cacheable, a DMB instruction ensures that all members of Group A reach a single peripheral or block of memory, of IMPLEMENTATION DEFINED size, before any member of Group B, where:
  - The definition of the operation of a DMB instruction defines Group A and Group B, see Data Memory Barrier (DMB) on page B2-99.
  - The IMPLEMENTATION DEFINED size of the single peripheral or block of memory is defined by the peripheral or block of memory.

This applies for all types of DMB instruction.

**Note**

Implementations can use the cache allocation hints to indicate a probable performance benefit of caching. For example, a programmer might know that a piece of memory is not going to be accessed again and would be better treated as Non-cacheable. The distinction between memory regions with attributes that differ only in the cache allocation hints exists only as a hint for performance.

For Normal memory, the ARM architecture provides cacheability attributes that are defined independently for each of two conceptual levels of cache, the inner and the outer cache. The relationship between these conceptual levels of cache and the implemented physical levels of cache is IMPLEMENTATION DEFINED, and can differ from the boundaries between the Inner and Outer Shareability domains. However:

- Inner refers to the innermost caches, meaning the caches that are closest to the PE, and always includes the lowest level of cache.
- No cache that is controlled by the Inner cacheability attributes can lie outside a cache that is controlled by the Outer cacheability attributes.
- An implementation might not have any outer cache.

Example B2-2 on page B2-118, Example B2-3 on page B2-118, and Example B2-4 on page B2-118 describe the possible ways of implementing a system with three levels of cache, level 1 (L1) to level 3 (L3).
Note

- L1 cache is the level closest to the PE, see Memory hierarchy on page B2-105.
- When managing coherency, system designs must consider both the inner and outer cacheability attributes, as well as the shareability attributes. This is because hardware might have to manage the coherency of caches at one conceptual level, even when another conceptual level has the Non-cacheable attribute.

Example B2-2 Implementation with two inner and one outer cache levels

Implement the three levels of cache in the system, L1 to L3, with:
- The Inner cacheability attribute applied to L1 and L2 cache.
- The Outer cacheability attribute applied to L3 cache.

Example B2-3 Implementation with three inner and no outer cache levels

Implement the three levels of cache in the system, L1 to L3, with the Inner cacheability attribute applied to L1, L2, and L3 cache. Do not use the Outer cacheability attribute.

Example B2-4 Implementation with one inner and two outer cache levels

Implement the three levels of cache in the system, L1 to L3, with:
- The Inner cacheability attribute applied to L1 cache.
- The Outer cacheability attribute applied to L2 and L3 cache.

Multi-register loads and stores that access Normal memory

For all instructions that load or store more than one general-purpose register from an Exception level there is no requirement for the memory system beyond the PE to be able to identify the size of the elements accessed by these load or store instructions.

For all instructions that load or store more than one general-purpose register from an Exception level the order in which the registers are accessed is not defined by the architecture.

For all instructions that load or store one or more SIMD&FP registers from an Exception level, there is no requirement for the memory system beyond the PE to be able to identify the size of the element accessed by these load or store instructions.

B2.7.2 Device memory

The Device memory type attributes define memory locations where an access to the location can cause side-effects, or where the value returned for a load can vary depending on the number of loads performed. Typically, the Device memory attributes are used for memory-mapped peripherals and similar locations.

The attributes for ARMv8 Device memory are:

- **Gathering** Identified as G or nG, see Gathering on page B2-121.
- **Reordering** Identified as R or nR, see Reordering on page B2-122.
- **Early Write Acknowledgement** Identified as E or nE, see Early Write Acknowledgement on page B2-123.
The ARMv8 Device memory types are:

**Device-nGaRnE**  
Device non-Gathering, non-Reordering, No Early write acknowledgement.  
Equivalent to the Strongly-ordered memory type in earlier versions of the architecture.

**Device-nGnRE**  
Device non-Gathering, non-Reordering, Early Write Acknowledgement.  
Equivalent to the Device memory type in earlier versions of the architecture.

**Device-nGRE**  
Device non-Gathering, Reordering, Early Write Acknowledgement.  
ARMv8 adds this memory type to the translation table formats found in earlier versions of the architecture. The use of barriers is required to order accesses to Device-nGRE memory.

**Device-GRE**  
Device Gathering, Reordering, Early Write Acknowledgement.  
ARMv8 adds this memory type to the translation table formats found in earlier versions of the architecture. Device-GRE memory has the fewest constraints. It behaves similar to Normal memory, with the restriction that *Speculative* accesses to Device-GRE memory is forbidden.

Collectively these are referred to as *any Device memory type*. Going down the list, the memory types are described as getting weaker; conversely the going up the list the memory types are described as getting stronger.

--- **Note** ---

- As the list of types shows, these additional attributes are hierarchical. For example, a memory location that permits Gathering must also permit Reordering and Early Write Acknowledgement.

- The architecture does not require an implementation to distinguish between each of these memory types and ARM recognizes that not all implementations will do so. The subsection that describes each of the attributes, describes the implementation rules for the attribute.

- Earlier versions of the ARM architecture defined the following memory types:
  - Strongly-ordered memory. This is the equivalent of the Device-nGnRnE memory type.
  - Device memory. This is the equivalent of the Device-nGnRE memory type.

All of these memory types have the following properties:

- Speculative data accesses are not permitted to any memory location with any Device memory attribute. This means that each memory access to any Device memory type must be one that would be generated by a simple sequential execution of the program.

The following exceptions to this apply:

- Reads generated by the SIMD and floating-point instructions can access bytes that are not explicitly accessed by the instruction if the bytes accessed are in a 16-byte window, aligned to 16-bytes, that contains at least one byte that is explicitly accessed by the instruction.

- For Device memory with the Gathering attribute, reads generated by the LDRP instructions are permitted to access bytes that are not explicitly accessed by the instruction, provided that the bytes accessed are in a 128-byte window, aligned to 128-bytes, that contains at least one byte that is explicitly accessed by the instruction.

- Where a load or store instruction performs a sequence of memory accesses, as opposed to one single-copy atomic access as defined in the rules for single-copy atomicity, these accesses might occur multiple times as a result of executing the load or store instruction. See *Properties of single-copy atomic accesses* on page B2-89.
A write to a memory location with any Device memory attribute completes in finite time. This means that it is globally observed for all observers in the system in finite time.

A completed write to a memory location with any Device memory attribute is globally observed for all observers in finite time without the need for explicit maintenance.

Data accesses to memory locations are coherent for all observers in the system, and correspondingly are treated as being Outer Shareable.

A memory location with any Device memory attribute cannot be allocated into a cache.

Writes to a memory location with any Device memory attribute must reach the endpoint for that address in the memory system in finite time. Typically, the endpoint is a peripheral or some physical memory.

For accesses to any Device memory type, a DMB instruction ensures that all members of Group A reach a single peripheral or block of memory, of IMPLEMENTATION DEFINED size, before any member of Group B, where:

- The definition of the operation of a DMB instruction defines Group A and Group B, see Data Memory Barrier (DMB) on page B2-99.
- The IMPLEMENTATION DEFINED size of the single peripheral or block of memory is defined by the peripheral or block of memory.

This applies for all types of DMB instruction.

All accesses to memory with any Device memory attribute must be aligned. Any unaligned access generates an Alignment fault at the first stage of translation that defined the location as being Device.

In the Non-secure EL1&0 translation regime in systems where HCR_EL2.TGE==1 and HCR_EL2.DC==0, any Alignment fault that results from the fact that all locations are treated as Device is a fault at the first stage of translation. This causes ESR_EL2.ISS[24] to be 0.

Hardware does not prevent speculative instruction fetches from a memory location with any of the Device memory attributes unless the memory location is also marked as Execute-never for all Exception levels.

This means that to prevent speculative instruction fetches from memory locations with Device memory attributes, any location that is assigned any Device memory type must also be marked as Execute-never for all Exception levels. Failure to mark a memory location with any Device memory attribute as Execute-never for all Exception levels is a programming error.

See also Memory access restrictions on page B2-124.
The memory types for translation table walks cannot be defined as any Device memory type within the TCR_ELx.
For the Non-secure EL1&0 translation regime, the memory accesses made during a stage 1 translation table walk are subject to a stage 2 translation, and as a result of this second stage of translation, the accesses from the first stage translation table walk might be made to memory locations with any Device memory type. These accesses might be made speculatively. When the value of the HCR_EL2.PTW bit is 1, a stage 2 permission fault is generated if a first stage translation table walk is made to any Device memory type.

**Note**
In general, making a translation table walk to any Device memory type is the result of a programming error.

For instruction fetches, if branches cause the program counter to point to an area of memory with the Device attribute which is not marked as Execute-never for the current Exception level, an implementation can either:
- Treat the instruction fetch as if it were to a memory location with the Normal Non-cacheable attribute.
- Take a Permission fault.

### Gathering
In the Device memory attribute:
- G Indicates that the location has the Gathering attribute.
- nG Indicates that the location does not have the Gathering attribute, meaning it is non-Gathering.

The Gathering attribute determines whether it is permissible for either:
- Multiple memory accesses of the same type, read or write, to the same memory location to be merged into a single transaction.
- Multiple memory accesses of the same type, read or write, to different memory locations to be merged into a single memory transaction on an interconnect.

**Note**
This also applies to writebacks from the cache, whether caused by a Natural eviction or as a result of a cache maintenance instruction.

For memory types with the Gathering attribute, either of these behaviors is permitted, provided that the ordering and coherency rules of the memory location are followed.

For memory types with the non-Gathering attribute, neither of these behaviors is permitted. As a result:
- The number of memory accesses that are made corresponds to the number that would be generated by a simple sequential execution of the program.
- All accesses occur at their programmed size, except that there is no requirement for the memory system beyond the PE to be able to identify the elements accessed by multi-register Load/Store instructions. See Multi-register loads and stores that access Device memory on page B2-124.

Gathering between memory accesses separated by a memory barrier that affects those memory accesses is not permitted. This applies if one memory access is in Group A and one memory access is in Group B. That is, gathering is not permitted between a memory access in Group A and a memory access in Group B if the two accesses are separated by a barrier that affects at least one of the accesses.

Gathering between two memory accesses generated by a Load-Acquire/Store-Release is not permitted.

A read from a memory location with the non-Gathering attribute cannot come from a cache or a buffer, but must come from the endpoint for that address in the memory system. Typically this is a peripheral or physical memory.
Note

A read from a memory location with the Gathering attribute can come from intermediate buffering of a previous write, provided that:

- The accesses are not separated by a DMB or DSB barrier that affects both of the accesses, for example if one access is in Group A and the other is in Group B.
- The accesses are not separated by other ordering constructions that require that the accesses are in order. Such a construction might be a combination of Load-Acquire and Store-Release.
- The accesses are not generated by a Store-Release instruction.

The ARM architecture only defines programmer visible behavior. Therefore, gathering can be performed if a programmer cannot tell whether gathering has occurred.

An implementation is permitted to perform an access with the Gathering attribute in a manner consistent with the requirements specified by the non-Gathering attribute.

Reordering

In the Device memory attribute:

R

Indicates that the location has the Reordering attribute. Accesses to the location can be reordered within the same rules that apply to accesses to Normal Non-cacheable memory. All memory types with the Reordering attribute have the same ordering rules as accesses to Normal Non-cacheable memory, see Ordering relations on page B2-95.

nR

Indicates that the location does not have the Reordering attribute, meaning it is non-Reordering.

Note

Some interconnect fabrics, such as PCIe, perform very limited re-ordering, which is not important for the software usage. It is outside the scope of the ARM architecture to prohibit the use of a non-Reordering memory type with these interconnects.

For all memory types with the non-Reordering attribute, the order of memory accesses arriving at a single peripheral of IMPLEMENTATION DEFINED size, as defined by the peripheral, must be the same order that occurs in a simple sequential execution of the program. That is, the accesses appear in program order. This ordering applies to all accesses using any of the memory types with the non-Reordering attribute. As a result, if there is a mixture of Device-nGnRE and Device-nGnRnE accesses to the same peripheral, these occur in program order. If the memory accesses are not to a peripheral, then this attribute imposes no restrictions.

Note

The IMPLEMENTATION DEFINED size of the single peripheral is the same as applies for the ordering guarantee provided by the DMB instruction.

The ARM architecture only defines programmer visible behavior. Therefore, reordering can be performed if a programmer cannot tell whether reordering has occurred.

An implementation:

- Is permitted to perform an access with the Reordering attribute in a manner consistent with the requirements specified by the non-Reordering attribute.
- Is not permitted to perform an access with the non-Reordering attribute in a manner consistent with the relaxations allowed by the Reordering attribute.
The non-Reordering attribute does not require any additional ordering, other than that which applies to Normal memory, between:

- Accesses with the non-Reordering attribute and accesses with the Reordering attribute.
- Accesses with the non-Reordering attribute and accesses to Normal memory.
- Accesses with the non-Reordering attribute and accesses to different peripherals of IMPLEMENTATION DEFINED size.

The non-Reordering attribute has no effect on the ordering of cache maintenance instructions, even if the memory location specified in the instruction has the non-Reordering attribute.

**Early Write Acknowledgement**

In the Device memory attribute:

- E Indicates that the location has the Early Write Acknowledgement attribute.
- nE Indicates that the location has the No Early Write Acknowledgement attribute.

For memory system endpoints where the system architecture in which the PE is operating requires that acknowledgement of a write comes from the endpoint, assigning the No Early Write Acknowledgement attribute to a Device memory location guarantees that:

- Only the endpoint of the write access returns a write acknowledgement of the access.
- No earlier point in the memory system returns a write acknowledgement.

This means that a DSB barrier instruction, executed by the PE that performed the write to the No Early Write Acknowledgement Location, completes only after the write has reached its endpoint in the memory system.

Peripherals are an example of system endpoints that require that the acknowledgement of a write comes from the endpoint.

---

**Note**

- The Early Write Acknowledgement attribute only affects where the endpoint acknowledgement is returned from, and does not affect the ordering of arrival at the endpoint between accesses, which is determined by either the Device Reordering attribute, or the use of barriers to create order.

- The areas of the physical memory map for which write acknowledgement from the endpoint is required is outside the scope of the ARM Architecture definition and must be defined as part of the system architecture in which the PE is operating. In particular, regions of memory handled as PCIe configuration writes are expected to support write acknowledgement from the endpoint.

- ARM recognizes that not all areas of a physical memory map will be capable of supporting write acknowledgement from the endpoint. In particular, ARM expects that regions of memory handled as posted writes under PCIe will not support write acknowledgement from the endpoint.

- For maximum software compatibility, ARM strongly recommends that all peripherals for which standard software drivers expect that the use of a DSB instruction will determine that a write has reached its endpoint are placed in areas of the physical memory map that support write acknowledgement from the endpoint.
Multi-register loads and stores that access Device memory

For all instructions that load or store more than one general-purpose register from an Exception level there is no requirement for the memory system beyond the PE to be able to identify the size of the elements accessed by these load or store instructions.

For all instructions that load or store more than one general-purpose register from an Exception level the order in which the registers are accessed is not defined by the architecture. This applies even to accesses to any type of Device memory.

For all instructions that load or store one or more floating-point and SIMD registers from an Exception level, there is no requirement for the memory system beyond the PE to be able to identify the size of the element accessed by these load or store instructions, even for access to any type of Device memory.

B2.7.3 Memory access restrictions

The following restrictions apply to memory accesses:

- For accesses to any two bytes, \( p \) and \( q \), that are generated by the same instruction:
  - The bytes \( p \) and \( q \) must have the same memory type and shareability attributes, otherwise the results are CONSTRAINED UNPREDICTABLE. For example, an LD1, ST1, or an unaligned load or store that spans the boundary between Normal memory and Device memory is CONSTRAINED UNPREDICTABLE.
  - Except for possible differences in the cache allocation hints, ARM deprecates having different cacheability attributes for bytes \( p \) and \( q \).

  For the permitted CONSTRAINED UNPREDICTABLE behavior, see Crossing a page boundary with different memory types or Shareability attributes on page K1-6417.

- If the accesses of an instruction that causes multiple accesses to any type of Device memory cross an address boundary that corresponds to the smallest implemented translation granule, then behavior is CONSTRAINED UNPREDICTABLE, and Crossing a peripheral boundary with a Device access on page K1-6417 describes the permitted behaviors. For this reason, it is important that an access to a volatile memory device is not made using a single instruction that crosses an address boundary of the size of the smallest implemented translation granule.

  Note
  - The boundary referred to is between two Device memory regions that are both of the size of the smallest implemented translation granule and aligned to the size of the smallest implemented translation granule.
  - This restriction means it is important that an access to a volatile memory device is not made using a single instruction that crosses an address boundary of the size of the smallest implemented translation granule.
  - ARM expects this restriction to constrain the placing of volatile memory devices in the system memory map, rather than expecting a compiler to be aware of the alignment of memory accesses.
B2.8 Mismatched memory attributes

Memory attributes are controlled by privileged software. For more information, see Chapter D4 The AArch64 Virtual Memory System Architecture.

Physical memory locations are accessed with mismatched attributes if all accesses to the location do not use a common definition of all of the following attributes of that location:

- Memory type, Device or Normal.
- Shareability.
- Cacheability, for the same level of the inner or outer cache, but excluding any cache allocation hints.

Collectively these are referred to as memory attributes.

--- Note ---

In this document, the terms location and memory location refer to any byte within the current coherency granule and are used interchangeably.

---

When a memory Location is accessed with mismatched attributes, the only software visible effects are one or more of the following:

- Uniprocessor semantics for reads and writes to that memory Location might be lost. This means:
  - A read of the memory Location by one agent might not return the value most recently written to that memory Location by the same agent.
  - Multiple writes to the memory Location by one agent with different memory attributes might not be ordered in program order.

- There might be a loss of coherency when multiple agents attempt to access a memory Location.

- There might be a loss of properties derived from the memory type, as described in later bullets in this section.

- If all Load-Exclusive/Store-Exclusive instructions executed across all threads to access a given memory Location do not use consistent memory attributes, the Exclusives monitor state becomes UNKNOWN.

- Bytes written without the Write-Back cacheable attribute within the same Write-Back granule as bytes written with the Write-Back cacheable attribute might have their values reverted to the old values as a result of cache Write-Back.

The loss of properties associated with mismatched memory type attributes refers only to the following properties of Device memory that are additional to the properties of Normal memory:

- Prohibition of Speculative read accesses.
- Prohibition on Gathering.
- Prohibition on Re-ordering.

For the following situations, when a physical memory Location is accessed with mismatched attributes, a more restrictive set of behaviors applies. The description of each situation also describes the behaviors that apply:

1. If the only memory type mismatch associated with a memory Location across all users of the memory Location is between different types of Device memory, then all accesses might take the properties of the weakest Device memory type.

2. Any agent that reads that memory Location using the same common definition of the Shareability and Cacheability attributes is guaranteed to access it coherently, to the extent required by that common definition of the memory attributes, only if all the following conditions are met:

   - All writes are performed to an alias of the memory Location that uses the same definition of the Shareability and Cacheability attributes.

   - Either:
     - In the Non-secure EL1&0 translation regime, HCR_EL2.MIOCNCE has a value of 0.
     - All aliases with write permission have the Inner Cacheability attribute the same as the Outer Cacheability attribute.
B2.8 Mismatched memory attributes

• Either:
  — All writes are performed to an alias of the memory Location that has Inner Cacheability and Outer Cacheability attributes both as Non-cacheable.
  — All aliases to a memory Location use a definition of the Shareability attributes that encompasses all the agents with permission to access the Location.

3. The possible software-visible effects caused by mismatched attributes for a memory Location are defined more precisely if all of the mismatched attributes define the memory Location as one of:
   • Any Device memory type.
   • Normal Inner Non-cacheable, Outer Non-cacheable memory.

In these cases, the only permitted software-visible effects of the mismatched attributes are one or more of the following:
   • Possible loss of properties derived from the memory type when multiple agents attempt to access the memory Location.
   • Possible reordering of memory transactions to the same memory Location with different memory attributes, potentially leading to a loss of coherency or uniprocessor semantics. Any possible loss of coherency or uniprocessor semantics can be avoided by inserting DMB barrier instructions between accesses to the same memory Location that might use different attributes.

Where there is a loss of the uniprocessor semantics, ordering, or coherency, the following approaches can be used:

1. If the mismatched attributes for a memory location all assign the same shareability attribute to a Location that has a cacheable attribute, any loss of uniprocessor semantics, ordering, or coherency within a shareability domain can be avoided by use of software cache management. To do so, software must use the techniques that are required for the software management of the ordering or coherency of cacheable Locations between agents in different shareability domains. This means:
   • Before writing to a cacheable Location not using the Write-Back attribute, software must invalidate, or clean, a Location from the caches if any agent might have written to the Location with the Write-Back attribute. This avoids the possibility of overwriting the Location with stale data.
   • After writing to a cacheable Location with the Write-Back attribute, software must clean the Location from the caches, to make the write visible to external memory.
   • Before reading the Location with a cacheable attribute, software must invalidate, or clean and invalidate, the Location from the caches, to ensure that any value held in the caches reflects the last value made visible in external memory.
   • Executing a DMB barrier instruction, with scope that applies to the common shareability of the accesses, between any accesses to the same cacheable Location that use different attributes.

In all cases:
   • Location refers to any byte within the current coherency granule.
   • A clean and invalidate instruction can be used instead of a clean instruction, or instead of an invalidate instruction.
   • In the sequences outlined in this section, all cache maintenance instructions and memory transactions must be completed, or ordered by the use of barrier operations, if they are not naturally ordered by the use of a common address, see Ordering and completion of data and instruction cache instructions on page D3-2069.

    Note
    With software management of coherency, race conditions can cause loss of data. A race condition occurs when different agents write simultaneously to bytes that are in the same Location, and the invalidate, write, clean sequence of one agent overlaps with the equivalent sequence of another agent. A race condition also occurs if the first operation of either sequence is a clean, rather than an invalidate.
2. If the mismatched attributes for a Location mean that multiple cacheable accesses to the Location might be made with different shareability attributes, then uniprocessor semantics, ordering, and coherency are guaranteed only if:

- Each PE that accesses the Location with a cacheable attribute performs a clean and invalidate of the Location before and after accessing that Location.
- A DMB barrier with scope that covers the full shareability of the accesses is placed between any accesses to the same memory Location that use different attributes.

**Note**

The Note in rule 1 of this list, about possible race conditions, also applies to this rule.

In addition, if multiple agents attempt to use Load-Exclusive or Store-Exclusive instructions to access a Location, and the accesses from the different agents have different memory attributes associated with the Location, the Exclusives monitor state becomes UNKNOWN.

ARM strongly recommends that software does not use mismatched attributes for aliases of the same Location. An implementation might not optimize the performance of a system that uses mismatched aliases.
B2.9 Synchronization and semaphores

ARMv8 provides non-blocking synchronization of shared memory, using synchronization primitives. The information in this section about memory accesses by synchronization primitives applies to accesses to both Normal memory and to any type of Device memory.

Note
Use of the ARMv8 synchronization primitives scales for multiprocessing system designs.

Table B2-3 shows the synchronization primitives and the associated CLREX instruction.

a. Instruction in the A64 instruction set.
b. A register instruction operates on a doubleword if accessing an X register, or on a word if accessing a W register. A pair instruction operates on two doublewords if accessing X registers, or on two words if accessing W registers.

Except for the row showing the CLREX instruction, the two instructions in a single row are a Load-Exclusive/Store-Exclusive instruction pair. The model for the use of a Load-Exclusive/Store-Exclusive instruction pair accessing a non-aborting memory address \( x \) is:

- The Load-Exclusive instruction reads a value from memory address \( x \).
- The corresponding Store-Exclusive instruction succeeds in writing back to memory address \( x \) only if no other observer, process, or thread has performed a more recent store to address \( x \). The Store-Exclusive instruction returns a status bit that indicates whether the memory write succeeded.

A Load-Exclusive instruction marks a small block of memory for exclusive access. The size of the marked block is IMPLEMENTATION DEFINED, see Marking and the size of the marked memory block on page B2-134. A Store-Exclusive instruction to any address in the marked block clears the marking.

Note
In this section, the term PE includes any observer that can generate a Load-Exclusive or a Store-Exclusive instruction.

The following sections give more information:

- Exclusive access instructions and Non-shareable memory locations on page B2-129.
- Exclusive access instructions and Shareable memory locations on page B2-131.
- Marking and the size of the marked memory block on page B2-134.
- Context switch support on page B2-134.
B2.9 Synchronization and semaphores

B2.9.1 Exclusive access instructions and Non-shareable memory locations

For memory locations for which the shareability attribute is Non-shareable, the exclusive access instructions rely on a local Exclusives monitor, or local monitor, that marks any address from which the PE executes a Load-Exclusive instruction. Any non-aborted attempt by the same PE to use a Store-Exclusive instruction to modify any address is guaranteed to clear the marking.

A Load-Exclusive instruction performs a load from memory, and:
- The executing PE marks the physical memory address for exclusive access.
- The local monitor of the executing PE transitions to the Exclusive Access state.

A Store-Exclusive instruction performs a conditional store to memory that depends on the state of the local monitor:

If the local monitor is in the Exclusive Access state
- If the address of the Store-Exclusive instruction is the same as the address that has been marked in the monitor by an earlier Load-Exclusive instruction, then the store occurs. Otherwise, it is IMPLEMENTATION DEFINED whether the store occurs.
- A status value is returned to a register:
  - If the store took place, the status value is 0.
  - Otherwise, the status value is 1.
- The local monitor of the executing PE transitions to the Open Access state.

When an Exclusives monitor is in the Exclusive Access state, the monitor is set.

If the local monitor is in the Open Access state
- No store takes place.
- A status value of 1 is returned to a register.
- The local monitor remains in the Open Access state.

When an Exclusives monitor is in the Open Access state, the monitor is clear.

The Store-Exclusive instruction defines the register to which the status value is returned.

When a PE writes using any instruction other than a Store-Exclusive instruction:

- If the write is to a PA that is not marked as Exclusive Access by its local monitor and that local monitor is in the Exclusive Access state, it is IMPLEMENTATION DEFINED whether the write affects the state of the local monitor.
- If the write is to a PA that is marked as Exclusive Access by its local monitor, it is IMPLEMENTATION DEFINED whether the write affects the state of the local monitor.

It is IMPLEMENTATION DEFINED whether a store to a marked PA causes a mark in the local monitor to be cleared if that store is by an observer other than the one that caused the PA to be marked.

Figure B2-4 on page B2-130 shows the state machine for the local monitor and the effect of each of the operations shown in the figure.
Figure B2-4  Local monitor state machine diagram

For more information about marking, see Marking and the size of the marked memory block on page B2-134.

--- Note ---

For the local monitor state machine, as shown in Figure B2-4:

- The IMPLEMENTATION DEFINED options for the local monitor are consistent with the local monitor being constructed so that it does not hold any PA, but instead treats any access as matching the address of the previous Load-Exclusive instruction.

- A local monitor implementation can be unaware of Load-Exclusive and Store-Exclusive instructions from other PEs.

- The architecture does not require a load instruction by another PE, that is not a Load-Exclusive instruction, to have any effect on the local monitor.

- It is IMPLEMENTATION DEFINED whether the transition from Exclusive Access to Open Access state occurs when the Store or StoreExcl is from another observer.

Changes to the local monitor state resulting from speculative execution

The architecture permits a local monitor to transition to the Open Access state as a result of speculation, or from some other cause. This is in addition to the transitions to Open Access state caused by the architectural execution of an operation shown in Figure B2-4.

An implementation must ensure that:

- The local monitor cannot be seen to transition to the Exclusive Access state except as a result of the architectural execution of one of the operations shown in Figure B2-4.

- Any transition of the local monitor to the Open Access state not caused by the architectural execution of an operation shown in Figure B2-4 must not indefinitely delay forward progress of execution.
B2.9.2 Exclusive access instructions and Shareable memory locations

In the context of this section, a shareable memory location is a memory location that has, or is treated as if it has, a Shareability attribute of Inner Shareable or Outer Shareable.

For shareable memory locations, exclusive access instructions rely on:

- A local monitor for each PE in the system, that marks any address from which the PE executes a Load-Exclusive. The local monitor operates as described in Exclusive access instructions and Non-shareable memory locations on page B2-129, except that for shareable memory any Store-Exclusive is then subject to checking by the global monitor if it is described in that section as doing at least one of the following:
  — Updating memory.
  — Returning a status value of 0.

  The local monitor can ignore accesses from other PEs in the system.

- A global monitor that marks a PA as exclusive access for a particular PE. This marking is used later to determine whether a Store-Exclusive to that address that has not been failed by the local monitor can occur. Any successful write to the marked block by any other observer in the shareability domain of the memory location is guaranteed to clear the marking. For each PE in the system, the global monitor:
  — Can hold at least one marked block.
  — Maintains a state machine for each marked block it can hold.

  Note
  For each PE, the architecture only requires global monitor support for a single marked address. Any situation that might benefit from the use of multiple marked addresses on a single PE is UNPREDICTABLE or CONSTRAINED UNPREDICTABLE, see Load-Exclusive and Store-Exclusive instruction usage restrictions on page B2-135.

  Note
  The global monitor can either reside within the PE, or exist as a secondary monitor at the memory interfaces. The IMPLEMENTATION DEFINED aspects of the monitors mean that the global monitor and local monitor can be combined into a single unit, provided that the unit performs the global monitor and local monitor functions defined in this manual.

For shareable memory locations, in some implementations and for some memory types, the properties of the global monitor require functionality outside the PE. Some system implementations might not implement this functionality for all locations of memory. In particular, this can apply to:

- Any type of memory in the system implementation that does not support hardware cache coherency.
- Non-cacheable memory, or memory treated as Non-cacheable, in an implementation that does support hardware cache coherency.

In such a system, it is defined by the system:

- Whether the global monitor is implemented.
- If the global monitor is implemented, which address ranges or memory types it monitors.

  Note
  To support the use of the Load-Exclusive/Store-Exclusive mechanism when address translation is disabled, a system might define at least one location of memory, of at least the size of the translation granule, in the system memory map to support the global monitor for all ARM PEs within a common Inner Shareable domain. However, this is not an architectural requirement. Therefore, architecturally-compliant software that requires mutual exclusion must not rely on using the Load-Exclusive/Store-Exclusive mechanism, and must instead use a software algorithm such as Lamport’s Bakery algorithm to achieve mutual exclusion.
Because implementations can choose which memory types are treated as Non-cacheable, the only memory types for which it is architecturally guaranteed that a global Exclusives monitor is implemented are:

- Inner Shareable, Inner Write-Back, Outer Write-Back Normal memory with Read allocation hints and Write allocation hints and not transient.
- Outer Shareable, Inner Write-Back, Outer Write-Back Normal memory with Read allocation hints and Write allocation hints and not transient.

If the global monitor is not implemented for an address range or memory type, then performing a Load-Exclusive or a Store-Exclusive instruction to such a location has one or more of the following effects:

- The instruction generates an External abort.
- The instruction generates an IMPLEMENTATION DEFINED MMU fault. This is reported using the Data Abort Fault status code of ESR_ELx.DFSC = 110101.
  
  If the IMPLEMENTATION DEFINED MMU fault is generated for the Non-secure EL1&0 translation regime then:
  - If the fault is generated because of the memory type defined in the first stage of translation, or if the second stage of translation is disabled, then this is a first stage fault and the exception is taken to EL1.
  - Otherwise, the fault is a second stage fault and the exception is taken to EL2.
  
  The priority of this fault is IMPLEMENTATION DEFINED.
- The instruction is treated as a NOP.
- The Load-Exclusive instruction is treated as if it were accessing a Non-shareable location, but the state of the local monitor becomes UNKNOWN.
- The Store-Exclusive instruction is treated as if it were accessing a Non-shareable location, but the state of the local monitor becomes UNKNOWN. In this case, if the store exclusive instruction is a store exclusive pair of 64-bit quantities, then the two quantities being stored might not be stored atomically.
- The value held in the result register of the Store-Exclusive instruction becomes UNKNOWN.

In addition, for write transactions generated by non-PE observers that do not implement exclusive accesses or other atomic access mechanisms, the effect that writes have on the global and local monitors used by ARM PEs is IMPLEMENTATION DEFINED. The writes might not clear the global monitors of other PEs for:

- Some address ranges.
- Some memory types.

**Operation of the global Exclusives monitor**

A Load-Exclusive instruction from shareable memory performs a load from memory, and causes the PA of the access to be marked as exclusive access for the requesting PE. This access can also cause the exclusive access mark to be removed from any other PA that has been marked by the requesting PE.

---

**Note**

The global monitor only supports a single outstanding exclusive access to shareable memory per PE.

---

A Load-Exclusive instruction by one PE has no effect on the global monitor state for any other PE.

A Store-Exclusive instruction performs a conditional store to memory:

- The store is guaranteed to succeed only if the PA accessed is marked as exclusive access for the requesting PE and both the local monitor and the global monitor state machines for the requesting PE are in the Exclusive Access state. In this case:
  - A status value of 0 is returned to a register to acknowledge the successful store.
  - The final state of the global monitor state machine for the requesting PE is IMPLEMENTATION DEFINED.
  - If the address accessed is marked for exclusive access in the global monitor state machine for any other PE, then that state machine transitions to Open Access state.
• If no address is marked as exclusive access for the requesting PE, the store does not succeed:
  — A status value of 1 is returned to a register to indicate that the store failed.
  — The global monitor is not affected and remains in Open Access state for the requesting PE.

• If a different PA is marked as exclusive access for the requesting PE, it is IMPLEMENTATION DEFINED whether the store succeeds or not:
  — If the store succeeds a status value of 0 is returned to a register, otherwise a value of 1 is returned.
  — If the global monitor state machine for the PE was in the Exclusive Access state before the Store-Exclusive instruction it is IMPLEMENTATION DEFINED whether that state machine transitions to the Open Access state.

The Store-Exclusive instruction defines the register to which the status value is returned.

In a shared memory system, the global monitor implements a separate state machine for each PE in the system. The state machine for accesses to shareable memory by PE(n) can respond to all the shareable memory accesses visible to it. This means that it responds to:
• Accesses generated by PE(n).
• Accesses generated by the other observers in the shareability domain of the memory location. These accesses are identified as (!n).

In a shared memory system, the global monitor implements a separate state machine for each observer that can generate a Load-Exclusive or a Store-Exclusive instruction in the system.

A global monitor:
• In the Exclusive Access state is set.
• In the Open Access state is clear.

Clear global monitor event

Whenever the global monitor state for a PE changes from Exclusive access to Open access, an event is generated and held in the Event register for that PE. This register is used by the Wait for Event mechanism, see Mechanisms for entering a low-power state on page D1-1954.

Figure B2-5 shows the state machine for PE(n) in a global monitor.

Figure B2-5 Global monitor state machine diagram for PE(n) in a multiprocessor system

For more information about marking, see Marking and the size of the marked memory block on page B2-134.
Note

For the global monitor state machine, as shown in Figure B2-5 on page B2-133:

- The architecture does not require a load instruction by another PE, that is not a Load-Exclusive instruction, to have any effect on the global monitor.

- Whether a Store-Exclusive instruction successfully updates memory or not depends on whether the address accessed matches the marked shareable memory address for the PE issuing the Store-Exclusive instruction, and whether the local and global monitors are in the exclusive state. For this reason, Figure B2-5 on page B2-133 only shows how the operations by \( (n) \) cause state transitions of the state machine for PE\((n) \).

- A Load-Exclusive instruction can only update the marked shareable memory address for the PE issuing the Load-Exclusive instruction.

- When the global monitor is in the Exclusive Access state, it is IMPLEMENTATION DEFINED whether a CLREX instruction causes the global monitor to transition from Exclusive Access to Open Access state.

  - It is IMPLEMENTATION DEFINED:
    - Whether a modification to a Non-shareable memory location can cause a global monitor to transition from Exclusive Access to Open Access state.
    - Whether a Load-Exclusive instruction to a Non-shareable memory location can cause a global monitor to transition from Open Access to Exclusive Access state.

B2.9.3 Marking and the size of the marked memory block

When a Load-Exclusive instruction is executed, the resulting marked block ignores the least significant bits of the 64-bit memory address.

When a Load-Exclusive instruction is executed, a marked block of size \( 2^a \) bytes is created by ignoring the least significant bits of the memory address. A marked address is any address within this marked block. The size of the marked memory block is called the Exclusives reservation granule. The Exclusives reservation granule is IMPLEMENTATION DEFINED in the range 4-512 words.

Note

This definition means that the Exclusives reservation granule is:

- 4 words in an implementation where \( a = 4 \).
- 512 words in an implementation where \( a = 11 \).

For example, in an implementation where \( a = 4 \), a successful LD\(XR\) of address \( 0x341B4 \) defines a marked block using bits\([47:4]\) of the address. This means that the four words of memory from \( 0x341B0 \) to \( 0x341BF \) are marked for exclusive access.

In some implementations the CTR identifies the Exclusives reservation granule, see CTR_EL0. Otherwise, software must assume that the maximum Exclusives reservation granule, 512 words, is implemented.

B2.9.4 Context switch support

An exception return clears the local monitor. As a result, performing a CLREX instruction as part of a context switch is not required in most situations.

Note

Context switching is not an application level operation. However, this information is included here to complete the description of the exclusive operations.
B2.9.5 Load-Exclusive and Store-Exclusive instruction usage restrictions

The Load-Exclusive and Store-Exclusive instructions are intended to work together as a pair, for example a LDXP/STXP pair or a LDXR/STXR pair. To support different implementations of these functions, software must follow the notes and restrictions given here.

The following notes describe the use of a LoadExcl/StoreExcl instruction pair, to indicate the use of any of the Load-Exclusive/Store-Exclusive instruction pairs shown in Table B2-3 on page B2-128. In this context, a LoadExcl/StoreExcl pair comprises two instructions in the same thread of execution:

- The exclusives support a single outstanding exclusive access for each PE thread that is executed. The architecture makes use of this by not requiring an address or size check as part of the IsExclusiveLocal() function. If the target VA of a StoreExcl is different from the VA of the preceding LoadExcl instruction in the same thread of execution, behavior can be CONSTRAINED UNPREDICTABLE with the following behavior:
  - The StoreExcl either passes or fails, the status value returned by the StoreExcl is UNKNOWN, and the states of the local and global monitors for that PE are UNKNOWN.
  
  Note
  This means the StoreExcl might pass for some instances of a LoadExcl/StoreExcl pair with mismatched addresses, and fail for other instances of a LoadExcl/StoreExcl pair with mismatched addresses.

  — The data at the address accessed by the LoadExcl, and at the address accessed by the StoreExcl, is UNKNOWN.

This means software can rely on a LoadExcl/StoreExcl pair to eventually succeed only if the LoadExcl and the StoreExcl are executed with the same VA.

- An implementation of the Load-Exclusive and Store-Exclusive instructions can require that, in any thread of execution, the transaction size of a StoreExcl instruction is the same as the transaction size of the preceding LoadExcl instruction executed in that thread. If the transaction size of a StoreExcl instruction is different from the preceding LoadExcl instruction in the same thread of execution, behavior can be CONSTRAINED UNPREDICTABLE with the following behavior:
  - The StoreExcl either passes or fails, and the status value returned by the StoreExcl is UNKNOWN.
  
  Note
  This means the StoreExcl might pass for some instances of a LoadExcl/StoreExcl pair with mismatched transaction sizes, and fail for other instances of a LoadExcl/StoreExcl pair with mismatched transaction sizes.

  — The block of data of the size of the larger of the transaction sizes used by the LoadExcl/StoreExcl pair at the address accessed by the LoadExcl/StoreExcl pair, is UNKNOWN.

This means software can rely on a LoadExcl/StoreExcl pair to eventually succeed only if the LoadExcl and the StoreExcl have the same transaction size.

- An implementation of the LoadExcl and StoreExcl instructions can require that, in any thread of execution, the StoreExcl instruction accesses the same number of registers as the preceding LoadExcl instruction executed in that thread. If the StoreExcl instruction accesses a different number of registers than the preceding LoadExcl instruction in the same thread of execution, behavior is CONSTRAINED UNPREDICTABLE. As a result, software can rely on an LoadExcl/StoreExcl pair to eventually succeed only if they access the same number of registers. For more information, see CONSTRAINED UNPREDICTABLE behavior when Load-Exclusive/Store-Exclusive access a different number of registers on page B2-137.

- LoadExcl/StoreExcl loops are guaranteed to make forward progress only if, for any LoadExcl/StoreExcl loop within a single thread of execution, the software meets all of the following conditions:
  
  1. Between the Load-Exclusive and the Store-Exclusive, there are no explicit memory accesses, preloads, direct or indirect System register writes, address translation instructions, cache or TLB maintenance instructions, exception generating instructions, exception returns, or indirect branches.
Between the Store-Exclusive returning a failing result and the retry of the corresponding Load-Exclusive:

- There are no stores or PRFM instructions to any address within the Exclusives reservation granule accessed by the Store-Exclusive.
- There are no loads or preloads to any address within the Exclusives reservation granule accessed by the Store-Exclusive that use a different VA alias to that address.
- There are no direct or indirect System register writes, address translation instructions, cache or TLB maintenance instructions, exception generating instructions, exception returns, or indirect branches.
- All loads and stores are to a block of contiguous virtual memory of not more than 512 bytes in size.

The Exclusives monitor can be cleared at any time without an application-related cause, provided that such clearing is not systematically repeated so as to prevent the forward progress in finite time of at least one of the threads that is accessing the Exclusives monitor. However, it is permissible for the LoadExcl/StoreExcl loop not to make forward progress if a different thread is repeatedly doing any of the following in a tight loop:

- Performing stores to a PA covered by the Exclusives monitor.
- Prefetching with intent to write to a PA covered by the Exclusives monitor.
- Executing data cache clean, data cache invalidate, or data cache clean and invalidate instructions to a PA covered by the Exclusives monitor.
- Executing instruction cache invalidate all instructions.
- Executing instruction cache invalidate by VA instructions to a PA covered by the Exclusives monitor.

- Implementations can benefit from keeping the LoadExcl and StoreExcl operations close together in a single thread of execution. This minimizes the likelihood of the Exclusives monitor state being cleared between the LoadExcl instruction and the StoreExcl instruction. Therefore, for best performance, ARM strongly recommends a limit of 128 bytes between LoadExcl and StoreExcl instructions in a single thread of execution.

- The architecture sets an upper limit of 2048 bytes on the Exclusives reservation granule that can be marked as exclusive. For performance reasons, ARM recommends that objects that are accessed by exclusive accesses are separated by the size of the Exclusives reservation granule. This is a performance guideline rather than a functional requirement.

- After taking a Data Abort exception, the state of the Exclusives monitors is UNKNOWN.

- For the memory location accessed by a LoadExcl/StoreExcl pair, if the memory attributes for a StoreExcl instruction are different from the memory attributes for the preceding LoadExcl instruction in the same thread of execution, behavior is CONSTRAINED UNPREDICTABLE. Where this occurs because the translation of the accessed address changes between the LoadExcl instruction and the StoreExcl instruction, the CONSTRAINED UNPREDICTABLE behavior is as follows:
  - The StoreExcl either passes or fails, and the status value returned by the StoreExcl is UNKNOWN.

  **Note**

  This means the StoreExcl might pass for some instances of a LoadExcl/StoreExcl pair with changed memory attributes, and fail for other instances of a LoadExcl/StoreExcl pair with changed memory attributes.

  **Note**

  The data at the address accessed by the StoreExcl is UNKNOWN.

Another bullet point in this list covers the case where the memory attributes of a LoadExcl/StoreExcl pair differ as a result of using different VAs with different attributes that point to the same PA.
The effect of a data or unified cache invalidate, clean, or clean and invalidate instruction on a local or global Exclusives monitor that is in the Exclusive Access state is CONSTRAINED UNPREDICTABLE, and the instruction might clear the monitor, or it might leave it in the Exclusive Access state. For address-based maintenance instructions, this also applies to the monitors of other PEs in the same shareability domain as the PE executing the cache maintenance instruction, as determined by the shareability domain of the address being maintained.

**Note**

ARM strongly recommends that implementations ensure that the use of such maintenance instructions by a PE in the Non-secure state cannot cause a denial of service on a PE in the Secure state.

If the mapping of the VA to PA is changed between the LoadExc1 instruction and the StoreExc1 instruction, and the change is performed using a break-before-make sequence as described in *Using break-before-make when updating translation table entries on page D4-2208*, if the StoreExc1 is performed after another write to the same PA as the StoreExc1, and that other write was performed after the old translation was properly invalidated and that invalidation was properly synchronized, then the StoreExc1 will not pass its monitor check.

**Note**

ARM expects that, in many implementations, either:

- The TLB invalidation will clear either the local or global monitor.
- The PA will be checked between the LoadExc1 and StoreExc1.

The Exclusive Access state for an address accessed by a PE can be lost as a result of a PFRM P5T* instruction to the same PA executed by another PE. This means that a very high rate of repeated PFRM P5T* accesses to a memory location might impede the forward progress of another PE.

**Note**

In the event of repeatedly-contending LoadExc1/StoreExc1 instruction sequences from multiple PEs, an implementation must ensure that forward progress is made by at least one PE.

**CONSTRAINED UNPREDICTABLE behavior when Load-Exclusive/Store-Exclusive access a different number of registers**

As stated in this section, an implementation can require that the instructions of a Load-Exclusive/Store-Exclusive pair access the same number of registers. In such an implementation, this means behavior is CONSTRAINED UNPREDICTABLE if, in a single thread of execution, either:

- An LDXp instruction of two 32-bit quantities is followed by an STXR instruction of one 64-bit quantity at the same address.
- An LDXr instruction of one 64-bit quantity is followed by an STXP instruction of two 32-bit quantities at the same address.

In these cases, the CONSTRAINED UNPREDICTABLE behavior must be one of:

- The STXP or STXR instruction generates an external Data Abort.
- The STXP or STXR instruction generates an IMPLEMENTATION DEFINED MMU fault reported using the Data Abort Fault status code of ESR_ELx.DFSC = 0b110101.
- The STXP or STXR instruction always fails, returning a status of 1.
- The STXP or STXR instruction always passes, returning a status of 0.
- This STXP or STXR instruction has the same pass or fail behavior that it would have had if the instruction had used the same size and number of registers as the preceding LDXr or LDXp instruction.
B2.9.6 Use of WFE and SEV instructions by spin-locks

ARMv8 provides Wait For Event, Send Event, and Send Event Local instructions, WFE, SEV, and SEVL, that can assist with reducing power consumption and bus contention caused by PEs repeatedly attempting to obtain a spin-lock. These instructions can be used at the application level, but a complete understanding of what they do depends on a system level understanding of exceptions. They are described in Wait for Event mechanism and Send event on page D1-1954. However, in ARMv8, when the global monitor for a PE changes from Exclusive Access state to Open Access state, an event is generated.

Note

This is equivalent to issuing an SEVL instruction on the PE for which the monitor state has changed. It removes the need for spinlock code to include an SEV instruction after clearing a spinlock.
Part C
The AArch64 Instruction Set
Chapter C1
The A64 Instruction Set

This chapter describes the A64 instruction set. It contains the following sections:

- About the A64 instruction set on page C1-142.
- Structure of the A64 assembler language on page C1-143.
- Address generation on page C1-149.
- Instruction aliases on page C1-152.
The A64 instruction set is the instruction set supported in the AArch64 Execution state. All A64 instructions have a width of 32 bits. The A64 encoding structure breaks down into the following functional groups:

- A miscellaneous group of branch instructions, exception generating instructions, and system instructions.
- Data-processing instructions associated with general-purpose registers. These instructions are supported by two functional groups, depending on whether the operands:
  - Are all held in registers.
  - Include an operand with a constant immediate value.
- Load and store instructions associated with the general-purpose register file and the SIMD and floating-point register file.
- SIMD and scalar floating-point data-processing instructions that operate on the SIMD and floating-point registers.

The encoding hierarchy within a functional group breaks down as follows:

- A functional group consists of a set of related instruction classes. A64 instruction set encoding on page C4-224 provides an overview of the instruction encodings in the form of a list of instruction classes within their functional groups.
- An instruction class consists of a set of related instruction forms. Instruction forms are documented in one of two alphabetic lists:
  - The load, store, and data-processing instructions associated with the general-purpose registers, together with those in the other instruction classes. See Chapter C6 A64 Base Instruction Descriptions.
  - The load, store, and data-processing instructions associated with the SIMD and floating-point support. See Chapter C7 A64 Advanced SIMD and Floating-point Instruction Descriptions.
- An instruction form might support a single instruction syntax. Where an instruction supports more than one syntax, each syntax is an instruction variant. Instruction variants can occur because of differences in:
  - The size or format of the operands.
  - The register file used for the operands.
  - The addressing mode used for load/load/store memory operands.
Instruction variants might also arise as the result of other factors.

Instruction variants are described in the instruction description for the individual instructions.

A64 instructions have a regular bit encoding structure:

- 5-bit register operand fields at fixed positions within the instruction. For general-purpose register operands, the values 0-30 select one of 31 registers. The value 31 is used as a special case that can:
  - Indicate use of the current stack pointer, when identifying a load/store base register or in a limited set of data-processing instructions. See The stack pointer registers on page D1-1859.
  - Indicate the value zero when used as a source register operand.
  - Indicate discarding the result when used as a destination register operand.
For SIMD and floating-point register access, the value used selects one of 32 registers.

- Immediate bits that provide constant data-processing values or address offsets are placed in contiguous bitfields. Some computed values in instruction variants use one or more immediate bitfields together with the secondary encoding bitfields.

All encodings that are not fully defined are described as unallocated. An attempt to execute an unallocated instruction is UNDEFINED, unless the behavior is otherwise defined in this Manual.
C1.2 Structure of the A64 assembler language

The following sections describe the A64 assembler syntax:
- General requirements.
- Common syntax terms.
- Instruction Mnemonics on page C1-144.
- Condition code on page C1-144.
- Register names on page C1-145.

C1.2.1 General requirements

The letter \( w \) denotes a general-purpose register holding a 32-bit word, and \( x \) denotes a general-purpose register holding a 64-bit doubleword.

An A64 assembler recognizes both uppercase and lowercase variants of the instruction mnemonics and register names, but not mixed case variants. An A64 disassembler can output either uppercase or lowercase mnemonics and register names. Program and data labels are case-sensitive.

The A64 assembly language does not require the \# character to introduce constant immediate operands, but an assembler must allow immediate values introduced with or without the \# character. ARM recommends that an A64 disassembler outputs a \# before an immediate operand.

In Example C1-1 on page C1-144, the sequence // is used as a comment leader and A64 assemblers are encouraged to accept this syntax.

C1.2.2 Common syntax terms

The following syntax terms are used frequently throughout the A64 instruction set description.

- **UPPER** Text in upper-case letters is fixed. Text in lower-case letters is variable. This means that register name \( Xn \) indicates that the \( X \) is required, followed by a variable register number, for example \( X29 \).
- **< >** Any text enclosed by angle braces, \(< >\), is a value that the user supplies. Subsequent text might supply additional information.
- **{}** Any item enclosed by curly brackets, \{ \}, is optional. A description of the item and how its presence or absence affects the instruction is normally supplied by subsequent text. In some cases curly braces are actual symbols in the syntax, for example when they surround a register list. These cases are called out in the surrounding text.
- **[]** Any items enclosed by square brackets, \[ \], constitute a list of alternative characters. A single one of the characters can be used in that position and the subsequent text describes the meaning of the alternatives. In some case the square brackets are part of the syntax itself, such as addressing modes or vector elements. These cases are called out in the surrounding text.
- **a|b** Alternative words are separated by a vertical bar, |, and can be surrounded by parentheses to delimit them. For example, \( U(ADD|SUB)w \) represents \( UADDW \) or \( USUBW \).
- **±** This indicates an optional + or - sign. If neither is used then + is assumed.
- **uimm** An \( n \)-bit unsigned, positive, immediate value.
- **simm** An \( n \)-bit two’s complement, signed immediate value, where \( n \) includes the sign bit.
C1.2 Structure of the A64 assembler language

C1.2.3 Instruction Mnemonics

The A64 assembly language overloads instruction mnemonics and distinguishes between the different forms of an instruction based on the operand types. For example, the following ADD instructions all have different opcodes. However, the programmer must only remember one mnemonic, as the assembler automatically chooses the correct opcode based on the operands. The disassembler follows the same procedure in reverse.

Example C1-1  ADD instructions with different opcodes

<table>
<thead>
<tr>
<th>Instruction</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD W0, W1, W2</td>
<td>add 32-bit register</td>
</tr>
<tr>
<td>ADD X0, X1, X2</td>

<td>add 64-bit extended register</td>
</tr>
<tr>
<td>ADD X0, X1, #42</td>
<td>add 64-bit immediate</td>
</tr>
</tbody>
</table>

C1.2.4 Condition code

The A64 ISA has some instructions that set Condition flags or test Condition codes or both. For information about instructions that set the Condition flags or use the condition mnemonics, see Condition flags and related instructions on page C6-525.

Table C1-1 shows the available Condition codes.

Table C1-1 Condition codes

</table>
This section describes the AArch64 registers. It contains the following subsections:

- General-purpose register file and zero register and stack pointer.
- SIMD and floating-point register file on page C1-146.
- SIMD and floating-point scalar register names on page C1-146.
- SIMD vector register names on page C1-147.
- SIMD vector element names on page C1-147.

### General-purpose register file and zero register and stack pointer

The 31 general-purpose registers in the general-purpose register file are named R0-R30 and encoded in the instruction register fields with values 0-30. In a general-purpose register field the value 31 represents either the current stack pointer or the zero register, depending on the instruction and the operand position.

When the registers are used in a specific instruction variant, they must be qualified to indicate the operand data size, 32 bits or 64 bits, and the data size of the instruction.

When the data size is 32 bits, the lower 32 bits of the register are used and the upper 32 bits are ignored on a read and cleared to zero on a write.

Table C1-2 shows the qualified names for registers, where \( n \) is a register number 0-30.

<table>
<thead>
<tr>
<th>Name</th>
<th>Size</th>
<th>Encoding</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wn</td>
<td>32 bits</td>
<td>0-30</td>
<td>General-purpose register 0-30</td>
</tr>
<tr>
<td>Xn</td>
<td>64 bits</td>
<td>0-30</td>
<td>General-purpose register 0-30</td>
</tr>
<tr>
<td>WZR</td>
<td>32 bits</td>
<td>31</td>
<td>Zero register</td>
</tr>
<tr>
<td>XZR</td>
<td>64 bits</td>
<td>31</td>
<td>Zero register</td>
</tr>
<tr>
<td>WSP</td>
<td>32 bits</td>
<td>31</td>
<td>Current stack pointer</td>
</tr>
<tr>
<td>SP</td>
<td>64 bits</td>
<td>31</td>
<td>Current stack pointer</td>
</tr>
</tbody>
</table>

This list gives more information about the instruction arguments shown in Table C1-2:

- The names Xn and Wn both refer to the same general-purpose register, Rn.
- There is no register named W31 or X31.
• The name SP represents the stack pointer for 64-bit operands where an encoding of the value 31 in the corresponding register field is interpreted as a read or write of the current stack pointer. When instructions do not interpret this operand encoding as the stack pointer, use of the name SP is an error.

• The name WSP represents the current stack pointer in a 32-bit context.

• The name XZR represents the zero register for 64-bit operands where an encoding of the value 31 in the corresponding register field is interpreted as returning zero when read or discarding the result when written. When instructions do not interpret this operand encoding as the zero register, use of the name XZR is an error.

• The name WZR represents the zero register in a 32-bit context.

• The architecture does not define a specific name for general-purpose register R30 to reflect its role as the link register on procedure calls. However, an A64 assembler must always use W30 and X30 for this purpose, and additional software names might be defined as part of the Procedure Call Standard, see Procedure Call Standard for the ARM 64-bit Architecture.

SIMD and floating-point register file

The 32 registers in the SIMD and floating-point register file, V0-V31, hold floating-point operands for the scalar floating-point instructions, and both scalar and vector operands for the SIMD instructions. When they are used in a specific instruction form, the names must be further qualified to indicate the data shape, that is the data element size and the number of elements or lanes within the register. A similar requirement is placed on the general-purpose registers. See General-purpose register file and zero register and stack pointer on page C1-145.

Note

The data type is described by the instruction mnemonics that operate on the data. The data type is not described by the register name. The data type is the interpretation of bits within each register or vector element, whether these are integers, floating-point values, polynomials, or cryptographic hashes.

SIMD and floating-point scalar register names

SIMD and floating-point instructions that operate on scalar data only access the lower bits of a SIMD and floating-point register. The unused high bits are ignored on a read and cleared to 0 on a write.

Table C1-3 shows the qualified names for accessing scalar SIMD and floating-point registers. The letter \( n \) denotes a register number between 0 and 31.

<table>
<thead>
<tr>
<th>Size</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>8 bits</td>
<td>( B_n )</td>
</tr>
<tr>
<td>16 bits</td>
<td>( H_n )</td>
</tr>
<tr>
<td>32 bits</td>
<td>( S_n )</td>
</tr>
<tr>
<td>64 bits</td>
<td>( D_n )</td>
</tr>
<tr>
<td>128 bits</td>
<td>( Q_n )</td>
</tr>
</tbody>
</table>
SIMD vector register names

If a register holds multiple data elements on which arithmetic is performed in a parallel, SIMD, manner, then a qualifier describes the vector shape. The vector shape is the element size and the number of elements or lanes. If the element size in bits multiplied by the number of lanes does not equal 128, then the upper 64 bits of the register are ignored on a read and cleared to zero on a write.

Table C1-4 shows the SIMD vector register names. The letter $n$ denotes a register number between 0 and 31.

<table>
<thead>
<tr>
<th>Shape</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>8 bits × 8 lanes</td>
<td>Vn.8B</td>
</tr>
<tr>
<td>8 bits × 16 lanes</td>
<td>Vn.16B</td>
</tr>
<tr>
<td>16 bits × 4 lanes</td>
<td>Vn.4H</td>
</tr>
<tr>
<td>16 bits × 8 lanes</td>
<td>Vn.8H</td>
</tr>
<tr>
<td>32 bits × 2 lanes</td>
<td>Vn.2S</td>
</tr>
<tr>
<td>32 bits × 4 lanes</td>
<td>Vn.4S</td>
</tr>
<tr>
<td>64 bits × 1 lane</td>
<td>Vn.1D</td>
</tr>
<tr>
<td>64 bits × 2 lanes</td>
<td>Vn.2D</td>
</tr>
</tbody>
</table>

SIMD vector element names

Appending a constant, zero-based element index to the register name inside square brackets indicates that a single element from a SIMD and floating-point register is used as a scalar operand. The number of lanes is not represented, as it is not encoded in the instruction and can only be inferred from the index value.

Table C1-5 shows the vector register names and the element index. The letter $i$ denotes the element index.

<table>
<thead>
<tr>
<th>Size</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>8 bits</td>
<td>Vn.B[i]</td>
</tr>

</tr>
<tr>
<td>32 bits</td>
<td>Vn.S[i]</td>
</tr>
<tr>
<td>64 bits</td>
<td>Vn.D[i]</td>
</tr>
</tbody>
</table>

An assembler must accept a fully qualified SIMD register name if the number of lanes is greater than the index value. See SIMD vector register names. For example, an assembler must accept all of the following forms as the name for the 32-bit element in bits [63:32] of the SIMD and floating-point register V9:

V9.2S[1] //optional number of lanes
V9.4S[1] //optional number of lanes

--- Note ---

The SIMD and floating-point register element name Vn.S[0] is not equivalent to the scalar SIMD and floating-point register name Sn. Although they represent the same bits in the register, they select different instruction encoding forms, either the vector element or the scalar form.
**SIMD vector register list**

Where an instruction operates on multiple SIMD and floating-point registers, for example vector Load/Store structure and table lookup operations, the registers are specified as a list enclosed by curly braces. This list consists of either a sequence of registers separated by commas, or a register range separated by a hyphen. The registers must be numbered in increasing order, modulo 32, in increments of one. The hyphenated form is preferred for disassembly if there are more than two registers in the list and the register number are increasing. The following examples are equivalent representations of a set of four registers V4 to V7, each holding four lanes of 32-bit elements:

\[
\begin{align*}
\{ \text{V4.4S - V7.4S} \} & \quad \text{//standard disassembly} \\
\{ \text{V4.4S, V5.4S, V6.4S, V7.4S} \} & \quad \text{//alternative representation}
\end{align*}
\]

**SIMD vector element list**

Registers in a list can also have a vector element form. For example, the LD4 instruction can load one element into each of four registers, and in this case the index is appended to the list as follows:

\[
\begin{align*}
\{ \text{V4.S - V7.S}[3] \} & \quad \text{//standard disassembly} \\
\{ \text{V4.4S, V5.4S, V6.4S, V7.4S}[3] \} & \quad \text{//alternative with optional number of lanes}
\end{align*}
\]
C1.3 Address generation

The A64 instruction set supports 64-bit virtual addresses (VAs). The valid VA range is determined by the following factors:

- The size of the implemented virtual address space.
- Memory Management Unit (MMU) configuration settings.

Limits on the VA size mean that the most significant bits of the virtual address do not hold valid address bits. These unused bits can hold:

- A tag, see Address tagging in AArch64 state on page D4-2084.
- If ARMv8.3-PAuth is implemented, a Pointer authentication code (PAC), see Pointer authentication in AArch64 state on page D4-2086.

For more information on memory management and address translation, see Chapter D4 The AArch64 Virtual Memory System Architecture.

C1.3.1 Register indexed addressing

The A64 instruction set allows a 64-bit index register to be added to the 64-bit base register, with optional scaling of the index by the access size. Additionally it allows for sign-extension or zero-extension of a 32-bit value within an index register, followed by optional scaling.

C1.3.2 PC-relative addressing

The A64 instruction set has support for position-independent code and data addressing:

- PC-relative literal loads have an offset range of ± 1MB.
- Process state flag and compare based conditional branches have a range of ± 1MB. Test bit conditional branches have a restricted range of ± 32KB.
- Unconditional branches, including branch and link, have a range of ± 128MB.

PC-relative Load/Store operations, and address generation with a range of ± 4GB can be performed using two instructions.

C1.3.3 Load/Store addressing modes

Load/Store addressing modes in the A64 instruction set require a 64-bit base address from a general-purpose register X0-X30 or the current stack pointer, SP, with an optional immediate or register offset. Table C1-6 shows the assembler syntax for the complete set of Load/Store addressing modes.

<table>
<thead>
<tr>
<th>Addressing Mode</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Base register only (no offset)</td>
<td>[base{, #0}]</td>
</tr>
<tr>
<td>Base plus offset</td>
<td>[base{, #imm}]</td>
</tr>
<tr>
<td>Pre-indexed</td>
<td>[base, #imm]!</td>
</tr>
<tr>
<td>Post-indexed</td>
<td>[base], #imm</td>
</tr>
<tr>
<td>Literal (PC-relative)</td>
<td>label</td>
</tr>
</tbody>
</table>

- Immediate
- Register
- Extended Register
Some types of Load/Store instruction support only a subset of the Load/Store addressing modes listed in Table C1-6 on page C1-149. Details of the supported modes are as follows:

- **Base plus offset addressing** means that the address is the value in the 64-bit base register plus an offset.
- **Pre-indexed addressing** means that the address is the sum of the value in the 64-bit base register and an offset, and the address is then written back to the base register.
- **Post-indexed addressing** means that the address is the value in the 64-bit base register, and the sum of the address and the offset is then written back to the base register.
- **Literal addressing** means that the address is the value of the 64-bit program counter for this instruction plus a 19-bit signed word offset. This means that it is a 4 byte aligned address within ±1MB of the address of this instruction with no offset. Literal addressing can only be used for loads of at least 32 bits and for prefetch instructions. The PC cannot be referenced using any other addressing modes. The syntax for labels is specific to individual toolchains.
- **An immediate offset** can be unsigned or signed, and scaled or unscaled, depending on the type of Load/Store instruction. When the immediate offset is scaled it is encoded as a multiple of the transfer size, although the assembly language always uses a byte offset, and the assembler or disassembler performs the necessary conversion. The usable byte offsets therefore depend on the type of Load/Store instruction and the transfer size.

Table C1-7 shows the offset and the type of Load/Store instruction.

<table>
<thead>
<tr>
<th>Offset bits</th>
<th>Sign</th>
<th>Scaling</th>
<th>Write-Back</th>
<th>Load/Store type</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>Exclusive/acquire/release</td>
</tr>
<tr>
<td>7</td>
<td>Signed</td>
<td>Scaled</td>
<td>Optional</td>
<td>Register pair</td>
</tr>
<tr>
<td>9</td>
<td>Signed</td>
<td>Unscaled</td>
<td>Optional</td>
<td>Single register</td>
</tr>
<tr>
<td>12</td>
<td>Unsigned</td>
<td>Scaled</td>
<td>No</td>
<td>Single register</td>
</tr>
</tbody>
</table>

- A register offset means that the offset is the 64 bits from a general-purpose register, Xm, optionally scaled by the transfer size, in bytes, if LSL #imm is present and where imm must be equal to log2(transfer_size).
- An extended register offset means that offset is the bottom 32 bits from a general-purpose register Wm, sign-extended or zero-extended to 64 bits, and then scaled by the transfer size if so indicated by #imm, where imm must be equal to log2(transfer_size). An assembler must accept Wm or Xm as an extended register offset, but Wm is preferred for disassembly.
- Generating an address lower than the value in the base register requires a negative signed immediate offset or a register offset holding a negative value.
- When stack alignment checking is enabled by system software and the base register is the SP, the current stack pointer must be initially quadword aligned, that is aligned to 16 bytes. Misalignment generates a Stack Alignment fault. The offset does not have to be a multiple of 16 bytes unless the specific Load/Store instruction requires this. SP cannot be used as a register offset.

### Address calculation

General-purpose arithmetic instructions can calculate the result of most addressing modes and write the address to a general-purpose register or, in most cases, to the current stack pointer.
Table C1-8 shows the arithmetic instructions that can compute addressing modes.

### Table C1-8 Arithmetic instructions to compute addressing modes

<table>
<thead>
<tr>
<th>Addressing Form</th>
<th>Immediate</th>
<th>Offset</th>

<td>SP, base, #imm</td>
<td>ADD &lt;Xd</td>
</tr>
<tr>
<td>Pre-indexed</td>
<td>-</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>Post-indexed</td>
<td>-</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>Literal (PC-relative)</td>
<td>ADR Xd, label</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

#### Note

- To calculate a base plus immediate offset the ADD instructions defined in *Arithmetic (immediate)* on page C3-185 accept an unsigned 12-bit immediate offset, with an optional left shift by 12. This means that a single ADD instruction cannot support the full range of byte offsets available to a single register Load/Store with a scaled 12-bit immediate offset. For example, a quadword LDR effectively has a 16-bit byte offset. To calculate an address with a byte offset that requires more than 12 bits it is necessary to use two ADD instructions. The following example shows this:

  ```
  ADD Xd, base, #(imm & 0xFFF)
  ADD Xd, Xd, #(imm>>12), LSL #12
  ```

- To calculate a base plus extended register offset, the ADD instructions defined in *Arithmetic (extended register)* on page C3-191 provide a superset of the addressing mode that also supports sign-extension or zero-extension of a byte or halfword value with any shift amount between 0 and 4, for example:

  ```
  ADD Xd, base, Wm, SXTW #3  // Xd = base + (SignExtend(Wm) LSL 3)
  ADD Xd, base, Wm, UXTH #4  // Xd = base + (ZeroExtend(Wm<15:0>) LSL 4)
  ```

- If the same extended register offset is used by more than one Load/Store instruction, then, depending on the implementation, it might be more efficient to calculate the extended and scaled intermediate result just once, and then re-use it as a simple register offset. The extend and scale calculation can be performed using the SBFIZ and UBFIZ bitfield instructions defined in *Bitfield move* on page C3-188, for example:

  ```
  SBFIZ Xd, Xm, #3, #32  // Xd = “Wm, SXTW #3”
  UBFIZ Xd, Xm, #4, #16  // Xd = “Wm, UXTH #4”
  ```
C1.4 Instruction aliases

Some instructions have an associated *architecture alias* that is used for disassembly of the encoding when the associated conditions are met. Architecture alias instructions are included in the alphabetic lists of instruction types and clearly presented as an alias form in descriptions for the individual instructions.
Chapter C2
About the A64 Instruction Descriptions

This chapter describes the instruction descriptions contained in Chapter C6 A64 Base Instruction Descriptions and Chapter C7 A64 Advanced SIMD and Floating-point Instruction Descriptions.

It contains the following sections:

• Understanding the A64 instruction descriptions on page C2-154.
• General information about the A64 instruction descriptions on page C2-157.
C2.1 Understanding the A64 instruction descriptions

Each instruction description in Chapter C6 and Chapter C7 has the following content:
1. A title.
2. An introduction to the instruction.
3. The instruction encoding or encodings.
4. Any alias conditions.
5. A list of the assembler symbols for the instruction.
6. Pseudocode describing how the instruction operates.
7. Notes, if applicable.

The following sections describe each of these.

C2.1.1 The title

The title of an instruction description includes the base mnemonic for the instruction. If different forms of an instruction use the same base mnemonic, each form has its own description. In this case, the title is the mnemonic followed by a short description of the instruction form in parentheses. This is most often used when an operand is an immediate value in one instruction form, but is a register in another form.

For example, in Chapter C6 there are the following titles for different forms of the \texttt{ADD} instruction:

• \texttt{ADD} (extended register) on page C6-529.
• \texttt{ADD} (immediate) on page C6-531.
• \texttt{ADD} (shifted register) on page C6-533.

C2.1.2 An introduction to the instruction

This briefly describes the function of the instruction. The introduction is not a complete description of the instruction, and it is not definitive. If there is any conflict between it and the more detailed information that follows it, the more detailed information takes priority.

C2.1.3 The instruction encoding or encodings

This shows the instruction encoding diagram, or if the instruction has more than one encoding, shows all of the encoding diagrams. Each diagram has a subheading.

For example, for load and store instructions, the subheadings might be:

• Post-index.
• Pre-index.
• Unsigned offset.

Each diagram numbers the bits from 31 to 0. The diagram for an instruction at address \(A\) shows, from left to right, the bytes at addresses \(A+3, A+2, A+1,\) and \(A\).

There might be variants of an encoding, if the \texttt{assembler syntax prototype} differs depending on the value in one or more of the encoding fields. In this case, each variant has a subheading that describes the variant and shows the distinguishing field value or values in parentheses. For example, in Chapter C6 there are the following subheadings for variants of the \texttt{ADC} instruction encoding:

• 32-bit variant (sf = 0).
• 64-bit variant (sf = 1).

The assembler syntax prototype for an encoding or variant of an encoding shows how to form a complete assembler source code instruction that assembles to the encoding. Unless otherwise stated, the prototype is also the preferred syntax for a disassembler to disassemble the encoding to. Disassemblers are permitted to omit optional symbols that represent the default value of a field or set of fields, to produce more readable disassembled code, provided that the output re-assembles to the same encoding.
Each encoding diagram, and its associated assembler syntax prototypes, is followed by encoding-specific pseudocode that translates the fields of that encoding into inputs for the encoding-independent pseudocode that describes the operation of the instruction. See Pseudocode describing how the instruction operates on page C2-156.

C2.1.4 Any alias conditions, if applicable

This is an optional part of an instruction description. If included, it describes the set of conditions for which an alternative mnemonic and its associated assembler syntax prototypes are preferred for disassembly by a disassembler. It includes a link to the alias instruction description that defines the alternative syntax. The alias syntax and the original syntax can be used interchangeably in the assembler source code.

ARM recommends that if a disassembler outputs the alias syntax, it consistently outputs the alias syntax.

C2.1.5 A list of the assembler symbols for the instruction

The Assembler symbols subsection of the instruction description contains a list of the symbols that the assembler syntax prototype or prototypes use, if any.

In assembler syntax prototypes, the following conventions are used:

- `< ` Angle brackets. Any symbol enclosed by these is a name or a value that the user supplies. For each symbol, there is a description of what the symbol represents. The description usually also specifies which encoding field or fields encodes the symbol.

- `{ ` Brace brackets. Any symbols enclosed by these are optional. For each optional symbol, there is a description of what the symbol represents and how its presence or absence is encoded.

  In some assembler syntax prototypes, some brace brackets are mandatory, for example if they surround a register list. When the use of brace brackets is mandatory, they are separated from other syntax items by one or more spaces.

- `# ` This usually precedes a numeric constant. All uses of # are optional in A64 assembler source code. ARM recommends that disassemblers output the # where the assembler syntax prototype includes it.

- `+/ ` This indicates an optional + or - sign. If neither is coded, + is assumed.

Single spaces are used for clarity, to separate syntax items. Where a space is mandatory, the assembler syntax prototype shows two or more consecutive spaces.

Any characters not shown in this conventions list must be coded exactly as shown in the assembler syntax prototype. Apart from brace brackets, the characters shown are used as part of a meta-language to define the architectural assembler syntax for an instruction encoding or alias, but have no architecturally defined significance in the input to an assembler or in the output from a disassembler.

The following symbol conventions are used:

- `<Xn>` The 64-bit name of a general-purpose register (X0-X30) or the zero register (XZR).

- `<Wn>` The 32-bit name of a general-purpose register (W0-W30) or the zero register (WZR).

- `<Xn|SP>` The 64-bit name of a general-purpose register (X0-X30) or the current stack pointer (SP).

- `<Wn|WSP>` The 32-bit name of a general-purpose register (W0-W30) or the current stack pointer (WSP).

- `<Bn>, <Hn>, <Sn>, <Dn>, <Qn>` The 8, 16, 32, 64 or 128-bit name of a SIMD and floating-point register in a scalar context as described in Register names on page C1-145.

- `<Vn>` The name of a SIMD and floating-point register name in a vector context as described in Register names on page C1-145.

If the description of a symbol specifies that the symbol is a register, the description might also specify that the range of permitted registers is extended or restricted. It also specifies any differences from the default rules for such fields.
C2 About the A64 Instruction Descriptions
C2.1 Understanding the A64 instruction descriptions

C2.1.6 Pseudocode describing how the instruction operates

The Operation subsection of the instruction description contains this pseudocode.

It is encoding-independent pseudocode that provides a precise description of what the instruction does.

Note

For a description of ARM pseudocode, see Appendix K12 ARM Pseudocode Definition. This appendix also describes the execution model for an instruction.

C2.1.7 Notes, if applicable

If applicable, other notes about the instruction appear under additional subheadings.
C2.2 General information about the A64 instruction descriptions

This section provides general information about the A64 instruction descriptions. Some of this information also applies to System register descriptions, for example the terms defined in Fixed values in AArch64 instruction and System register descriptions apply to the AArch64 descriptions throughout this manual. The following subsections provide this information:

• Execution of instructions in debug state.
• Fixed values in AArch64 instruction and System register descriptions.
• Modified immediate constants in A64 instructions on page C2-158.

C2.2.1 Execution of instructions in debug state

In general, except for the instructions described in Debug state on page C3-164, the A64 instruction descriptions do not indicate any differences in the behavior of the instruction if it is executed in Debug state. For this information, see Executing instructions in Debug state on page H2-5708.

Note
For many instructions, execution is unchanged in Debug state. Executing instructions in Debug state on page H2-5708 identifies these instructions.

C2.2.2 Fixed values in AArch64 instruction and System register descriptions

This section summarizes the terms used to describe fixed values in AArch64 register and instruction descriptions. The Glossary gives full descriptions of these terms, and each entry in this section includes a link to the corresponding Glossary entry.

Note
In register descriptions, the meaning of some bits depends on the PE state. This affects the definitions of RES0 and RES1, as shown in the Glossary.

The following terms are used to describe bits or fields with fixed values:

RAZ Read-As-Zero. See Read-As-Zero (RAZ).
In diagrams, a RAZ bit can be shown as 0.

(0), RES0 Reserved, Should-Be-Zero (SBZ) or RES0.
In instruction encoding diagrams, and sometimes in other descriptions, (0) indicates an SBZ bit. If the bit is set to 1, behavior is CONSTRAINED UNPREDICTABLE, and must be one of the following:
• The instruction is UNDEFINED.
• The instruction is treated as a NOP.
• The instruction executes as if the value of the bit was 0.
• Any destination registers of the instruction become UNKNOWN.
This notation can be expanded for fields, so a three-bit field can be shown as either (0)(0)(0) or as (000).
In register diagrams, but not in the A64 encoding and instruction descriptions, bits or fields can be shown as RES0. See the Glossary definition of RES0 for more information.

Note
Some of the System instruction descriptions in this chapter are based on the field description of the input value for the instruction. These are register descriptions and therefore can include RES0 fields.

The (0) and RES0 descriptions can be applied to bits or bitfields that are read-only, or are write-only. The Glossary definitions cover these cases.

RAO Read-As-One. See Read-As-One (RAO).
In diagrams, a RAO bit can be shown as 1.

(1), RES1 Reserved, Should-Be-One (SBO) or RES1.
In instruction encoding diagrams, and sometimes in other descriptions, (1) indicates a SBO bit. If the bit is set to 0, behavior is CONSTRAINED UNPREDICTABLE, and must be one of the following:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if the value of the bit was 1.
- Any destination registers of the instruction become UNKNOWN.

This notation can be expanded for fields, so a three-bit field can be shown as either (1)(1)(1) or as (111).

In register diagrams, but not in the A64 encoding and instruction descriptions, bits or fields can be shown as RES1. See the Glossary definition of RES1 for more information.

---

**Note**

Some of the System instruction descriptions in this chapter are based on the field description of the input value for the instruction. These are register descriptions and therefore can include RES1 fields, and RES1 descriptions can be applied to bits or bitfields that are read-only, or are write-only. The Glossary definitions cover these cases.

### C2.2.3 Modified immediate constants in A64 instructions

It contains the following subsections:

- Modified immediate constants in A64 floating-point instructions.

#### Modified immediate constants in A64 floating-point instructions

Table C2-1 shows the immediate constants available in FMOV (scalar, immediate) and FMOV (vector, immediate) floating-point instructions.

<table>
<thead>
<tr>
<th>Data type</th>
<th>immediate</th>
<th>Constant a</th>
</tr>
</thead>
<tbody>
<tr>
<td>F16</td>
<td>abcddefgh</td>
<td>a8bbbcdef gh000000</td>
</tr>
<tr>

</tr>
<tr>
<td>F64</td>
<td>abcddefgh</td>
<td>a8bbbbbb bbcdefgh 00000000 00000000 00000000 00000000</td>
</tr>
</tbody>
</table>

a. In this column, B = NOT(b). The bit pattern represents the floating-point number \((-1)^S \times 2^{\text{exp}} \times \text{mantissa}\), where \(S = \text{UInt}(a)\), \(\text{exp} = \text{UInt}(\text{NOT}(b):c:d)-3\) and \(\text{mantissa} = (16+\text{UInt}(e:f:g:h))/16\).

The immediate value shown in the table is either:

- The value of the \text{imm8} field for an FMOV (scalar, immediate) instruction, see *FMOV (scalar, immediate)* on page C7-1276.

- The value obtained by concatenating the \text{a:b:c:d:e:f:g:h} fields field for an FMOV (vector, immediate) instruction, see *FMOV (vector, immediate)* on page C7-1269.
Table C2-2 shows the floating-point constant values encoded in the \texttt{b:c:d:e:f:g:h} fields of the \texttt{FMOV} (vector, immediate) instruction.

\textbf{Operation of modified immediate constants, floating-point instructions}

For an A64 floating-point instruction that uses a modified immediate constant, the operation described by the \texttt{VFPExpandImm()} pseudocode function returns the value of the immediate constant.
Chapter C3
A64 Instruction Set Overview

This chapter provides an overview of the A64 instruction set. It contains the following sections:

•  *Branches, Exception generating, and System instructions* on page C3-162.
•  *Loads and stores* on page C3-169.
•  *Data processing - immediate* on page C3-185.
•  *Data processing - register* on page C3-190.
•  *Data processing - SIMD and floating-point* on page C3-198.

For a structured breakdown of instruction groups by encoding, see Chapter C4 *A64 Instruction Set Encoding.*
C3.1 Branches, Exception generating, and System instructions

This section describes the branch, exception generating, and system instructions. It contains the following subsections:

- Conditional branch.
- Unconditional branch (immediate) on page C3-163.
- Unconditional branch (register) on page C3-163.
- Exception generation and return on page C3-163.
- System register instructions on page C3-164.
- System instructions on page C3-164.
- Hint instructions on page C3-165.
- Barriers and CLREX instructions on page C3-165.
- Pointer authentication instructions on page C3-166.

For information about the encoding structure of the instructions in this instruction group, see Branches, Exception Generating and System instructions on page C4-228.

---

Note

Software must:

- Use only BLR or BL to perform a nested subroutine call when that subroutine is expected to return to the immediately following instruction, that is, the instruction with the address of the BLR or BL instruction incremented by four.

- Use only RET to perform a subroutine return, when that subroutine is expected to have been entered by a BL or BLR instruction.

- Use only B, BR, or the instructions listed in Table C3-1 to perform a control transfer that is not a subroutine call or subroutine return described in this Note.

---

### C3.1.1 Conditional branch

Conditional branches change the flow of execution depending on the current state of the Condition flags or the value in a general-purpose register. See Table C1-1 on page C1-144 for a list of the Condition codes that can be used for cond.

Table C3-1 shows the Conditional branch instructions.

<table>
<thead>
<tr>
<th>Mnemonic</th>
<th>Instruction</th>
<th>Branch offset range from the PC</th>
<th>See</th>
</tr>
</thead>
<tbody>
<tr>
<td>B .cond</td>
<td>Branch conditionally</td>
<td>±1MB</td>
<td>B .cond on page C6-561</td>
</tr>
<tr>
<td>CBNZ</td>
<td>Compare and branch if nonzero</td>
<td>±1MB</td>
<td>CBNZ on page C6-589</td>
</tr>
<tr>
<td>CBZ</td>
<td>Compare and branch if zero</td>
<td>±1MB</td>
<td>CBZ on page C6-590</td>
</tr>
<tr>
<td>TBNZ</td>
<td>Test bit and branch if nonzero</td>
<td>±32KB</td>
<td>TBNZ on page C6-981</td>
</tr>
<tr>
<td>TBZ</td>
<td>Test bit and branch if zero</td>
<td>±32KB</td>
<td>TBZ on page C6-982</td>
</tr>
</tbody>
</table>
### C3.1.2 Unconditional branch (immediate)

Unconditional branch (immediate) instructions change the flow of execution unconditionally by adding an immediate offset with a range of ±128MB to the value of the program counter that fetched the instruction. The BL instruction also writes the address of the sequentially following instruction to general-purpose register, X30.

Table C3-2 shows the Unconditional branch instructions with an immediate branch offset.

<table>
<thead>
<tr>
<th>Mnemonic</th>
<th>Instruction</th>
<th>Immediate branch offset range from the PC</th>
<th>See</th>
</tr>
</thead>
<tbody>
<tr>
<td>B</td>
<td>Branch unconditionally</td>
<td>±128MB</td>
<td>B on page C6-562</td>
</tr>
<tr>
<td>BL</td>
<td>Branch with link</td>
<td>±128MB</td>
<td>BL on page C6-572</td>
</tr>
</tbody>
</table>

### C3.1.3 Unconditional branch (register)

Unconditional branch (register) instructions change the flow of execution unconditionally by setting the program counter to the value in a general-purpose register. The BLR instruction also writes the address of the sequentially following instruction to general-purpose register X30. The RET instruction behaves identically to BR, but provides an additional hint to the PE that this is a return from a subroutine. Table C3-3 shows Unconditional branch instructions that jump directly to an address held in a general-purpose register.

<table>
<thead>
<tr>
<th>Mnemonic</th>
<th>Instruction</th>
<th>See</th>
</tr>
</thead>
<tbody>
<tr>
<td>BLR</td>
<td>Branch with link to register</td>
<td>BLR on page C6-573</td>
</tr>
<tr>
<td>BR</td>
<td>Branch to register</td>
<td>BR on page C6-576</td>
</tr>
<tr>
<td>RET</td>
<td>Return from subroutine</td>
<td>RET on page C6-841</td>
</tr>
</tbody>
</table>

### C3.1.4 Exception generation and return

This section describes the following exceptions:

- Exception generating.
- Exception return on page C3-164.
- Debug state on page C3-164.

#### Exception generating

Table C3-4 shows the Exception generating instructions.

<table>
<thead>
<tr>

<tr>
<td>ISB</td>
<td>Instruction synchronization barrier</td>
<td>ISB on page C6-647</td>
</tr>
<tr>
<td>PSB CSYNC</td>
<td>Profiling synchronization barrier</td>
<td>PSB CSYNC on page C6-839</td>
</tr>
</tbody>
</table>

For more information about:
- DSB, DMB, and ISB, see *Memory barriers on page B2-98.*
- ESB, see the *ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile.*
- PSB CSYNC, see *Chapter D6 The Statistical Profiling Extension.*
For information about the allocated values for the data barriers, see:
- **DMB** on page C6-628.
- **DSB** on page C6-631.

### C3.1.9 Pointer authentication instructions

ARMv8.3-PAuth adds support for pointer authentication, see *Pointer authentication in AArch64 state on page D4-2086*. This functionality includes the A64 instructions described in this section. These instructions fall into two groups, see:
- **Basic pointer authentication instructions**.
- **Combined instructions that include pointer authentication** on page C3-168.

#### Basic pointer authentication instructions

Each of these instructions only performs an operation that supports pointer authentication.

Table C3-11 shows the instructions that add a *Pointer Authentication Code* (PAC) to the address in a register:

<table>
<thead>
<tr>
<th>Mnemonic</th>
<th>Instruction</th>
<th>See</th>
</tr>
</thead>
<tbody>
<tr>
<td>PACIA5P</td>
<td>Add PAC to instruction address using APIAKey_EL1 and SP</td>

</tbody>
</table>
C3.2 Loads and stores

This section describes the Load/Store instructions. It contains the following subsections:

- Load/Store register.
- Load/Store register (unscaled offset) on page C3-170.
- Load/Store Pair on page C3-171.
- Load/Store Non-temporal Pair on page C3-172.
- Load/Store unprivileged on page C3-173.
- Load-Exclusive/Store-Exclusive on page C3-174.
- LoadLOAcquire/StoreLORelease on page C3-175.
- Load/Store scalar SIMD and floating-point on page C3-176.
- Load/Store Vector on page C3-178.
- Prefetch memory on page C3-180.
- Compare and Swap on page C3-181.
- Atomic memory operations on page C3-182.
- Swap on page C3-184.

Apart from Load-Exclusive, Store-Exclusive, Load-Acquire, and Store-Release, addresses can have any alignment unless strict alignment checking is enabled, that is if SCTLR_ELx.A == 1.

The additional control bits SCTLR_ELx.SA and SCTLR_EL1.SA0 control whether the stack pointer must be quadword aligned when used as a base register. See SP alignment checking on page D1-1868. Using a misaligned stack pointer generates an SP alignment fault exception.

For information about the encoding structure of the instructions in this instruction group, see Loads and Stores on page C4-234.

Note

In some cases, Load/Store instructions can lead to CONstrained UNPreditable behavior. See AArch64 CONstrained UNPREDICTABLE behaviors on page K1-6413.

C3.2.1 Load/Store register

The Load/Store register instructions support the following addressing modes:

- Base plus a scaled 12-bit unsigned immediate offset or base plus an unscaled 9-bit signed immediate offset.
- Base plus a 64-bit register offset, optionally scaled.
- Base plus a 32-bit extended register offset, optionally scaled.
- Pre-indexed by an unscaled 9-bit signed immediate offset.
- Post-indexed by an unscaled 9-bit signed immediate offset.
- PC-relative literal for loads of 32 bits or more.

See also Load/Store addressing modes on page C1-149.

If a Load instruction specifies writeback and the register being loaded is also the base register, then behavior is CONstrained UNPREDICTABLE and one of the following behaviors must occur:

- The instruction is treated as UNDEFINED.
- The instruction is treated as a NOP.
- The instruction performs the load using the specified addressing mode and the base register becomes UNKNOWN. In addition, if an exception occurs during the execution of such an instruction, the base address might be corrupted so that the instruction cannot be repeated.
If a Store instruction performs a writeback and the register that is stored is also the base register, then behavior is CONSTRAINED UNPREDICTABLE and one of the following behaviors must occur:

- The instruction is treated as UNDEFINED.
- The instruction is treated as a NOP.
- The instruction performs the store to the designated register using the specified addressing mode, but the value stored is UNKNOWN.

Table C3-15 shows the Load/Store Register instructions.

</table>

#### C3.2.2 Load/Store register (unscaled offset)

The Load/Store register instructions with an unscaled offset support only one addressing mode:

- Base plus an unscaled 9-bit signed immediate offset.

See Load/Store addressing modes on page C1-149.
The Load/Store register (unscaled offset) instructions are required to disambiguate this instruction class from the Load/Store register instruction forms that support an addressing mode of base plus a scaled, unsigned 12-bit immediate offset, because that can represent some offset values in the same range.

The ambiguous immediate offsets are byte offsets that are both:

- In the range 0-255, inclusive.
- Naturally aligned to the access size.

Other byte offsets in the range -256 to 255 inclusive are unambiguous. An assembler program translating a Load/Store instruction, for example LDR, is required to encode an unambiguous offset using the unscaled 9-bit offset form, and to encode an ambiguous offset using the scaled 12-bit offset form. A programmer might force the generation of the unscaled 9-bit form by using one of the mnemonics in Table C3-16. ARM recommends that a disassembler outputs all unscaled 9-bit offset forms using one of these mnemonics, but unambiguous offsets can be output using a Load/Store single register mnemonic, for example, LDR.

Table C3-16 shows the Load/Store register instructions with an unscaled offset.

C3.2.3    Load/Store Pair

The Load/Store Pair instructions support the following addressing modes:

- Base plus a scaled 7-bit signed immediate offset.
- Pre-indexed by a scaled 7-bit signed immediate offset.
- Post-indexed by a scaled 7-bit signed immediate offset.

See also Load/Store addressing modes on page C1-149.

If a Load Pair instruction specifies the same register for the two registers that are being loaded, then behavior is constrained unpredictable and one of the following behaviors must occur:

- The instruction is treated as undefined.
- The instruction is treated as a NOP.
- The instruction performs all the loads using the specified addressing mode and the register that is loaded takes an unknown value.
If a Load Pair instruction specifies writeback and one of the registers being loaded is also the base register, then behavior is CONSTRAINED UNPREDICTABLE and one of the following behaviors must occur:

- The instruction is treated as UNDEFINED.
- The instruction is treated as a NOP.
- The instruction performs all of the loads using the specified addressing mode, and the base register becomes UNKNOWN. In addition, if an exception occurs during the instruction, the base address might be corrupted so that the instruction cannot be repeated.

If a Store Pair instruction performs a writeback and one of the registers being stored is also the base register, then behavior is CONSTRAINED UNPREDICTABLE and one of the following behaviors must occur:

- The instruction is treated as UNDEFINED.
- The instruction is treated as a NOP.
- The instruction performs all the stores of the registers indicated by the specified addressing mode, but the value stored for the base register is UNKNOWN.

Table C3-17 shows the Load/Store Pair instructions.

<td>STP on page C6-898</td>
</tr>
</tbody>
</table>

C3.2.4 Load/Store Non-temporal Pair

The Load/Store Non-temporal Pair instructions support only one addressing mode:

- Base plus a scaled 7-bit signed immediate offset.

See Load/Store addressing modes on page C1-149.

The Load/Store Non-temporal Pair instructions provide a hint to the memory system that an access is non-temporal or streaming, and unlikely to be repeated in the near future. This means that data caching is not required. However, depending on the memory type, the instructions might permit memory reads to be preloaded and memory writes to be gathered to accelerate bulk memory transfers.

In addition, there is an exception to the usual memory ordering rules. If an address dependency exists between two memory reads, and a Load Non-Temporal Pair instruction generated the second read, then in the absence of any other barrier mechanism to achieve order, the memory accesses can be observed in any order by the other observers within the shareability domain of the memory addresses being accessed.

If a Load Non-Temporal Pair instruction specifies the same register for the two registers that are being loaded, then behavior is CONSTRAINED UNPREDICTABLE and one of the following must occur:

- The instruction is treated as UNDEFINED.
- The instruction is treated as a NOP.
- The instruction performs all the loads using the specified addressing mode and the register that is loaded takes an UNKNOWN value.
Table C3-18 shows the Load/Store Non-temporal Pair instructions.

</tr>
</tbody>
</table>

### C3.2.5 Load/Store unprivileged

The Load/Store unprivileged instructions support only one addressing mode:

- Base plus an unscaled 9-bit signed immediate offset.

See [Load/Store addressing modes on page C1-149](#).

The accesses permissions that apply to accesses made at EL0 apply to the memory accesses made by a Load/Store unprivileged instruction that is executed either:

- At EL1 when the *Effective value* of `PSTATE.UAO` is 0.
- At EL2 when both the *Effective value* of `HCR_EL2.{E2H, TGE}` is {1, 1} and the *Effective value* of `PSTATE.UAO` is 0.

Otherwise, memory accesses made by a Load/Store unprivileged instruction are subject to the access permissions that apply to the Exception level at which the instruction is executed. These are the permissions that apply to the corresponding Load/Store register instruction, see [Load/Store register on page C3-169](#).

**Note**

This means that when the value of `PSTATE.UAO` is 1 the access permissions for a Load/Store unprivileged instruction are always the same as those for the corresponding Load/Store register instruction.

Table C3-19 shows the Load/Store unprivileged instructions.

</tbody>
</table>
C3.2.6 Load-Exclusive/Store-Exclusive

The Load-Exclusive/Store-Exclusive instructions support only one addressing mode:

- Base register with no offset.

See Load/Store addressing modes on page C1-149.

The Load-Exclusive instructions mark the physical address being accessed as an exclusive access. This exclusive access mark is checked by the Store-Exclusive instruction, permitting the construction of atomic read-modify-write operations on shared memory variables, semaphores, mutexes, and spinlocks. See Synchronization and semaphores on page B2-128.

The Load-Exclusive/Store-Exclusive instructions other than Load-Exclusive pair and Store-Exclusive pair require natural alignment, and an unaligned address generates an Alignment fault. Memory accesses generated by Load-Exclusive pair or Store-Exclusive pair instructions must be aligned to the size of the pair, otherwise the access generates an Alignment fault. When a Store-Exclusive pair succeeds, it causes a single-copy atomic update of the entire memory location.

Table C3-20 shows the Load-Exclusive/Store-Exclusive instructions.

<table>
<thead>

C3.2.7 Load-Acquire/Store-Release

The Load-Acquire, Load-AcquirePC, and Store-Release instructions support only one addressing mode:

- Base register with no offset.

See Load/Store addressing modes on page C1-149.

The Load-Acquire, Load-AcquirePC, and Store-Release instructions other than Load-Acquire pair and Store-Release pair require natural alignment, and an unaligned address generates an Alignment fault. Memory accesses generated by Load-Acquire pair or Store-Release pair instructions must be aligned to the size of the pair, otherwise the access generates an Alignment fault.

A Store-Release Exclusive instruction only has the Release semantics if the store is successful.

ARMv8.1 adds more instructions with load-acquire and store-release mechanisms, see LoadLOAcquire/StoreLORelease on page C3-175.
Table C3-21 shows the Non-exclusive Load-Acquire/Store-Release instructions.

**C3.2.8 LoadLOAcquire/StoreLORelease**

The LoadLOAcquire/StoreLORelease instructions support only one addressing mode:

- Base register with no offset.

See *Load/Store addressing modes on page C1-149*.

The LoadLOAcquire/StoreLORelease instructions can remove the requirement to use the explicit DMB memory barrier instruction. For more information about the ordering of LoadLOAcquire/StoreLORelease, see *LoadLOAcquire, StoreLORelease on page B2-102*.

The LoadLOAcquire/StoreLORelease instructions require natural alignment, and an unaligned address generates an Alignment fault.
Table C3-23 shows the LoadLOAcquire/StoreLORelease instructions.

### C3.2.9 Load/Store scalar SIMD and floating-point

The Load/Store scalar SIMD and floating-point instructions operate on scalar values in the SIMD and floating-point register file as described in *SIMD and floating-point scalar register names* on page C1-146. The memory addressing modes available, described in *Load/Store addressing modes* on page C1-149, are identical to the general-purpose register Load/Store instructions, and like those instructions permit arbitrary address alignment unless strict alignment checking is enabled. However, unlike the Load/Store instructions that transfer general-purpose registers, Load/Store scalar SIMD and floating-point instructions make no guarantee of atomicity, even when the address is naturally aligned to the size of the data.

#### Load/Store scalar SIMD and floating-point register

The Load/Store scalar SIMD and floating-point register instructions support the following addressing modes:

- Base plus a scaled 12-bit unsigned immediate offset or base plus unscaled 9-bit signed immediate offset.
- Base plus 64-bit register offset, optionally scaled.
- Base plus 32-bit extended register offset, optionally scaled.
- Pre-indexed by an unscaled 9-bit signed immediate offset.
- Post-indexed by an unscaled 9-bit signed immediate offset.
- PC-relative literal for loads of 32 bits or more.

For more information on the addressing modes, see *Load/Store addressing modes* on page C1-149.

---

**Note**

The unscaled 9-bit signed immediate offset address mode requires its own instruction form, see *Load/Store scalar SIMD and floating-point register (unscaled offset)* on page C3-177.

---

Table C3-24 shows the Load/Store instructions for a single SIMD and floating-point register.

<table>
<thead>
<tr>

</tr>
<tr>
<td></td>
<td>Store scalar SIMD&amp;FP register (immediate offset)</td>
<td>STR (immediate, SIMD&amp;FP) on page C7-1700</td>
</tr>
</tbody>
</table>
Load/Store scalar SIMD and floating-point register (unscaled offset)

The Load/Store scalar SIMD and floating-point register instructions support only one addressing mode:

- Base plus an unscaled 9-bit signed immediate offset.

See also *Load/Store addressing modes* on page C1-149.

The Load/Store scalar SIMD and floating-point register (unscaled offset) instructions are required to disambiguate this instruction class from the Load/Store single SIMD and floating-point instruction forms that support an addressing mode of base plus a scaled, unsigned 12-bit immediate offset. This is similar to the Load/Store register (unscaled offset) instructions, that disambiguate this instruction class from the Load/Store register instruction, see *Load/Store register (unscaled offset)* on page C3-170.

Table C3-25 shows the Load/Store SIMD and floating-point register instructions with an unscaled offset.

<table>
<thead>
<tr>
<th>Mnemonic</th>

</tr>
</thead>
<tbody>
<tr>
<td>LDUR</td>
<td>Load scalar SIMD&amp;FP register (unscaled offset)</td>
<td><em>LDUR (SIMD&amp;FP)</em> on page C7-1414</td>
</tr>
<tr>
<td>STUR</td>
<td>Store scalar SIMD&amp;FP register (unscaled offset)</td>
<td><em>STUR (SIMD&amp;FP)</em> on page C7-1707</td>
</tr>
</tbody>
</table>

Load/Store SIMD and Floating-point register pair

The Load/Store SIMD and floating-point register pair instructions support the following addressing modes:

- Base plus a scaled 7-bit signed immediate offset.
- Pre-indexed by a scaled 7-bit signed immediate offset.
- Post-indexed by a scaled 7-bit signed immediate offset.

See also *Load/Store addressing modes* on page C1-149.

If a Load pair instruction specifies the same register for the two registers that are being loaded, then behavior is CONSTRAINED UNPREDICTABLE and one of the following behaviors must occur:

- The instruction is treated as UNDEFINED.
- The instruction is treated as a NOP.
- The instruction performs all of the loads using the specified addressing mode and the register being loaded takes an UNKNOWN value.

Table C3-26 shows the Load/Store SIMD and floating-point register pair instructions.

<table>
<thead>
<tr>
<th>Mnemonic</th>
<th>Instruction</th>

<td>Store pair of scalar SIMD&amp;FP registers</td>
<td><em>STP (SIMD&amp;FP)</em> on page C7-1697</td>
</tr>
</tbody>
</table>
Load/Store SIMD and Floating-point Non-temporal pair

The Load/Store SIMD and Floating-point Non-temporal pair instructions support only one addressing mode:

* Base plus a scaled 7-bit signed immediate offset.

See also *Load/Store addressing modes* on page C1-149.

The Load/Store Non-temporal pair instructions provide a hint to the memory system that an access is non-temporal or streaming, and unlikely to be repeated in the near future. This means that data caching is not required. However, depending on the memory type, the instructions might permit memory reads to be preloaded and memory writes to be gathered to accelerate bulk memory transfers.

In addition, there is an exception to the usual memory ordering rules. If an address dependency exists between two memory reads, and a Load non-temporal pair instruction generated the second read, then in the absence of any other barrier mechanism to achieve order, those memory accesses can be observed in any order by the other observers within the shareability domain of the memory addresses being accessed.

If a Load Non-temporal pair instruction specifies the same register for the two registers that are being loaded, then behavior is **CONSTRAINED UNPREDICTABLE** and one of the following behaviors must occur:

* The instruction is treated as **UNDEFINED**.
* The instruction is treated as a **NOP**.
* The instruction performs all the loads using the specified addressing mode and the register that is loaded takes an **UNKNOWN** value.

Table C3-27 shows the Load/Store SIMD and floating-point Non-temporal pair instructions.

C3.2.10 Load/Store Vector

The Vector Load/Store structure instructions support the following addressing modes:

* Base register only.
* Post-indexed by a 64-bit register.
* Post-indexed by an immediate, equal to the number of bytes transferred.

Load/Store vector instructions, like other Load/Store instructions, allow any address alignment, unless strict alignment checking is enabled. If strict alignment checking is enabled, then alignment checking to the size of the element is performed. However, unlike the Load/Store instructions that transfer general-purpose registers, the Load/Store vector instructions do not guarantee atomicity, even when the address is naturally aligned to the size of the element.

Load/Store structures

Table C3-28 on page C3-179 shows the Load/Store structure instructions. A post-increment immediate offset, if present, must be 8, 16, 24, 32, 48, or 64, depending on the number of elements transferred.

<td>LD4R on page C7-1397</td>
</tr>
</tbody>
</table>

C3.2.11 Prefetch memory

The Prefetch memory instructions support the following addressing modes:
- Base plus a scaled 12-bit unsigned immediate offset or base plus an unscaled 9-bit signed immediate offset.
- Base plus a 64-bit register offset. This can be optionally scaled by 8-bits, for example LSL #3.
- Base plus a 32-bit extended register offset. This can be optionally scaled by 8-bits.
- PC-relative literal.

The prefetch memory instructions signal to the memory system that memory accesses from a specified address are likely to occur in the near future. The memory system can respond by taking actions that are expected to speed up the memory access when they do occur, such as preloading the specified address into one or more caches. Because these signals are only hints, it is valid for the PE to treat any or all prefetch instructions as a NOP.

Because they are hints to the memory system, the operation of a PRFM instruction cannot cause a synchronous exception. However, a memory operation performed as a result of one of these memory system hints might in exceptional cases trigger an asynchronous event, and thereby influence the execution of the PE. An example of an asynchronous event that might be triggered is an SError interrupt.

A PRFM instruction can only have an effect on software visible structures, such as caches and translation lookaside buffers associated with memory locations that can be accessed by reads, writes, or execution as defined in the translation regime of the current Exception level.

A PRFM instruction is guaranteed not to access Device memory.

A PRFM instruction using a PLI hint must not result in any access that could not be performed by the PE speculatively fetching an instruction. Therefore, if all associated MMUs are disabled, a PLI hint cannot access any memory location that cannot be accessed by instruction fetches.

The PRFM instructions require an additional <prfop> operand to be specified, which must be one of the following:
- PLDL1KEEP, PLDL1STRM, PLDL2KEEP, PLDL2STRM, PLDL3KEEP, PLDL3STRM
- PSTL1KEEP, PSTL1STRM, PSTL2KEEP, PSTL2STRM, PSTL3KEEP, PSTL3STRM
- PLIL1KEEP, PLIL1STRM, PLIL2KEEP, PLIL2STRM, PLIL3KEEP, PLIL3STRM

<prfop> is defined as <type><target><policy>.

Here:
- <type> is one of:
  - PLD: Prefetch for load.
  - PST: Prefetch for store.
  - PLI: Preload instructions.
<target> is one of:
- L1 Level 1 cache.
- L2 Level 2 cache.
- L3 Level 3 cache.

<policy> is one of:
- KEEP Retained or temporal prefetch, allocated in the cache normally.
- STRM Streaming or non-temporal prefetch, for data that is used only once.

PRFUM explicitly uses the unscaled 9-bit signed immediate offset addressing mode, as described in Load/Store register (unscaled offset) on page C3-170.

Table C3-30 shows the Prefetch memory instructions.

### C3.2.12 Compare and Swap

The Compare and Swap instructions support only one addressing mode:

- Base register only.

See also Load/Store addressing modes on page C1-149.

For the purpose of permission checking, and for watchpoints, all the new atomic instructions are treated as performing both a load and a store.

The CAS instructions require natural alignment.

The CASP instructions require alignment to the total size of the memory being accessed.

All Compare and Swap instructions generate an Alignment fault if the address being accessed is not aligned to the size of the data structure being accessed.

The instructions are provided with ordering options, which map to the acquire and release definitions used in the ARMv8-A architecture. If a compare and swap instruction does not perform a store, then the instruction does not have release semantics, regardless of the instruction ordering options.

The atomic instructions with release semantics have the same rules as Store-Release instructions regarding multi-copy atomicity.
For the CAS and CASP instructions, the architecture permits that a data read clears any Exclusives monitors associated with that location, even if the compare subsequently fails. If these instructions generate a synchronous Data Abort, the registers which are compared and loaded are restored to the values held in the registers before the instruction was executed.

C3.2.13 Atomic memory operations

The atomic memory operation instructions support only one addressing mode:

- Base register only.

See also Load/Store addressing modes on page C1-149.

For the purpose of permission checking, and for watchpoints, all the new atomic instructions are treated as performing both a load and a store.

The LD<OP> and ST<OP> instructions require natural alignment, and an unaligned address generates an Alignment fault.

The instructions are provided with ordering options, which map to the acquire and release definitions used in the ARMv8-A architecture. The atomic instructions with release semantics have the same rules as Store-Release instructions regarding multi-copy atomicity. These operations map to the acquire and release definitions, and are counted as Load-Acquire and Store-Release operations respectively.

For the LD<OP> instructions, where the source and destination registers are the same, if the instruction generates a synchronous Data Abort, then the source register is restored to the value it held before the instruction was executed.

The ST<OP> instructions, and LD<OP> instructions where the destination register is WZR or XZR, are not regarded as doing a read for the purpose of a DMB LD barrier.

### C3.2.14 Swap

The swap instructions support only one addressing mode:

- Base register only.

See also *Load/Store addressing modes on page C1-149.*

For the purpose of permission checking, and for watchpoints, all the new atomic instructions are treated as performing both a load and a store.

The **Sw** instructions require natural alignment, and an unaligned address generates an Alignment fault.

The instructions are provided with ordering options, which map to the acquire and release definitions used in the ARMv8-A architecture. The atomic instructions with release semantics have the same rules as Store-Release instructions regarding multi-copy atomicity.

For the **Sw** instructions, where the source and destination registers are the same, if the instruction generates a synchronous Data Abort, then the source register is restored to the value it held before the instruction was executed.

C3.3 Data processing - immediate

This section describes the instruction groups for data processing with immediate operands. It contains the following subsections:

- Arithmetic (immediate).
- Logical (immediate) on page C3-186.
- Move (wide immediate) on page C3-186.
- Move (immediate) on page C3-187.
- PC-relative address calculation on page C3-187.
- Bitfield move on page C3-188.
- Bitfield insert and extract on page C3-188
- Extract register on page C3-188.
- Shift (immediate) on page C3-189.
- Sign-extend and Zero-extend on page C3-189.

For information about the encoding structure of the instructions in this instruction group, see Data Processing -- Immediate on page C4-224.

C3.3.1 Arithmetic (immediate)

The Arithmetic (immediate) instructions accept a 12-bit unsigned immediate value, optionally shifted left by 12 bits.

The Arithmetic (immediate) instructions that do not set Condition flags can read from and write to the current stack pointer. The flag setting instructions can read from the stack pointer, but they cannot write to it.

Table C3-34 shows the Arithmetic instructions with an immediate offset.

<table>

<td>Compare</td>
<td>CMP (immediate) on page C6-607</td>
</tr>
<tr>
<td>CMN</td>
<td>Compare negative</td>
<td>CMN (immediate) on page C6-602</td>
</tr>
</tbody>
</table>
C3.3.2 Logical (immediate)

The Logical (immediate) instructions accept a bitmask immediate value that is a 32-bit pattern or a 64-bit pattern viewed as a vector of identical elements of size $e = 2, 4, 8, 16, 32$ or, 64 bits. Each element contains the same sub-pattern, that is a single run of 1 to $(e - 1)$ nonzero bits from bit 0 followed by zero bits, then rotated by 0 to $(e - 1)$ bits. This mechanism can generate $5334$ unique 64-bit patterns as $2667$ pairs of pattern and their bitwise inverse.

--- Note ---

Values that consist of only zeros or only ones cannot be described in this way.

--- Note ---

The Logical (immediate) instructions that do not set the Condition flags can write to the current stack pointer, for example to align the stack pointer in a function prologue.

--- Note ---

Apart from ANDS, and its TST alias, Logical (immediate) instructions do not set the Condition flags. However, the final results of a bitwise operation can be tested by a CBZ, CBNZ, TBZ, or TBNZ conditional branch.

Table C3-35 shows the Logical immediate instructions.

--- Table C3-35 Logical immediate instructions ---

<table>
<thead>
<tr>

</tr>
<tr>
<td>TST</td>
<td>Test bits</td>
<td>TST (immediate) on page C6-985</td>
</tr>
</tbody>
</table>

C3.3.3 Move (wide immediate)

The Move (wide immediate) instructions insert a 16-bit immediate, or inverted immediate, into a 16-bit aligned position in the destination register. The value of the other bits in the destination register depends on the variant used. The optional shift amount can be any multiple of 16 that is smaller than the register size.

Table C3-36 shows the Move (wide immediate) instructions.

--- Table C3-36 Move (wide immediate) instructions ---

<table>
<thead>
<tr>
<th>Mnemonic</th>

<td>Move wide with NOT</td>
<td>MOVN on page C6-798</td>
</tr>
<tr>
<td>MOVK</td>
<td>Move wide with keep</td>
<td>MOVK on page C6-797</td>
</tr>
</tbody>
</table>
C3.3.4 Move (immediate)

The Move (immediate) instructions are aliases for a single MOVZ, MOVN, or ORR (immediate with zero register), instruction to load an immediate value into the destination register. An assembler must permit a signed or unsigned immediate, as long as its binary representation can be generated using one of these instructions, and an assembler error results if the immediate cannot be generated in this way. On disassemblry, it is unspecified whether the immediate is output as a signed or an unsigned value.

If there is a choice between the MOVZ, MOVN, and ORR instruction to encode the immediate, then an assembler must prefer MOVZ to MOVN, and MOVZ or MOVN to ORR, to ensure reversability. A disassembler must output ORR (immediate with zero register) MOVZ, and MOVN, as a MOV mnemonic except that the underlying instruction must be used when:

- ORR has an immediate that can be generated by a MOVZ or MOVN instruction.
- A MOVN instruction has an immediate that can be encoded by MOVZ.
- MOVZ #0 or MOVN #0 have a shift amount other than LSL #0.

Table C3-37 shows the Move (immediate) instructions.

</tr>
</tbody>
</table>

C3.3.5 PC-relative address calculation

The ADR instruction adds a signed, 21-bit immediate to the value of the program counter that fetched this instruction, and then writes the result to a general-purpose register. This permits the calculation of any byte address within ±1MB of the current PC.

The ADRP instruction shifts a signed, 21-bit immediate left by 12 bits, adds it to the value of the program counter with the bottom 12 bits cleared to zero, and then writes the result to a general-purpose register. This permits the calculation of the address at a 4KB aligned memory region. In conjunction with an ADD (immediate) instruction, or a Load/Store instruction with a 12-bit immediate offset, this allows for the calculation of, or access to, any address within ±4GB of the current PC.

_____ Note _____
The term page used in the ADRP description is short-hand for the 4KB memory region, and is not related to the virtual memory translation granule size.

Table C3-38 shows the instructions used for PC-relative address calculations are as follows:

<table>
<thead>
<tr>
<th>Mnemonic</th>
<th>Instruction</th>
<th>See</th>
</tr>
</thead>
<tbody>
<tr>

<td>Compute address of label at a PC-relative offset.</td>
<td>ADR on page C6-541</td>
</tr>
</tbody>
</table>
C3.3.6 Bitfield move

The Bitfield move instructions copy a field of constant width from bit 0 in the source register to a constant bit position in the destination register, or from a constant bit position in the source register to bit 0 in the destination register. The remaining bits in the destination register are set as follows:

- For BFM, the remaining bits are unchanged.
- For UBFM the lower bits, if any, and upper bits, if any, are set to zero.
- For SBFM, the lower bits, if any, are set to zero, and the upper bits, if any, are set to a copy of the most-significant bit in the copied field.

Table C3-39 shows the Bitfield move instructions.

</tbody>
</table>

C3.3.8 Extract register

Depending on the register width of the operands, the Extract register instruction copies a 32-bit or 64-bit field from a constant bit position within a double-width value formed by the concatenation of a pair of source registers to a destination register.

Table C3-41 shows the Extract (immediate) instructions.

<table>

C3.4 Data processing - register

This section describes the instruction groups for data processing with all register operands. It contains the following subsections:

- Arithmetic (shifted register).
- Arithmetic (extended register) on page C3-191.
- Arithmetic with carry on page C3-192.
- Logical (shifted register) on page C3-192.
- Move (register) on page C3-193.
- Shift (register) on page C3-193.
- Multiply and divide on page C3-194.
- CRC32 on page C3-195.
- Bit operation on page C3-196.
- Conditional select on page C3-196.
- Conditional comparison on page C3-197.

For information about the encoding structure of the instructions in this instruction group, see Data Processing -- Register on page C4-266.

C3.4.1 Arithmetic (shifted register)

The Arithmetic (shifted register) instructions apply an optional shift operator to the second source register value before performing the arithmetic operation. The register width of the instruction controls whether the new bits are fed into the intermediate result on a right shift or rotate at bit[63] or bit[31].

The shift operators LSL, ASR, and LSR accept an immediate shift amount in the range 0 to one less than the register width of the instruction, inclusive.

Omitting the shift operator implies LSL #0, which means that there is no shift. A disassembler must not output LSL #0. However, a disassembler must output all other shifts by zero.

The current stack pointer, SP or WSP, cannot be used with this class of instructions. See Arithmetic (extended register) on page C3-191 for arithmetic instructions that can operate on the current stack pointer.

Table C3-44 shows the Arithmetic (shifted register) instructions.

</tr>
<tr>
<td>NEGS</td>
<td>Negate and set flags</td>
<td>NEGS on page C6-813</td>
</tr>
</tbody>
</table>
C3.4.2 Arithmetic (extended register)

The extended register instructions provide an optional sign-extension or zero-extension of a portion of the second source register value, followed by an optional left shift by a constant amount of 1-4, inclusive.

The extended shift is described by the mandatory extend operator SXTB, SXTH, SXTW, UXTB, UXTH, or UXTW. This is followed by an optional left shift amount. If the shift amount is not specified, the default shift amount is zero. A disassembler must not output a shift amount of zero.

For 64-bit instruction forms, the additional operators UXTX and SXTX use all 64 bits of the second source register with an optional shift. In that case, ARM recommends UXTX as the operator. If and only if at least one register is SP, ARM recommends use of the LSL operator name, rather than UXTX, and when the shift amount is also zero then both the operator and the shift amount can be omitted. UXTW and SXTW both use all 32 bits of the second source register with an optional shift. In that case ARM recommends UXTW as the operator. If and only if at least one register is WSP, ARM recommends use of the LSL operator name, rather than UXTW, and when the shift amount is also zero then both the operator and the shift amount can be omitted.

For 32-bit instruction forms, the operators UXTW and SXTW both use all 32 bits of the second source register with an optional shift. In that case, ARM recommends UXTW as the operator. If and only if at least one register is WSP, ARM recommends use of the LSL operator name, rather than UXTW, and when the shift amount is also zero then both the operator and the shift amount can be omitted.

The non-flag setting variants of the extended register instruction permit the use of the current stack pointer as either the destination register and the first source register. The flag setting variants only permit the stack pointer to be used as the first source register.

In the 64-bit form of these instructions, the final register operand is written as \( Wm \) for all except the UXTX/LSL and SXTX extend operators. For example:

```
CMP X4, W5, SXTW
ADD X1, X2, W3, UXTB #2
SUB SP, SP, X1 // SUB SP, SP, X1, UXTX #0
```

Table C3-45 shows the Arithmetic (extended register) instructions.

</tbody>
</table>

C3.4.4 Logical (shifted register)

The Logical (shifted register) instructions apply an optional shift operator to the second source register value before performing the main operation. The register width of the instruction controls whether the new bits are fed into the intermediate result on a right shift or rotate at bit[63] or bit[31].

The shift operators LSL, ASR, LSR, and ROR accept a constant immediate shift amount in the range 0 to one less than the register width of the instruction, inclusive.

Omitting the shift operator and amount implies LSL #0, which means that there is no shift. A disassembler must not output LSL #0. However, a disassembler must output all other shifts by zero.

Note

Apart from ANDS, TST, and BICS the logical instructions do not set the Condition flags, but the final result of a bit operation can usually directly control a CBZ, CBNZ, TBZ, or TBNZ conditional branch.

Table C3-47 shows the Logical (shifted register) instructions.

<table>
<thead>
<tr>
<th>Mnemonic</th>

</tr>
<tr>
<td>ORR</td>
<td>Bitwise inclusive OR</td>
<td>ORR (shifted register) on page C6-822</td>
</tr>
</tbody>
</table>
C3.4.5 Move (register)

The Move (register) instructions are aliases for other data processing instructions. They copy a value from a
general-purpose register to another general-purpose register or the current stack pointer, or from the current stack
pointer to a general-purpose register.

<table>
<thead>
<tr>
<th>Mnemonic</th>

<td>ORN (shifted register) on page C6-818</td>
</tr>
<tr>
<td>TST</td>
<td>Test bits</td>
<td>TST (shifted register) on page C6-986</td>
</tr>
</tbody>
</table>

C3.4.6 Shift (register)

In the Shift (register) instructions, the shift amount is the positive value in the second source register modulo the
register size. The register width of the instruction controls whether the new bits are fed into the result on a right shift
or rotate at bit[63] or bit[31].

Table C3-49 shows the Shift (register) instructions.

<table>

C3.4.7 Multiply and divide

This section describes the instructions used for integer multiplication and division. It contains the following subsections:

- Multiply.
- Divide on page C3-195.

Multiply

The Multiply instructions write to a single 32-bit or 64-bit destination register, and are built around the fundamental four operand multiply-add and multiply-subtract operation, together with 32-bit to 64-bit widening variants. A 64-bit to 128-bit widening multiple can be constructed with two instructions, using SMULH or UMULH to generate the upper 64 bits. Table C3-51 shows the Multiply instructions.

</tr>
<tr>
<td>UMULH</td>
<td>Unsigned multiply high</td>
<td>UMULH on page C6-996</td>
</tr>
</tbody>
</table>
Divide

The Divide instructions compute the quotient of a division, rounded towards zero. The remainder can then be computed as (numerator - (quotient × denominator)), using the MSUB instruction.

If a signed integer division (INT_MIN / -1) is performed where INT_MIN is the most negative integer value representable in the selected register size, then the result overflows the signed integer range. No indication of this overflow is produced and the result that is written to the destination register is INT_MIN.

A division by zero results in a zero being written to the destination register, without any indication that the division by zero occurred.

Table C3-52 shows the Divide instructions.

</tbody>
</table>

C3.4.8 CRC32

The CRC32 instructions operate on the general-purpose register file to update a 32-bit CRC value from an input value comprising 1, 2, 4, or 8 bytes. There are two different classes of CRC instructions, CRC32, and CRC32C, that support two commonly used 32-bit polynomials, known as CRC-32 and CRC-32C.

To fit with common usage, the bit order of the values is reversed as part of the operation.

When bits[19:16] of ID_AA64ISAR0_EL1 are set to 0b0001, the CRC instructions are implemented.

These instructions are optional in an ARMv8.0 implementation.

All implementations of ARMv8.1 architecture and later are required to implement the CRC32 instructions.

Table C3-53 shows the CRC instructions.

</tbody>
</table>

C3.4.10 Conditional select

The Conditional select instructions select between the first or second source register, depending on the current state of the Condition flags. When the named condition is true, the first source register is selected and its value is copied without modification to the destination register. When the condition is false the second source register is selected and its value might be optionally inverted, negated, or incremented by one, before writing to the destination register.

Other useful conditional set and conditional unary operations are implemented as aliases of the four Conditional select instructions.

Table C3-55 shows the Conditional select instructions.

</tbody>
</table>
C3.4.11 Conditional comparison

The Conditional comparison instructions provide a conditional select for the NZCV Condition flags, setting the flags to the result of an arithmetic comparison of its two source register values if the named input condition is true, or to an immediate value if the input condition is false. There are register and immediate forms. The immediate form compares the source register to a small 5-bit unsigned value.

Table C3-56 shows the Conditional comparison instructions.

C3.5 Data processing - SIMD and floating-point

This section describes the instruction groups for data processing with SIMD and floating-point register operands. Common features of SIMD instructions gives general information about SIMD instructions.

The following subsections describe the scalar floating-point data processing instructions:

- Floating-point move (register) on page C3-199.
- Floating-point move (immediate) on page C3-199.
- Floating-point conversion on page C3-200.
- Floating-point round to integer on page C3-201.
- Floating-point arithmetic (one source) on page C3-202.
- Floating-point arithmetic (two sources) on page C3-203.
- Floating-point minimum and maximum on page C3-203.
- Floating-point comparison on page C3-203.
- Floating-point conditional select on page C3-204.

The following subsections describe the SIMD data processing instructions:

- SIMD move on page C3-204
- SIMD arithmetic on page C3-205.
- SIMD compare on page C3-208.
- SIMD widening and narrowing arithmetic on page C3-209.
- SIMD table lookup on page C3-218.
- SIMD by element arithmetic on page C3-212.
- SIMD permute on page C3-213.
- SIMD immediate on page C3-213.
- SIMD shift (immediate) on page C3-213.
- SIMD floating-point and integer conversion on page C3-215.
- SIMD reduce (across vector lanes) on page C3-216.
- SIMD pairwise arithmetic on page C3-216.
- SIMD dot product on page C3-217.
- SIMD table lookup on page C3-218.
- SIMD complex number arithmetic on page C3-218.
- The Cryptographic Extension on page C3-218.

For information about the encoding structure of the instructions in this instruction group, see Data Processing -- Scalar Floating-Point and Advanced SIMD on page C4-275.

For information about the floating-point exceptions, see Floating-point exceptions and exception traps on page D1-1899.

C3.5.1 Common features of SIMD instructions

A number of SIMD instructions come in three forms:

- **Wide** Indicated by the suffix \( W \). The element width of the destination register and the first source operand is double that of the second source operand.
- **Long** Indicated by the suffix \( L \). The element width of the destination register is double that of both source operands.
- **Narrow** Indicated by the suffix \( N \). The element width of the destination register is half that of both source operands.
In addition, each vector form of the instruction is part of a pair, with a second and upper half suffix of 2, to identify the variant of the instruction:

- Where a SIMD operation widens or lengthens a 64-bit vector to a 128-bit vector, the instruction provides a second part operation that can extract the source from the upper 64 bits of the source registers.
- Where a SIMD operation narrows a 128-bit vector to a 64-bit vector, the instruction provides a second-part operation that can pack the result of a second operation into the upper part of the same destination register.

--- Note ---
This is referred to as a lane set specifier.

### C3.5.2 Floating-point move (register)

The Floating-point move (register) instructions copy a scalar floating-point value from one register to another register without performing any conversion.

Some of the Floating-point move (register) instructions overlap with the functionality provided by the Advanced SIMD instructions DUP, INS, and UMOV. However, ARM recommends using the FMOV instructions when operating on scalar floating-point data to avoid the creation of scalar floating-point code that depends on the availability of the Advanced SIMD instruction set.

Table C3-57 shows the Floating-point move (register) instructions.

<table>
<thead>
<tr>
<th>Mnemonic</th>
<th>Instruction</th>
<th>See</th>
</tr>
</thead>
<tbody>
<tr>
<td>FMOV</td>
<td>Floating-point move register without conversion</td>

</tr>
<tr>
<td></td>
<td>Floating-point move to or from general-purpose register without conversion</td>
<td>FMOV (general) on page C7-1273</td>
</tr>
</tbody>
</table>

### C3.5.3 Floating-point move (immediate)

The Floating-point move (immediate) instructions convert a small constant immediate floating-point value into a half-precision, single-precision, or double-precision scalar floating-point value in a SIMD and floating-point register.

The floating-point constant can be specified either in decimal notation, such as 12.0 or -1.2e1, or as a string beginning with `0x` followed by a hexadecimal representation of the IEEE 754 half-precision, single-precision, or double-precision encoding. ARM recommends that a disassembler uses the decimal notation, provided that this displays the value precisely.

--- Note ---
When ARMv8.2-FP16 is not implemented, the only half-precision instructions that are supported are floating-point conversions between half-precision, single-precision, and double-precision.

The floating-point value must be expressible as \((\pm n/16 \times 2^r)\), where \(n\) is an integer in the range \(16 \leq n \leq 31\) and \(r\) is an integer in the range of \(-3 \leq r \leq 4\), that is a normalized binary floating-point encoding with one sign bit, four bits of fraction, and a 3-bit exponent.

Table C3-58 shows the Floating-point move (immediate) instruction:

<table>
<thead>
<tr>
<th>Mnemonic</th>
<th>Instruction</th>
<th>See</th>
</tr>
</thead>
<tbody>
<tr>
<td>FMOV</td>
<td>Floating-point move immediate</td>
<td>FMOV (scalar; immediate) on page C7-1276</td>
</tr>
</tbody>
</table>
C3.5.4 Floating-point conversion

The following subsections describe the conversion of floating-point values:

- Convert floating-point precision.
- Convert between floating-point and integer or fixed-point.

Convert floating-point precision

These instructions convert a floating-point scalar with one precision to a floating-point scalar with a different precision, using the current rounding mode as specified by FPCR.RMode.

Table C3-59 shows the Floating-point precision conversion instruction.

<table>
<thead>
<tr>
<th>Mnemonic</th>
<th>Instruction</th>
<th>See</th>
</tr>
</thead>
<tbody>
<tr>
<td>FCVT</td>
<td>Floating-point convert precision (scalar)</td>
<td>FCVT on page C7-1134</td>
</tr>
</tbody>
</table>

Convert between floating-point and integer or fixed-point

These instructions convert a floating-point scalar in a SIMD and floating-point register to or from a signed or unsigned integer or fixed-point value in a general-purpose register. For a fixed-point value, a final immediate operand indicates that the general-purpose register holds a fixed-point number and fbits indicates the number of bits after the binary point. fbits is in the range 1-32 inclusive for a 32-bit general-purpose register name, and 1-64 inclusive for a 64-bit general-purpose register name.

These instructions can cause the following floating-point exceptions:

Invalid Operation

Occurs if the floating-point input is a NaN, infinity, or a numerical value that cannot be represented in the destination register. An out-of-range integer or fixed-point result is saturated to the size of the destination register.

Inexact

Occurs if the numeric result that differs from the input value.

Input Denormal

As Flush-to-zero on page A1-53 describes, when Flush-to-zero mode is enabled, occurs when zero replaces a double-precision or single-precision denormal input.

--- Note ---

When ARMv8.2-FP16 is implemented, a half-precision denormal input that is flushed to zero does not generate an Input Denormal exception.

Table C3-60 shows the Floating-point and fixed-point conversion instructions.

<table>
<thead>
<tr>
<th>Mnemonic</th>
<th>Instruction</th>
<th>See</th>
</tr>
</thead>
<tbody>
<tr>
<td>FCVTAS</td>
<td>Floating-point scalar convert to signed integer, rounding to nearest with ties to away (scalar form)</td>
<td>FCVTAS (scalar) on page C7-1139</td>
</tr>
<tr>
<td>FCVTAU</td>
<td>Floating-point scalar convert to unsigned integer, rounding to nearest with ties to away (scalar form)</td>
<td>FCVTAU (scalar) on page C7-1144</td>
</tr>
<tr>
<td>FCVTMS</td>
<td>Floating-point scalar convert to signed integer, rounding toward minus infinity (scalar form)</td>
<td>FCVTMS (scalar) on page C7-1151</td>
</tr>
</tbody>
</table>
The Floating-point round to integer instructions round a floating-point value to an integer floating-point value of the same size.

For these instructions:
- A zero input gives a zero result with the same sign.
- An infinite input gives an infinite result with the same sign.
- A NaN is propagated as in normal floating-point arithmetic.

These instructions can cause the following floating-point exceptions:

**Invalid Operation**
Occurs in response to a floating-point input of a signaling NaN.

**Inexact, FRINTX instruction only**
Occurs if the result is numeric and does not have the same numerical value as the input.
Input Denormal

As *Flush-to-zero on page A1-53* describes, when Flush-to-zero mode is enabled, occurs when zero replaces a double-precision or single-precision denormal input.

--- Note ---
When ARMv8.2-FP16 is implemented, a half-precision denormal input that is flushed to zero does not generate an Input Denormal exception.

Table C3-61 shows the Floating-point round to integer instructions.

</tbody>
</table>

**C3.5.9 Floating-point minimum and maximum**

The \( \min(x,y) \) and \( \max(x,y) \) operations return a quiet NaN when either \( x \) or \( y \) is NaN.

As described in *Flush-to-zero on page A1-53*, in flush-to-zero mode, denormal operands are flushed to zero before comparison, and if the result of the comparison is the flushed value, then a zero value is returned. Where both \( x \) and \( y \) are zero, or denormal values flushed to zero, with different signs, then +0.0 is returned by \( \max() \) and -0.0 by \( \min() \).

The \( \minNum(x,y) \) and \( \maxNum(x,y) \) operations follow the IEEE 754-2008 standard and return the numerical operand when one operand is numerical and the other a quiet NaN. Apart from this additional handling of a single quiet NaN the result is then identical to \( \min(x,y) \) and \( \max(x,y) \).

Table C3-65 shows the Floating-point instructions that can perform floating-point minimum and maximum operations.

**C3.5.10 Floating-point comparison**

These instructions set the NZCV Condition flags in PSTATE, based on the result of a comparison of two operands. If the floating-point comparisons are unordered, where one or both operands are a form of NaN, the C and V bits are set to 1 and the N and Z bits are cleared to 0.

--- **Note** ---

The NZCV flags in the FPSR are associated with AArch32 state. The A64 floating-point comparison instructions do not change the Condition flags in the FPSR.

---

For the conditional Floating-point comparison instructions, if the condition is TRUE, the flags are updated to the result of the comparison, otherwise the flags are updated to the immediate value that is defined in the instruction encoding.
The quiet compare instructions generate an Invalid Operation floating-point exception if either of the source operands is a signaling NaN. The signaling compare instructions generate an Invalid Operation floating-point exception if either of the source operands is any type of NaN.

Table C3-66 shows the Floating-point comparison instructions.

C3.5.14 SIMD compare

The SIMD compare instructions compare vector or scalar elements according to the specified condition and set the destination vector element to all ones if the condition holds, or to zero if the condition does not hold.

**Note**

Some of the comparisons, such as LS, LE, LO, and LT, can be made by reversing the operands and using the opposite comparison, HS, GE, HI, or GT.

Table C3-70 shows that SIMD compare instructions.

C3.5.21 SIMD floating-point and integer conversion

The SIMD floating-point and integer conversion instructions generate the Invalid Operation floating-point exception in response to a floating-point input of NaN, infinity, or a numerical value that cannot be represented within the destination register. An out-of-range integer or a fixed-point result is saturated to the size of the destination register. A numeric result that differs from the input raises the Inexact floating-point exception.

Table C3-77 shows the SIMD floating-point and integer conversion instructions.

</tbody>
</table>
C3.5.24   SIMD dot product

ARMv8.2-DotProd provides SIMD instructions that perform the dot product of the four 8-bit subelements of the 32-bit elements of one vector with the four 8-bit subelements of a second vector. It provides two forms of the instructions, each with signed and unsigned versions:

**Vector form**  The dot product is calculated for each element of the first vector with the corresponding element of the second element.

**Indexed form**  The dot product is calculated for each element of the first vector with the element of the second vector that is indicated by the index argument to the instruction.

--- Note ---

That is, a single element from the second vector is used, and the dot product is calculated between each element of the first vector and this single element from the second vector.

</tbody>
</table>

C3.5.26 SIMD complex number arithmetic

ARMv8.3-CompNum provides SIMD instructions that perform arithmetic on complex numbers held in element pairs in vector registers, where the less significant element of the pair contains the real component and the more significant element contains the imaginary component.

These instructions provide double-precision and single-precision versions. If ARMv8.2-FP16 is implemented they also provide half-precision versions, otherwise the half-precision encodings are UNDEFINED.

Table C3-82 shows the ARMv8.3-CompNum SIMD instructions:

<table>
<thead>
<tr>
<th>Mnemonic</th>
<th>Instruction</th>
<th>See</th>
</tr>
</thead>
<tbody>
<tr>
<td>FCADD</td>
<td>Floating-point complex add</td>

</tr>
<tr>
<td>FCMLA</td>
<td>Floating-point complex multiply accumulate (indexed form)</td>
<td>FCMLA (by element) on page C7-1117</td>
</tr>
</tbody>
</table>

A pair of FCMLA instructions can be used to perform a complex number multiplication. This is demonstrated in Complex multiplication on page K10-6514.

C3.5.27 The Cryptographic Extension

The instructions provided by the optional ARMv8.0 Cryptographic Extension use the SIMD and floating-point register file. For more information about the functions they provide see:

- Announcing the Advanced Encryption Standard.
- The Galois/Counter Mode of Operation.
- Announcing the Secure Hash Standard.

Table C3-83 shows the ARMv8.0 Cryptographic Extension instructions.

<table>

</tr>
</tbody>
</table>

**ARMv8.2 extensions to the Cryptographic Extension**

ARMv8.2 provides two optional extensions to the Cryptographic Extension, see:

- ARMv8.2-SHA, SHA2-512 and SHA3.
- ARMv8.2-SM, SM3 and SM4 on page C3-220.

**ARMv8.2-SHA, SHA2-512 and SHA3**

ARMv8.2-SHA provides:

- Instructions to accelerate the SHA-2 hash algorithm using a digest that is larger than 256 bits. The relevant standards are SHA-384, SHA-512, SHA-512/224 and SHA-512/256. These are all based on the SHA-512 computation, and therefore this set of instructions is described as the SHA512 instructions.

- Instructions to accelerate the SHA-3 hash algorithm. This set of instructions is described as the SHA3 instructions.

Implementation of ARMv8.2-SHA requires the implementation of the SHA1 and SHA2-256 instructions from the ARMv8.0 Cryptographic Extension.

**Note**

Implementation of ARMv8.2-SHA does not require the implementation of the AES instructions, and the 64-bit polynomial variants of the PMULL instructions, from the ARMv8.0 Cryptographic Extension.

When ARMv8.2-SHA is implemented:

- The value of ID_AA64ISAR0_EL1.SHA2 is 0b0010, indicating support for the SHA512 instructions.
- The value of ID_AA64ISAR0_EL1.SHA3 is 0b0001, indicating support for the SHA3 instructions.
Table C3-84 shows the ARMv8.2-SHA SHA512 instructions:

<table>
<thead>
<tr>
<th>Mnemonic</th>
<th>Instruction</th>
<th>See</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td>SHA512SU1</td>
<td>SHA512 Schedule Update 1</td>
<td>SHA512SU1 on page C7-1512</td>
</tr>
</tbody>
</table>

Use of the SHA512 instructions on page K10-6516 shows an example of the use of these instructions to calculate a SHA512 hash iteration. This example code is not part of the architectural definition of these instructions.

Table C3-85 shows the ARMv8.2-SHA SHA3 instructions. The SHA-3 hash algorithm is based on a running digest of 1600 bytes, arranged as a five by five array of 64-bit registers. The ARM acceleration of these instructions is based on mapping the 25 64-bit values into 25 vector registers, with each 64-bit value occupying the same 64-bit element in each vector. A series of transformations is performed on these registers as part of a round of the SHA-3 hash calculation.

The SIMD nature of the vector registers means the acceleration can compute two parallel SHA3 hash calculations, where one calculation is performed using the zeroth 64-bit element of each vector, and the other calculation is performed using the first 64-bit element of each vector.

——— Note ———

This is useful because the SHA-3 family of standards is being extended to introduce a fast parallel hash algorithm that benefits from being able to calculate SHA-3 hashes in parallel.

To provide acceleration where the SIMD calculation is not required, the instructions provide variants that operate only on the zeroth 64-bit elements. These are provided as a power optimization.

Use of the SHA3 instructions on page K10-6517 shows an example of the use of these instructions to calculate the combined theta, phi, rho and chi operations of a SHA3 iteration. This example code is not part of the architectural definition of these instructions.

**ARMv8.2-SM, SM3 and SM4**

ARMv8.2-SM provides:

- Instructions to accelerate the SM3 hash algorithm, the standard Chinese hash algorithm. These are described as the SM3 instructions.

- Instructions to accelerate the SM4 encryption algorithm, the standard Chinese encryption algorithm. This set of instructions is described as the SM4 instructions.

ARMv8.2-SM can be implemented independently of any part of the ARMv8.0 Cryptographic Extension, and independently of ARMv8.2-SHA.
Note
This means that ARMv8.2 permits an implementation of the Cryptographic Extension that provides only the ARMv8.2-SM functionality.

When ARMv8.2-SM is implemented:
- The value of ID_AA64ISAR0_EL1.SM3 is 0b0001, indicating support for the SM3 instructions.
- The value of ID_AA64ISAR0_EL1.SM4 is 0b0001, indicating support for the SM4 instructions.

Table C3-86 shows the ARMv8.2-SM SM3 instructions. The SM3 algorithm computes a digest of 256 bits, that can be held in two vector registers. The SM3 instructions include instructions to accelerate the computation of the hash and the schedule update.

Note
The SM3 instruction names refer to intermediate variables defined as part of the SM3 Cryptographic Hash Algorithm specification.

</tbody>
</table>

Use of the SM3 instructions on page K10-6518 shows an example of the use of these instructions to generate an SM3 hash. This example code is not part of the architectural definition of these instructions.

Table C3-87 shows the ARMv8.2-SM SM4 instructions. The SM4 algorithm is 128-bit wide block cipher. The SM4E instruction accelerates a single round of encryption or decryption, and the SM4EKEY instruction accelerates a single round of key generation:

</tbody>
</table>

Use of the SM4 instructions on page K10-6520 shows an example of the use of these instructions to perform SM4 encryption and decryption. This example code is not part of the architectural definition of these instructions.
Chapter C4
A64 Instruction Set Encoding

This chapter describes the encoding of the A64 instruction set. It contains the following section:

• A64 instruction set encoding on page C4-224.

In this chapter:

• In the decode tables, an entry of - for a field value means the value of the field does not affect the decoding.
• In the decode diagrams, a shaded field indicates that the bits in that field are not used in that level of decode.
C4.1 A64 instruction set encoding

The A64 instruction encoding is:

```
| 31  | 29 28| 25 24| 23 22| 21 20| 19 18| 17 16| 15 14| 13 12| 11 10| 9  8| 7  6| 5  4| 3  2| 1  0 |
```

```
op0
```

### Compare and branch (immediate)

This section describes the encoding of the Compare and branch (immediate) instruction class. The encodings in this section are decoded from *Branches, Exception Generating and System instructions* on page C4-228.
Test and branch (immediate)

This section describes the encoding of the Test and branch (immediate) instruction class. The encodings in this section are decoded from **Branches, Exception Generating and System instructions on page C4-228**.

C4.1.3 Loads and Stores

This section describes the encoding of the Loads and Stores group. The encodings in this section are decoded from **A64 instruction set encoding on page C4-224**.

C4.1.5 Data Processing -- Scalar Floating-Point and Advanced SIMD

This section describes the encoding of the Data Processing -- Scalar Floating-Point and Advanced SIMD group. The encodings in this section are decoded from A64 instruction set encoding on page C4-224.

U size opcode
Advanced SIMD scalar pairwise

This section describes the encoding of the Advanced SIMD scalar pairwise instruction class. The encodings in this section are decoded from *Data Processing -- Scalar Floating-Point and Advanced SIMD* on page C4-275.

The following table shows the encoding fields for advanced SIMD scalar pairwise instructions:

<table>
<thead>
<tr>
<th>Decode fields</th>

Advanced SIMD extract

This section describes the encoding of the Advanced SIMD extract instruction class. The encodings in this section are decoded from *Data Processing -- Scalar Floating-Point and Advanced SIMD* on page C4-275.

Advanced SIMD copy

This section describes the encoding of the Advanced SIMD copy instruction class. The encodings in this section are decoded from *Data Processing -- Scalar Floating-Point and Advanced SIMD* on page C4-275.
This section describes the encoding of the Advanced SIMD three same (FP16) instruction class. The encodings in this section are decoded from *Data Processing -- Scalar Floating-Point and Advanced SIMD* on page C4-275.

### Advanced SIMD three same (FP16)

The encodings in this section are decoded from *Data Processing -- Scalar Floating-Point and Advanced SIMD* on page C4-275.
### Advanced SIMD two-register miscellaneous (FP16)

This section describes the encoding of the Advanced SIMD two-register miscellaneous (FP16) instruction class. The encodings in this section are decoded from *Data Processing -- Scalar Floating-Point and Advanced SIMD* on page C4-275.

- **FMOV (scalar, immediate)** - *Half-precision variant* on page C7-1276

---

**Note:** The table above shows the encoding of Floating-point immediate instructions in the AArch64 instruction set. Each entry in the table corresponds to a specific instruction, with the fields M, S, type, imm5, Instruction page, and Architecture version indicating their respective values and the associated instruction class. The table covers a range of encoding patterns, each representing a specific instruction type, and notes the precision variant and architecture version where applicable.
Floating-point conditional compare

This section describes the encoding of the Floating-point conditional compare instruction class. The encodings in this section are decoded from Data Processing -- Scalar Floating-Point and Advanced SIMD on page C4-275.

<table>
<thead>
<tr>

Chapter C5
The A64 System Instruction Class

This chapter describes the A64 System instruction class, and the System instruction class encoding space, that is a subset of the System registers encoding space. It contains the following sections:

- The System instruction class encoding space on page C5-328.
- Special-purpose registers on page C5-339.
- A64 System instructions for cache maintenance on page C5-409.
- A64 system instructions for address translation on page C5-432.
- A64 System instructions for TLB maintenance on page C5-459.

See General information about the A64 instruction descriptions on page C2-157 for information about entries used in the instruction encoding descriptions.
C5.1 The System instruction class encoding space

Part of the A64 instruction encoding space is assigned to instructions that access the System register encoding space. These instructions provide:

- Access to System registers, including the debug registers, that provide system control, and system status information.
- Access to Special-purpose registers such as SPSR_ELx, ELR_ELx, and the equivalent fields of the Process State.
- The cache and TLB maintenance instructions and address translation instructions.
- Barriers and the CLREX instruction.
- Architectural hint instructions.

This section describes the general model for accessing this functionality.

Note

- See Fixed values in AArch64 instruction and System register descriptions on page C2-157 for information about abbreviations used in the System instruction descriptions.

In AArch32 state much of this functionality is provided through the System register interface described in The AArch32 System register interface on page G1-4693. In AArch64 state, the parameters used to characterize the System register encoding space are \{(op0, op1, CRn, CRm, op2)\}. These are based on the parameters that characterize the AArch32 System register encoding space, which reflect the original implementation of these registers, as described in Background to the System register interface on page G1-4694. In ARMv8, there is no particular significance to the naming of these parameters, and no functional distinction between the opn parameters and the CRx parameters.

Principles of the System instruction class encoding describes some general properties of these encodings. System instruction class encoding overview on page C5-329 then describes the top-level encoding of these instructions, and the following sections then describe the next level of the encoding hierarchy of System instructions and Special-purpose registers:

- \(op0 = 0b00\), architectural hints, barriers and CLREX, and PSTATE access on page C5-330.
- \(op0 = 0b01\), cache maintenance, TLB maintenance, and address translation instructions on page C5-332.
- \(op0 = 0b11\), Moves to and from Special-purpose registers on page C5-336.

For the description of the next level of encoding hierarchy of System registers, see:

- \(op0 = 0b10\), Moves to and from debug and trace System registers on page D9-2333.
- \(op0 = 0b11\), Moves to and from non-debug System registers, Special-purpose registers on page D9-2335.
- Reserved encodings for IMPLEMENTATION DEFINED registers on page D9-2345.

C5.1.1 Principles of the System instruction class encoding

In ARMv8, an encoding in the System instruction space is identified by a set of arguments, \{(op0, op1, CRn, CRm, op2)\}. These form an encoding hierarchy, where:

- \(op0\) defines the top-level division of the encoding space, see System instruction class encoding overview on page C5-329.

- \(op1\) identifies the lowest Exception level at which the encoding is accessible, as follows:
  - Accessible at EL0 \(op1\) has the value 3.
  - Accessible at EL1 \(op1\) has the value 0, 1, or 2. The value is the same as the \(op1\) value used to access the equivalent AArch32 register.
  - Accessible at EL2 \(op1\) has the value 4.
  - Accessible at EL3 \(op1\) has the value 6.
ARM strongly recommends that implementers adopt this use of op1 when using the IMPLEMENTATION DEFINED regions of the encoding space described in Reserved encodings for IMPLEMENTATION DEFINED registers on page D9-2345.

System register width

In AArch64 state, each encoding in the System instruction space can provide access to a 64-bit register. An AArch64 System register is described as either a 32-bit register or a 64-bit register. For a 32-bit registers, the upper bits, bits[63:32], are RES0.

C5.1.2 System instruction class encoding overview

The encoding of the System instruction class describes each instruction as being either:

• A transfer to a System register. This is a System instruction with the semantics of a write.
• A transfer from a System register. This is a System instruction with the semantics of a read.

A System instruction that initiates an operation operates as if it was making a transfer to a register.

In the AArch64 instruction set, the decode structure for the System instruction class is:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>16</th>
<th>15</th>
<th>12</th>
<th>11</th>
<th>8</th>
<th>7</th>
<th>5</th>
<th>4</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
<td>0</td>
<td>1</td>
<td>0</td>
<td>1</td>
<td>0</td>
<td>0</td>
<td>L</td>
<td>op0</td>
<td>op1</td>
<td>CRn</td>
<td>CRm</td>
<td>op2</td>
<td>Rt</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The value of L indicates the transfer direction:

0 Transfer to System register.
1 Transfer from System register.

The op0 field is the top level encoding of the System instruction type. Its possible values are:

0b00 These encodings provide:

• Instructions with an immediate field for accessing PSTATE, the current PE state.
• The architectural hint instructions.
• Barriers and the CLREX instruction.

For more information about these encodings, see op0==0b00, architectural hints, barriers and CLREX, and PSTATE access on page C5-330.

0b01 These encodings provide the cache maintenance, TLB maintenance, and address translation instructions.

--- Note ---
These are equivalent to operations in the AArch32 (coproc==0b1111) encoding space.

For more information, see op0==0b01, cache maintenance, TLB maintenance, and address translation instructions on page C5-332.

0b10 These encodings provide moves to and from:

• Legacy AArch32 System registers for execution environments, to provide access to these registers from higher Exception levels that are using AArch64.
• Debug and trace registers.

--- Note ---
These are equivalent to the registers in the AArch32 (coproc==0b1110) encoding space.

For more information, see op0==0b10, Moves to and from debug and trace System registers on page D9-2333.

0b11 These encodings provide:

• Moves to and from Non-debug System registers. The accessed registers provide system control, and system status information.
UNDEFINED behaviors

In the System register instruction encoding space, the following principles apply:

- All unallocated encodings are treated as UNDEFINED.
- All encodings with \( L = 1 \) and \( \text{op0} = 0b0x \) are UNDEFINED, except for encodings in the area reserved for IMPLEMENTATION DEFINED use, see Reserved encodings for IMPLEMENTATION DEFINED registers on page D9-2345.

For registers and operations that are accessible from a particular Exception level, any attempt to access those registers from a lower Exception level is UNDEFINED.

If a particular Exception level:

- Defines a register to be RO, then any attempt to write to that register, at that Exception level, is UNDEFINED. This means that any access to that register with \( L = 0 \) is UNDEFINED.
- Defines a register to be WO, then any attempt to read from that register, at that Exception level, is UNDEFINED. This means that any access to that register with \( L = 1 \) is UNDEFINED.

For IMPLEMENTATION DEFINED encoding spaces, the treatment of the encodings is IMPLEMENTATION DEFINED, but see the recommendation in Principles of the System instruction class encoding on page C5-328.

C5.1.3 \text{op0}==0b00, architectural hints, barriers and CLREX, and PSTATE access

The different groups of System register instructions with \( \text{op0}==0b00 \):

- Are identified by the value of \( \text{Crn} \).
- Are always encoded with a value of 0b11111 in the \( \text{Rt} \) field.

The encoding of these instructions is:

\[
\begin{array}{cccccccccccccccccccccccccc}
1 & 1 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & \text{op1} & \text{CRn} & \text{CRm} & \text{op2} & 1 & 1 & 1 & 1 & 1 \\
\end{array}
\]

The encoding of the \( \text{Crn} \) field is as follows:

- \( 0b0010 \) See Architectural hint instructions.
- \( 0b0011 \) See Barriers and CLREX on page C5-331.
- \( 0b1000 \) See Instructions for accessing the PSTATE fields on page C5-332.

Architectural hint instructions

Within the \( \text{op0}==0b00 \) encodings, the architectural hint instructions are identified by \( \text{Crn} \) having the value \( 0b0010 \). The encoding of these instructions is:

\[
\begin{array}{cccccccccccccccccccccccccc}
1 & 1 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & \text{Op<6:0>} & 1 & 1 & 1 & 1 & 1 \\
\end{array}
\]

The value of \( \text{Op<6:0>} \), formed by concatenating the \( \text{Crn} \) and \( \text{op2} \) fields, determines the hint instruction as follows:

- \( 0b0000000 \) NOP instruction.
0b0000001 YIELD instruction.
0b0000010 WFE instruction.
0b0000011 WFI instruction.
0b0000100 SEV instruction.
0b0000101 SEVL instruction.
0b0000110-0b0001111
Unallocated values. These encodings behave as NOPs.
0b0010000 ESB instruction.
0b0010001 PSB CSYNC instruction.
0b0010010-0b1111111
Unallocated values. These encodings behave as NOPs.

These instructions are described in Chapter C6 A64 Base Instruction Descriptions.

--- Note ---

* Instruction encodings with bits[4:0] not set to 0b11111 are UNDEFINED.
* The operation of the A64 instructions for architectural hints are identical to the corresponding A32 and T32 instructions.

---

For more information about:
* The WFE, WFI, SEV, and SEVL instructions, see Mechanisms for entering a low-power state on page D1-1954.
* The YIELD instruction, see Software control features and EL0 on page B1-82.

**Barriers and CLREX**

Within the op0==0b00 encodings, the barriers and CLREX instructions are identified by CRn having the value 0b0011.

The encoding of these instructions is:

<table>
<thead>
<tr>
<th>CRn</th>
<th>op2</th>
<th>op0</th>
<th>op1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b011</td>
<td>0b010</td>
<td>DSB instruction.</td>
<td></td>
</tr>
<tr>
<td>0b110</td>
<td>0b100</td>
<td>DMB instruction.</td>
<td></td>
</tr>
<tr>
<td>0b111</td>
<td>0b110</td>
<td>ISB instruction.</td>
<td></td>
</tr>
<tr>
<td>0b100, 0b001, 0b011, 0b111</td>
<td>UNDEFINED.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The value of op2 determines the instruction, as follows.

0b010 CLREX instruction.

These instructions are described in Chapter C6 A64 Base Instruction Descriptions.

--- Note ---

* Instruction encodings with bits[4:0] not set to 0b11111 are UNDEFINED.
* The operation of the A64 instructions for barriers and CLREX are identical to the corresponding A32 and T32 instructions.

---

For more information about:
* The barrier instructions, see Memory barriers on page B2-98.
* The CLREX instruction, see Synchronization and semaphores on page B2-128.
Instructions for accessing the PSTATE fields

Within the op0==0b00 encodings, the instructions that can be used to modify PSTATE fields directly are identified by CRn having the value 0b0100. The encoding of these instructions is:

These instructions are:

- MSR DAIFSet, #Imm4 ; Used to set any or all of DAIF to 1
- MSR DAIFClr, #Imm4 ; Used to clear any or all of DAIF to 0
- MSR SPSel, #Imm4 ; Used to select the Stack Pointer, between SP_EL0 and SP_ELx
- MSR UAO, #Imm4 ; Used to set the value of PSTATE.UAO
- MSR PAN, #Imm4 ; Used to set the value of PSTATE.PAN

The value of op2 selects the instruction form, which defines the constraints on the values of the op1 and Imm4 arguments, as follows:

- op2==0b011 selects the MSR UAO instruction.
- op2==0b100 selects the MSR PAN instruction.
- op2==0b101 selects the MSR SPSel instruction.
- op2==0b110 selects the MSR DAIFSet instruction, that sets the specified PSTATE.{D, A, I, F} bits to 1.
- op2==0b111 selects the MSR DAIFClr instruction, that clears the specified PSTATE.{D, A, I, F} bits to 0.

All other combinations of op1 and op2 are reserved, and the corresponding instructions are UNDEFINED.

Note

For PSTATE updates, instruction encodings with bits[4:0] not set to 0b11111 are UNDEFINED.

Writes to PSTATE.{PAN, D, A, I, F} occur in program order without the need for additional synchronization. Changing PSTATE.SPSel to use SP_EL0 synchronizes any updates to SP_EL0 that have been written by an MSR to SP_EL0, without the need for additional synchronization.

C5.1.4 op0==0b01, cache maintenance, TLB maintenance, and address translation instructions

The System instructions are encoded with op0==0b01. The different groups of System instructions are identified by the values of CRn and CRm, except that some of this encoding space is reserved for IMPLEMENTATION DEFINED functionality. The encoding of these instructions is:

The grouping of these instructions depending on the CRn and CRm fields is as follows:

CRn==7
- CRm==1, 5 Instruction cache maintenance instructions.
- CRm==4 Data cache zero operation.
- CRm==6, 10, 11, 12, 14 Data cache maintenance instructions.

See Cache maintenance instructions, and data cache zero on page C5-333.

CRn==8
- CRm==8 See Address translation instructions on page C5-334.

CRn==11, 15
See Reserved encoding space for IMPLEMENTATION DEFINED instructions on page C5-336.
Cache maintenance instructions, and data cache zero

Table C5-1 lists the Cache maintenance instructions and their encodings. Instructions that take an argument include Xt in the instruction syntax. For instructions that do not take an argument, the Xt field is encoded as `0b11111`.

### Table C5-1 Cache maintenance instructions

Reserved encoding space for IMPLEMENTATION DEFINED instructions

The A64 instruction set reserves the following encoding space for IMPLEMENTATION DEFINED instructions:

For more information about these instructions, see TLB maintenance instructions on page D4-2209.

Reserved encoding space for IMPLEMENTATION DEFINED instructions

The A64 instruction set reserves the following encoding space for IMPLEMENTATION DEFINED instructions:

For more information about these instructions, see TLB maintenance instructions on page D4-2209.

Reserved encodings for IMPLEMENTATION DEFINED registers on page D9-2345.

C5.1.5 \( \text{op0} = \text{b11} \), Moves to and from Special-purpose registers

The instructions that move data to and from non-debug System registers are encoded with \( \text{op0} = \text{b11} \), except that some of this encoding space is reserved for IMPLEMENTATION DEFINED functionality. The encoding of these instructions is:

Instructions for accessing Special-purpose registers

The value of CRn provides the next level of decode of these instructions. For Special-purpose registers, the value of CRn is 4.

The A64 instructions for accessing Special-purpose registers are:

For these accesses, CRn has the value 4. The encoding for Special-purpose register accesses is:

<table>
<thead>
<tr>
<th>Instruction</th>
<th>Access instruction encoding</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>MSR &lt;Special-purpose register&gt;, Xt</td>
<td>op0 CRn CRm op2</td>
<td>Write to Special-purpose register</td>
</tr>
<tr>
<td>MRS Xt, &lt;Special-purpose register&gt;</td>
<td>op0 CRn CRm op2</td>
<td>Read from Special-purpose register</td>
</tr>
</tbody>
</table>
The Special-purpose registers are:

- **CurrentEL, DAIF, and NZCV**, that return PSTATE information.
- The ELRs, **DLR_EL0** and **ELR_ELx**, that hold the return address for the return from Debug state, or for the exception return.
- **FPCR** and **FPSR**, that provide floating-point status and control.
- The stack pointers, **SP_ELx**, and stack pointer selector, **SPSel**.
- The SPSRs, **DPSR_EL0** and **SPSR_ELx**, that hold the PE state from immediately before entering Debug state or taking an exception. This means they hold the state required for the return from Debug state, or for the exception return.
- **SPSR_abt, SPSR_fiq, SPSR_irq, and SPSR_und**, that map to the corresponding AArch32 registers.

  **Note**

  The AArch32 SPSRs **SPSR_hyp**, **SPSR_mon**, and **SPSR_svc** are mapped to the AArch64 **SPSR_ELx** registers.

The characteristic of a Special-purpose register is that all direct and indirect reads and writes to the register appear to occur in program order relative to other instructions, without the need for any explicit synchronization.
Table C5-4 lists the encodings for op1, CRn, and op2 fields for accesses to the Special-purpose registers in AArch64.

All direct and indirect reads and writes to Special-purpose registers appear to occur in program order relative to other instructions.
C5.2 Special-purpose registers

This section describes the following Special-purpose registers:

- **CurrentEL**, that holds PSTATE.EL, and that software can read to determine the current Exception level.
- **DAIF**, that holds the current PSTATE.{D, A, I, F} interrupt mask bits.
- **ELR_EL1**, that holds the address to return to for an exception return from EL1.
- **ELR_EL2**, that holds the address to return to for an exception return from EL2.
- **ELR_EL3**, that holds the address to return to for an exception return from EL3.
- **FPCR**, that provides control of floating-point operation.
- **FPSR**, that provides floating-point status information.
- **NZCV**, that holds the PSTATE.{N, Z, C, V} condition flags.
- **PAN**, that holds the PSTATE.PAN state bit.
- **SP_EL0**, that holds the stack pointer for EL0.
- **SP_EL1**, that holds the stack pointer for EL1.
- **SP_EL2**, that holds the stack pointer for EL2.
- **SP_EL3**, that holds the stack pointer for EL3.
- **SPSel**, that holds PSTATE.SP, that at EL1 or higher selects the current SP.
- **SPSR_abt**, that holds process state on taking an exception to AArch32 Abort mode.
- **SPSR_EL1**, that holds process state on taking an exception to AArch64 EL1.
- **SPSR_EL2**, that holds process state on taking an exception to AArch64 EL2.
- **SPSR_EL3**, that holds process state on taking an exception to AArch64 EL3.
- **SPSR_fiq**, that holds process state on taking an exception to AArch32 FIQ mode.
- **SPSR_irq**, that holds process state on taking an exception to AArch32 IRQ mode.
- **SPSR_und**, that holds process state on taking an exception to AArch32 Undefined mode.
- **UAO**, that holds the PSTATE.UAO bit.

The following registers are also Special-purpose registers:

- **DLR_EL0**, that holds the address to return to for a return from Debug state.
- **DSPSR_EL0**, that holds process state on entry to Debug state.
C5.2.1 CurrentEL, Current Exception Level

The CurrentEL characteristics are:

**Purpose**

Holds the current Exception level.

**Configurations**

There are no configuration notes.

**Attributes**

CurrentEL is a 32-bit register.

**Field descriptions**

The CurrentEL bit assignments are:

```
31 4 3 2 1 0
   RES0   EL
```

**Bits [31:4]**

Reserved, RES0.

**EL, bits [3:2]**

Current Exception level. Possible values of this field are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>EL0</td>
</tr>
<tr>
<td>01</td>
<td>EL1</td>
</tr>
<tr>
<td>10</td>
<td>EL2</td>
</tr>
<tr>
<td>11</td>
<td>EL3</td>
</tr>
</tbody>
</table>

When the HCR_EL2.NV bit is 1, Non-secure EL1 read accesses to the CurrentEL register return the value of 0x2 in this field.

This field resets to a value that is architecturally UNKNOWN.

**Bits [1:0]**

Reserved, RES0.

**Accessing the CurrentEL**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CurrentEL</td>
<td>11</td>
<td>000</td>
<td>0100</td>
<td>0010</td>
<td>010</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>TGE</td>

<tr>
<td>NS</td>
<td>- RO n/a RO</td>
</tr>
<tr>
<td>x</td>
<td>x 0 1 1</td>
</tr>
<tr>
<td>x</td>
<td>0 1 1</td>
</tr>
<tr>
<td>x</td>
<td>1 1</td>
</tr>
</tbody>
</table>
### C5.2.2 DAIF, Interrupt Mask Bits

The DAIF characteristics are:

**Purpose**

Allows access to the interrupt mask bits.

**Configurations**

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally **UNKNOWN** values.

**Attributes**

DAIF is a 32-bit register.

**Field descriptions**

The DAIF bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Purpose</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
<td></td>
</tr>
<tr>
<td>30</td>
<td>D, bit [9]</td>
<td>Process state D mask. The possible values of this bit are:</td>
</tr>
<tr>
<td>29</td>
<td></td>
<td>0: Watchpoint, Breakpoint, and Software Step exceptions targeted at the current Exception level are not masked.</td>
</tr>
<tr>
<td>29</td>
<td></td>
<td>1: Watchpoint, Breakpoint, and Software Step exceptions targeted at the current Exception level are masked.</td>
</tr>
<tr>
<td>28</td>
<td></td>
<td>When the target Exception level of the debug exception is higher than the current Exception level, the exception is not masked by this bit.</td>
</tr>
<tr>
<td>27</td>
<td></td>
<td>When this register has an architecturally-defined reset value, this field resets to 1.</td>
</tr>
<tr>
<td>26</td>
<td>A, bit [8]</td>
<td>SError interrupt mask bit. The possible values of this bit are:</td>
</tr>
<tr>
<td>25</td>
<td></td>
<td>0: Exception not masked.</td>
</tr>
<tr>
<td>24</td>
<td></td>
<td>1: Exception masked.</td>
</tr>
<tr>
<td>23</td>
<td></td>
<td>When this register has an architecturally-defined reset value, this field resets to 1.</td>
</tr>
<tr>
<td>22</td>
<td>I, bit [7]</td>
<td>IRQ mask bit. The possible values of this bit are:</td>
</tr>
<tr>
<td>21</td>
<td></td>
<td>0: Exception not masked.</td>
</tr>
<tr>
<td>20</td>
<td></td>
<td>1: Exception masked.</td>
</tr>
<tr>
<td>19</td>
<td></td>
<td>When this register has an architecturally-defined reset value, this field resets to 1.</td>
</tr>
<tr>
<td>18</td>
<td>F, bit [6]</td>
<td>FIQ mask bit. The possible values of this bit are:</td>
</tr>
<tr>
<td>17</td>
<td></td>
<td>0: Exception not masked.</td>
</tr>
<tr>
<td>16</td>
<td></td>
<td>1: Exception masked.</td>
</tr>
</tbody>
</table>
When this register has an architecturally-defined reset value, this field resets to 1.

**Bits [5:0]**

Reserved, RES0.

### Accessing the DAIF

This register can be read using MRS with the following syntax:

\[ \text{MRS } <Xt>, <systemreg> \]

This register can be written using MSR (register) with the following syntax:

\[ \text{MSR } <systemreg>, <Xt> \]

This syntax is encoded with the following settings in the instruction encoding:

\[
\begin{array}{|c|c|c|c|c|}
\hline
<systemreg> & op0 & CRn & CRm & op2 \\
\hline
\text{DAIF} & 11 & 011 & 0100 & 0010 & 001 \\
\hline
\end{array}
\]

This register can be modified using MSR (immediate) with the following syntax:

\[ \text{MSR } <pstatefield>, <imm> \]

This syntax is encoded with the following settings in the instruction encoding:

\[
\begin{array}{|c|c|c|c|}
\hline
<pstatefield> & op0 & CRn & op2 \\
\hline
\text{DAIFSet} & 00 & 011 & 0100 & 110 \\
\text{DAIFClr} & 00 & 011 & 0100 & 111 \\
\hline
\end{array}
\]

### Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>x x 0</td>
<td>RW RW n/a RW</td>
</tr>
<tr>
<td>x 0 1</td>
<td>RW RW RW RW</td>
</tr>
<tr>
<td>0 1 1</td>
<td>RW n/a RW RW</td>
</tr>
<tr>
<td>1 1 1</td>
<td>- n/a RW RW</td>
</tr>
</tbody>
</table>

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

When SCR_EL3.NS==0:

- If SCTLR_EL1.UMA==0, Secure accesses to this register from EL0 are trapped to EL1.
When SCR_EL3.NS==1:

- If (HCR_EL2.E2H==1 and HCR_EL2.TGE==1), Non-secure accesses to this register from EL0 are trapped to EL2.

- If SCTLR_EL1.UMA==0, and !(HCR_EL2.E2H==1 && HCR_EL2.TGE==1), Non-secure accesses to this register from EL0 are trapped to EL1.
C5.2.3 DLR_EL0, Debug Link Register

This register is described in DLR_EL0.
C5.2.4 DSPSR_EL0, Debug Saved Program Status Register

This register is described in DSPSR_EL0.
C5.2.5  ELR_EL1, Exception Link Register (EL1)

The ELR_EL1 characteristics are:

**Purpose**

When taking an exception to EL1, holds the address to return to.

**Configurations**

There are no configuration notes.

**Attributes**

ELR_EL1 is a 64-bit register.

**Field descriptions**

The ELR_EL1 bit assignments are:

```
<table>
<thead>
<tr>
<th>Bit Assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:0]</td>
<td>Return address.</td>
</tr>
<tr>
<td></td>
<td>An exception return from EL1 using AArch64 makes ELR_EL1 become UNKNOWN.</td>
</tr>
</tbody>
</table>
```

**Accessing the ELR_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>ELR_EL1</td>
<td>11</td>
<td>000</td>
<td>0100</td>
<td>0000</td>
<td>001</td>
</tr>
<tr>
<td>ELR_EL12</td>
<td>11</td>
<td>101</td>
<td>0100</td>
<td>0000</td>
<td>001</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>ELR_EL1</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>ELR_EL12</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>ELR_EL1</td>
<td>0</td>
<td>1</td>
</tr>
</tbody>
</table>
C5 The A64 System Instruction Class
C5.2 Special-purpose registers

This table applies to all instructions that can access this register.

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic ELR_EL1 or ELR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV1 == 1, Non-secure accesses to this register from EL1 using accessor ELR_EL12 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If HCR_EL2.NV1 == 1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV1 == 1, Non-secure accesses to this register from EL1 using accessor ELR_EL12 are trapped to EL2.
C5.2.6  ELR_EL2, Exception Link Register (EL2)

The ELR_EL2 characteristics are:

Purpose
When taking an exception to EL2, holds the address to return to.

Configurations
AArch64 System register ELR_EL2 is architecturally mapped to AArch32 System register ELR_hyp.

Attributes
ELR_EL2 is a 64-bit register.

Field descriptions
The ELR_EL2 bit assignments are:

Return address

Bits [63:0]
Return address.
An exception return from EL2 using AArch64 makes ELR_EL2 become UNKNOWN.
When EL2 is in AArch32 Execution state and an exception is taken from EL0, EL1, or EL2 to EL3 and AArch64 execution, the upper 32-bits of ELR_EL2 are either set to 0 or hold the same value that they did before AArch32 execution. Which option is adopted is determined by an implementation, and might vary dynamically within an implementation. Correspondingly software must regard the value as being an UNKNOWN choice between the two values.

Accessing the ELR_EL2
This register can be read using MRS with the following syntax:
MRS <Xt>, <systemreg>
This register can be written using MSR (register) with the following syntax:
MSR <systemreg>, <Xt>
This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>ELR_EL2</td>
<td>11</td>
<td>100</td>
<td>0100</td>
<td>0000</td>
<td>001</td>
</tr>
<tr>
<td>ELR_EL1</td>
<td>11</td>
<td>000</td>
<td>0100</td>
<td>0000</td>
<td>001</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>E2H TGE</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>ELR_EL2</td>
<td>x x 0</td>
<td>- - n/a RW</td>
</tr>
<tr>
<td>ELR_EL2</td>
<td>0 0 1</td>
<td>- - RW RW</td>
</tr>
<tr>
<td>ELR_EL2</td>
<td>0 1 1</td>
<td>- n/a RW RW</td>
</tr>
<tr>
<td>ELR_EL2</td>
<td>1 0 1</td>
<td>- - RW RW</td>
</tr>
<tr>
<td>ELR_EL2</td>
<td>1 1 1</td>
<td>- n/a RW RW</td>
</tr>
<tr>
<td>ELR_EL1</td>
<td>x x 0</td>
<td>- ELR_EL1 n/a ELR_EL1</td>
</tr>
<tr>
<td>ELR_EL1</td>
<td>0 0 1</td>
<td>- ELR_EL1 ELR_EL1 ELR_EL1</td>
</tr>
<tr>
<td>ELR_EL1</td>
<td>0 1 1</td>
<td>- n/a ELR_EL1 ELR_EL1</td>
</tr>
<tr>
<td>ELR_EL1</td>
<td>1 0 1</td>
<td>- ELR_EL1 RW ELR_EL1</td>
</tr>
<tr>
<td>ELR_EL1</td>
<td>1 1 1</td>
<td>- n/a RW ELR_EL1</td>
</tr>
</tbody>
</table>

This table applies to all instructions that can access this register.

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic ELR_EL2 or ELR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
C5.2.7 ELR_EL3, Exception Link Register (EL3)

The ELR_EL3 characteristics are:

**Purpose**

When taking an exception to EL3, holds the address to return to.

**Configurations**

There are no configuration notes.

**Attributes**

ELR_EL3 is a 64-bit register.

**Field descriptions**

The ELR_EL3 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Return address</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>An exception return from EL3 using AArch64 makes ELR_EL3 become <strong>UNKNOWN</strong>.</td>
</tr>
</tbody>
</table>

**Accessing the ELR_EL3**

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>ELR_EL3</td>
<td>11</td>
<td>110</td>
<td>0100</td>
<td>0000</td>
<td>001</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td></td>
</tr>
<tr>
<td>TGE</td>
<td></td>

</tr>
</tbody>
</table>
C5.2.8 FPCR, Floating-point Control Register

The FPCR characteristics are:

Purpose

Controls floating-point behavior.

Configurations

The named fields in this register map to the equivalent fields in the AArch32 FPSCR.

It is IMPLEMENTATION DEFINED whether the Len and Stride fields can be programmed to non-zero values, which will cause some AArch32 floating-point instruction encodings to be UNDEFINED, or whether these fields are RAZ.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

FPCR is a 32-bit register.

Field descriptions

The FPCR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>22</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

AHP, bit [26]

Alternative half-precision control bit:

0  IEEE half-precision format selected.
1  Alternative half-precision format selected.

This bit is only used for conversions between half-precision floating-point and other floating-point formats.

The data-processing instructions added as part of the ARMv8.2-FP16 extension always use the IEEE half-precision format, and ignore the value of this bit.

DN, bit [25]

Default NaN mode control bit:

0  NaN operands propagate through to the output of a floating-point operation.
1  Any operation involving one or more NaNs returns the Default NaN.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.
FZ, bit [24]
Flush-to-zero mode control bit:

0  Flush-to-zero mode disabled. Behavior of the floating-point system is fully compliant with the IEEE 754 standard.
1  Flush-to-zero mode enabled.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.
This bit has no effect on half-precision calculations.

RMode, bits [23:22]
Rounding Mode control field. The encoding of this field is:

00  Round to Nearest (RN) mode
01  Round towards Plus Infinity (RP) mode
10  Round towards Minus Infinity (RM) mode
11  Round towards Zero (RZ) mode.

The specified rounding mode is used by both scalar and Advanced SIMD floating-point instructions.

Stride, bits [21:20]
This field has no function in AArch64 state, and non-zero values are ignored during execution in AArch64 state. It is included only for context saving and restoration of the AArch32 FPSCR.Stride field.

FZ16, bit [19]

In ARMv8.3 and ARMv8.2
When ARMv8.2-FP16 is implemented, flush-to-zero mode control bit on half-precision data-processing instructions:

0  Flush-to-zero mode disabled. Behavior of the floating-point system is fully compliant with the IEEE 754 standard.
1  Flush-to-zero mode enabled.

The value of this bit applies to both scalar and Advanced SIMD floating-point half-precision calculations. A half-precision floating-point number that is flushed to zero as a result of the value of the FZ16 bit does not generate an Input Denormal exception.

When ARMv8.2-FP16 is not implemented, this bit is RES0.

In ARMv8.1 and ARMv8.0.
Reserved, RES0.

Len, bits [18:16]
This field has no function in AArch64 state, and non-zero values are ignored during execution in AArch64 state. It is included only for context saving and restoration of the AArch32 FPSCR.Len field.

IDE, bit [15]
Input Denormal floating-point exception trap enable. Possible values are:

0  Untrapped exception handling selected. If the floating-point exception occurs then the FPSR.IDC bit is set to 1.
1  Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.IDC bit. The trap handling software can decide whether to set the FPSR.IDC bit to 1.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.
If the implementation does not support this exception, this bit is RAZ/WI.
C5 The A64 System Instruction Class
C5.2 Special-purpose registers

Bits [14:13]
Reserved, RES0.

IXE, bit [12]
Inexact floating-point exception trap enable. Possible values are:
0 Untrapped exception handling selected. If the floating-point exception occurs then the FPSR.IXC bit is set to 1.
1 Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.IXC bit. The trap handling software can decide whether to set the FPSR.IXC bit to 1.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.
If the implementation does not support this exception, this bit is RAZ/WI.

UFE, bit [11]
Underflow floating-point exception trap enable. Possible values are:
0 Untrapped exception handling selected. If the floating-point exception occurs then the FPSR.UFC bit is set to 1.
1 Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.UFC bit. The trap handling software can decide whether to set the FPSR.UFC bit to 1.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.
If the implementation does not support this exception, this bit is RAZ/WI.

OFE, bit [10]
Overflow floating-point exception trap enable. Possible values are:
0 Untrapped exception handling selected. If the floating-point exception occurs then the FPSR.OFC bit is set to 1.
1 Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.OFC bit. The trap handling software can decide whether to set the FPSR.OFC bit to 1.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.
If the implementation does not support this exception, this bit is RAZ/WI.

DZE, bit [9]
Divide by Zero floating-point exception trap enable. Possible values are:
0 Untrapped exception handling selected. If the floating-point exception occurs then the FPSR.DZC bit is set to 1.
1 Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.DZC bit. The trap handling software can decide whether to set the FPSR.DZC bit to 1.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.
If the implementation does not support this exception, this bit is RAZ/WI.

IOE, bit [8]
Invalid Operation floating-point exception trap enable. Possible values are:
0 Untrapped exception handling selected. If the floating-point exception occurs then the FPSR.IOC bit is set to 1.
1 Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.IOC bit. The trap handling software can decide whether to set the FPSR.IOC bit to 1.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.
If the implementation does not support this exception, this bit is RAZ/WI.

**Bits [7:0]**

Reserved, RES0.

**Accessing the FPCR**

This register can be read using MRS with the following syntax:

MRS \(<Xt>, <systemreg>\)

This register can be written using MSR (register) with the following syntax:

MSR \(<systemreg>, <Xt>\)

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>(&lt;systemreg&gt;)</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>FPCR</td>
<td>11</td>
<td>011</td>
<td>0100</td>
<td>0100</td>
<td>000</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>
</tr>
<tr>
<td>TGE</td>
<td>RW</td>
</tr>
<tr>
<td>NS</td>
<td>RW</td>
</tr>
<tr>
<td></td>
<td>RW</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When `HCR_EL2.E2H == 0`:
  - If `CPACR_EL1.FPEN==00`, accesses to this register from EL0 and EL1 are trapped to EL1.
  - If `CPACR_EL1.FPEN==01`, accesses to this register from EL0 are trapped to EL1.
  - If `CPACR_EL1.FPEN==10`, accesses to this register from EL0 and EL1 are trapped to EL1.

- When EL2 is implemented and is using AArch64 and `(SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0)`:
  - If `CPTR_EL2.TFP==1`, Non-secure accesses to this register from EL0, EL1, and EL2 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and `(SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0)`:
  - If `CPACR_EL1.FPEN==00`, Non-secure accesses to this register from EL0 and EL1 are trapped to EL1.
  - If `CPACR_EL1.FPEN==01`, Non-secure accesses to this register from EL0 are trapped to EL1.
  - If `CPACR_EL1.FPEN==10`, Non-secure accesses to this register from EL0 and EL1 are trapped to EL1.
— If CPTR_EL2.FPEN==00, Non-secure accesses to this register from EL0, EL1, and EL2 are trapped to EL2.
— If CPTR_EL2.FPEN==10, Non-secure accesses to this register from EL0, EL1, and EL2 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 1):
  — If CPTR_EL2.FPEN==00, Non-secure accesses to this register from EL0 and EL2 are trapped to EL2.
  — If CPTR_EL2.FPEN==01, Non-secure accesses to this register from EL0 are trapped to EL2.
  — If CPTR_EL2.FPEN==10, Non-secure accesses to this register from EL0 and EL2 are trapped to EL2.

- When EL3 is implemented and is using AArch64:
  — If CPTR_EL3.TFP==1, accesses to this register from EL0, EL1, EL2, and EL3 are trapped to EL3.
C5.2.9 FPSR, Floating-point Status Register

The FPSR characteristics are:

**Purpose**

Provides floating-point system status information.

**Configurations**

The named fields in this register map to the equivalent fields in the AArch32 FPSCR. RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

FPSR is a 32-bit register.

**Field descriptions**

The FPSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>N, Negative condition flag for AArch32 floating-point comparison operations. AArch64 floating-point comparisons set the PSTATE.N flag instead.</td>
</tr>
<tr>
<td>30</td>
<td>Z, Zero condition flag for AArch32 floating-point comparison operations. AArch64 floating-point comparisons set the PSTATE.Z flag instead.</td>
</tr>
<tr>
<td>29</td>
<td>C, Carry condition flag for AArch32 floating-point comparison operations. AArch64 floating-point comparisons set the PSTATE.C flag instead.</td>
</tr>
<tr>
<td>28</td>
<td>V, Overflow condition flag for AArch32 floating-point comparison operations. AArch64 floating-point comparisons set the PSTATE.V flag instead.</td>
</tr>
<tr>
<td>27</td>
<td>QC, Cumulative saturation bit, Advanced SIMD only. This bit is set to 1 to indicate that an Advanced SIMD integer operation has saturated since 0 was last written to this bit.</td>
</tr>
<tr>
<td>26:8</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>7</td>
<td>IDC, Input Denormal cumulative floating-point exception bit. This bit is set to 1 to indicate that the Input Denormal floating-point exception has occurred since 0 was last written to this bit.</td>
</tr>
</tbody>
</table>
How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.IDE bit. This bit is only set to 1 to indicate a floating-point exception if FPCR.IDE is 0, or if trapping software sets it.

**Bits [6:5]**

Reserved, RES0.

**IXC, bit [4]**

Inexact cumulative floating-point exception bit. This bit is set to 1 to indicate that the Inexact exception floating-point has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.IXE bit. This bit is only set to 1 to indicate a floating-point exception if FPCR.IXE is 0, or if trapping software sets it.

**UFC, bit [3]**

Underflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Underflow floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.UFE bit. This bit is only set to 1 to indicate a floating-point exception if FPCR.UFE is 0, or if trapping software sets it.

**OFC, bit [2]**

Overflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Overflow floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.OFE bit. This bit is only set to 1 to indicate a floating-point exception if FPCR.OFE is 0, or if trapping software sets it.

**DZC, bit [1]**

Divide by Zero cumulative floating-point exception bit. This bit is set to 1 to indicate that the Divide by Zero floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.DZE bit. This bit is only set to 1 to indicate a floating-point exception if FPCR.DZE is 0, or if trapping software sets it.

**IOC, bit [0]**

Invalid Operation cumulative floating-point exception bit. This bit is set to 1 to indicate that the Invalid Operation floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.IOE bit. This bit is only set to 1 to indicate a floating-point exception if FPCR.IOE is 0, or if trapping software sets it.

**Accessing the FPSR**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>FPSR</td>
<td>11</td>
<td>011</td>
<td>0100</td>
<td>0100</td>
<td>001</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>E2H</th>
<th>TGE</th>
<th>NS</th>
<th>EL0</th>
<th>EL1</th>
<th>EL2</th>
<th>EL3</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>x</td>
<td>0</td>
<td>RW</td>
<td>RW</td>
<td>n/a</td>
<td>RW</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
<td>1</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
<td>1</td>
<td>RW</td>
<td>n/a</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When HCR_EL2.E2H == 0:
  - If CPACR_EL1.FPEN==00, accesses to this register from EL0 and EL1 are trapped to EL1.
  - If CPACR_EL1.FPEN==01, accesses to this register from EL0 are trapped to EL1.
  - If CPACR_EL1.FPEN==10, accesses to this register from EL0 and EL1 are trapped to EL1.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If CPTR_EL2.TFP==1, Non-secure accesses to this register from EL0, EL1, and EL2 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If CPACR_EL1.FPEN==00, Non-secure accesses to this register from EL0 and EL1 are trapped to EL1.
  - If CPACR_EL1.FPEN==01, Non-secure accesses to this register from EL0 are trapped to EL1.
  - If CPACR_EL1.FPEN==10, Non-secure accesses to this register from EL0 and EL1 are trapped to EL1.
  - If CPTR_EL2.FPEN==00, Non-secure accesses to this register from EL0, EL1, and EL2 are trapped to EL2.
  - If CPTR_EL2.FPEN==10, Non-secure accesses to this register from EL0, EL1, and EL2 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 1):
  - If CPTR_EL2.FPEN==00, Non-secure accesses to this register from EL0 and EL2 are trapped to EL2.
  - If CPTR_EL2.FPEN==01, Non-secure accesses to this register from EL0 are trapped to EL2.
  - If CPTR_EL2.FPEN==10, Non-secure accesses to this register from EL0 and EL2 are trapped to EL2.

- When EL3 is implemented and is using AArch64:
  - If CPTR_EL3.TFP==1, accesses to this register from EL0, EL1, EL2, and EL3 are trapped to EL3.
C5.2.10 NZCV, Condition Flags

The NZCV characteristics are:

Purpose

Allows access to the condition flags.

Configurations

There are no configuration notes.

Attributes

NZCV is a 32-bit register.

Field descriptions

The NZCV bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>N, negative condition flag. Set to 1 if the result of the last flag-setting instruction was negative.</td>
</tr>
<tr>
<td>30</td>
<td>Z, zero condition flag. Set to 1 if the result of the last flag-setting instruction was zero, and to 0 otherwise. A result of zero often indicates an equal result from a comparison.</td>
</tr>
<tr>
<td>29</td>
<td>C, carry condition flag. Set to 1 if the last flag-setting instruction resulted in a carry condition, for example an unsigned overflow on an addition.</td>
</tr>
<tr>
<td>28</td>
<td>V, overflow condition flag. Set to 1 if the last flag-setting instruction resulted in an overflow condition, for example a signed overflow on an addition.</td>
</tr>
<tr>
<td>27-0</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

Accessing the NZCV

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>NZCV</td>
<td>11</td>
<td>011</td>
<td>0100</td>
<td>0010</td>
<td>000</td>
</tr>
</tbody>
</table>
### Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>
C5.2.11 PAN, Privileged Access Never

The PAN characteristics are:

**Purpose**
- When ARMv8.1-PAN is implemented, allows access to the Privileged Access Never bit.
- When ARMv8.1-PAN is not implemented, this register is not implemented.

**Configurations**
This register is introduced in ARMv8.1.

**Attributes**
PAN is a 32-bit register.

**Field descriptions**
The PAN bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[31:23]</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>[22]</td>
<td>PAN, Privileged Access Never</td>
</tr>
<tr>
<td>[21:0]</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

**Accessing the PAN**
This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>PAN</td>
<td>11</td>
<td>00</td>
<td>0100</td>
<td>0010</td>
<td>011</td>
</tr>
</tbody>
</table>
This register can be modified using MSR (immediate) with the following syntax:

MSR <pstatefield>, <imm>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;pstatefield&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>PAN</td>
<td>00</td>
<td>000</td>
<td>0100</td>
<td>100</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>
</tr>
<tr>
<td>TGE</td>
<td>RW</td>
</tr>
<tr>
<td>NS</td>
<td>-</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>
### C5.2.12 SP_EL0, Stack Pointer (EL0)

The SP_EL0 characteristics are:

**Purpose**

Holds the stack pointer associated with EL0. At higher Exception levels, this is used as the current stack pointer when the value of SPSel.SP is 0.

**Configurations**

There are no configuration notes.

**Attributes**

SP_EL0 is a 64-bit register.

**Field descriptions**

The SP_EL0 bit assignments are:

```
63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
```

- **Stack pointer**

**Accessing the SP_EL0**

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>SP_EL0</td>
<td>11</td>
<td>000</td>
<td>0100</td>
<td>0001</td>
<td>00</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>TGE</td>
<td>RW n/a RW RW</td>
</tr>
<tr>
<td>NS</td>
<td>RW RW RW RW</td>
</tr>
</tbody>
</table>
This accessibility information only applies when the value of $SPSel.SP$ is 1, and only for accesses using the MRS or MSR instructions. In addition, this register is accessible at EL0 as the current stack pointer.

When the value of $SPSel.SP$ is 0:

- Any access to SP_EL0 using the MRS or MSR instructions is **UNDEFINED**.
- This register is accessible at all Exception levels as the current stack pointer.
C5.2.13 SP_EL1, Stack Pointer (EL1)

The SP_EL1 characteristics are:

**Purpose**
Holds the stack pointer associated with EL1. When executing at EL1, the value of SPsel.SP determines the current stack pointer:

<table>
<thead>
<tr>
<th>SPsel.SP</th>
<th>current stack pointer</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>SP_EL0</td>
</tr>
<tr>
<td>1</td>
<td>SP_EL1</td>
</tr>
</tbody>
</table>

**Configurations**
There are no configuration notes.

**Attributes**
SP_EL1 is a 64-bit register.

**Field descriptions**
The SP_EL1 bit assignments are:

Bits [63:0]
Stack pointer.

**Accessing the SP_EL1**
This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>SP_EL1</td>
<td>11</td>
<td>100</td>
<td>0100</td>
<td>0001</td>
<td>00</td>
</tr>
</tbody>
</table>
Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

This accessibility information only applies to accesses using the MRS or MSR instructions.

When the value of SPSel.SP is 1, this register is also accessible at EL1 as the current stack pointer.

--- Note ---

When the value of SPSel.SP is 0, SP_EL0 is used as the current stack pointer at all Exception levels.

---

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
C5.2.14 SP_EL2, Stack Pointer (EL2)

The SP_EL2 characteristics are:

**Purpose**

Holds the stack pointer associated with EL2. When executing at EL2, the value of SPsel.SP determines the current stack pointer:

<table>
<thead>
<tr>
<th>SPsel.SP</th>
<th>current stack pointer</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>SP_EL0</td>
</tr>
<tr>
<td>1</td>
<td>SP_EL2</td>
</tr>
</tbody>
</table>

**Configurations**

There are no configuration notes.

**Attributes**

SP_EL2 is a 64-bit register.

**Field descriptions**

The SP_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Stack pointer</th>
</tr>
</thead>
</table>

**Accessing the SP_EL2**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>SP_EL2</td>
<td>11</td>
<td>110</td>
<td>0100</td>
<td>0001</td>
<td>000</td>
</tr>
</tbody>
</table>
### Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td></td>
</tr>
<tr>
<td>TGE</td>
<td></td>
</tr>
<tr>
<td>NS</td>
<td>EL0</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

This accessibility information only applies to accesses using the MRS or MSR instructions.

When the value of SPSel.SP is 1, this register is also accessible at EL2 as the current stack pointer.

--- **Note** ---

When the value of SPSel.SP is 0, SP_EL0 is used as the current stack pointer at all Exception levels.
C5.2.15  SP_EL3, Stack Pointer (EL3)

The SP_EL3 characteristics are:

Purpose

Holds the stack pointer associated with EL3. When executing at EL3, the value of SPSel.SP determines the current stack pointer:

<table>
<thead>
<tr>
<th>SPSel.SP</th>
<th>current stack pointer</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>SP_EL0</td>
</tr>
<tr>
<td>1</td>
<td>SP_EL3</td>
</tr>
</tbody>
</table>

Configurations

There are no configuration notes.

Attributes

SP_EL3 is a 64-bit register.

Field descriptions

The SP_EL3 bit assignments are:

63 0

Stack pointer

Bits [63:0]

Stack pointer.
C5.2.16 SPSel, Stack Pointer Select

The SPSel characteristics are:

**Purpose**

Allows the Stack Pointer to be selected between SP_EL0 and SP_ELx.

**Configurations**

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

SPSel is a 32-bit register.

**Field descriptions**

The SPSel bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:1 RES0</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>0 SP</td>
<td>Stack pointer to use. Possible values of this bit are:</td>
</tr>
<tr>
<td></td>
<td>0: Use SP_EL0 at all Exception levels.</td>
</tr>
<tr>
<td></td>
<td>1: Use SP_ELx for Exception level ELx.</td>
</tr>
</tbody>
</table>

When this register has an architecturally-defined reset value, this field resets to 1.

**Accessing the SPSel**

This register can be read using MRS with the following syntax:

\[ \text{MRS } \langle \text{Xt} \rangle, \langle \text{systemreg} \rangle \]

This register can be written using MSR (register) with the following syntax:

\[ \text{MSR } \langle \text{systemreg} \rangle, \langle \text{Xt} \rangle \]

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>SPSel</td>
<td>11</td>
<td>000</td>
<td>010</td>
<td>0010</td>
<td>000</td>
</tr>
</tbody>
</table>
This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;pstatefield&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>SPSel</td>
<td>00</td>
<td>000</td>
<td>0100</td>
<td>101</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>
C5.2.17 SPSR_abt, Saved Program Status Register (Abort mode)

The SPSR_abt characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Abort mode.

**Configurations**

AArch64 System register SPSR_abt is architecturally mapped to AArch32 System register SPSR_abt.

If EL1 does not support execution in AArch32 state, this register is RES0.

**Attributes**

SPSR_abt is a 32-bit register.

**Field descriptions**

The SPSR_abt bit assignments are:

```
31 30 29 28 27 26 25 24 23 22 21 20 19 16 15 10 9 8 7 6 5 4 3 0
N  Z  C  V  Q  J  IL  GE  IT[7:2]  E  A  I  F  T  M[3:0]
```

- **N, bit [31]**
  Set to the value of CPSR.N on taking an exception to Abort mode, and copied to CPSR.N on executing an exception return operation in Abort mode.

- **Z, bit [30]**
  Set to the value of CPSR.Z on taking an exception to Abort mode, and copied to CPSR.Z on executing an exception return operation in Abort mode.

- **C, bit [29]**
  Set to the value of CPSR.C on taking an exception to Abort mode, and copied to CPSR.C on executing an exception return operation in Abort mode.

- **V, bit [28]**
  Set to the value of CPSR.V on taking an exception to Abort mode, and copied to CPSR.V on executing an exception return operation in Abort mode.

- **Q, bit [27]**
  Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.

- **IT[1:0], bits [26:25]**
  IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

- **J, bit [24]**
  RES0.
In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

Bit [23]
Reserved, RES0.

PAN, bit [22]

*In ARMv8.3, ARMv8.2 and ARMv8.1*

When ARMv8.1-PAN is implemented, set to the value of CPSR.PAN on taking an exception to Abort mode, and copied to CPSR.PAN on executing an exception return operation in Abort mode.

When ARMv8.1-PAN is not implemented, this bit is RES0.

*In ARMv8.0*
Reserved, RES0.

Bit [21]
Reserved, RES0.

IL, bit [20]

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

GE, bits [19:16]
Greater than or Equal flags, for parallel addition and subtraction.

*IT[7:2], bits [15:10]*

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is \texttt{0b00000000} when no IT block is active.

E, bit [9]
Endianness state bit. Controls the load and store endianness for data accesses:

- 0 Little-endian operation
- 1 Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

A, bit [8]
SError interrupt mask bit. The possible values of this bit are:

- 0 Exception not masked.
- 1 Exception masked.
I, bit [7]

IRQ mask bit. The possible values of this bit are:

|   0   | Exception not masked. |
|   1   | Exception masked.     |

F, bit [6]

FIQ mask bit. The possible values of this bit are:

|   0   | Exception not masked. |
|   1   | Exception masked.     |

T, bit [5]

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:

|   0   | Taken from A32 state. |
|   1   | Taken from T32 state. |

M[4], bit [4]

Execution state that the exception was taken from. Possible values of this bit are:

|   1   | Exception taken from AArch32. |

M[3:0], bits [3:0]

AArch32 mode that an exception was taken from. The possible values are:

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>User</td>
</tr>
<tr>
<td>0001</td>
<td>FIQ</td>
</tr>
<tr>
<td>0010</td>
<td>IRQ</td>
</tr>
<tr>
<td>0011</td>
<td>Supervisor</td>
</tr>
<tr>
<td>0100</td>
<td>Monitor</td>
</tr>
<tr>
<td>0110</td>
<td>Abort</td>
</tr>
<tr>
<td>0111</td>
<td>Hyp</td>
</tr>
<tr>
<td>1011</td>
<td>Undefined</td>
</tr>
<tr>
<td>1111</td>
<td>System</td>
</tr>
</tbody>
</table>

Other values are reserved.

Accessing the SPSR_abt

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>
This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>

<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
C5.2.18 **SPSR_EL1, Saved Program Status Register (EL1)**

The SPSR_EL1 characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to EL1.

**Configurations**

AArch64 System register SPSR_EL1 is architecturally mapped to AArch32 System register SPSR_svc.

**Attributes**

SPSR_EL1 is a 32-bit register.

**Field descriptions**

The SPSR_EL1 bit assignments are:

*When exception taken from AArch32:*

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>N, bit [31] Set to the value of CPSR.N on taking an exception to Supervisor mode, and copied to CPSR.N on executing an exception return operation in Supervisor mode.</td>
</tr>
<tr>
<td>30</td>
<td>Z, bit [30] Set to the value of CPSR.Z on taking an exception to Supervisor mode, and copied to CPSR.Z on executing an exception return operation in Supervisor mode.</td>
</tr>
<tr>

<tr>
<td>27</td>
<td>Q, bit [27] Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.</td>
</tr>
<tr>
<td>26:25</td>
<td>IT[1:0], bits [26:25] IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.</td>
</tr>
</tbody>
</table>

An exception return from EL1 using AArch64 makes SPSR_EL1 become UNKNOWN.
In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**Bit [23]**
Reserved, RES0.

**PAN, bit [22]**

**In ARMv8.3, ARMv8.2 and ARMv8.1**

When ARMv8.1-PAN is implemented, set to the value of CPSR.PAN on taking an exception to Supervisor mode, and copied to CPSR.PAN on executing an exception return operation in Supervisor mode.

When ARMv8.1-PAN is not implemented, this bit is RES0.

**In ARMv8.0**
Reserved, RES0.

**SS, bit [21]**
Software step. Shows the value of PSTATE.SS immediately before the exception was taken.

**IL, bit [20]**
Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

**GE, bits [19:16]**
Greater than or Equal flags, for parallel addition and subtraction.

**IT[7:2], bits [15:10]**

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is \(0b00000000\) when no IT block is active.

**E, bit [9]**
Endianness state bit. Controls the load and store endianness for data accesses:

- 0 Little-endian operation
- 1 Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

**A, bit [8]**
SError interrupt mask bit. The possible values of this bit are:

- 0 Exception not masked.
- 1 Exception masked.
I, bit [7]
IRQ mask bit. The possible values of this bit are:
0 Exception not masked.
1 Exception masked.

F, bit [6]
FIQ mask bit. The possible values of this bit are:
0 Exception not masked.
1 Exception masked.

T, bit [5]
T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:
0 Taken from A32 state.
1 Taken from T32 state.

M[4], bit [4]
Execution state that the exception was taken from. Possible values of this bit are:
1 Exception taken from AArch32.

M[3:0], bits [3:0]
AArch32 mode that an exception was taken from. The possible values are:

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>User</td>
</tr>
<tr>
<td>0b0001</td>
<td>FIQ</td>

<td></td>
<td></td>
</tr>
</tbody>
</table>

UAO
PAN

M[4]
RES0
An exception return from EL1 using AArch64 makes SPSR_EL1 become **UNKNOWN**.

**N, bit [31]**
Set to the value of the N condition flag on taking an exception to EL1, and copied to the N condition flag on executing an exception return operation in EL1.

**Z, bit [30]**
Set to the value of the Z condition flag on taking an exception to EL1, and copied to the Z condition flag on executing an exception return operation in EL1.

**C, bit [29]**
Set to the value of the C condition flag on taking an exception to EL1, and copied to the C condition flag on executing an exception return operation in EL1.

**V, bit [28]**
Set to the value of the V condition flag on taking an exception to EL1, and copied to the V condition flag on executing an exception return operation in EL1.

**Bits [27:24]**
Reserved, RES0.

**UAO, bit [23]**

*In ARMv8.3 and ARMv8.2*
When ARMv8.2-UAO is implemented, set to the value of PSTATE.UAO on taking an exception to EL1, and copied to PSTATE.UAO on executing an exception return operation in EL1.
When ARMv8.2-UAO is not implemented, this bit is RES0.

*In ARMv8.1 and ARMv8.0.*
Reserved, RES0.

**PAN, bit [22]**

*In ARMv8.3, ARMv8.2 and ARMv8.1*
When ARMv8.1-PAN is implemented, set to the value of PSTATE.PAN on taking an exception to EL1, and copied to PSTATE.PAN on executing an exception return operation in EL1.
When ARMv8.1-PAN is not implemented, this bit is RES0.

*In ARMv8.0.*
Reserved, RES0.

**SS, bit [21]**
Software step. Shows the value of PSTATE.SS immediately before the exception was taken.

**IL, bit [20]**
Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

**Bits [19:10]**
Reserved, RES0.

**D, bit [9]**
Process state D mask. The possible values of this bit are:

0  Watchpoint, Breakpoint, and Software Step exceptions targeted at the current Exception level are not masked.
1  Watchpoint, Breakpoint, and Software Step exceptions targeted at the current Exception level are masked.
When the target Exception level of the debug exception is higher than the current Exception level, the exception is not masked by this bit.

A, bit [8]

SError interrupt mask bit. The possible values of this bit are:

0 Exception not masked.
1 Exception masked.

I, bit [7]

IRQ mask bit. The possible values of this bit are:

0 Exception not masked.
1 Exception masked.

F, bit [6]

FIQ mask bit. The possible values of this bit are:

0 Exception not masked.
1 Exception masked.

Bit [5]

Reserved, RES0.

M[4], bit [4]

Execution state that the exception was taken from. Possible values of this bit are:

0 Exception taken from AArch64.

M[3:0], bits [3:0]

AArch64 state (Exception level and selected SP) that an exception was taken from. The possible values are:

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL0t</td>
</tr>
<tr>
<td>0b0100</td>
<td>EL1t</td>
</tr>
<tr>
<td>0b0101</td>
<td>EL1h</td>
</tr>
</tbody>
</table>

Other values are reserved, and returning to an Exception level that is using AArch64 with a reserved value in this field is treated as an illegal exception return.

The bits in this field are interpreted as follows:

- M[1] is unused and is RES0 for all non-reserved values.
- M[0] is used to select the SP:
  - 0 means the SP is always SP0.
  - 1 means the exception SP is determined by the EL.

Accessing the SPSR_EL1

This register can be read using MRS with the following syntax:

\[
\text{MRS } <Xt>, <\text{systemreg}>
\]

This register can be written using MSR (register) with the following syntax:

\[
\text{MSR } <\text{systemreg}>, <Xt>
\]
This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

This table applies to all instructions that can access this register.

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic SPSR_EL1 or SPSR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor SPSR_EL12 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If HCR_EL2.NV1==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 using accessor SPSR_EL12 are trapped to EL2.
C5.2.19 SPSR_EL2, Saved Program Status Register (EL2)

The SPSR_EL2 characteristics are:

**Purpose**
Holds the saved process state when an exception is taken to EL2.

**Configurations**
AArch64 System register SPSR_EL2 is architecturally mapped to AArch32 System register SPSR_hyp.

**Attributes**
SPSR_EL2 is a 32-bit register.

**Field descriptions**
The SPSR_EL2 bit assignments are:

When exception taken from AArch32:

| 31 30 29 28 27 26 25 24 23 22 21 20 19 | 16 15 10 9 8 7 6 5 4 3 2 1 0 |
|----------------------------------------|------------------|-----------------|-----------------|-----------------|-----------------|-----------------|

An exception return from EL2 using AArch64 makes SPSR_EL2 become **UNKNOWN**.

**N, bit [31]**
Set to the value of CPSR.N on taking an exception to Hyp mode, and copied to CPSR.N on executing an exception return operation in Hyp mode.

**Z, bit [30]**
Set to the value of CPSR.Z on taking an exception to Hyp mode, and copied to CPSR.Z on executing an exception return operation in Hyp mode.

**C, bit [29]**
Set to the value of CPSR.C on taking an exception to Hyp mode, and copied to CPSR.C on executing an exception return operation in Hyp mode.

**V, bit [28]**
Set to the value of CPSR.V on taking an exception to Hyp mode, and copied to CPSR.V on executing an exception return operation in Hyp mode.

**Q, bit [27]**
Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.

**IT[1:0], bits [26:25]**
IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

**J, bit [24]**
RES0.
In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**Bit [23]**
Reserved, RES0.

**PAN, bit [22]**

In ARMv8.3, ARMv8.2 and ARMv8.1
When ARMv8.1-PAN is implemented, set to the value of CPSR.PAN on taking an exception to Hyp mode, and copied to CPSR.PAN on executing an exception return operation in Hyp mode.
When ARMv8.1-PAN is not implemented, this bit is RES0.

In ARMv8.0
Reserved, RES0.

**SS, bit [21]**
Software step. Shows the value of PSTATE.SS immediately before the exception was taken.

**IL, bit [20]**
Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

**GE, bits [19:16]**
Greater than or Equal flags, for parallel addition and subtraction.

**IT[7:2], bits [15:10]**
IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.
- **IT[7:5]** holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- **IT[4:0]** encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is \texttt{0b00000000} when no IT block is active.

**E, bit [9]**
Endianness state bit. Controls the load and store endianness for data accesses:
- 0: Little-endian operation.
- 1: Big-endian operation.
Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.
Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

**A, bit [8]**
SError interrupt mask bit. The possible values of this bit are:
- 0: Exception not masked.
- 1: Exception masked.
I, bit [7]

IRQ mask bit. The possible values of this bit are:

0 Exception not masked.
1 Exception masked.

F, bit [6]

FIQ mask bit. The possible values of this bit are:

0 Exception not masked.
1 Exception masked.

T, bit [5]

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:

0 Taken from A32 state.
1 Taken from T32 state.

M[4], bit [4]

Execution state that the exception was taken from. Possible values of this bit are:

1 Exception taken from AArch32.

M[3:0], bits [3:0]

AArch32 mode that an exception was taken from. The possible values are:

<table>
<thead>
<tr>

UAO       PAN       M[4]      RES0
An exception return from EL2 using AArch64 makes SPSR_EL2 become UNKNOWN.

N, bit [31]
Set to the value of the N condition flag on taking an exception to EL2, and copied to the N condition flag on executing an exception return operation in EL2.

Z, bit [30]
Set to the value of the Z condition flag on taking an exception to EL2, and copied to the Z condition flag on executing an exception return operation in EL2.

C, bit [29]
Set to the value of the C condition flag on taking an exception to EL2, and copied to the C condition flag on executing an exception return operation in EL2.

V, bit [28]
Set to the value of the V condition flag on taking an exception to EL2, and copied to the V condition flag on executing an exception return operation in EL2.

Bits [27:24]
Reserved, RES0.

UAO, bit [23]
In ARMv8.3 and ARMv8.2
When ARMv8.2-UAO is implemented, set to the value of PSTATE.UAO on taking an exception to EL2, and copied to PSTATE.UAO on executing an exception return operation in EL2.
When ARMv8.2-UAO is not implemented, this bit is RES0.

In ARMv8.1 and ARMv8.0.
Reserved, RES0.

PAN, bit [22]
In ARMv8.3, ARMv8.2 and ARMv8.1
When ARMv8.1-PAN is implemented, set to the value of PSTATE.PAN on taking an exception to EL2, and copied to PSTATE.PAN on executing an exception return operation in EL2.
When ARMv8.1-PAN is not implemented, this bit is RES0.

In ARMv8.0.
Reserved, RES0.

SS, bit [21]
Software step. Shows the value of PSTATE.SS immediately before the exception was taken.

IL, bit [20]
Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

Bits [19:10]
Reserved, RES0.

D, bit [9]
Process state D mask. The possible values of this bit are:

0  Watchpoint, Breakpoint, and Software Step exceptions targeted at the current Exception level are not masked.
1  Watchpoint, Breakpoint, and Software Step exceptions targeted at the current Exception level are masked.
When the target Exception level of the debug exception is higher than the current Exception level, the exception is not masked by this bit.

A, bit [8]
SError interrupt mask bit. The possible values of this bit are:
0 Exception not masked.
1 Exception masked.

I, bit [7]
IRQ mask bit. The possible values of this bit are:
0 Exception not masked.
1 Exception masked.

F, bit [6]
FIQ mask bit. The possible values of this bit are:
0 Exception not masked.
1 Exception masked.

Bit [5]
Reserved, RES0.

M[4], bit [4]
Execution state that the exception was taken from. Possible values of this bit are:
0 Exception taken from AArch64.

M[3:0], bits [3:0]
AArch64 state (Exception level and selected SP) that an exception was taken from. The possible values are:

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL0t</td>
</tr>
<tr>
<td>0b0100</td>
<td>EL1t</td>
</tr>
<tr>
<td>0b0101</td>
<td>EL1h</td>
</tr>
<tr>
<td>0b1000</td>
<td>EL2t</td>
</tr>
<tr>
<td>0b1001</td>
<td>EL2h</td>
</tr>
</tbody>
</table>

Other values are reserved, and returning to an Exception level that is using AArch64 with a reserved value in this field is treated as an illegal exception return.

The bits in this field are interpreted as follows:
- M[1] is unused and is RES0 for all non-reserved values.
- M[0] is used to select the SP:
  - 0 means the SP is always SP0.
  - 1 means the exception SP is determined by the EL.

**Accessing the SPSR_EL2**

This register can be read using MRS with the following syntax:
MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>SPSR_EL2</td>
<td>11</td>
<td>100</td>
<td>0100</td>
<td>0000</td>
<td>000</td>
</tr>
<tr>
<td>SPSR_EL1</td>
<td>11</td>
<td>000</td>
<td>0100</td>
<td>0000</td>
<td>000</td>
</tr>
</tbody>
</table>

Accessibility

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>SPSR_EL2</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>SPSR_EL2</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>SPSR_EL2</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>SPSR_EL2</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>SPSR_EL2</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>SPSR_EL1</td>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>SPSR_EL1</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>SPSR_EL1</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>SPSR_EL1</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>SPSR_EL1</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

This table applies to all instructions that can access this register.

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic SPSR_EL2 or SPSR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
### SPSR_EL3, Saved Program Status Register (EL3)

The SPSR_EL3 characteristics are:

- **Purpose**
  
  Holds the saved process state when an exception is taken to EL3.

- **Configurations**

  AArch64 System register SPSR_EL3 can be mapped to AArch32 System register SPSR_mon, but this is not architecturally mandated.

- **Attributes**

  SPSR_EL3 is a 32-bit register.

### Field descriptions

The SPSR_EL3 bit assignments are:

**When exception taken from AArch32:**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>N, bit [31]</td>
<td>Set to the value of CPSR.N on taking an exception to Monitor mode, and copied to CPSR.N on executing an exception return operation in Monitor mode.</td>
</tr>
<tr>
<td>30</td>
<td>Z, bit [30]</td>
<td>Set to the value of CPSR.Z on taking an exception to Monitor mode, and copied to CPSR.Z on executing an exception return operation in Monitor mode.</td>
</tr>
<tr>
<td>29</td>
<td>C, bit [29]</td>
<td>Set to the value of CPSR.C on taking an exception to Monitor mode, and copied to CPSR.C on executing an exception return operation in Monitor mode.</td>
</tr>
<tr>
<td>28</td>
<td>V, bit [28]</td>
<td>Set to the value of CPSR.V on taking an exception to Monitor mode, and copied to CPSR.V on executing an exception return operation in Monitor mode.</td>
</tr>
<tr>
<td>27</td>
<td>Q, bit [27]</td>
<td>Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.</td>
</tr>
<tr>
<td>26:25</td>
<td>IT[1:0], bits [26:25]</td>
<td>IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.</td>
</tr>
</tbody>
</table>

An exception return from EL3 using AArch64 makes SPSR_EL3 become **UNKNOWN**.
In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**Bit [23]**

Reserved, RES0.

**PAN, bit [22]**

*In ARMv8.3, ARMv8.2 and ARMv8.1*

When ARMv8.1-PAN is implemented, set to the value of CPSR.PAN on taking an exception to Monitor mode, and copied to CPSR.PAN on executing an exception return operation in Monitor mode.

When ARMv8.1-PAN is not implemented, this bit is RES0.

*In ARMv8.0*

Reserved, RES0.

**SS, bit [21]**

Software step. Shows the value of PSTATE.SS immediately before the exception was taken.

**IL, bit [20]**

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

**GE, bits [19:16]**

Greater than or Equal flags, for parallel addition and subtraction.

**IT[7:2], bits [15:10]**

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

**E, bit [9]**

Endianness state bit. Controls the load and store endianness for data accesses:

- 0 Little-endian operation
- 1 Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

**A, bit [8]**

SError interrupt mask bit. The possible values of this bit are:

- 0 Exception not masked.
- 1 Exception masked.
I, bit [7]

IRQ mask bit. The possible values of this bit are:
0  Exception not masked.
1  Exception masked.

F, bit [6]

FIQ mask bit. The possible values of this bit are:
0  Exception not masked.
1  Exception masked.

T, bit [5]

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:
0  Taken from A32 state.
1  Taken from T32 state.

M[4], bit [4]

Execution state that the exception was taken from. Possible values of this bit are:
1  Exception taken from AArch32.

M[3:0], bits [3:0]

AArch32 mode that an exception was taken from. The possible values are:

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>User</td>
</tr>
<tr>
<td>0b0001</td>
<td>FIQ</td>
</tr>
<tr>
<td>0b0010</td>
<td>IRQ</td>
</tr>
<tr>
<td>0b0011</td>
<td>Supervisor</td>
</tr>
<tr>
<td>0b0110</td>
<td>Monitor</td>
</tr>
<tr>
<td>0b0111</td>
<td>Abort</td>
</tr>
<tr>
<td>0b1010</td>
<td>Hyp</td>
</tr>
<tr>
<td>0b1011</td>
<td>Undefined</td>
</tr>
<tr>
<td>0b1111</td>
<td>System</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in Reserved values in System and memory-mapped registers and translation table entries on page K1-6427.

When exception taken from AArch64:
An exception return from EL3 using AArch64 makes SPSR_EL3 become UNKNOWN.

N, bit [31]
Set to the value of the N condition flag on taking an exception to EL3, and copied to the N condition flag on executing an exception return operation in EL3.

Z, bit [30]
Set to the value of the Z condition flag on taking an exception to EL3, and copied to the Z condition flag on executing an exception return operation in EL3.

C, bit [29]
Set to the value of the C condition flag on taking an exception to EL3, and copied to the C condition flag on executing an exception return operation in EL3.

V, bit [28]
Set to the value of the V condition flag on taking an exception to EL3, and copied to the V condition flag on executing an exception return operation in EL3.

Bits [27:24]
Reserved, RES0.

UAO, bit [23]

In ARMv8.3 and ARMv8.2
When ARMv8.2-UAO is implemented, set to the value of PSTATE.UAO on taking an exception to EL3, and copied to PSTATE.UAO on executing an exception return operation in EL3.

When ARMv8.2-UAO is not implemented, this bit is RES0.

In ARMv8.1 and ARMv8.0.
Reserved, RES0.

PAN, bit [22]

In ARMv8.3, ARMv8.2 and ARMv8.1
When ARMv8.1-PAN is implemented, set to the value of PSTATE.PAN on taking an exception to EL3, and copied to PSTATE.PAN on executing an exception return operation in EL3.

When ARMv8.1-PAN is not implemented, this bit is RES0.

In ARMv8.0.
Reserved, RES0.

SS, bit [21]
Software step. Shows the value of PSTATE.SS immediately before the exception was taken.

IL, bit [20]
Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

Bits [19:10]
Reserved, RES0.

D, bit [9]
Process state D mask. The possible values of this bit are:

0  Watchpoint, Breakpoint, and Software Step exceptions targeted at the current Exception level are not masked.

1  Watchpoint, Breakpoint, and Software Step exceptions targeted at the current Exception level are masked.
When the target Exception level of the debug exception is higher than the current Exception level, the exception is not masked by this bit.

A, bit [8]

SError interrupt mask bit. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Exception not masked</td>
</tr>
<tr>
<td>1</td>
<td>Exception masked</td>
</tr>
</tbody>
</table>

I, bit [7]

IRQ mask bit. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Exception not masked</td>
</tr>
<tr>
<td>1</td>
<td>Exception masked</td>
</tr>
</tbody>
</table>

F, bit [6]

FIQ mask bit. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Exception not masked</td>
</tr>
<tr>
<td>1</td>
<td>Exception masked</td>
</tr>
</tbody>
</table>

Bit [5]

Reserved, RES0.

M[4], bit [4]

Execution state that the exception was taken from. Possible values of this bit are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Exception taken from AArch64</td>
</tr>
</tbody>
</table>

M[3:0], bits [3:0]

AArch64 state (Exception level and selected SP) that an exception was taken from. The possible values are:

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL0t</td>
</tr>
<tr>
<td>0b0100</td>
<td>EL1t</td>
</tr>
<tr>
<td>0b0101</td>
<td>EL1h</td>
</tr>
<tr>
<td>0b1000</td>
<td>EL2t</td>
</tr>
<tr>
<td>0b1001</td>
<td>EL2h</td>
</tr>
<tr>
<td>0b1100</td>
<td>EL3t</td>
</tr>
<tr>
<td>0b1101</td>
<td>EL3h</td>
</tr>
</tbody>
</table>

Other values are reserved, and returning to an Exception level that is using AArch64 with a reserved value in this field is treated as an illegal exception return.

The bits in this field are interpreted as follows:

- M[1] is unused and is RES0 for all non-reserved values.
- M[0] is used to select the SP:
  - 0 means the SP is always SP0.
  - 1 means the exception SP is determined by the EL.
Accessing the SPSR_EL3

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>

</table>
C5.2.21 **SPSR_fiq, Saved Program Status Register (FIQ mode)**

The SPSR_fiq characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to FIQ mode.

**Configurations**

AArch64 System register SPSR_fiq is architecturally mapped to AArch32 System register SPSR_fiq.
If EL1 does not support execution in AArch32 state, this register is RES0.

**Attributes**

SPSR_fiq is a 32-bit register.

**Field descriptions**

The SPSR_fiq bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[31]</td>
<td>N, bit</td>
</tr>
<tr>
<td>[30]</td>
<td>Z, bit</td>
</tr>

</tbody>
</table>

- **N, bit [31]**
  
  Set to the value of CPSR.N on taking an exception to FIQ mode, and copied to CPSR.N on executing an exception return operation in FIQ mode.

- **Z, bit [30]**
  
  Set to the value of CPSR.Z on taking an exception to FIQ mode, and copied to CPSR.Z on executing an exception return operation in FIQ mode.

- **C, bit [29]**
  
  Set to the value of CPSR.C on taking an exception to FIQ mode, and copied to CPSR.C on executing an exception return operation in FIQ mode.

- **V, bit [28]**
  
  Set to the value of CPSR.V on taking an exception to FIQ mode, and copied to CPSR.V on executing an exception return operation in FIQ mode.

- **Q, bit [27]**
  
  Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.

- **IT[1:0], bits [26:25]**
  
  IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

- **J, bit [24]**
  
  RES0.
In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

Bit [23]
Reserved, RES0.

PAN, bit [22]

In \textit{ARMv8.3, ARMv8.2 and ARMv8.1}

When \textit{ARMv8.1-PAN} is implemented, set to the value of CPSR.PAN on taking an exception to FIQ mode, and copied to CPSR.PAN on executing an exception return operation in FIQ mode.

When \textit{ARMv8.1-PAN} is not implemented, this bit is RES0.

In \textit{ARMv8.0}

Reserved, RES0.

Bit [21]
Reserved, RES0.

IL, bit [20]

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

\textit{IT}[7:2], bits [15:10]

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- \textit{IT}[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- \textit{IT}[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

E, bit [9]

Endianness state bit. Controls the load and store endianness for data accesses:

- 0 Little-endian operation
- 1 Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

A, bit [8]

S\textit{E}r\textit{r}ror interrupt mask bit. The possible values of this bit are:

- 0 Exception not masked.
- 1 Exception masked.
I, bit [7]

IRQ mask bit. The possible values of this bit are:
0 Exception not masked.
1 Exception masked.

F, bit [6]

FIQ mask bit. The possible values of this bit are:
0 Exception not masked.
1 Exception masked.

T, bit [5]

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:
0 Taken from A32 state.
1 Taken from T32 state.

M[4], bit [4]

Execution state that the exception was taken from. Possible values of this bit are:
1 Exception taken from AArch32.

M[3:0], bits [3:0]

AArch32 mode that an exception was taken from. The possible values are:

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>User</td>
</tr>
<tr>
<td>0b0001</td>
<td>FIQ</td>
</tr>
<tr>
<td>0b0010</td>
<td>IRQ</td>

</table>

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
C5.2.22 SPSR_irq, Saved Program Status Register (IRQ mode)

The SPSR_irq characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to IRQ mode.

**Configurations**

AArch64 System register SPSR_irq is architecturally mapped to AArch32 System register SPSR_irq.

If EL1 does not support execution in AArch32 state, this register is RES0.

**Attributes**

SPSR_irq is a 32-bit register.

**Field descriptions**

The SPSR_irq bit assignments are:

```
| 31 30 29 28 27 26 25 24 23 22 21 20 19 16 15 10 9 8 7 6 5 4 3 0 |
|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|

| IT[7:2]         |                  |                 |                 |                 |                 |                 |                 |

N, bit [31]
Set to the value of CPSR.N on taking an exception to IRQ mode, and copied to CPSR.N on executing an exception return operation in IRQ mode.

Z, bit [30]
Set to the value of CPSR.Z on taking an exception to IRQ mode, and copied to CPSR.Z on executing an exception return operation in IRQ mode.

C, bit [29]
Set to the value of CPSR.C on taking an exception to IRQ mode, and copied to CPSR.C on executing an exception return operation in IRQ mode.

V, bit [28]
Set to the value of CPSR.V on taking an exception to IRQ mode, and copied to CPSR.V on executing an exception return operation in IRQ mode.

Q, bit [27]
Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.

IT[1:0], bits [26:25]
IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

J, bit [24]
RES0.
In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**Bit [23]**
Reserved, RES0.

**PAN, bit [22]**

*In ARMv8.3, ARMv8.2 and ARMv8.1*

When ARMv8.1-PAN is implemented, set to the value of CPSR.PAN on taking an exception to IRQ mode, and copied to CPSR.PAN on executing an exception return operation in IRQ mode.

When ARMv8.1-PAN is not implemented, this bit is RES0.

*In ARMv8.0*

Reserved, RES0.

**Bit [21]**
Reserved, RES0.

**IL, bit [20]**
Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

**GE, bits [19:16]**
Greater than or Equal flags, for parallel addition and subtraction.

**IT[7:2], bits [15:10]**
IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.
- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is \texttt{0b00000000} when no IT block is active.

**E, bit [9]**
Endianness state bit. Controls the load and store endianness for data accesses:
- 0 Little-endian operation
- 1 Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

**A, bit [8]**
SIError interrupt mask bit. The possible values of this bit are:
- 0 Exception not masked.
- 1 Exception masked.
I, bit [7]

IRQ mask bit. The possible values of this bit are:
0  Exception not masked.
1  Exception masked.

F, bit [6]

FIQ mask bit. The possible values of this bit are:
0  Exception not masked.
1  Exception masked.

T, bit [5]

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:
0  Taken from A32 state.
1  Taken from T32 state.

M[4], bit [4]

Execution state that the exception was taken from. Possible values of this bit are:
1  Exception taken from AArch32.

M[3:0], bits [3:0]

AArch32 mode that an exception was taken from. The possible values are:

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>User</td>
</tr>
<tr>
<td>0b0001</td>
<td>FIQ</td>
</tr>
<tr>
<td>0b0010</td>
<td>IRQ</td>
</tr>
<tr>
<td>0b0011</td>
<td>Supervisor</td>
</tr>
<tr>
<td>0b0110</td>
<td>Monitor</td>
</tr>
<tr>
<td>0b1110</td>
<td>Abort</td>
</tr>
<tr>
<td>0b1011</td>
<td>Hyp</td>
</tr>
<tr>
<td>0b1011</td>
<td>Undefined</td>
</tr>
<tr>
<td>0b1111</td>
<td>System</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONstrained UNpredictable, as described in Reserved values in System and memory-mapped registers and translation table entries on page K1-6427.

Accessing the SPSR_irq

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>
This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th></th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>SPSR_irq</td>
<td>11</td>
<td>100</td>
<td>0100</td>
<td>0011</td>
<td>000</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
C5.2.23   SPSR_und, Saved Program Status Register (Undefined mode)

The SPSR_und characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Undefined mode.

**Configurations**

AArch64 System register SPSR_und is architecturally mapped to AArch32 System register SPSR_und.

If EL1 does not support execution in AArch32 state, this register is RES0.

**Attributes**

SPSR_und is a 32-bit register.

**Field descriptions**

The SPSR_und bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>N, bit [31] Set to the value of CPSR.N on taking an exception to Undefined mode, and copied to CPSR.N on executing an exception return operation in Undefined mode.</td>
</tr>
<tr>
<td>30</td>
<td>Z, bit [30] Set to the value of CPSR.Z on taking an exception to Undefined mode, and copied to CPSR.Z on executing an exception return operation in Undefined mode.</td>
</tr>
<tr>
<td>29</td>
<td>C, bit [29] Set to the value of CPSR.C on taking an exception to Undefined mode, and copied to CPSR.C on executing an exception return operation in Undefined mode.</td>
</tr>
<tr>
<td>28</td>
<td>V, bit [28] Set to the value of CPSR.V on taking an exception to Undefined mode, and copied to CPSR.V on executing an exception return operation in Undefined mode.</td>
</tr>
<tr>
<td>27</td>
<td>Q, bit [27] Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.</td>
</tr>
<tr>
<td>26-25</td>
<td>IT[1:0], bits [26:25] IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.</td>
</tr>
</tbody>
</table>
In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

### Bit [23]
Reserved, RES0.

### PAN, bit [22]

**In ARMv8.3, ARMv8.2 and ARMv8.1**

When ARMv8.1-PAN is implemented, set to the value of CPSR.PAN on taking an exception to Undefined mode, and copied to CPSR.PAN on executing an exception return operation in Undefined mode.

When ARMv8.1-PAN is not implemented, this bit is RES0.

**In ARMv8.0**

Reserved, RES0.

### Bit [21]
Reserved, RES0.

### IL, bit [20]
Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

### GE, bits [19:16]
Greater than or Equal flags, for parallel addition and subtraction.

### IT[7:2], bits [15:10]

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is \texttt{0b00000000} when no IT block is active.

### E, bit [9]
Endianness state bit. Controls the load and store endianness for data accesses:

0  Little-endian operation  
1  Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

### A, bit [8]
SError interrupt mask bit. The possible values of this bit are:

0  Exception not masked.  
1  Exception masked.
I, bit [7]

IRQ mask bit. The possible values of this bit are:

0  Exception not masked.
1  Exception masked.

F, bit [6]

FIQ mask bit. The possible values of this bit are:

0  Exception not masked.
1  Exception masked.

T, bit [5]

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:

0  Taken from A32 state.
1  Taken from T32 state.

M[4], bit [4]

Execution state that the exception was taken from. Possible values of this bit are:

1  Exception taken from AArch32.

M[3:0], bits [3:0]

AArch32 mode that an exception was taken from. The possible values are:

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>User</td>
</tr>
<tr>
<td>0b0001</td>
<td>FIQ</td>
</tr>
<tr>
<td>0b0010</td>
<td>IRQ</td>
</tr>
<tr>
<td>0b0011</td>
<td>Supervisor</td>
</tr>
<tr>
<td>0b0110</td>
<td>Monitor</td>
</tr>
<tr>
<td>0b0111</td>
<td>Abort</td>
</tr>
<tr>
<td>0b1010</td>
<td>Hyp</td>
</tr>
<tr>
<td>0b1111</td>
<td>Undefined</td>
</tr>
<tr>
<td>0b1111</td>
<td>System</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in Reserved values in System and memory-mapped registers and translation table entries on page K1-6427.

Accessing the SPSR_und

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>
This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>SPSR_und</td>
<td>11</td>
<td>100</td>
<td>0100</td>
<td>0011</td>
<td>010</td>
</tr>
</tbody>
</table>

**Accessibility**

The register is accessible in software as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure accesses to this register from EL1 are trapped to EL2.
C5.2.24 UAO, User Access Override

The UAO characteristics are:

**Purpose**

When ARMv8.2-UAO is implemented, allows access to the User Access Override bit.

When ARMv8.2-UAO is not implemented, this register is not implemented.

**Configurations**

This register is introduced in ARMv8.2.

**Attributes**

UAO is a 32-bit register.

**Field descriptions**

The UAO bit assignments are:

<table>
<thead>
<tr>
<th>Bits [31:24]</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
<tbody>
<tr>
<td>UAO, bit [23]</td>
<td>User Access Override. Defined values are:</td>
</tr>
<tr>
<td>0</td>
<td>The behavior of LDTR* and STR* instructions is as defined in the base ARMv8 architecture.</td>
</tr>
<tr>
<td>1</td>
<td>When executed at EL1, or at EL2 with HCR_EL2.{E2H, TGE} == {1, 1}, LDTR* and STR* instructions behave as the equivalent LDR* and STR* instructions. When executed at EL3, or at EL2 with HCR_EL2.E2H == 0 or HCR_EL2.TGE == 0, the LDTR* and STR* instructions behave as the equivalent LDR* and STR* instructions, regardless of the setting of the PSTATE.UAO bit.</td>
</tr>
</tbody>
</table>

| Bits [22:0] | Reserved, RES0. |

**Accessing the UAO**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;systemreg&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>UAO</td>
<td>11</td>
<td>000</td>
<td>0100</td>
<td>0010</td>
<td>100</td>
</tr>
</tbody>
</table>
This register can be modified using MSR (immediate) with the following syntax:

MSR <pstatefield>, <imm>

This syntax is encoded with the following settings in the instruction encoding:

<table>
<thead>
<tr>
<th>&lt;pstatefield&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>
C5.3 A64 System instructions for cache maintenance

This section lists the A64 system instructions for cache maintenance.
C5.3.1 DC CISW, Data or unified Cache line Clean and Invalidate by Set/Way

The DC CISW characteristics are:

**Purpose**
Clean and Invalidate data cache by set/way.

**Configurations**
AArch64 System instruction DC CISW performs the same function as AArch32 System instruction DCCISW.

**Attributes**
DC CISW is a 64-bit System instruction.

**Field descriptions**
The DC CISW input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:32</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>31:4</td>
<td>SetWay</td>
</tr>
<tr>
<td>3:0</td>
<td>Level</td>
</tr>
<tr>
<td>0</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

**Bits [63:32]**
Reserved, RES0.

**SetWay, bits [31:4]**
Contains two fields:
- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

A = Log_2(ASSOCIATIVITY), L = Log_2(LINELEN), B = (L + S), S = Log_2(NSETS).
ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

**Level, bits [3:1]**
Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

**Bit [0]**
Reserved, RES0.

**Executing the DC CISW instruction**
This instruction is executed using DC with the following syntax:

DC <dc_op>, <Xt>
This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;dc_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CISW</td>
<td>01</td>
<td>000</td>
<td>0111</td>
<td>1110</td>
<td>010</td>
</tr>
</tbody>
</table>

### Accessibility

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>TGE</td>
<td></td>
</tr>
<tr>
<td>NS</td>
<td></td>
</tr>
</tbody>
</table>

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONstrained UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

### Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TSW==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TSW==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.3.2 DC CIVAC, Data or unified Cache line Clean and Invalidate by VA to PoC

The DC CIVAC characteristics are:

**Purpose**

Clean and Invalidate data cache by address to Point of Coherency.

**Configurations**

AArch64 System instruction DC CIVAC performs the same function as AArch32 System instruction DCCIMVAC.

**Attributes**

DC CIVAC is a 64-bit System instruction.

**Field descriptions**

The DC CIVAC input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Virtual address to use</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Virtual address to use. No alignment restrictions apply to this VA.</td>
</tr>
</tbody>
</table>

**Executing the DC CIVAC instruction**

This instruction is executed using DC with the following syntax:

```
DC <dc_op>, <Xt>
```

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;dc_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CIVAC</td>
<td>01</td>
<td>011</td>
<td>0111</td>
<td>1110</td>
<td>001</td>
</tr>
</tbody>
</table>

**Accessibility**

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS EL0 EL1 EL2 EL3</td>
<td>WO WO n/a WO</td>
</tr>
<tr>
<td>x x 0</td>
<td>WO WO WO WO</td>
</tr>
<tr>
<td>x 0 1</td>
<td>WO WO WO WO</td>
</tr>
<tr>
<td>x 1 1</td>
<td>WO n/a WO WO</td>
</tr>
</tbody>
</table>

If EL0 access is enabled, when executed at EL0, this instruction requires read access permission to the VA, otherwise it generates a Permission Fault, subject to the constraints described in Permission fault on page D4-2192.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information see The data cache maintenance instruction (DC) on page D3-2063.
Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When `SCTLR_EL1.UCI==0`, execution of this instruction at EL0 is trapped to EL1.

- When EL2 is implemented and is using AArch64 and `(SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0)`:
  - If `HCR_EL2.TPC==1`, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If `HCR_EL2.TPC==1` and `SCTLR_EL1.UCI==1`, Non-secure execution of this instruction at EL0 is trapped to EL2.

- When EL2 is implemented and is using AArch64 and `(SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0)`:
  - If `HCR_EL2.TPC==1`, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If `HCR_EL2.TPC==1` and `SCTLR_EL1.UCI==1`, Non-secure execution of this instruction at EL0 is trapped to EL2.

- When EL2 is implemented and is using AArch64 and `(SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 1)`:
  - If `SCTLR_EL2.UCI==0`, Non-secure execution of this instruction at EL0 is trapped to EL2.
C5.3.3 DC CSW, Data or unified Cache line Clean by Set/Way

The DC CSW characteristics are:

**Purpose**
Clean data cache by set/way.

**Configurations**
AArch64 System instruction DC CSW performs the same function as AArch32 System instruction DCCSW.

**Attributes**
DC CSW is a 64-bit System instruction.

**Field descriptions**
The DC CSW input value bit assignments are:

Bits [63:32]
Reserved, RES0.

SetWay, bits [31:4]
Contains two fields:
- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

A = \( \log_2(\text{ASSOCIATIVITY}) \), \( L = \log_2(\text{LINELEN}) \), \( B = (L + S) \), \( S = \log_2(\text{NSETS}) \).
ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

Level, bits [3:1]
Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

Bit [0]
Reserved, RES0.

**Executing the DC CSW instruction**
This instruction is executed using DC with the following syntax:

\[ DC \ <\text{dc_op}> , \ <\text{Xt}> \]
This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>CSW</th>
<th>01</th>
<th>000</th>
<th>0111</th>
<th>1010</th>
<th>010</th>
</tr>
</thead>
</table>

**Accessibility**

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TSW==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TSW==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.3.4 DC CVAC, Data or unified Cache line Clean by VA to PoC

The DC CVAC characteristics are:

**Purpose**

Clean data cache by address to Point of Coherency.

**Configurations**

AArch64 System instruction DC CVAC performs the same function as AArch32 System instruction DCCMVAC.

**Attributes**

DC CVAC is a 64-bit System instruction.

**Field descriptions**

The DC CVAC input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;dc_op&gt;</td>
<td>op0</td>
</tr>
<tr>
<td>CVAC</td>
<td>01</td>
</tr>
</tbody>
</table>

**Executing the DC CVAC instruction**

This instruction is executed using DC with the following syntax:

DC <dc_op>, <Xt>

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;dc_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CVAC</td>
<td>01</td>
<td>011</td>
<td>0111</td>
<td>1010</td>
<td>001</td>
</tr>
</tbody>
</table>

**Accessibility**

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>x x 0</td>
<td>WO WO n/a WO</td>
</tr>
<tr>
<td>x 0 1</td>
<td>WO WO WO WO</td>
</tr>
<tr>
<td>x 1 1</td>
<td>WO n/a WO WO</td>
</tr>
</tbody>
</table>

If EL0 access is enabled, when executed at EL0, this instruction requires read access permission to the VA, otherwise it generates a Permission Fault, subject to the constraints described in Permission fault on page D4-2192.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information see The data cache maintenance instruction (DC) on page D3-2063.
Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When SCTLR_EL1.UCI==0, execution of this instruction at EL0 is trapped to EL1.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TPC==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If HCR_EL2.TPC==1 and SCTLR_EL1.UCI==1, Non-secure execution of this instruction at EL0 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TPC==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If HCR_EL2.TPC==1 and SCTLR_EL1.UCI==1, Non-secure execution of this instruction at EL0 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 1):
  - If SCTLR_EL2.UCI==0, Non-secure execution of this instruction at EL0 is trapped to EL2.
C5.3.5 **DC CVAP, Data or unified Cache line Clean by VA to PoP**

The DC CVAP characteristics are:

**Purpose**

Clean data cache by address to Point of Persistence.

If the memory system does not identify a Point of Persistence, then this instruction behaves as a DC CVAC.

**Configurations**

This instruction is introduced in ARMv8.2.

**Attributes**

DC CVAP is a 64-bit System instruction.

**Field descriptions**

The DC CVAP input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 0</td>
<td>Virtual address to use. No alignment restrictions apply to this VA.</td>
</tr>
</tbody>
</table>

**Executing the DC CVAP instruction**

This instruction is executed using DC with the following syntax:

DC <dc_op>, <Xt>

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;dc_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CVAP</td>
<td>01</td>
<td>011</td>
<td>011</td>
<td>1100</td>
<td>001</td>
</tr>
</tbody>
</table>

**Accessibility**

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>
</tr>
<tr>
<td>TGE</td>
<td>WO</td>
</tr>
<tr>
<td>NS</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL0 access is enabled, when executed at EL0, this instruction requires read access permission to the VA, otherwise it generates a Permission Fault, see *Permission fault on page D4-2192*.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information see *The data cache maintenance instruction (DC)* on page D3-2063.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When `SCTLR_EL1.UCI==0`, execution of this instruction at EL0 is trapped to EL1.
- When EL2 is implemented and is using AArch64 and `(SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0)`:  
  - If `HCR_EL2.TPC==1`, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If `HCR_EL2.TPC==1`, and `SCTLR_EL1.UCI==1`, Non-secure execution of this instruction at EL0 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and `(SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0)`:  
  - If `HCR_EL2.TPC==1`, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If `HCR_EL2.TPC==1` and `SCTLR_EL1.UCI==1`, Non-secure execution of this instruction at EL0 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and `(SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 1)`:  
  - If `SCTLR_EL2.UCI==0`, Non-secure execution of this instruction at EL0 is trapped to EL2.
C5.3.6 DC CVAU, Data or unified Cache line Clean by VA to PoU

The DC CVAU characteristics are:

**Purpose**
Clean data cache by address to Point of Unification.

**Configurations**
AArch64 System instruction DC CVAU performs the same function as AArch32 System instruction DCCMVAU.

**Attributes**
DC CVAU is a 64-bit System instruction.

**Field descriptions**
The DC CVAU input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Virtual address to use</td>
<td>No alignment restrictions apply to this VA.</td>
</tr>
</tbody>
</table>

**Executing the DC CVAU instruction**
This instruction is executed using DC with the following syntax:

```
DC <dc_op>, <Xt>
```

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;dc_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>CVAU</td>
<td>01</td>
<td>011</td>
<td>0111</td>
<td>1011</td>
<td>001</td>
</tr>
</tbody>
</table>

**Accessibility**
The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>
</tr>
<tr>
<td>TGE</td>
<td>WO</td>
</tr>
<tr>
<td>NS</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL0 access is enabled, when executed at EL0, this instruction requires read access permission to the VA, otherwise it generates a Permission Fault, subject to the constraints described in Permission fault on page D4-2192.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information see The data cache maintenance instruction (DC) on page D3-2063.
Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When `SCTLR_EL1.UCI==0`, execution of this instruction at EL0 is trapped to EL1.
- When EL2 is implemented and is using AArch64 and `SCR_EL3.NS == 1` && `HCR_EL2.E2H == 0`:
  - If `HCR_EL2.TPU==1`, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If `HCR_EL2.TPU==1`, and `SCTLR_EL1.UCI==1`, Non-secure execution of this instruction at EL0 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and `SCR_EL3.NS == 1` && `HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0`:
  - If `HCR_EL2.TPU==1`, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If `HCR_EL2.TPU==1`, and `SCTLR_EL1.UCI==1`, Non-secure execution of this instruction at EL0 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and `SCR_EL3.NS == 1` && `HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 1`:
  - If `SCTLR_EL2.UCI==0`, Non-secure execution of this instruction at EL0 is trapped to EL2.
C5.3.7 DC ISW, Data or unified Cache line Invalidate by Set/Way

The DC ISW characteristics are:

**Purpose**

Invalidate data cache by set/way.

**Configurations**

AArch64 System instruction DC ISW performs the same function as AArch32 System instruction DCISW.

**Attributes**

DC ISW is a 64-bit System instruction.

**Field descriptions**

The DC ISW input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:32</td>
<td>RESERVED</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>
| 31:4  | SETWAY           | Contains two fields:
|       |                  | • Way, bits[31:32-A], the number of the way to operate on.                  |
|       |                  | • Set, bits[B-1:L], the number of the set to operate on.                    |
|       |                  | Bits[L-1:4] are RES0.                                                      |
| 3:1   | LEVEL            | Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache. |
| 0     | RESERVED         | Reserved, RES0.                                                             |

**Executing the DC ISW instruction**

This instruction is executed using DC with the following syntax:

DC <dc_op>, <Xt>
This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th></th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISW</td>
<td>01</td>
<td>000</td>
<td>0111</td>
<td>0110</td>
<td>010</td>
</tr>
</tbody>
</table>

### Accessibility

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

At EL1, this instruction performs a cache clean and invalidate, meaning it performs the same invalidation as a DC CISW instruction, if all of the following apply:

- EL2 is implemented.
- The value of HCR_EL2.SWIO is 1 or the value of HCR_EL2.VM is 1.
- The value of SCR_EL3.NS is 1 or EL3 is not implemented.

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TSW == 1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TSW == 1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.3.8  DC IVAC, Data or unified Cache line Invalidate by VA to PoC

The DC IVAC characteristics are:

**Purpose**

Invalidate data cache by address to Point of Coherency.

**Configurations**

AArch64 System instruction DC IVAC performs the same function as AArch32 System instruction DCIMVAC.

**Attributes**

DC IVAC is a 64-bit System instruction.

**Field descriptions**

The DC IVAC input value bit assignments are:

Bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

**Executing the DC IVAC instruction**

This instruction is executed using DC with the following syntax:

```
DC <dc_op>, <Xt>
```

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;dc_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>IVAC</td>
<td>01</td>
<td>000</td>
<td>0111</td>
<td>0110</td>
<td>001</td>
</tr>
</tbody>
</table>

When the instruction is executed, it can generate a watchpoint, which is prioritized in the same way as other watchpoints. If a watchpoint is generated, the CM bit in the ESR_ELx.ISS field is set to 1.

**Accessibility**

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>
</tr>
<tr>
<td>TGE</td>
<td>WO</td>
</tr>
<tr>
<td>NS</td>
<td></td>
</tr>
</tbody>
</table>

This instruction requires write access permission to the VA, otherwise it generates a Permission Fault, subject to the constraints described in Permission fault on page D4-2192.
At EL1, this instruction performs a cache clean and invalidate, meaning it performs the same invalidation as a DC CIVAC instruction, if all of the following apply:

- EL2 is implemented.
- HCR_EL2.VM is set to 1.
- SCR_EL3.NS is set to 1 or EL3 is not implemented.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information see *The data cache maintenance instruction (DC)* on page D3-2063.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TPC==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.3.9   DC ZVA, Data Cache Zero by VA

The DC ZVA characteristics are:

Purpose

Zero data cache by address. Zeroes a naturally aligned block of N bytes, where the size of N is identified in DCZID_EL0.

Configurations

There are no configuration notes.

Attributes

DC ZVA is a 64-bit System instruction.

Field descriptions

The DC ZVA input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 0</td>
<td>Virtual address to use. There is no alignment restriction on the address within the block of N bytes that is used.</td>
</tr>
</tbody>
</table>

Executing the DC ZVA instruction

This instruction is executed using DC with the following syntax:

DC <dc_op>, <Xt>

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;dc_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>ZVA</td>
<td>01</td>
<td>011</td>
<td>011</td>
<td>0100</td>
<td>001</td>
</tr>
</tbody>
</table>

When this instruction is executed, it can generate memory faults or watchpoints which are prioritized in the same way as other memory-related faults or watchpoints. If a synchronous data abort fault or a watchpoint is generated, the CM bit in the ESR_ELx.ISS field is not set.

If the memory region being zeroed is any type of Device memory, this instruction can give an alignment fault which is prioritized in the same way as other alignment faults that are determined by the memory type.

This instruction applies to Normal memory regardless of cacheability attributes.

This instruction behaves as a set of Stores to each byte within the block being accessed, and so it:

• Generates a Permission Fault if the translation system does not permit writes to the locations.

• Requires the same considerations for ordering and the management of coherency as any other store instructions.
Accessibility

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

When EL0 access is disabled (SCTLR_EL1.DZE is set to 0) and HCR_EL2.TDZ is set to 1, execution of this instruction at EL0 is UNDEFINED.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If SCTLR_EL1.DZE==0, execution of this instruction at EL0 is trapped to EL1.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TDZ==1, Non-secure execution of this instruction at EL0 and EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TDZ==1, Non-secure execution of this instruction at EL0 and EL1 is trapped to EL2.
C5.3.10 IC IALLU, Instruction Cache Invalidate All to PoU

The IC IALLU characteristics are:

**Purpose**
Invalidate all instruction caches to Point of Unification.

**Configurations**
AArch64 System instruction IC IALLU performs the same function as AArch32 System instruction IC\text{IALLU}.

**Attributes**
IC IALLU is a 64-bit System instruction.

**Field descriptions**
IC IALLU ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

**Executing the IC IALLU instruction**
This instruction is executed using IC with the following syntax:

\text{IC } <\text{ic\_op}>

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;ic_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
<th>Rt</th>
</tr>
</thead>
<tbody>
<tr>
<td>IALLU</td>
<td>01</td>
<td>000</td>
<td>011</td>
<td>010</td>
<td>000</td>
<td>1111</td>
</tr>
</tbody>
</table>

**Accessibility**
The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>
</tr>
<tr>
<td>TGE</td>
<td></td>
</tr>
<tr>
<td>NS</td>
<td></td>
</tr>
<tr>
<td>x</td>
<td></td>
</tr>
<tr>
<td>x</td>
<td></td>
</tr>
<tr>
<td>x</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td></td>
</tr>
</tbody>
</table>

When HCR\_EL2.FB is 1, at Non-secure EL1 this instruction executes as a IC IALLUIS.

**Traps and Enables**
For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TPU==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TPU==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.3.11 IC IALLUIS, Instruction Cache Invalidate All to PoU, Inner Shareable

The IC IALLUIS characteristics are:

**Purpose**
Invalidate all instruction caches in Inner Shareable domain to Point of Unification.

**Configurations**
AArch64 System instruction IC IALLUIS performs the same function as AArch32 System instruction ICIALLUIS.

**Attributes**
IC IALLUIS is a 64-bit System instruction.

**Field descriptions**
IC IALLUIS ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

**Executing the IC IALLUIS instruction**
This instruction is executed using IC with the following syntax:

IC `<ic_op>`

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th><code>&lt;ic_op&gt;</code></th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
<th>Rt</th>
</tr>
</thead>
<tbody>
<tr>
<td>IALLUIS</td>
<td>01</td>
<td>000</td>
<td>011</td>
<td>001</td>
<td>000</td>
<td>1111</td>
</tr>
</tbody>
</table>

**Accessibility**
The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>TGE</td>
<td>WO n/a WO WO</td>
</tr>
<tr>
<td>NS</td>
<td>WO WO WO WO</td>
</tr>
</tbody>
</table>

**Traps and Enables**
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TPU==1, Non-secure execution of this instruction at EL1 is trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TPU==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.3.12 IC IVAU, Instruction Cache line Invalidate by VA to PoU

The IC IVAU characteristics are:

**Purpose**

Invalidate instruction cache by address to Point of Unification.

**Configurations**

AArch64 System instruction IC IVAU performs the same function as AArch32 System instruction ICIMVAU.

**Attributes**

IC IVAU is a 64-bit System instruction.

**Field descriptions**

The IC IVAU input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Virtual address to use</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>x</td>
</tr>
<tr>
<td>52-0</td>
<td>x</td>
</tr>
</tbody>
</table>

Virtual address to use. No alignment restrictions apply to this VA.

**Executing the IC IVAU instruction**

This instruction is executed using IC with the following syntax:

IC <ic_op>, <Xt>

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;ic_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>IVAU</td>
<td>01</td>
<td>011</td>
<td>011</td>
<td>010</td>
<td>001</td>
</tr>
</tbody>
</table>

**Accessibility**

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>

</tbody>
</table>

If EL0 access is enabled, when executed at EL0, this instruction requires read access permission to the VA, otherwise it is IMPLEMENTATION DEFINED whether it generates a Permission Fault, see Permission fault on page D4-2192.
Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see *The instruction cache maintenance instruction (IC)* on page D3-2063.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When $\text{SCTLR\_EL1.UCI}=0$, execution of this instruction at EL0 is trapped to EL1.
- When EL2 is implemented and is using AArch64 and $(\text{SCR\_EL3.NS} = 1) \& \& (\text{HCR\_EL2.E2H} = 0)$:
  - If $\text{HCR\_EL2.TPU}=1$, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If $\text{HCR\_EL2.TPU}=1$, and $\text{SCTLR\_EL1.UCI}=1$, Non-secure execution of this instruction at EL0 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and $(\text{SCR\_EL3.NS} = 1) \& \& (\text{HCR\_EL2.E2H} = 1) \& \& (\text{HCR\_EL2.TGE} = 0)$:
  - If $\text{HCR\_EL2.TPU}=1$, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If $\text{HCR\_EL2.TPU}=1$, and $\text{SCTLR\_EL1.UCI}=1$, Non-secure execution of this instruction at EL0 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and $(\text{SCR\_EL3.NS} = 1) \& \& (\text{HCR\_EL2.E2H} = 1) \& \& (\text{HCR\_EL2.TGE} = 1)$:
  - If $\text{SCTLR\_EL2.UCI}=0$, Non-secure execution of this instruction at EL0 is trapped to EL2.
C5.4 A64 system instructions for address translation

This section lists the A64 System instructions for address translation.
C5.4.1 AT S12E0R, Address Translate Stages 1 and 2 EL0 Read

The AT S12E0R characteristics are:

**Purpose**

Performs stage 1 and 2 address translations from EL0, with permissions as if reading from the given virtual address, using the following translation regime:

- In Secure state, and in Non-secure state when HCR_EL2.{E2H, TGE} is not {1, 1}, the EL1&0 translation regime.
- In Non-secure state when HCR_EL2.{E2H, TGE} is {1, 1}, the EL2&0 translation regime.

**Configurations**

There are no configuration notes.

**Attributes**

AT S12E0R is a 64-bit System instruction.

**Field descriptions**

The AT S12E0R input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>63 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input address for translation</td>
<td></td>
</tr>
</tbody>
</table>

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

**Executing the AT S12E0R instruction**

This instruction is executed using AT with the following syntax:

AT <at_op>, <Xt>

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;at_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>S12E0R</td>
<td>01</td>
<td>100</td>
<td>011</td>
<td>1000</td>
<td>110</td>
</tr>
</tbody>
</table>

**Accessibility**

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>x x 0</td>
<td>- - n/a WO</td>
</tr>
<tr>
<td>0 0 1</td>
<td>- - WO WO</td>
</tr>
</tbody>
</table>
If EL2 is not implemented, or stage 2 translation is disabled, or the instruction is executed at EL3 when the value of SCR_EL3.NS is 0, this instruction executes as AT S1E0R.

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>
C5.4.2 AT S12E0W, Address Translate Stages 1 and 2 EL0 Write

The AT S12E0W characteristics are:

**Purpose**

Performs stage 1 and 2 address translations from EL0, with permissions as if writing to the given virtual address, using the following translation regime:

- In Secure state, and in Non-secure state when HCR_EL2.{E2H, TGE} is not \{1, 1\}, the EL1&0 translation regime.
- In Non-secure state when HCR_EL2.{E2H, TGE} is \{1, 1\}, the EL2&0 translation regime.

**Configurations**

There are no configuration notes.

**Attributes**

AT S12E0W is a 64-bit System instruction.

**Field descriptions**

The AT S12E0W input value bit assignments are:

- **Input address for translation**

  Bits [63:0]

  Input address for translation. The resulting address can be read from the PAR_EL1.

  If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

**Executing the AT S12E0W instruction**

This instruction is executed using AT with the following syntax:

\[
\text{AT <at_op>, <Xt>}
\]

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;at_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>S12E0W</td>
<td>01</td>
<td>100</td>
<td>0111</td>
<td>1000</td>
<td>111</td>
</tr>
</tbody>
</table>

**Accessibility**

The instruction is executable as follows:
If EL2 is not implemented, or stage 2 translation is disabled, or the instruction is executed at EL3 when the value of SCR_EL3.NS is 0, this instruction executes as AT S1E0W.

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>

<td>1</td>
</tr>
</tbody>
</table>
C5.4.3 AT S12E1R, Address Translate Stages 1 and 2 EL1 Read

The AT S12E1R characteristics are:

**Purpose**

Performs stage 1 and 2 address translation, with permissions as if reading from the given virtual address, using the following translation regime and exception level:

- In Secure state, and in Non-secure state when HCR_EL2.{E2H, TGE} is not {1, 1}, the EL1&0 translation regime, accessed from EL1.
- In Non-secure state when HCR_EL2.{E2H, TGE} is {1, 1}, the EL2&0 translation regime, accessed from EL2.

**Configurations**

There are no configuration notes.

**Attributes**

AT S12E1R is a 64-bit System instruction.

**Field descriptions**

The AT S12E1R input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 0</td>
<td>Input address for translation. The resulting address can be read from the PAR_EL1. If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.</td>
</tr>
</tbody>
</table>

**Executing the AT S12E1R instruction**

This instruction is executed using AT with the following syntax:

\[
\text{AT } \langle \text{at\_op}, \langle \text{x}\rangle\rangle
\]

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>(&lt;\text{at_op}&gt;)</th>
<th>(\text{op0})</th>
<th>(\text{op1})</th>
<th>(\text{CRn})</th>
<th>(\text{CRm})</th>
<th>(\text{op2})</th>
</tr>
</thead>
<tbody>
<tr>
<td>S12E1R</td>
<td>01</td>
<td>100</td>
<td>0111</td>
<td>1000</td>
<td>100</td>
</tr>
</tbody>
</table>
Accessibility

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>EL0</td>
</tr>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

If EL2 is not implemented, or stage 2 translation is disabled, or the instruction is executed at EL3 when the value of SCR_EL3.NS is 0, this instruction executes as AT S1E1R.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.4.4 AT S12E1W, Address Translate Stages 1 and 2 EL1 Write

The AT S12E1W characteristics are:

**Purpose**

Performs stage 1 and 2 address translation, with permissions as if writing to the given virtual address, using the following translation regime and exception level:

- In Secure state, and in Non-secure state when HCR_EL2.{E2H, TGE} is not \{1, 1\}, the EL1&0 translation regime, accessed from EL1.
- In Non-secure state when HCR_EL2.{E2H, TGE} is \{1, 1\}, the EL2&0 translation regime, accessed from EL2.

**Configurations**

There are no configuration notes.

**Attributes**

AT S12E1W is a 64-bit System instruction.

**Field descriptions**

The AT S12E1W input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Input address for translation</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>Input address for translation. The resulting address can be read from the PAR_EL1.</td>
</tr>
<tr>
<td>VA[63:32]</td>
<td>If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.</td>
</tr>
</tbody>
</table>

**Executing the AT S12E1W instruction**

This instruction is executed using AT with the following syntax:

AT \(<at\_op>, <x>\)

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;at_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>S12E1W</td>
<td>01</td>
<td>100</td>
<td>0111</td>
<td>1000</td>
<td>101</td>
</tr>
</tbody>
</table>
Accessibility

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0</td>
</tr>
<tr>
<td>x x 0</td>
<td>-</td>
</tr>
<tr>
<td>0 0 1</td>
<td>-</td>

<tr>
<td>0 1 1</td>
<td>-</td>
</tr>
<tr>
<td>1 0 1</td>
<td>-</td>
</tr>
<tr>
<td>1 1 1</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL2 is not implemented, or stage 2 translation is disabled, or the instruction is executed at EL3 when the value of SCR_EL3.NS is 0, this instruction executes as AT S1E1W.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.4.5 AT S1E0R, Address Translate Stage 1 EL0 Read

The AT S1E0R characteristics are:

Purpose

Performs stage 1 address translation from EL0, with permissions as if reading from the given virtual address, using the following translation regime:

- In Secure state, and in Non-secure state when HCR_EL2.{E2H, TGE} is not {1, 1}, the EL1&0 translation regime.
- In Non-secure state when HCR_EL2.{E2H, TGE} is {1, 1}, the EL2&0 translation regime.

Configurations

There are no configuration notes.

Attributes

AT S1E0R is a 64-bit System instruction.

Field descriptions

The AT S1E0R input value bit assignments are:

| Bits [63:0] | Input address for translation |

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

Executing the AT S1E0R instruction

This instruction is executed using AT with the following syntax:

\[ \text{AT} \ <\text{at}\_\text{op}, \ <\text{x}\_\text{t}> \]

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;at_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>S1E0R</td>
<td>01</td>
<td>000</td>
<td>0111</td>
<td>1000</td>
<td>010</td>
</tr>
</tbody>
</table>

Accessibility

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0</td>
</tr>
<tr>
<td>x x 0</td>
<td>-</td>
</tr>
<tr>
<td>0 0 1</td>
<td>-</td>
</tr>
</tbody>
</table>
Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If HCR_EL2.AT == 1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.4.6 AT S1E0W, Address Translate Stage 1 EL0 Write

The AT S1E0W characteristics are:

**Purpose**

Performs stage 1 address translation from EL0, with permissions as if writing to the given virtual address, using the following translation regime:

- In Secure state, and in Non-secure state when HCR_EL2.{E2H, TGE} is not \{1, 1\}, the EL1&0 translation regime.
- In Non-secure state when HCR_EL2.{E2H, TGE} is \{1, 1\}, the EL2&0 translation regime.

**Configurations**

There are no configuration notes.

**Attributes**

AT S1E0W is a 64-bit System instruction.

**Field descriptions**

The AT S1E0W input value bit assignments are:

```
63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
```

<table>
<thead>
<tr>

<td>- WO WO WO</td>
</tr>
</tbody>
</table>
Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If HCR_EL2.AT==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.4.7 AT S1E1R, Address Translate Stage 1 EL1 Read

The AT S1E1R characteristics are:

**Purpose**

Performs stage 1 address translation, with permissions as if reading from the given virtual address, using the following translation regime and exception level:

- In Secure state, and in Non-secure state when HCR_EL2.{E2H, TGE} is not {1, 1}, the EL1&0 translation regime, accessed from EL1.
- In Non-secure state when HCR_EL2.{E2H, TGE} is {1, 1}, the EL2&0 translation regime, accessed from EL2.

**Configurations**

There are no configuration notes.

**Attributes**

AT S1E1R is a 64-bit System instruction.

**Field descriptions**

The AT S1E1R input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Input address for translation</th>
</tr>
</thead>
</table>

Bits [63:0]  
Input address for translation. The resulting address can be read from the PAR_EL1.

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

**Executing the AT S1E1R instruction**

This instruction is executed using AT with the following syntax:

\[ \text{AT \ <at\_op>, \ <x\_t>} \]

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;at_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

• When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  — If HCR_EL2.AT==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.4.8 AT S1E1RP, Address Translate Stage 1 EL1 Read PAN

The AT S1E1RP characteristics are:

**Purpose**

When ARMv8.2-ATS1E1 is implemented, performs a stage 1 address translation, where the value of PSTATE.PAN determines if a read from a location will generate a permission fault for a privileged access, using the following translation regime and exception level:

- In Secure state, and in Non-secure state when HCR_EL2.{E2H, TGE} is not \{1, 1\}, the EL1&0 translation regime, accessed from EL1.
- In Non-secure state when HCR_EL2.{E2H, TGE} is \{1, 1\}, the EL2&0 translation regime, accessed from EL2.

**Configurations**

This instruction is introduced in ARMv8.2.

**Attributes**

AT S1E1RP is a 64-bit System instruction.

**Field descriptions**

The AT S1E1RP input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Input address for translation</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Input address for translation. The resulting address can be read from the PAR_EL1.

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

**Executing the AT S1E1RP instruction**

This instruction is executed using AT with the following syntax:

\[\text{AT <at\_op>, <Xt>}\]

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;at_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>S1E1RP</td>
<td>01</td>
<td>000</td>
<td>0111</td>
<td>1001</td>
<td>000</td>
</tr>
</tbody>
</table>
Accessibility

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>
</tr>
<tr>
<td>TGE</td>
<td></td>

</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If HCR_EL2.AT==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.4.9  AT S1E1W, Address Translate Stage 1 EL1 Write

The AT S1E1W characteristics are:

Purpose

Performs stage 1 address translation, with permissions as if writing to the given virtual address, using the following translation regime and exception level:

- In Secure state, and in Non-secure state when $\text{HCR\_EL2.\{E2H, TGE\}}$ is not $\{1, 1\}$, the EL1&0 translation regime, accessed from EL1.
- In Non-secure state when $\text{HCR\_EL2.\{E2H, TGE\}}$ is $\{1, 1\}$, the EL2&0 translation regime, accessed from EL2.

Configurations

There are no configuration notes.

Attributes

AT S1E1W is a 64-bit System instruction.

Field descriptions

The AT S1E1W input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Input address for translation</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-0</td>
<td></td>
</tr>
</tbody>
</table>

Bits [63:0]

Input address for translation. The resulting address can be read from the PAR_EL1.

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

Executing the AT S1E1W instruction

This instruction is executed using AT with the following syntax:

AT <at_op>, <Xt>

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;at_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>S1E1W</td>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

• When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  — If HCR_EL2.AT==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.4.10 AT S1E1WP, Address Translate Stage 1 EL1 Write PAN

The AT S1E1WP characteristics are:

Purpose

When ARMv8.2-ATS1E1 is implemented, performs a stage 1 address translation, where the value of PSTATE.PAN determines if a write to a location will generate a permission fault for a privileged access, using the following translation regime and exception level:

- In Secure state, and in Non-secure state when HCR_EL2.{E2H, TGE} is not {1, 1}, the EL1&0 translation regime, accessed from EL1.
- In Non-secure state when HCR_EL2.{E2H, TGE} is {1, 1}, the EL2&0 translation regime, accessed from EL2.

Configurations

This instruction is introduced in ARMv8.2.

Attributes

AT S1E1WP is a 64-bit System instruction.

Field descriptions

The AT S1E1WP input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Input address for translation</th>
</tr>
</thead>
</table>

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

Executing the AT S1E1WP instruction

This instruction is executed using AT with the following syntax:

`AT <at_op>, <Xt>`

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;at_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>S1E1WP</td>
<td>01</td>
<td>000</td>
<td>011</td>
<td>1001</td>
<td>001</td>
</tr>
</tbody>
</table>
Accessibility

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0</td>
</tr>
<tr>
<td>x x 0</td>
<td>-</td>
</tr>
<tr>
<td>0 0 1</td>
<td>-</td>
</tr>
<tr>
<td>0 1 1</td>
<td>-</td>
</tr>
<tr>
<td>1 0 1</td>
<td>-</td>
</tr>
<tr>
<td>1 1 1</td>
<td>-</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR_EL3.NS == 1:
  - If HCR_EL2.AT==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.4.11 AT S1E2R, Address Translate Stage 1 EL2 Read

The AT S1E2R characteristics are:

Purpose

Performs stage 1 address translation as defined for EL2, with permissions as if reading from the given virtual address.

Configurations

There are no configuration notes.

Attributes

AT S1E2R is a 64-bit System instruction.

Field descriptions

The AT S1E2R input value bit assignments are:

Bits [63:0]

Input address for translation. The resulting address can be read from the PAR_EL1.

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

Executing the AT S1E2R instruction

This instruction is executed using AT with the following syntax:

AT <at_op>, <Xt>

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;at_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>S1E2R</td>
<td>01</td>
<td>100</td>
<td>011</td>
<td>1000</td>
<td>000</td>
</tr>
</tbody>
</table>

Accessibility

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE</td>
<td>EL0</td>
</tr>
<tr>
<td>x x 0</td>
<td>-</td>
</tr>
<tr>
<td>0 0 1</td>
<td>-</td>
</tr>
<tr>
<td>0 1 1</td>
<td>-</td>
</tr>
<tr>
<td>1 0 1</td>
<td>-</td>
</tr>
<tr>
<td>1 1 1</td>
<td>-</td>
</tr>
</tbody>
</table>
If EL2 is not implemented, this instruction is UNDEFINED at EL3.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.4.12 AT S1E2W, Address Translate Stage 1 EL2 Write

The AT S1E2W characteristics are:

**Purpose**

Performs stage 1 address translation as defined for EL2, with permissions as if writing to the given virtual address.

**Configurations**

There are no configuration notes.

**Attributes**

AT S1E2W is a 64-bit System instruction.

**Field descriptions**

The AT S1E2W input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Input address for translation</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 0</td>
<td></td>
</tr>
</tbody>
</table>

Input address for translation. The resulting address can be read from the PAR_EL1.

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

**Executing the AT S1E2W instruction**

This instruction is executed using AT with the following syntax:

`AT <at_op>, <Xt>`

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;at_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>S1E2W</td>
<td>01</td>
<td>100</td>
<td>011</td>
<td>1000</td>
<td>001</td>
</tr>
</tbody>
</table>

**Accessibility**

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>x x 0</td>
<td>- - n/a -</td>
</tr>
<tr>
<td>0 0 1</td>
<td>- - WO WO</td>
</tr>
<tr>
<td>0 1 1</td>
<td>- n/a WO WO</td>
</tr>
<tr>
<td>1 0 1</td>
<td>- - WO WO</td>
</tr>
<tr>
<td>1 1 1</td>
<td>- n/a WO WO</td>
</tr>
</tbody>
</table>
If EL2 is not implemented, this instruction is undefined at EL3.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

• When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  — If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.

• When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) &&
  (HCR_EL2.TGE == 0):
  — If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.4.13 AT S1E3R, Address Translate Stage 1 EL3 Read

The AT S1E3R characteristics are:

**Purpose**

Performs stage 1 address translation as defined for EL3, with permissions as if reading from the given virtual address.

**Configurations**

There are no configuration notes.

**Attributes**

AT S1E3R is a 64-bit System instruction.

**Field descriptions**

The AT S1E3R input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 0</td>
<td>Input address for translation</td>
</tr>
</tbody>
</table>

**Executing the AT S1E3R instruction**

This instruction is executed using AT with the following syntax:

\[
\text{AT } \langle \text{at\_op} \rangle, \ <Xt> \\
\]

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>\langle \text{at_op} \rangle</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>S1E3R</td>
<td>01</td>
<td>110</td>
<td>011</td>
<td>1000</td>
<td>000</td>
</tr>
</tbody>
</table>

**Accessibility**

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x x</td>
<td>0</td>
</tr>
<tr>
<td>0 0</td>
<td>1</td>
</tr>
<tr>
<td>0 1</td>
<td>1</td>
</tr>
<tr>
<td>1 0</td>
<td>1</td>
</tr>
<tr>
<td>1 1</td>
<td>1</td>
</tr>
</tbody>
</table>
C5.4.14 AT S1E3W, Address Translate Stage 1 EL3 Write

The AT S1E3W characteristics are:

**Purpose**

Performs stage 1 address translation as defined for EL3, with permissions as if writing to the given virtual address.

**Configurations**

There are no configuration notes.

**Attributes**

AT S1E3W is a 64-bit System instruction.

**Field descriptions**

The AT S1E3W input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Input address for translation</th>
</tr>
</thead>
</table>

Input address for translation. The resulting address can be read from the PAR_EL1.

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

**Executing the AT S1E3W instruction**

This instruction is executed using AT with the following syntax:

AT <at_op>, <Xt>

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;at_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

C5.5 A64 System instructions for TLB maintenance

This section lists the A64 System instructions for TLB maintenance.

For more information about these instructions see TLB maintenance instructions on page D4-2209. In particular, for the full description of the scope of each instruction see Scope of the A64 TLB maintenance instructions on page D4-2212.
C5.5.1 TLBI ALLE1, TLB Invalidate All, EL1

The TLBI ALLE1 characteristics are:

**Purpose**

Invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If SCR_EL3.NS is 0, the entry would be required to translate an address using the Secure EL1&0 translation regime.
- If SCR_EL3.NS is 1, the entry would be required to translate an address using the Non-secure EL1&0 translation regime.

The invalidation applies to entries with any VMID.

The invalidation only applies to the PE that executes this instruction.

**Note**

For the EL1&0 translation regime, the invalidation applies to both:

- Global entries.
- Non-global entries with any ASID.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI ALLE1 is a 64-bit System instruction.

**Field descriptions**

TLBI ALLE1 ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

**Executing the TLBI ALLE1 instruction**

This instruction is executed using TLBI with the following syntax:

TLBI \&lt;tlbi\_op\

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>(&lt;\text{tlbi}_\text{op}&gt;)</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
<th>Rt</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALLE1</td>
<td>01</td>
<td>100</td>
<td>1000</td>
<td>0111</td>
<td>100</td>
<td>11111</td>
</tr>
</tbody>
</table>
Accessibility

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.5.2 TLBI ALLE1IS, TLB Invalidate All, EL1, Inner Shareable

The TLBI ALLE1IS characteristics are:

**Purpose**

Invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If SCR_EL3.NS is 0, the entry would be required to translate an address using the Secure EL1&0 translation regime.
- If SCR_EL3.NS is 1, the entry would be required to translate an address using the Non-secure EL1&0 translation regime.

The invalidation applies to entries with any VMID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instructions.

--- **Note** ---

For the EL1&0 translation regime, the invalidation applies to both:

- Global entries.
- Non-global entries with any ASID.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI ALLE1IS is a 64-bit System instruction.

**Field descriptions**

TLBI ALLE1IS ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

**Executing the TLBI ALLE1IS instruction**

This instruction is executed using TLBI with the following syntax:

TLBI `<tlbi_op>`

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th><code>&lt;tlbi_op&gt;</code></th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
<th>Rt</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALLE1IS</td>
<td>01</td>
<td>100</td>
<td>1000</td>
<td>0011</td>
<td>100</td>
<td>1111</td>
</tr>
</tbody>
</table>
Accessibility

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H  TGE NS</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>x x 0</td>
<td>- - n/a WO</td>
</tr>
<tr>
<td>0 0 1</td>
<td>- - WO WO</td>
</tr>
<tr>
<td>0 1 1</td>
<td>- n/a WO WO</td>
</tr>
<tr>
<td>1 0 1</td>
<td>- - WO WO</td>
</tr>
<tr>
<td>1 1 1</td>
<td>- n/a WO WO</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.5.3 TLBI ALLE2, TLB Invalidate All, EL2

The TLBI ALLE2 characteristics are:

**Purpose**

If EL2 is implemented, invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- SCR_EL3.NS is 1.
- The entry would be required to translate an address using the EL2 translation regime.

The invalidation only applies to the PE that executes this instruction.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI ALLE2 is a 64-bit System instruction.

**Field descriptions**

TLBI ALLE2 ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

**Executing the TLBI ALLE2 instruction**

This instruction is executed using TLBI with the following syntax:

```plaintext
TLBI <tlbi_op>
```

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;tlbi_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
<th>Rt</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALLE2</td>
<td>01</td>
<td>100</td>
<td>1000</td>
<td>0111</td>
<td>000</td>
<td>11111</td>
</tr>
</tbody>
</table>

**Accessibility**

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>
</tr>
<tr>
<td>TGE</td>
<td>-</td>
</tr>
<tr>
<td>NS</td>
<td>0</td>
</tr>
<tr>
<td></td>
<td>0</td>
</tr>
<tr>
<td></td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>1</td>
</tr>
</tbody>
</table>

If EL2 is not implemented, this instruction is UNDEFINED.
Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.5.4 TLBI ALLE2IS, TLB Invalidate All, EL2, Inner Shareable

The TLBI ALLE2IS characteristics are:

**Purpose**

If EL2 is implemented, invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- SCR_EL3.NS is 1.
- The entry would be required to translate an address using the EL2 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instruction.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI ALLE2IS is a 64-bit System instruction.

**Field descriptions**

TLBI ALLE2IS ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

**Executing the TLBI ALLE2IS instruction**

This instruction is executed using TLBI with the following syntax:

```
TLBI <tlbi_op>
```

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;tlbi_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
<th>Rt</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALLE2IS</td>
<td>01</td>
<td>100</td>
<td>1000</td>
<td>0011</td>
<td>000</td>
<td>1111</td>

</tr>
</tbody>
</table>

If EL2 is not implemented, this instruction is **UNDEFINED**.
Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.5.5 TLBI ALLE3, TLB Invalidate All, EL3

The TLBI ALLE3 characteristics are:

**Purpose**

If EL3 is implemented, invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be required to translate an address using the EL3 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instruction.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI ALLE3 is a 64-bit System instruction.

**Field descriptions**

TLBI ALLE3 ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

**Executing the TLBI ALLE3 instruction**

This instruction is executed using TLBI with the following syntax:

```
TLBI <tlbi_op>
```

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;tlbi_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
<th>Rt</th>
</tr>
</thead>
<tbody>

</tbody>
</table>
C5.5.6 TLBI ALLE3IS, TLB Invalidate All, EL3, Inner Shareable

The TLBI ALLE3IS characteristics are:

**Purpose**

If EL3 is implemented, invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be required to translate an address using the EL3 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instructions.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI ALLE3IS is a 64-bit System instruction.

**Field descriptions**

TLBI ALLE3IS ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

**Executing the TLBI ALLE3IS instruction**

This instruction is executed using TLBI with the following syntax:

`TLBI <tlbi_op>`

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;tlbi_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
<th>Rt</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALLE3IS</td>
<td>01</td>
<td>110</td>
<td>1000</td>
<td>0011</td>
<td>000</td>
<td>1111</td>
</tr>
</tbody>
</table>

**Accessibility**

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE</td>
<td>NS EL0</td>
</tr>
<tr>
<td>x x 0</td>
<td>- -</td>
</tr>
<tr>
<td>0 0 1</td>
<td>- -</td>
</tr>
<tr>
<td>0 1 1</td>
<td>- n/a</td>
</tr>
<tr>
<td>1 0 1</td>
<td>- -</td>
</tr>
<tr>
<td>1 1 1</td>
<td>- n/a</td>
</tr>
</tbody>
</table>
C5.5.7 TLBI ASIDE1, TLB Invalidate by ASID, EL1

The TLBI ASIDE1 characteristics are:

**Purpose**

Invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- If SCR_EL3.NS is 0, the entry would be required to translate an address using the Secure EL1&0 translation regime.
- If SCR_EL3.NS is 1, then:
  - If EL2 is not implemented, the entry would be required to translate an address using the Non-secure EL1&0 translation regime.
  - If EL2 is implemented and HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID, and would be required to translate an address using the Non-secure EL1&0 translation regime.
  - If EL2 is implemented and HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate an address using the EL2&0 translation regime.

The invalidation only applies to the PE that executes this instruction.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI ASIDE1 is a 64-bit System instruction.

**Field descriptions**

The TLBI ASIDE1 input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-48</td>
<td>ASID</td>
</tr>
<tr>
<td>47-0</td>
<td>RES0</td>
</tr>
</tbody>
</table>

**ASID, bits [63:48]**

ASID value to match. Any appropriate TLB entries that match the ASID values will be affected by this operation.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

**Bits [47:0]**

Reserved, RES0.

**Executing the TLBI ASIDE1 instruction**

This instruction is executed using TLBI with the following syntax:

`TLBI <tlbi_op>, <xt>`
This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;tlbi_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASIDE1</td>
<td>01</td>
<td>000</td>
<td>1000</td>
<td>0111</td>
<td>010</td>
</tr>
</tbody>
</table>

### Accessibility

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x x 0</td>
<td>-</td>
</tr>
<tr>
<td>0 0 1</td>
<td>-</td>
</tr>
<tr>
<td>0 1 1</td>
<td>-</td>
</tr>
<tr>
<td>1 0 1</td>
<td>-</td>
</tr>
<tr>
<td>1 1 1</td>
<td>-</td>
</tr>
</tbody>
</table>

When `HCR_EL2.FB` is 1, at Non-secure EL1 this instruction executes as a `TLBI ASIDE1IS`.

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If `HCR_EL2.TTLB==1`, Non-secure execution of this instruction at EL1 is trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) &&
  (HCR_EL2.TGE == 0):
  - If `HCR_EL2.TTLB==1`, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.5.8 TLBI ASIDE1IS, TLB Invalidate by ASID, EL1, Inner Shareable

The TLBI ASIDE1IS characteristics are:

**Purpose**

Invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- If SCR_EL3.NS is 0, the entry would be required to translate an address using the Secure EL1&0 translation regime.
- If SCR_EL3.NS is 1, then:
  - If EL2 is not implemented, the entry would be required to translate an address using the Non-secure EL1&0 translation regime.
  - If EL2 is implemented and HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate an address using the Non-secure EL1&0 translation regime.
  - If EL2 is implemented and HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate an address using the EL2&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instructions.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI ASIDE1IS is a 64-bit System instruction.

**Field descriptions**

The TLBI ASIDE1IS input value bit assignments are:

```
   63 48 47 0
  +---+---+---+---+
  | ASID | RES0 |
  +---+---+---+---+
```

**ASID, bits [63:48]**

ASID value to match. Any appropriate TLB entries that match the ASID values will be affected by this operation.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

**Bits [47:0]**

Reserved, RES0.

**Executing the TLBI ASIDE1IS instruction**

This instruction is executed using TLBI with the following syntax:

TLBI <tlbi_op>, <Xt>
This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;tlibi_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASIDE1IS</td>
<td>01</td>
<td>000</td>
<td>1000</td>
<td>0011</td>
<td>010</td>
</tr>
</tbody>
</table>

**Accessibility**

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TTLB==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TTLB==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.5.9 TLBI IPAS2E1, TLB Invalidate by Intermediate Physical Address, Stage 2, EL1

The TLBI IPAS2E1 characteristics are:

Purpose

If EL2 is implemented, invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- SCR_EL3.NS is 1.
- The entry would be used with the current VMID.
- The entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation only applies to the PE that executes this instruction.

For more information about the architectural requirements for this instruction see Invalidation of TLB entries from stage 2 translations on page D4-2216.

Configurations

There are no configuration notes.

Attributes

TLBI IPAS2E1 is a 64-bit System instruction.

Field descriptions

The TLBI IPAS2E1 input value bit assignments are:

Bits [63:40]

Reserved, RES0.

IPA[51:48], bits [39:36]

In ARMv8.3 and ARMv8.2

Extension to IPA[47:12]. See IPA[47:12] for more details.

In ARMv8.1 and ARMv8.0.

Reserved, RES0.

IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match.

When ARMv8.2-LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

Executing the TLBI IPAS2E1 instruction

This instruction is executed using TLBI with the following syntax:

TLBI <tlbi_op>, <Xt>
This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;ttbi_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPAS2E1</td>
<td>01</td>
<td>100</td>
<td>1000</td>
<td>0100</td>
<td>001</td>
</tr>
</tbody>
</table>

**Accessibility**

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>x</td>
<td>0</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
</tr>
</tbody>
</table>

If EL2 is not implemented, or SCR_EL3.NS is 0, this instruction is a NOP.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.5.10 TLBI IPAS2E1IS, TLB Invalidate by Intermediate Physical Address, Stage 2, EL1, Inner Shareable

The TLBI IPAS2E1IS characteristics are:

**Purpose**

If EL2 is implemented, invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- SCR_EL3.NS is 1.
- The entry would be used with the current VMID.
- The entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instruction.

For more information about the architectural requirements for this instruction see *Invalidation of TLB entries from stage 2 translations* on page D4-2216.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI IPAS2E1IS is a 64-bit System instruction.

**Field descriptions**

The TLBI IPAS2E1IS input value bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>40</th>
<th>36</th>
<th>35</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>IPA[47:12]</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:40]**

Reserved, RES0.

**IPA[51:48]**, bits [39:36]

*In ARMv8.3 and ARMv8.2*

Extension to IPA[47:12]. See IPA[47:12] for more details.

*In ARMv8.1 and ARMv8.0*

Reserved, RES0.

**IPA[47:12]**, bits [35:0]

Bits[47:12] of the intermediate physical address to match.

When ARMv8.2-LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.
Executing the TLBI IPAS2E1IS instruction

This instruction is executed using TLBI with the following syntax:

TLBI <tlbi_op>, <xt>

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;tlbi_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPAS2E1IS</td>
<td>01</td>
<td>100</td>
<td>1000</td>
<td>0000</td>
<td>001</td>
</tr>
</tbody>
</table>

Accessibility

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>E2H</th>
<th>TGE</th>
<th>NS</th>
<th>EL0</th>
<th>EL1</th>
<th>EL2</th>
<th>EL3</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>x</td>
<td>0</td>
<td>-</td>
<td>-</td>
<td>n/a</td>
<td>WO</td>
</tr>
<tr>
<td>x</td>

<td>1</td>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
</tr>
<tr>
<td>x</td>
<td>1</td>
<td>1</td>
<td>-</td>
<td>n/a</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL2 is not implemented, or SCR_EL3.NS is 0, this instruction is a NOP.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  — If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  — If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.5.11 TLBI IPAS2LE1, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1

The TLBI IPAS2LE1 characteristics are:

**Purpose**

If EL2 is implemented, invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation entry, from the final level of the translation table walk.
- SCR_EL3.NS is 1.
- The entry would be used with the current VMID.
- The entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation only applies to the PE that executes this instruction.

For more information about the architectural requirements for this instruction see *Invalidation of TLB entries from stage 2 translations* on page D4-2216.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI IPAS2LE1 is a 64-bit System instruction.

**Field descriptions**

The TLBI IPAS2LE1 input value bit assignments are:

```
<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>40-39</td>
<td>IPA[47:12]</td>
</tr>
<tr>
<td>36-35</td>
<td>IPA[51:48]</td>
</tr>
</tbody>
</table>
```

**Bits [63:40]**

Reserved, RES0.

**IPA[51:48], bits [39:36]**

*In ARMv8.3 and ARMv8.2*

Extension to IPA[47:12]. See IPA[47:12] for more details.

*In ARMv8.1 and ARMv8.0*

Reserved, RES0.

**IPA[47:12], bits [35:0]**

Bits[47:12] of the intermediate physical address to match.

When ARMv8.2-LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

**Executing the TLBI IPAS2LE1 instruction**

This instruction is executed using TLBI with the following syntax:
TLBI `<tlbi_op>`, `<Xt>`

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th><code>&lt;tlbi_op&gt;</code></th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPAS2LE1</td>
<td>01</td>
<td>100</td>
<td>1000</td>
<td>0100</td>
<td>101</td>
</tr>
</tbody>
</table>

### Accessibility

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>x x 0</td>
<td>- - n/a WO</td>
</tr>
<tr>
<td>x 0 1</td>
<td>- - WO WO</td>
</tr>
<tr>
<td>x 1 1</td>
<td>- n/a WO WO</td>
</tr>
</tbody>
</table>

If EL2 is not implemented, or SCR_EL3.NS is 0, this instruction is a NOP.

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
The TLBI IPAS2LE1IS characteristics are:

**Purpose**

If EL2 is implemented, invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation entry, from the final level of the translation table walk.
- SCR_EL3.NS is 1.
- The entry would be used with the current VMID.
- The entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instruction.

For more information about the architectural requirements for this instruction see *Invalidation of TLB entries from stage 2 translations on page D4-2216.*

**Configurations**

There are no configuration notes.

**Attributes**

TLBI IPAS2LE1IS is a 64-bit System instruction.

**Field descriptions**

The TLBI IPAS2LE1IS input value bit assignments are:

**Bits [63:40]**

Reserved, RES0.

**IPA[51:48], bits [39:36]**

In ARMv8.3 and ARMv8.2

Extension to IPA[47:12]. See IPA[47:12] for more details.

In ARMv8.1 and ARMv8.0.

Reserved, RES0.

**IPA[47:12], bits [35:0]**

Bits[47:12] of the intermediate physical address to match.

When ARMv8.2-LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.
Executing the TLBI IPAS2LE1IS instruction

This instruction is executed using TLBI with the following syntax:

TLBI <tlbi_op>, <x>

This syntax uses the following encoding in the System instruction encoding space:

```
<table>
<thead>
<tr>
<th>&lt;tlbi_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPAS2LE1IS</td>
<td>01</td>
<td>100</td>
<td>1000</td>
<td>0000</td>
<td>101</td>
</tr>
</tbody>
</table>
```

**Accessibility**

The instruction is executable as follows:

```
<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0 EL1 EL2 EL3</td>
</tr>
<tr>
<td>x x 0</td>
<td>- - n/a WO</td>
</tr>
<tr>
<td>x 0 1</td>
<td>- - WO WO</td>
</tr>
<tr>
<td>x 1 1</td>
<td>- n/a WO WO</td>
</tr>
</tbody>
</table>
```

If EL2 is not implemented, or SCR_EL3.NS is 0, this instruction is a NOP.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.5.13 TLBI VAAE1, TLB Invalidate by VA, All ASID, EL1

The TLBI VAAE1 characteristics are:

**Purpose**

Invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified address.
- If SCR_EL3.NS is 0, the entry would be required to translate using the Secure EL1&0 translation regime.
- If SCR_EL3.NS is 1, then:
  - If EL2 is not implemented, the entry would be required to translate using the Non-secure EL1&0 translation regime.
  - If EL2 is implemented and HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate using the Non-secure EL1&0 translation regime.
  - If EL2 is implemented and HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate using the EL2&0 translation regime.

The invalidation only applies to the PE that executes this instruction.

**Note**

For the EL1&0 translation regime, the invalidation applies to both:

- Global entries.
- Non-global entries with any ASID.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI VAAE1 is a 64-bit System instruction.

**Field descriptions**

The TLBI VAAE1 input value bit assignments are:

| Bits [63:44] | Reserved, RES0. |
| VA[55:12], bits [43:0] | Bits [55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this operation, regardless of the ASID. If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0. The treatment of the low-order bits of this field depends on the translation granule size, as follows:
- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation. |
• Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.

• Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAAE1 instruction**

This instruction is executed using TLBI with the following syntax:

```
TLBI <tlbi_op>, <Xt>
```

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;tlbi_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>VAAE1</td>
<td>01</td>
<td>000</td>
<td>1000</td>
<td>0111</td>
<td>011</td>
</tr>
</tbody>
</table>

**Accessibility**

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>
</tr>
<tr>
<td>TGE</td>
<td></td>
</tr>
<tr>
<td>NS</td>
<td></td>
</tr>
<tr>
<td>x</td>
<td>-</td>
</tr>
<tr>
<td>0</td>
<td>-</td>
</tr>
<tr>
<td>0</td>
<td>-</td>
</tr>
<tr>
<td>1</td>
<td>-</td>
</tr>
<tr>
<td>1</td>
<td>-</td>
</tr>
</tbody>
</table>

When HCR_EL2.FB is 1, at Non-secure EL1 this instruction executes as a TLBI VAAE1IS.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

• When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  — If HCR_EL2.TTLB==1, Non-secure execution of this instruction at EL1 is trapped to EL2.

• When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  — If HCR_EL2.TTLB==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.5.14   TLB VAAE1IS, TLB Invalidate by VA, All ASID, EL1, Inner Shareable

The TLBI VAAE1IS characteristics are:

Purpose

Invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

• The entry is a stage 1 translation table entry, from any level of the translation table walk.
• The entry would be used to translate the specified address.
• If SCR_EL3.NS is 0, the entry would be required to translate using the Secure EL1&0 translation regime.
• If SCR_EL3.NS is 1, then:
  — If EL2 is not implemented, the entry would be required to translate using the Non-secure EL1&0 translation regime.
  — If EL2 is implemented and HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate using the Non-secure EL1&0 translation regime.
  — If EL2 is implemented and HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate using the EL2&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instructions.

Note

For the EL1&0 translation regime, the invalidation applies to both:

• Global entries.
• Non-global entries with any ASID.

Configurations

There are no configuration notes.

Attributes

TLBI VAAE1IS is a 64-bit System instruction.

Field descriptions

The TLBI VAAE1IS input value bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>44</th>
<th>43</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>VA[55:12]</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [63:44]

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this operation, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

• Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
• Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.

• Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAAE1IS instruction

This instruction is executed using TLBI with the following syntax:

TLBI <tlbi_op>, <Xt>

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;tlbi_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>VAAE1IS</td>
<td>01</td>
<td>000</td>
<td>1000</td>
<td>0011</td>
<td>011</td>
</tr>
</tbody>
</table>

Accessibility

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

• When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  — If HCR_EL2.TTLB==1, Non-secure execution of this instruction at EL1 is trapped to EL2.

• When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  — If HCR_EL2.TTLB==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.5.15 TLBI VAALE1, TLB Invalidate by VA, All ASID, Last level, EL1

The TLBI VAALE1 characteristics are:

**Purpose**

Invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified address.
- If SCR_EL3.NS is 0, the entry would be required to translate using the Secure EL1&0 translation regime.
- If SCR_EL3.NS is 1, then:
  - If EL2 is not implemented, the entry would be required to translate using the Non-secure EL1&0 translation regime.
  - If EL2 is implemented and HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate using the Non-secure EL1&0 translation regime.
  - If EL2 is implemented and HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate using the EL2&0 translation regime.

The invalidation only applies to the PE that executes this instruction.

**Note**

For the EL1&0 translation regime, the invalidation applies to both:

- Global entries.
- Non-global entries with any ASID.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI VAALE1 is a 64-bit System instruction.

**Field descriptions**

The TLBI VAALE1 input value bit assignments are:

```
   63 44 43 0
   RES0 VA[55:12]
```

**Bits [63:44]**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this operation, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
• Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.

• Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAALE1 instruction**

This instruction is executed using TLBI with the following syntax:

```
TLBI <tlbi_op>, <xt>
```

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;tlbi_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>VAALE1</td>
<td>01</td>
<td>000</td>
<td>1000</td>
<td>0111</td>
<td>111</td>
</tr>
</tbody>
</table>

**Accessibility**

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>EL0</td>
</tr>
<tr>
<td>TGE</td>
<td></td>
</tr>
<tr>
<td>NS</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>E2H</th>
<th>TGE</th>
<th>NS</th>
<th>EL0</th>
<th>EL1</th>
<th>EL2</th>
<th>EL3</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>x</td>
<td>0</td>
<td>-</td>
<td>WO</td>
<td>n/a</td>
<td>WO</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
<td>1</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
<td>1</td>
<td>-</td>
<td>n/a</td>
<td>WO</td>
<td>WO</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>1</td>

<td>WO</td>
<td>WO</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>1</td>
<td>-</td>
<td>n/a</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

When HCR_EL2.FB is 1, at Non-secure EL1 this instruction executes as a TLBI VAALE1IS.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

• When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  — If HCR_EL2.TTLB==1, Non-secure execution of this instruction at EL1 is trapped to EL2.

• When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  — If HCR_EL2.TTLB==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.5.16 TLBI VAALE1IS, TLB Invalidate by VA, All ASID, Last Level, EL1, Inner Shareable

The TLBI VAALE1IS characteristics are:

**Purpose**

Invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified address.
- If SCR_EL3.NS is 0, the entry would be required to translate using the Secure EL1&0 translation regime.
- If SCR_EL3.NS is 1, then:
  - If EL2 is not implemented, the entry would be required to translate using the Non-secure EL1&0 translation regime.
  - If EL2 is implemented and HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate using the Non-secure EL1&0 translation regime.
  - If EL2 is implemented and HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate using the EL2&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instructions.

**Note**

For the EL1&0 translation regime, the invalidation applies to both:

- Global entries.
- Non-global entries with any ASID.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI VAALE1IS is a 64-bit System instruction.

**Field descriptions**

The TLBI VAALE1IS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 - 44</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>43 - 0</td>
<td>VA[55:12]</td>
</tr>
</tbody>
</table>

- **Bits [63:44]**
  - Reserved, RES0.

- **VA[55:12], bits [43:0]**
  - Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this operation, regardless of the ASID.
  - If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.
  - The treatment of the low-order bits of this field depends on the translation granule size, as follows:
    - Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
• Where a 16KB translation granularity is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
• Where a 64KB translation granularity is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAALE1IS instruction

This instruction is executed using TLBI with the following syntax:

TLBI <tlbi_op>, <xt>

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;tlbi_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

• When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  — If HCR_EL2.TTLB==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
• When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  — If HCR_EL2.TTLB==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.5.17   TLBI VAE1, TLB Invalidate by VA, EL1

The TLBI VAE1 characteristics are:

**Purpose**

Invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If SCR_EL3.NS is 0, the entry would be required to translate using the Secure EL1&0 translation regime.
- If SCR_EL3.NS is 1, then:
  - If EL2 is not implemented, the entry would be required to translate using the Non-secure EL1&0 translation regime.
  - If EL2 is implemented and HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate using the Non-secure EL1&0 translation regime.
  - If EL2 is implemented and HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate using the EL2&0 translation regime.

The invalidation only applies to the PE that executes this instruction.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI VAE1 is a 64-bit System instruction.

**Field descriptions**

The TLBI VAE1 input value bit assignments are:

```
+-----+-----+-----+-----+-----+-----+-----+-----+
| 63  | 48  | 47  | 44  | 43  | 0   |
+-----+-----+-----+-----+-----+-----+
| ASID| RES0| VA[55:12] |
+-----+-----+-----+-----+-----+-----+
```

**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

**Bits [47:44]**

Reserved, RES0.
VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this operation.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAE1 instruction

This instruction is executed using TLBI with the following syntax:

TLBI <tlbi_op>, <Xt>

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;tlbi_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>VAE1</td>
<td>01</td>
<td>000</td>
<td>1000</td>
<td>0111</td>
<td>001</td>
</tr>
</tbody>
</table>

Accessibility

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0</td>
</tr>
<tr>
<td>x x 0</td>
<td>-</td>
</tr>
<tr>
<td>0 0 1</td>
<td>-</td>
</tr>
<tr>
<td>0 1 1</td>
<td>-</td>
</tr>
<tr>
<td>1 0 1</td>
<td>-</td>
</tr>
<tr>
<td>1 1 1</td>
<td>-</td>
</tr>
</tbody>
</table>

When HCR_EL2.FB is 1, at Non-secure EL1 this instruction executes as a TLBI VAE1IS.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TTLB==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
• When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  — If HCR_EL2.TTLB==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.5.18 TLBI VAE1IS, TLB Invalidate by VA, EL1, Inner Shareable

The TLBI VAE1IS characteristics are:

**Purpose**

Invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If SCR_EL3.NS is 0, the entry would be required to translate using the Secure EL1&0 translation regime.
- If SCR_EL3.NS is 1, then:
  - If EL2 is not implemented, the entry would be required to translate using the Non-secure EL1&0 translation regime.
  - If EL2 is implemented and HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate using the Non-secure EL1&0 translation regime.
  - If EL2 is implemented and HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate using the EL2&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instructions.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI VAE1IS is a 64-bit System instruction.

**Field descriptions**

The TLBI VAE1IS input value bit assignments are:

```
63  48  47  44  43  0
ASID  RES0  VA[55:12]
```

**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

**Bits [47:44]**

Reserved, RES0.
VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this operation.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAE1IS instruction

This instruction is executed using TLBI with the following syntax:

TLBI <tlbi_op>, <Xt>

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;tlbi_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>VAE1IS</td>
<td>01</td>
<td>000</td>
<td>1000</td>
<td>0011</td>
<td>001</td>
</tr>
</tbody>
</table>

Accessibility

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS EL0 EL1 EL2 EL3</td>

<td>WO WO WO</td>
</tr>
<tr>
<td>1 1 1</td>
<td>n/a WO WO</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TTLB==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.TTLB==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.5.19  TLBI VAE2, TLB Invalidate by VA, EL2

The TLBI VAE2 characteristics are:

Purpose

If EL2 is implemented, invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified address.
- SCR_EL3.NS is 1.
- The entry would be required to translate using the EL2 translation regime.

The invalidation only applies to the PE that executes this instruction.

Configurations

There are no configuration notes.

Attributes

TLBI VAE2 is a 64-bit System instruction.

Field descriptions

The TLBI VAE2 input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>44</td>
<td>VA[55:12].</td>
</tr>
<tr>
<td>43</td>
<td>0</td>
</tr>
</tbody>
</table>

Bits [63:44] Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this operation.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAE2 instruction

This instruction is executed using TLBI with the following syntax:

TLBI <tlbi_op>, <xt>
This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;tlbi_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>VAE2</td>
<td>01</td>
<td>100</td>
<td>1000</td>
<td>0111</td>
<td>001</td>
</tr>
</tbody>
</table>

### Accessibility

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>

</table>

If EL2 is not implemented, or SCR_EL3.NS is 0, this instruction is **UNDEFINED**.

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.5.20 TLBI VAE2IS, TLB Invalidate by VA, EL2, Inner Shareable

The TLBI VAE2IS characteristics are:

**Purpose**

If EL2 is implemented, invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified address.
- SCR_EL3.NS is 1.
- The entry would be required to translate using the EL2 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instruction.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI VAE2IS is a 64-bit System instruction.

**Field descriptions**

The TLBI VAE2IS input value bit assignments are:

![Bit Assignment Diagram]

**Bits [63:44]**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this operation.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAE2IS instruction**

This instruction is executed using TLBI with the following syntax:

TLBI <tlbi_op>, <Xt>
This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;tlbi_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>VAE2IS</td>
<td>01</td>
<td>100</td>
<td>1000</td>
<td>0011</td>
<td>001</td>
</tr>
</tbody>
</table>

### Accessibility

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

If EL2 is not implemented, or SCR_EL3.NS is 0, this instruction is **UNDEFINED**.

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.5.21 TLBI VAE3, TLB Invalidate by VA, EL3

The TLBI VAE3 characteristics are:

**Purpose**

If EL3 is implemented, invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified address.
- The entry would be required to translate using the EL3 translation regime.

The invalidation only applies to the PE that executes this instruction.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI VAE3 is a 64-bit System instruction.

**Field descriptions**

The TLBI VAE3 input value bit assignments are:

```
  63 44 43 0
  RES0 VA[55:12]
```

**Bits [63:44]**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits [55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this operation.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits [55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granularity size, as follows:

- Where a 4KB translation granularity is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granularity is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granularity is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAE3 instruction**

This instruction is executed using TLBI with the following syntax:

```
TLBI <tlbi_op>, <xt>
```
This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;tlbi_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>VAE3</td>
<td>01</td>
<td>110</td>
<td>1000</td>
<td>0111</td>
<td>001</td>
</tr>
</tbody>
</table>

**Accessibility**

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>
C5.5.22 TLBI VAE3IS, TLB Invalidate by VA, EL3, Inner Shareable

The TLBI VAE3IS characteristics are:

Purpose

If EL3 is implemented, invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified address.
- The entry would be required to translate using the EL3 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instruction.

Configurations

There are no configuration notes.

Attributes

TLBI VAE3IS is a 64-bit System instruction.

Field descriptions

The TLBI VAE3IS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit Positions</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63–44</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>43–0</td>
<td>VA[55:12]</td>
</tr>
</tbody>
</table>

Bits [63:44]

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this operation.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAE3IS instruction

This instruction is executed using TLBI with the following syntax:

TLBI <tlbi_op>, <xt>
This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;tlbi_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>VAE3IS</td>
<td>01</td>
<td>110</td>
<td>1000</td>
<td>0011</td>
<td>001</td>
</tr>
</tbody>
</table>

**Accessibility**

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>

<td>-</td>
</tr>
<tr>
<td>1 0 1</td>
<td>-</td>
</tr>
<tr>
<td>1 1 1</td>
<td>-</td>
</tr>
</tbody>
</table>
C5.5.23 TLBI VALE1, TLB Invalidate by VA, Last level, EL1

The TLBI VALE1 characteristics are:

Purpose
Invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If SCR_EL3.NS is 0, the entry would be required to translate using the Secure EL1&0 translation regime.
- If SCR_EL3.NS is 1, then:
  - If EL2 is not implemented, the entry would be required to translate using the Non-secure EL1&0 translation regime.
  - If EL2 is implemented and HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate using the Non-secure EL1&0 translation regime.
  - If EL2 is implemented and HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate using the EL2&0 translation regime.

The invalidation only applies to the PE that executes this instruction.

Configurations
There are no configuration notes.

Attributes
TLBI VALE1 is a 64-bit System instruction.

Field descriptions
The TLBI VALE1 input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit 63</th>
<th>Bit 48</th>
<th>Bit 47</th>
<th>Bit 44</th>
<th>Bit 43</th>
<th>Bit 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASID</td>
<td>RES0</td>
<td>VA[55:12]</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

ASID, bits [63:48]
ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

Bits [47:44]
Reserved, RES0.

VA[55:12], bits [43:0]
Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this operation.
If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VALE1 instruction**

This instruction is executed using TLBI with the following syntax:

TLBI <tlbi_op>, <xt>

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;tlbi_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALE1</td>
<td>01</td>
<td>000</td>
<td>1000</td>
<td>0111</td>
<td>101</td>
</tr>
</tbody>
</table>

**Accessibility**

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS</td>
<td>EL0</td>
</tr>
<tr>
<td>x x 0</td>
<td>-</td>
</tr>
<tr>
<td>0 0 1</td>
<td>-</td>
</tr>
<tr>
<td>0 1 1</td>
<td>-</td>
</tr>
<tr>
<td>1 0 1</td>
<td>-</td>
</tr>
<tr>
<td>1 1 1</td>
<td>-</td>
</tr>
</tbody>
</table>

When HCR_EL2.FB is 1, at Non-secure EL1 this instruction executes as a TLBI VALE1IS.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  
  — If HCR_EL2.TTLB==1, Non-secure execution of this instruction at EL1 is trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  
  — If HCR_EL2.TTLB==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.5.24 TLBI VALE1IS, TLB Invalidate by VA, Last level, EL1, Inner Shareable

The TLBI VALE1IS characteristics are:

Purpose

Invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If SCR_EL3.NS is 0, the entry would be required to translate using the Secure EL1&0 translation regime.
- If SCR_EL3.NS is 1, then:
  - If EL2 is not implemented, the entry would be required to translate using the Non-secure EL1&0 translation regime.
  - If EL2 is implemented and HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID, and would be required to translate using the Non-secure EL1&0 translation regime.
  - If EL2 is implemented and HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate using the EL2&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instruction.

Configurations

There are no configuration notes.

Attributes

TLBI VALE1IS is a 64-bit System instruction.

Field descriptions

The TLBI VALE1IS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>ASID</td>
</tr>
<tr>
<td>48</td>
<td>Reserved</td>
</tr>
<tr>
<td>47</td>
<td>Reserved</td>
</tr>
<tr>
<td>44</td>
<td>VA[55:12]</td>
</tr>
<tr>
<td>43</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are Reserved.

Bits [47:44]

Reserved, Reserved.
VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this operation.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VALE1IS instruction

This instruction is executed using TLBI with the following syntax:

TLBI <tlbi_op>, <xt>

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;tlbi_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.TTLB==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) &&
  (HCR_EL2.TGE == 0):
  - If HCR_EL2.TTLB==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.5.25 TLBI VALE2, TLB Invalidate by VA, Last level, EL2

The TLBI VALE2 characteristics are:

**Purpose**

If EL2 is implemented, invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified address.
- SCR_EL3.NS is 1.
- The entry would be required to translate using the EL2 translation regime.

The invalidation only applies to the PE that executes this instruction.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI VALE2 is a 64-bit System instruction.

**Field descriptions**

The TLBI VALE2 input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:44]</th>
<th>63 44 43 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
</tr>
<tr>
<td>VA[55:12]</td>
<td></td>
</tr>
</tbody>
</table>

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this operation.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VALE2 instruction**

This instruction is executed using TLBI with the following syntax:

`TLBI <tlbi_op>, <xt>`
This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;tlbi_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALE2</td>
<td>01</td>
<td>100</td>
<td>1000</td>
<td>0111</td>
<td>101</td>
</tr>
</tbody>
</table>

### Accessibility

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

If EL2 is not implemented, or SCR_EL3.NS is 0, this instruction is undefined.

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.5.26 TLBI VALE2IS, TLB Invalidate by VA, Last level, EL2, Inner Shareable

The TLBI VALE2IS characteristics are:

**Purpose**

If EL2 is implemented, invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified address.
- SCR_EL3.NS is 1.
- The entry would be required to translate using the EL2 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instruction.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI VALE2IS is a 64-bit System instruction.

**Field descriptions**

The TLBI VALE2IS input value bit assignments are:

```
<table>
<thead>
<tr>
<th>63</th>
<th>44</th>
<th>43</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
<td>VA[55:12]</td>
<td></td>
</tr>
</tbody>
</table>
```

**Bits [63:44]**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this operation.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VALE2IS instruction**

This instruction is executed using TLBI with the following syntax:

```
TLBI <tlbi_op>, <Xt>
```
This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;tlbi_op&gt;</th>

<td>1</td>
</tr>
</tbody>
</table>

If EL2 is not implemented, or SCR_EL3.NS is 0, this instruction is **UNDEFINED**.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.5.27 TLBI VALE3, TLB Invalidate by VA, Last level, EL3

The TLBI VALE3 characteristics are:

**Purpose**

If EL3 is implemented, invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified address.
- The entry would be required to translate using the EL3 translation regime.

The invalidation only applies to the PE that executes this instruction.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI VALE3 is a 64-bit System instruction.

**Field descriptions**

The TLBI VALE3 input value bit assignments are:

```
   63  44  43  0
    ||
RES0  VA[55:12]
    ||
```

**Bits [63:44]**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this operation.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VALE3 instruction**

This instruction is executed using TLBI with the following syntax:

```
TLBI <tlbi_op>, <Xt>
```
This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;tlbi_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALE3</td>
<td>01</td>
<td>110</td>
<td>1000</td>
<td>0111</td>
<td>101</td>
</tr>
</tbody>
</table>

**Accessibility**

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H TGE NS EL0 EL1 EL2 EL3</td>
<td></td>
</tr>
<tr>
<td>x x 0 - - n/a WO</td>
<td></td>
</tr>
<tr>
<td>0 0 1 - - - WO</td>
<td></td>
</tr>
<tr>
<td>0 1 1 - n/a - WO</td>
<td></td>
</tr>
<tr>
<td>1 0 1 - - - WO</td>
<td></td>
</tr>
<tr>
<td>1 1 1 - n/a - WO</td>
<td></td>
</tr>
</tbody>
</table>
C5.5.28 TLBI VALE3IS, TLB Invalidate by VA, Last level, EL3, Inner Shareable

The TLBI VALE3IS characteristics are:

**Purpose**

If EL3 is implemented, invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified address.
- The entry would be required to translate using the EL3 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instruction.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI VALE3IS is a 64-bit System instruction.

**Field descriptions**

The TLBI VALE3IS input value bit assignments are:

| Bits [63:44] | Reserved, RES0. |
| VA[55:12], bits [43:0] | Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this operation. If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0. The treatment of the low-order bits of this field depends on the translation granule size, as follows: |
| 63 | 44 43 | 0 |
| RES0 | VA[55:12] |

**Executing the TLBI VALE3IS instruction**

This instruction is executed using TLBI with the following syntax:

```
TLBI <tlbi_op>, <xt>
```
This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;tlbi_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALE3IS</td>
<td>01</td>
<td>110</td>
<td>1000</td>
<td>0011</td>
<td>101</td>
</tr>
</tbody>
</table>

**Accessibility**

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>

<td>0</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>
C5.5.29 TLBI VMALLE1, TLB Invalidate by VMID, All at stage 1, EL1

The TLBI VMALLE1 characteristics are:

Purpose

Invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- If SCR_EL3.NS is 0, the entry would be required to translate an address using the Secure EL1&0 translation regime.
- If SCR_EL3.NS is 1, then:
  - If EL2 is not implemented, the entry would be required to translate an address using the Non-secure EL1&0 translation regime.
  - If EL2 is implemented and HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate an address using the Non-secure EL1&0 translation regime.
  - If EL2 is implemented and HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate an address using the EL2&0 translation regime.

The invalidation only applies to the PE that executes this instruction.

Note

For the EL1&0 translation regime, the invalidation applies to both:
- Global entries.
- Non-global entries with any ASID.

Configurations

There are no configuration notes.

Attributes

TLBI VMALLE1 is a 64-bit System instruction.

Field descriptions

TLBI VMALLE1 ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

Executing the TLBI VMALLE1 instruction

This instruction is executed using TLBI with the following syntax:

TLBI <tlbi_op>

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;tlbi_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
<th>Rt</th>
</tr>
</thead>
<tbody>
<tr>
<td>VMALLE1</td>
<td>01</td>
<td>000</td>
<td>1000</td>
<td>0111</td>
<td>000</td>
<td>1111</td>
</tr>
</tbody>
</table>
Accessibility

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

When HCR_EL2.FB is 1, at Non-secure EL1 this instruction executes as a TLBI VMALLE1IS.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  — If HCR_EL2.TTLB==1, Non-secure execution of this instruction at EL1 is trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  — If HCR_EL2.TTLB==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.5.30 TLBI VMALLE1IS, TLB Invalidate by VMID, All at stage 1, EL1, Inner Shareable

The TLBI VMALLE1IS characteristics are:

Purpose

Invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- If SCR_EL3.NS is 0, the entry would be required to translate an address using the Secure EL1&0 translation regime.
- If SCR_EL3.NS is 1, then:
  - If EL2 is not implemented, the entry would be required to translate an address using the Non-secure EL1&0 translation regime.
  - If EL2 is implemented and HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate an address using the Non-secure EL1&0 translation regime.
  - If EL2 is implemented and HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate an address using the EL2&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instruction.

--- Note ---

For the EL1&0 translation regime, the invalidation applies to both:

- Global entries.
- Non-global entries with any ASID.

Configurations

There are no configuration notes.

Attributes

TLBI VMALLE1IS is a 64-bit System instruction.

Field descriptions

TLBI VMALLE1IS ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

Executing the TLBI VMALLE1IS instruction

This instruction is executed using TLBI with the following syntax:

TLBI <tlbi_op>

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;tlbi_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
<th>Rt</th>
</tr>
</thead>
<tbody>
<tr>
<td>VMALLE1IS</td>
<td>01</td>
<td>000</td>
<td>1000</td>
<td>0011</td>
<td>000</td>
<td>1111</td>
</tr>
</tbody>
</table>
Accessibility

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>

</tr>
<tr>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

• When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  — If HCR_EL2.TTLB==1, Non-secure execution of this instruction at EL1 is trapped to EL2.

• When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  — If HCR_EL2.TTLB==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
TLBI VMALLS12E1, TLB Invalidate by VMID, All at Stage 1 and 2, EL1

The TLBI VMALLS12E1 characteristics are:

**Purpose**

Invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If SCR_EL3.NS is 0, the entry would be required to translate an address using the Secure EL1&0 translation regime.
- If SCR_EL3.NS is 1, then:
  - The entry would be required to translate an address using the Non-secure EL1&0 translation regime.
  - If EL2 is implemented, the entry would be used with the current VMID.

The invalidation only applies to the PE that executes this instruction.

**Note**

For the EL1&0 translation regime, the invalidation applies to both:

- Global entries.
- Non-global entries with any ASID.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI VMALLS12E1 is a 64-bit System instruction.

**Field descriptions**

TLBI VMALLS12E1 ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

**Executing the TLBI VMALLS12E1 instruction**

This instruction is executed using TLBI with the following syntax:

`TLBI <tlbi_op>`

This instruction uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;tlbi_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
<th>Rt</th>
</tr>
</thead>
<tbody>
<tr>
<td>VMALLS12E1</td>
<td>01</td>
<td>100</td>
<td>1000</td>
<td>0111</td>
<td>110</td>
<td>11111</td>
</tr>
</tbody>
</table>
Accessibility

The instruction is executable as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>E2H</td>
<td>TGE</td>
</tr>
<tr>
<td>x</td>
<td>x</td>

<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

If SCR_EL3.NS==0, or EL2 is not implemented, this instruction executes as a TLBI VMALLE1.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  - If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
C5.5.32 TLBI VMALLS12E1IS, TLB Invalidate by VMID, All at Stage 1 and 2, EL1, Inner Shareable

The TLBI VMALLS12E1IS characteristics are:

**Purpose**

Invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If SCR_EL3.NS is 0, the entry would be required to translate an address using the Secure EL1&0 translation regime.
- If SCR_EL3.NS is 1, then:
  - The entry would be required to translate an address using the Non-secure EL1&0 translation regime.
  - If EL2 is implemented, the entry would be used with the current VMID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instruction.

**Note**

For the EL1&0 translation regime, the invalidation applies to both:

- Global entries.
- Non-global entries with any ASID.

**Configurations**

There are no configuration notes.

**Attributes**

TLBI VMALLS12E1IS is a 64-bit System instruction.

**Field descriptions**

TLBI VMALLS12E1IS ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

** Executing the TLBI VMALLS12E1IS instruction **

This instruction is executed using TLBI with the following syntax:

TLBI <tlbi_op>

This syntax uses the following encoding in the System instruction encoding space:

<table>
<thead>
<tr>
<th>&lt;tlbi_op&gt;</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
<th>Rt</th>
</tr>
</thead>
<tbody>
<tr>
<td>VMALLS12E1IS</td>

</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

If SCR_EL3.NS=0, or EL2 is not implemented, this instruction executes as a TLBI VMALLE1IS.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1895. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
  — If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
  — If HCR_EL2.NV==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
Chapter C6
A64 Base Instruction Descriptions

This chapter describes the A64 base instructions.

It contains the following sections:

• About the A64 base instructions on page C6-524.
• Alphabetical list of A64 base instructions on page C6-526.
C6.1 About the A64 base instructions

Alphabetical list of A64 base instructions on page C6-526 gives full descriptions of the A64 instructions that are in the following instruction groups:

- Branch, Exception generation, and system instructions.
- Loads and stores associated with the general-purpose registers.
- Data processing (immediate).
- Data processing (register).

A64 instruction set encoding on page C4-224 provides an overview of the instruction encodings as well as of the instruction classes within their functional groups.

The rest of this section is general description of the base instructions. It contains the following subsections:

- Register size.
- Use of the PC.
- Use of the stack pointer on page C6-525.
- Condition flags and related instructions on page C6-525.

C6.1.1 Register size

Most data processing, comparison, and conversion instructions that use the general-purpose registers as the source or destination operand have two instruction variants that operate on either a 32-bit or a 64-bit value.

Where a 32-bit instruction form is selected, the following holds:

- The upper 32 bits of the source registers are ignored.
- The upper 32 bits of the destination register are set to zero.
- Right shifts and right rotates inject at bit[31], not at bit[63].
- The Condition flags, where set by the instruction, are computed from the lower 32 bits.

This distinction applies even when the results of a 32-bit instruction form are indistinguishable from the lower 32 bits computed by the equivalent 64-bit instruction form. For example, a 32-bit bitwise ORR could be performed using a 64-bit ORR and simply ignoring the top 32 bits of the result. However, the A64 instruction set includes separate 32-bit and 64-bit forms of the ORR instruction.

As well as distinct sign-extend or zero-extend instructions, the A64 instruction set also provides the ability to extend and shift the final source register of an ADD, SUB, ADDS, or SUBS instruction and the index register of a Load/Store instruction. This enables array index calculations involving a 64-bit array pointer and a 32-bit array index to be implemented efficiently.

The assembly language notation enables the distinct identification of registers holding 32-bit values and registers holding 64-bit values. See Register names on page C1-145 and Register indexed addressing on page C1-149.

C6.1.2 Use of the PC

A64 instructions have limited access to the PC. The only instructions that can read the PC are those that generate a PC relative address:

- ADR and ADRP.
- The Load register (literal) instruction class.
- Direct branches that use an immediate offset.
- The unconditional branch with link instructions, BL and BLR, that use the PC to create the return link address.

Only explicit control flow instructions can modify the PC:

- Conditional and unconditional branch and return instructions.
- Exception generation and exception return instructions.
C6.1 About the A64 base instructions

For more details of instructions that can modify the PC, see Branches, Exception generating, and System instructions on page C3-162.

C6.1.3 Use of the stack pointer

A64 instructions can use the stack pointer only in a limited number of cases:

- Load/Store instructions use the current stack pointer as the base address:
  - When stack alignment checking is enabled by system software and the base register is SP, the current stack pointer must be initially quadword aligned, That is, it must be aligned to 16 bytes. Misalignment generates an SP alignment fault. See SP alignment checking on page D1-1868 for more information.
- Add and subtract data processing instructions in their immediate and extended register forms, use the current stack pointer as a source register or the destination register or both.
- Logical data processing instructions in their immediate form use the current stack pointer as the destination register.

C6.1.4 Condition flags and related instructions

The A64 base instructions that use the Condition flags as an input are:

- Conditional branch. The conditional branch instruction is B.cond.
- Add or subtract with carry. These instruction types include instructions to perform multi-precision arithmetic and calculate checksums. The add or subtract with carry instructions are ADC, ADCS, SBC, and SBCS, or an architectural alias for these instructions.
- Conditional select with increment, negate, or invert. This instruction type conditionally selects between one source register and a second, incremented, negated, inverted, or unmodified source register. The conditional select with increment, negate, or invert instructions are CSINC, CSINV, and CSNEG.

These instructions also implement:

- Conditional select or move. The Condition flags select one of two source registers as the destination register. Short conditional sequences can be replaced by unconditional instructions followed by a conditional select, CSEL.
- Conditional set. Conditionally selects between 0 and 1, or 0 and -1. This can be used to convert the Condition flags to a Boolean value or mask in a general-purpose register, for example. These instructions include CSET and CSETM.
- Conditional compare. This instruction type sets the Condition flags to the result of a comparison if the original condition is true, otherwise it sets the Condition flags to an immediate value. It permits the flattening of nested conditional expressions without using conditional branches or performing Boolean arithmetic within the general-purpose registers. The conditional compare instructions are CONP and CON.

The A64 base instructions that update the Condition flags as an output are:

- Flag-setting data processing instructions, such as ADCS, ADDS, ANDS, BICS, SBCS, and SUBS, and the aliases CMN, CMP, and TST.
- Conditional compare instructions such as CON, CONP.

The flags can be directly accessed for a read/write using the NZCV, Condition Flags on page C5-360.

The A64 base instructions also include conditional branch instructions that do not use the Condition flags as an input:

- Compare and branch if a register is zero or nonzero, CBZ and CBNZ.
- Test a single bit in a register and branch if the bit is zero or nonzero, TBZ and TBNZ.
C6.2 Alphabetical list of A64 base instructions

This section lists every instruction in the base category of the A64 instruction set. For details of the format used, see Understanding the A64 instruction descriptions on page C2-154.
C6.2.1 ADC

Add with Carry adds two register values and the Carry flag value, and writes the result to the destination register.

32-bit variant

Applies when \( sf = 0 \).

\[
\text{ADC} \ <\text{Wd}>, \ <\text{Wn}>, \ <\text{Wm}>
\]

64-bit variant

Applies when \( sf = 1 \).

\[
\text{ADC} \ <\text{Xd}>, \ <\text{Xn}>, \ <\text{Xm}>
\]

Decode for all variants of this encoding

\[
\begin{align*}
\text{integer } d &= \text{UInt}(Rd); \\
\text{integer } n &= \text{UInt}(Rn); \\
\text{integer } m &= \text{UInt}(Rm); \\
\text{integer } datasize &= \text{if } sf == '1' \text{ then } 64 \text{ else } 32;
\end{align*}
\]

Assembler symbols

\[
\begin{align*}
<\text{Wd}> & \quad \text{Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.} \\
<\text{Wn}> & \quad \text{Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.} \\
<\text{Wm}> & \quad \text{Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.} \\
<\text{Xd}> & \quad \text{Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.} \\
<\text{Xn}> & \quad \text{Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.} \\
<\text{Xm}> & \quad \text{Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.}
\end{align*}
\]

Operation

\[
\begin{align*}
\text{bits(datasize) result;} \\
\text{bits(datasize) operand1} &= X[n]; \\
\text{bits(datasize) operand2} &= X[m]; \\
\text{(result, -)} &= \text{AddWithCarry(operand1, operand2, PSTATE.C)}; \\
X[d] &= \text{result;}
\end{align*}
\]
C6.2.2 ADCS

Add with Carry, setting flags, adds two register values and the Carry flag value, and writes the result to the destination register. It updates the condition flags based on the result.

### 32-bit variant

Applies when \( sf = 0 \).

\[ \text{ADCS} \ <Wd>, \ <Wn>, \ <Wm> \]

### 64-bit variant

Applies when \( sf = 1 \).

\[ \text{ADCS} \ <Xd>, \ <Xn>, \ <Xm> \]

#### Decode for all variants of this encoding

\[
\begin{align*}
\text{integer } d &= \text{UInt}(Rd); \\
\text{integer } n &= \text{UInt}(Rn); \\
\text{integer } m &= \text{UInt}(Rm); \\
\text{integer } \text{datasize} &= \text{if } sf = '1' \text{ then } 64 \text{ else } 32;
\end{align*}
\]

#### Assembler symbols

- \(<Wd>\) Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Wn>\) Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.
- \(<Wm>\) Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.
- \(<Xd>\) Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Xn>\) Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.
- \(<Xm>\) Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.

#### Operation

\[
\begin{align*}
\text{bits(datasize) } \text{result}; \\
\text{bits(datasize) } \text{operand1} &= X[n]; \\
\text{bits(datasize) } \text{operand2} &= X[m]; \\
\text{bits(4) } \text{nczv}; \\
(\text{result}, \text{nczv}) &= \text{AddWithCarry}(\text{operand1}, \text{operand2}, \text{PSTATE.C}); \\
\text{PSTATE.}<N,Z,C,V> &= \text{nczv}; \\
X[d] &= \text{result};
\end{align*}
\]
### C6.2.3 ADD (extended register)

Add (extended register) adds a register value and a sign or zero-extended register value, followed by an optional left shift amount, and writes the result to the destination register. The argument that is extended from the \(<R_m>\) register can be a byte, halfword, word, or doubleword.

#### 32-bit variant
Applies when \(sf = 0\).

\[
\text{ADD} \ <Wd|WSP>, <Wn|WSP>, <Wm>\{, <extend> \{#<amount>\}\}
\]

#### 64-bit variant
Applies when \(sf = 1\).

\[
\text{ADD} \ <Xd|SP>, <Xn|SP>, \langle R \rangle_<m>\{, <extend> \{#<amount>\}\}
\]

#### Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
ExtendType extend_type = DecodeRegExtend(option);
integer shift = UInt(imm3);
if shift > 4 then ReservedValue();
```

#### Assembler symbols

- \(<Wd|WSP>\) Is the 32-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.
- \(<Wn|WSP>\) Is the 32-bit name of the first source general-purpose register or stack pointer, encoded in the "Rn" field.
- \(<Wm>\) Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.
- \(<Xd|SP>\) Is the 64-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.
- \(<Xn|SP>\) Is the 64-bit name of the first source general-purpose register or stack pointer, encoded in the "Rn" field.
- \(<R>\) Is a width specifier, encoded in the "option" field. It can have the following values:
  - \(W\) when option = 00x
  - \(W\) when option = 010
  - \(X\) when option = x11
  - \(W\) when option = 10x
  - \(W\) when option = 110
- \(<m>\) Is the number [0-30] of the second general-purpose source register or the name ZR (31), encoded in the "Rm" field.
For the 32-bit variant: is the extension to be applied to the second source operand, encoded in the "option" field. It can have the following values:

- **UXTB** when option = 000
- **UXTH** when option = 001
- **LSL|UXTW** when option = 010
- **UXTX** when option = 011
- **SXTB** when option = 100
- **SXTH** when option = 101
- **SXTW** when option = 110
- **SXTX** when option = 111

If "Rd" or "Rn" is '11111' (WSP) and "option" is '010' then LSL is preferred, but may be omitted when "imm3" is '000'. In all other cases <extend> is required and must be UXTW when "option" is '010'.

For the 64-bit variant: is the extension to be applied to the second source operand, encoded in the "option" field. It can have the following values:

- **UXTB** when option = 000
- **UXTH** when option = 001
- **UXTW** when option = 010
- **LSL|UXTX** when option = 011
- **SXTB** when option = 100
- **SXTH** when option = 101
- **SXTW** when option = 110
- **SXTX** when option = 111

If "Rd" or "Rn" is '11111' (SP) and "option" is '011' then LSL is preferred, but may be omitted when "imm3" is '000'. In all other cases <extend> is required and must be UXTX when "option" is '011'.

Is the left shift amount to be applied after extension in the range 0 to 4, defaulting to 0, encoded in the "imm3" field. It must be absent when <extend> is absent, is required when <extend> is LSL, and is optional when <extend> is present but not LSL.

**Operation**

```plaintext
bits(datasize) result;
bits(datasize) operand1 = if n == 31 then SP[] else X[n];
bits(datasize) operand2 = ExtendReg(m, extend_type, shift);

(result, -) = AddWithCarry(operand1, operand2, '0');
if d == 31 then
    SP[] = result;
else
    X[d] = result;
```
C6.2.4   ADD (immediate)

Add (immediate) adds a register value and an optionally-shifted immediate value, and writes the result to the destination register.

This instruction is used by the alias MOV (to/from SP). See Alias conditions for details of when each alias is preferred.

### 32-bit variant
Applies when \( sf == 0 \).

ADD <Wd|WSP>, <Wn|WSP>, #<imm>{, <shift>}

### 64-bit variant
Applies when \( sf == 1 \).

ADD <Xd|SP>, <Xn|SP>, #<imm>{, <shift>}

### Decode for all variants of this encoding

integer \( d = \text{UInt}(Rd) \);
integer \( n = \text{UInt}(Rn) \);
integer \( \text{datasize} = \text{if } sf == '1' \text{ then 64 else 32} \);
bits(\( \text{datasize} \)) \( \text{imm} \);

case shift of
when '00' \( \text{imm} = \text{ZeroExtend}(\text{imm12}, \text{datasize}) \);
when '01' \( \text{imm} = \text{ZeroExtend}(\text{imm12}:\text{Zeros}(12), \text{datasize}) \);
when '1x' ReservedValue();

### Alias conditions

<table>
<thead>

</tr>
</tbody>
</table>

### Assembler symbols

- \(<Wd|WSP>\): Is the 32-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.
- \(<Wn|WSP>\): Is the 32-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.
- \(<Xd|SP>\): Is the 64-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.
- \(<Xn|SP>\): Is the 64-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.
- \(<\text{imm}>\): Is an unsigned immediate, in the range 0 to 4095, encoded in the "imm12" field.
<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in the "shift" field. It can have the following values:

- LSL #0 when shift = 00
- LSL #12 when shift = 01
- The encoding shift = 1x is reserved.

**Operation**

```
bits(datasize) result;
bits(datasize) operand1 = if n == 31 then SP[] else X[n];
(result, -) = AddWithCarry(operand1, imm, '0');
if d == 31 then
  SP[] = result;
else
  X[d] = result;
```
C6.2.5   ADD (shifted register)

Add (shifted register) adds a register value and an optionally-shifted register value, and writes the result to the
destination register.

<table>

\ SP[] &= \text{result}; \\
\text{else} \\
\ X[d] &= \text{result};
\end{align*}
\]
C6.2.12   AND (shifted register)

Bitwise AND (shifted register) performs a bitwise AND of a register value and an optionally-shifted register value, and writes the result to the destination register.

### 32-bit variant

Applies when \( sf \) == 0.

\[
\text{AND} \ <Wd>, \ <Wn>, \ <Wm> \{, \ <shift> \ #\<amount>\}
\]

### 64-bit variant

Applies when \( sf \) == 1.

\[
\text{AND} \ <Xd>, \ <Xn>, \ <Xm> \{, \ <shift> \ #\<amount>\}
\]

#### Decode for all variants of this encoding

integer \( d = \text{UInt}(Rd) \);
integer \( n = \text{UInt}(Rn) \);
integer \( m = \text{UInt}(Rm) \);
integer \( \text{datasize} = \text{if} \ sf == '1' \ \text{then} \ 64 \ \text{else} \ 32; \)
\( \text{if} \ sf == '0' \ \&\& \ \text{imm6<5>} == '1' \ \text{then} \ \text{ReservedValue}(); \)

\[
\text{ShiftType} \ shift\_type = \text{DecodeShift}(\text{shift});
\]
integer \( shift\_amount = \\text{UInt}(\text{imm6});\)

#### Assembler symbols

- \(<Wd>\) Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Wn>\) Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.
- \(<Wm>\) Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.
- \(<Xd>\) Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Xn>\) Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.
- \(<Xm>\) Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.
- \(<\text{shift}>\) Is the optional shift to be applied to the final source, defaulting to LSL and encoded in the "shift" field. It can have the following values:

  - LSL when \( \text{shift} = 00 \)
  - LSR when \( \text{shift} = 01 \)
  - ASR when \( \text{shift} = 10 \)
  - ROR when \( \text{shift} = 11 \)

- \(<\text{amount}>\) For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.

For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field,
Operation

bits(datasize) operand1 = X[n];
bits(datasize) operand2 = ShiftReg(m, shift_type, shift_amount);

result = operand1 AND operand2;
X[d] = result;
C6.2.13 ANDS (immediate)

Bitwise AND (immediate), setting flags, performs a bitwise AND of a register value and an immediate value, and writes the result to the destination register. It updates the condition flags based on the result.

This instruction is used by the alias TST (immediate). See Alias conditions for details of when each alias is preferred.

<table>
<thead>

<td>imm</td>
<td>Rn</td>
<td>Rd</td>
<td></td>
</tr>
</tbody>
</table>

**32-bit variant**

Applies when \( sf == 0 \) \&\& \( N == 0 \).

ANDS \(<Wd>, <Wn>, #<imm>\)

**64-bit variant**

Applies when \( sf == 1 \).

ANDS \(<Xd>, <Xn>, #<imm>\)

**Decode for all variants of this encoding**

integer \( d = UInt(Rd) \);
integer \( n = UInt(Rn) \);
integer \( datasize = if sf == '1' then 64 else 32; \)

bits(\( datasize \)) \( imm; \)
if \( sf == '0' \) \&\& \( N != '0' \) then ReservedValue();
(\( imm, - \) = DecodeBitMasks\( N, imms, immr, TRUE \));

**Alias conditions**

**Assembler symbols**

\(<Wd>\) Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

\(<Wn>\) Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.

\(<Xd>\) Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

\(<Xn>\) Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.

\(<imm>\) For the 32-bit variant: is the bitmask immediate, encoded in "imms:immr".

For the 64-bit variant: is the bitmask immediate, encoded in "N:imms:immr".

**Operation**

bits(\( datasize \)) result;
bits(\( datasize \)) operand1 = \( X[n] \);
result = operand1 AND imm;
PSTATE.<N,Z,C,V> = result<datasize-1>:IsZeroBit(result):'00';

X[d] = result;
ANDS (shifted register)

Bitwise AND (shifted register), setting flags, performs a bitwise AND of a register value and an optionally-shifted register value, and writes the result to the destination register. It updates the condition flags based on the result.

This instruction is used by the alias TST (shifted register). See Alias conditions for details of when each alias is preferred.

32-bit variant
Applies when $sf == 0$.

ANDS <Wd>, <Wn>, <Wm>{, <shift> #<amount>}

64-bit variant
Applies when $sf == 1$.

ANDS <Xd>, <Xn>, <Xm>{, <shift> #<amount>}

Decode for all variants of this encoding

```plaintext
d = UInt(Rd);
n = UInt(Rn);
m = UInt(Rm);

if sf == '1' then datasize = 64 else 32;
if sf == '0' \&\& imm6<5> == '1' then ReservedValue();
shift_type = DecodeShift(shift);
shift_amount = UInt(imm6);
```

</tbody>
</table>

Assembler symbols

- `<Wd>`: Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- `<Wn>`: Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.
- `<Wm>`: Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.
- `<Xd>`: Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- `<Xn>`: Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.
- `< Xm>`: Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.
- `<shift>`: Is the optional shift to be applied to the final source, defaulting to LSL and encoded in the "shift" field. It can have the following values:
  - LSL when `shift = 00`
### LSR
when shift = 01

### ASR
when shift = 10

### ROR
when shift = 11

<amount>

For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.

For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field,

#### Operation

```plaintext
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = ShiftReg(m, shift_type, shift_amount);
result = operand1 AND operand2;
PSTATE.<N,Z,C,V> = result<datasize-1>:IsZeroBit(result):'00';
X[d] = result;
```
C6.2.15   ASR (register)

Arithmetic Shift Right (register) shifts a register value right by a variable number of bits, shifting in copies of its sign bit, and writes the result to the destination register. The remainder obtained by dividing the second source register by the data size defines the number of bits by which the first source register is right-shifted.

This instruction is an alias of the ASRV instruction. This means that:

- The encodings in this description are named to match the encodings of ASRV.
- The description of ASRV gives the operational pseudocode for this instruction.

32-bit variant
Applies when $sf == 0$.

ASR <Wd>, <Wn>, <Wm>
is equivalent to

ASRV <Wd>, <Wn>, <Wm>
and is always the preferred disassembly.

64-bit variant
Applies when $sf == 1$.

ASR <Xd>, <Xn>, <Xm>
is equivalent to

ASRV <Xd>, <Xn>, <Xm>
and is always the preferred disassembly.

Assembler symbols

- $<Wd>$ is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- $<Wn>$ is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.
- $<Wm>$ is the 32-bit name of the second general-purpose source register holding a shift amount from 0 to 31 in its bottom 5 bits, encoded in the "Rm" field.
- $<Xd>$ is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- $<Xn>$ is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.
- $<Xm>$ is the 64-bit name of the second general-purpose source register holding a shift amount from 0 to 63 in its bottom 6 bits, encoded in the "Rm" field.

Operation
The description of ASRV gives the operational pseudocode for this instruction.
C6.2.16   **ASR (immediate)**

Arithmetic Shift Right (immediate) shifts a register value right by an immediate number of bits, shifting in copies of the sign bit in the upper bits and zeros in the lower bits, and writes the result to the destination register.

This instruction is an alias of the SBFM instruction. This means that:

- The encodings in this description are named to match the encodings of SBFM.
- The description of SBFM gives the operational pseudocode for this instruction.

### 32-bit variant

Applies when $sf == 0 \land N == 0 \land imms == 011111$.

$ASR <Wd>, <Wn>, #<shift>$

is equivalent to

$SBFM <Wd>, <Wn>, #<shift>, #31$

and is always the preferred disassembly.

### 64-bit variant

Applies when $sf == 1 \land N == 1 \land imms == 111111$.

$ASR <Xd>, <Xn>, #<shift>$

is equivalent to

$SBFM <Xd>, <Xn>, #<shift>, #63$

and is always the preferred disassembly.

### Assembler symbols

- $<Wd>$ is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- $<Wn>$ is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.
- $<Xd>$ is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- $<Xn>$ is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.
- $<shift>$ For the 32-bit variant: is the shift amount, in the range 0 to 31, encoded in the "immr" field.
  For the 64-bit variant: is the shift amount, in the range 0 to 63, encoded in the "immr" field.

### Operation

The description of SBFM gives the operational pseudocode for this instruction.
C6.2.17   ASRV

Arithmetic Shift Right Variable shifts a register value right by a variable number of bits, shifting in copies of its sign
bit, and writes the result to the destination register. The remainder obtained by dividing the second source register
by the data size defines the number of bits by which the first source register is right-shifted.

This instruction is used by the alias ASR (register). The alias is always the preferred disassembly.

32-bit variant
Applies when $sf == 0$.

\[
\text{ASRV} <Wd>, <Wn>, <Wm>
\]

64-bit variant
Applies when $sf == 1$.

\[
\text{ASRV} <Xd>, <Xn>, <Xm>
\]

**Decode for all variants of this encoding**

\[
\begin{align*}
\text{integer } d &= \text{UInt}(Rd); \\
\text{integer } n &= \text{UInt}(Rn); \\
\text{integer } m &= \text{UInt}(Rm); \\
\text{integer } \text{datasize} &= \text{if } sf == '1' \text{ then } 64 \text{ else } 32; \\
\text{ShiftType } \text{shift_type} &= \text{DecodeShift(op2)};
\end{align*}
\]

**Assembler symbols**

\[
\begin{align*}
<Wd> & \quad \text{Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.} \\
<Xd> & \quad \text{Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.} \\
<Wn> & \quad \text{Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.} \\
<Xn> & \quad \text{Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.} \\
<Wm> & \quad \text{Is the 32-bit name of the second general-purpose source register holding a shift amount from 0 to} \\
& \quad \text{31 in its bottom 5 bits, encoded in the "Rm" field.} \\
<Xm> & \quad \text{Is the 64-bit name of the second general-purpose source register holding a shift amount from 0 to} \\
& \quad \text{63 in its bottom 6 bits, encoded in the "Rm" field.}
\end{align*}
\]

**Operation**

\[
\begin{align*}
\text{bits(datasize) result;} \\
\text{bits(datasize) operand2 = X[m];} \\
\text{result = ShiftReg(n, shift_type, UInt(operand2) MOD datasize);} \\
X[d] = \text{result;}
\end{align*}
\]
C6.2.18 AT

Address Translate. For more information, see `op0==0b01`, cache maintenance, TLB maintenance, and address translation instructions on page C5-332.

This instruction is an alias of the SYS instruction. This means that:

- The encodings in this description are named to match the encodings of SYS.
- The description of SYS gives the operational pseudocode for this instruction.

```
<table>

</tbody>
</table>

L   CRn   CRm
```

**System variant**

AT `<at_op>, <Xt>`

is equivalent to

SYS `#<op1>, C7, <Cm>, #<op2>, <Xt>`

and is the preferred disassembly when `SysOp(op1,'0111',CRm,op2) == Sys_AT`.

**Assembler symbols**

- `<at_op>` Is an AT instruction name, as listed for the AT system instruction group, encoded in the "op1:CRm<0>:op2" field. It can have the following values:
  - `S1E1R` when `op1 = 000`, `CRm<0> = 0`, `op2 = 000`
  - `S1E1W` when `op1 = 000`, `CRm<0> = 0`, `op2 = 001`
  - `S1E0R` when `op1 = 000`, `CRm<0> = 0`, `op2 = 010`
  - `S1E0W` when `op1 = 000`, `CRm<0> = 0`, `op2 = 011`
  - `S1E2R` when `op1 = 100`, `CRm<0> = 0`, `op2 = 000`
  - `S1E2W` when `op1 = 100`, `CRm<0> = 0`, `op2 = 001`
  - `S12E1R` when `op1 = 100`, `CRm<0> = 0`, `op2 = 100`
  - `S12E1W` when `op1 = 100`, `CRm<0> = 0`, `op2 = 101`
  - `S12E0R` when `op1 = 100`, `CRm<0> = 0`, `op2 = 110`
  - `S12E0W` when `op1 = 100`, `CRm<0> = 0`, `op2 = 111`
  - `S1E3R` when `op1 = 110`, `CRm<0> = 0`, `op2 = 000`
  - `S1E3W` when `op1 = 110`, `CRm<0> = 0`, `op2 = 001`

When ARMv8.2-ATS1E1 is implemented, the following values are also valid:
  - `S1E1RP` when `op1 = 000`, `CRm<0> = 1`, `op2 = 000`
  - `S1E1WP` when `op1 = 000`, `CRm<0> = 1`, `op2 = 001`

- `<op1>` Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op1" field.
- `<Cm>` Is a name 'Cm', with 'm' in the range 0 to 15, encoded in the "CRm" field.
- `<op2>` Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op2" field.
- `<Xt>` Is the 64-bit name of the general-purpose source register, encoded in the "Rt" field.
Operation

The description of SYS gives the operational pseudocode for this instruction.
C6.2.19 AUTDA, AUTDZA

Authenticate Data address, using key A. This instruction authenticates a data address, using a modifier and key A. The address is in the general-purpose register that is specified by <Xd>.

The modifier is:
- In the general-purpose register or stack pointer that is specified by <Xn|SP> for AUTDA.
- The value zero, for AUTDZA.

If the authentication passes, the upper bits of the address are restored to enable subsequent use of the address. If the authentication fails, the upper bits are corrupted and any subsequent use of the address results in a Translation fault.

ARMv8.3

```
|31 30 29 28|27 26 25 24|23 22 21 20|19 18 17 16|15 14 13 12|11 10  9 |  5  4 |  0 |
|-------------|-------------|-------------|-------------|-------------|-------------|-------------|
| 1   1   0     1   1   0   1   0          0   0   0   0   1   0   0   Z| 1 | 1 | 0 |

AUTDA variant

Applies when Z == 0.

AUTDA <Xd>, <Xn|SP>

AUTDZA variant

Applies when Z == 1 && Rn == 11111.

AUTDZA <Xd>

Decode for all variants of this encoding

```python
boolean source_is_sp = FALSE;
integer d = UInt(Rd);
integer n = UInt(Rn);
if !HavePACExt() then
    UnallocatedEncoding();
if Z == '0' then // AUTDA
    if n == 31 then source_is_sp = TRUE;
else // AUTDZA
    if n != 31 then UnallocatedEncoding();
```

Assembler symbols

- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Xn|SP> Is the 64-bit name of the general-purpose source register or stack pointer, encoded in the "Rn" field.

Operation

```python
if source_is_sp then
    X[d] = AuthDA(X[d], SP[]);
else
    X[d] = AuthDA(X[d], X[n]);
```
C6.2.20 AUTDB, AUTDZB

Authenticate Data address, using key B. This instruction authenticates a data address, using a modifier and key B. The address is in the general-purpose register that is specified by \(<Xd>\).

The modifier is:

- In the general-purpose register or stack pointer that is specified by \(<Xn|SP>\) for AUTDB.
- The value zero, for AUTDZB.

If the authentication passes, the upper bits of the address are restored to enable subsequent use of the address. If the authentication fails, the upper bits are corrupted and any subsequent use of the address results in a Translation fault.

ARMv8.3

`| 31 30 29 28 | 27 26 25 24 | 23 22 21 20 | 19 18 17 16 | 15 14 13 12 | 11 10 9 | 5 4 | 0 |
  1 1 0 1 1 0 1 1 0 0 0 0 1 0 0 | 1 1 1 | Rn | Rd`

**AUTDB variant**

Applies when \(Z == 0\).

`AUTDB <Xd>, <Xn|SP>`

**AUTDZB variant**

Applies when \(Z == 1 \&\& Rn == 1111\).

`AUTDZB <Xd>`

**Decode for all variants of this encoding**

```plaintext
boolean source_is_sp = FALSE;
integer d = UInt(Rd);
integer n = UInt(Rn);
if !HavePACExt() then
    UnallocatedEncoding();
if Z == '0' then // AUTDB
    if n == 31 then source_is_sp = TRUE;
else // AUTDZB
    if n != 31 then UnallocatedEncoding();
```

**Assembler symbols**

- \(<Xd>\) Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Xn|SP>\) Is the 64-bit name of the general-purpose source register or stack pointer, encoded in the "Rn" field.

**Operation**

```plaintext
if source_is_sp then
    X[d] = AuthDB(X[d], SP[]);
else
    X[d] = AuthDB(X[d], X[n]);
```
C6.2.21 AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIZA

Authenticate Instruction address, using key A. This instruction authenticates an instruction address, using a modifier and key A.

The address is:
- In the general-purpose register that is specified by <Xd> for AUTIA and AUTIZA.
- In X17, for AUTIA1716.
- In X30, for AUTIASP and AUTIAZ.

The modifier is:
- In the general-purpose register or stack pointer that is specified by <Xn|SP> for AUTIA.
- The value zero, for AUTIZA and AUTIAZ.
- In X16, for AUTIA1716.
- In SP, for AUTIASP.

If the authentication passes, the upper bits of the address are restored to enable subsequent use of the address. If the authentication fails, the upper bits are corrupted and any subsequent use of the address results in a Translation fault.

Integer

ARMv8.3

```
|Z| Rn| Rd |
---|---|---|
   |   |    |
```

**AUTIA variant**

Applies when Z == 0.

AUTIA <Xd>, <Xn|SP>

**AUTIZA variant**

Applies when Z == 1 && Rn == 11111.

AUTIZA <Xd>

**Decode for all variants of this encoding**

```java
boolean source_is_sp = FALSE;
integer d = UInt(Rd);
integer n = UInt(Rn);

if !HavePACExt() then
  UnallocatedEncoding();

if Z == '0' then // AUTIA
  if n == 31 then source_is_sp = TRUE;
else // AUTIZA
  if n != 31 then UnallocatedEncoding();
```

**System**

ARMv8.3
AUTIA1716 variant
Applies when CRm == 0001 && op2 == 100.

AUTIA1716

AUTIASP variant
Applies when CRm == 0011 && op2 == 101.

AUTIASP

AUTIAZ variant
Applies when CRm == 0011 && op2 == 100.

AUTIAZ

Decode for all variants of this encoding

```plaintext
d; n;
source_is_sp = FALSE;

case CRm:op2 of
  when '0011 100'    // AUTIAZ
    d = 30;
    n = 31;
  when '0011 101'    // AUTIASP
    d = 30;
    source_is_sp = TRUE;
    when '0001 100'    // AUTIA1716
    d = 17;
    n = 16;
    when '0001 000' SEE "PACIA";
    when '0001 010' SEE "PACIB";
    when '0001 110' SEE "AUTIB";
    when '0011 00x' SEE "PACIA";
    when '0011 01x' SEE "PACIB";
    when '0011 11x' SEE "AUTIB";
    when '0000 111' SEE "XPACLRI";
    otherwise SEE "HINT";
```

Assembler symbols

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xn|SP> Is the 64-bit name of the general-purpose source register or stack pointer, encoded in the "Rn" field.

Operation for all encodings

```plaintext
if HavePACExt() then
  if source_is_sp then
    X[d] = AuthIA(X[d], SP[;]);
  else
    X[d] = AuthIA(X[d], X[n]);
```
C6.2.22 AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZB

Authenticate Instruction address, using key B. This instruction authenticates an instruction address, using a modifier and key B.

The address is:

- In the general-purpose register that is specified by \(<X_d>\) for AUTIB and AUTIZB.
- In X17, for AUTIB1716.
- In X30, for AUTIBSP and AUTIBZ.

The modifier is:

- In the general-purpose register or stack pointer that is specified by \(<X_n|SP>\) for AUTIB.
- The value zero, for AUTIZB and AUTIBZ.
- In X16, for AUTIB1716.
- In SP, for AUTIBSP.

If the authentication passes, the upper bits of the address are restored to enable subsequent use of the address. If the authentication fails, the upper bits are corrupted and any subsequent use of the address results in a Translation fault.

**Integer**

ARMv8.3

```
<table>

<tbody>
<tr>
<td>1</td>
<td>1</td>
<td>0</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

AUTIB variant

Applies when \(Z == 0\).

AUTIB \(<X_d>, <X_n|SP>\)

AUTIZB variant

Applies when \(Z == 1 && Rn == 11111\).

AUTIZB \(<X_d>\)

**Decode for all variants of this encoding**

```
boolean source_is_sp = FALSE;
integer d = UInt(Rd);
integer n = UInt(Rn);
if !HavePACExt() then
  UnallocatedEncoding();
if Z == '0' then // AUTIB
  if n == 31 then source_is_sp = TRUE;
else // AUTIZB
  if n != 31 then UnallocatedEncoding();
```

**System**

ARMv8.3
AUTIB1716 variant
Applies when CRm == 0001 && op2 == 110.

AUTIB1716

AUTIBSP variant
Applies when CRm == 0011 && op2 == 111.

AUTIBSP

AUTIBZ variant
Applies when CRm == 0011 && op2 == 110.

AUTIBZ

Decode for all variants of this encoding
integer d;
integer n;
boolean source_is_sp = FALSE;
case CRm:op2 of
    when '0011 110' // AUTIBZ
d = 30;

Assembler symbols
<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Xn|SP> Is the 64-bit name of the general-purpose source register or stack pointer, encoded in the "Rn" field.

Operation for all encodings
if HavePACExt() then
    if source_is_sp then
        X[d] = AuthIB(X[d], SP[1]);
    else
        X[d] = AuthIB(X[d], X[n]);
C6.2.23   B.cond

Branch conditionally to a label at a PC-relative offset, with a hint that this is not a subroutine call or return.

```
<table>
<thead>
<tr>
<th>31 30 29 28</th>
<th>27 26 25 24</th>
<th>23</th>
<th>5 4 3 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 1 0 1 0 0 0</td>
<td>imm19</td>
<td>0</td>
<td>cond</td>
</tr>
</tbody>
</table>
```

19-bit signed PC-relative branch offset variant

B.<cond> <label>

**Decode for this encoding**

bits(64) offset = SignExtend(imm19:'00', 64);

**Assemble symbols**

<cond>  Is one of the standard conditions, encoded in the "cond" field in the standard way.

<label>  Is the program label to be conditionally branched to. Its offset from the address of this instruction, in the range +/-1MB, is encoded as "imm19" times 4.

**Operation**

if ConditionHolds(cond) then

   BranchTo(PC[] + offset, BranchType_JMP);

C6.2.24   B

Branch causes an unconditional branch to a label at a PC-relative offset, with a hint that this is not a subroutine call or return.

```
|31 30 29 28|27 26 25 |
| 0 | 0 | 0 | 1 | 0 | 1 |

imm26
```

**26-bit signed PC-relative branch offset variant**

B <label>

**Decode for this encoding**

bits(64) offset = SignExtend(imm26:'00', 64);

**Assembler symbols**

<label> Is the program label to be unconditionally branched to. Its offset from the address of this instruction, in the range +/-128MB, is encoded as "imm26" times 4.

**Operation**

BranchTo(PC[] + offset, BranchType_JMP);
C6.2.25   BFC

Bitfield Clear, leaving other bits unchanged.

This instruction is an alias of the BFM instruction. This means that:

- The encodings in this description are named to match the encodings of BFM.
- The description of BFM gives the operational pseudocode for this instruction.

ARMv8.2

<table>
<thead>
<tr>
<th>32-bit variant</th>
<th>64-bit variant</th>
</tr>
</thead>
</table>

32-bit variant

Applies when sf == 0 && N == 0.

BFC <Wd>, #<lsb>, #<width>

is equivalent to

BFM <Wd>, WZR, #(-<lsb> MOD 32), #(<width>-1)

and is the preferred disassembly when UInt(imms) < UInt(immr).

64-bit variant

Applies when sf == 1 && N == 1.

BFC <Xd>, #<lsb>, #<width>

is equivalent to

BFM <Xd>, XZR, #(-<lsb> MOD 64), #(<width>-1)

and is the preferred disassembly when UInt(imms) < UInt(immr).

Assembler symbols

- <Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <lsb> For the 32-bit variant: is the bit number of the lsb of the destination bitfield, in the range 0 to 31.
  For the 64-bit variant: is the bit number of the lsb of the destination bitfield, in the range 0 to 63.
- <width> For the 32-bit variant: is the width of the bitfield, in the range 1 to 32-<lsb>.
  For the 64-bit variant: is the width of the bitfield, in the range 1 to 64-<lsb>.

Operation

The description of BFM gives the operational pseudocode for this instruction.
C6.2.26   BFI

Bitfield Insert copies any number of low-order bits from a source register into the same number of adjacent bits at any position in the destination register, leaving other bits unchanged.

This instruction is an alias of the BFM instruction. This means that:

- The encodings in this description are named to match the encodings of BFM.
- The description of BFM gives the operational pseudocode for this instruction.

**32-bit variant**

Applies when \( sf == 0 \&\& N == 0 \).

\[
\text{BFI} \ <Wd>, \ <Wn>, \ #<lsb>, \ #<width>
\]

is equivalent to

\[
\text{BFM} \ <Wd>, \ <Wn>, \ #(-<lsb> MOD 32), \ #(<width>-1)
\]

and is the preferred disassembly when \( \text{UInt}(\text{imms}) < \text{UInt}(\text{immr}) \).

**64-bit variant**

Applies when \( sf == 1 \&\& N == 1 \).

\[
\text{BFI} \ <Xd>, \ <Xn>, \ #<lsb>, \ #<width>
\]

is equivalent to

\[
\text{BFM} \ <Xd>, \ <Xn>, \ #(-<lsb> MOD 64), \ #(<width>-1)
\]

and is the preferred disassembly when \( \text{UInt}(\text{imms}) < \text{UInt}(\text{immr}) \).

**Assembler symbols**

- \(<Wd>\) Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Wn>\) Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.
- \(<Xd>\) Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Xn>\) Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.
- \(<\text{lsb}>\) For the 32-bit variant: is the bit number of the lsb of the destination bitfield, in the range 0 to 31.
  For the 64-bit variant: is the bit number of the lsb of the destination bitfield, in the range 0 to 63.
- \(<\text{width}>\) For the 32-bit variant: is the width of the bitfield, in the range 1 to 32-<lsb>.
  For the 64-bit variant: is the width of the bitfield, in the range 1 to 64-<lsb>.

**Operation**

The description of BFM gives the operational pseudocode for this instruction.
C6.2.27   BFM

Bitfield Move copies any number of low-order bits from a source register into the same number of adjacent bits at any position in the destination register, leaving other bits unchanged.

This instruction is used by the aliases BFC, BFI, and BFXIL. See *Alias conditions* for details of when each alias is preferred.

32-bit variant

Applies when \( sf == 0 \) \&\& \( N == 0 \).

\[
\text{BFM} <Wd>, <Wn>, #<immr>, #<imms>
\]

64-bit variant

Applies when \( sf == 1 \) \&\& \( N == 1 \).

\[
\text{BFM} <Xd>, <Xn>, #<immr>, #<imms>
\]

**Decode for all variants of this encoding**

\[
\begin{align*}

<imm> For the 32-bit variant: is the right rotate amount, in the range 0 to 31, encoded in the "immr" field. 
For the 64-bit variant: is the right rotate amount, in the range 0 to 63, encoded in the "immr" field.

<imms> For the 32-bit variant: is the leftmost bit number to be moved from the source, in the range 0 to 31, 
encoded in the "imms" field. 
For the 64-bit variant: is the leftmost bit number to be moved from the source, in the range 0 to 63, 
encoded in the "imms" field.

**Operation**

```
bits(datasize) dst = X[d];
bits(datasize) src = X[n];

// perform bitfield move on low bits
bits(datasize) bot = (dst AND NOT(wmask)) OR (ROR(src, R) AND wmask);

// combine extension bits and result bits
X[d] = (dst AND NOT(tmask)) OR (bot AND tmask);
```
C6.2.28   BFXIL

Bitfield extract and insert at low end copies any number of low-order bits from a source register into the same number of adjacent bits at the low end in the destination register, leaving other bits unchanged.

This instruction is an alias of the BFM instruction. This means that:

• The encodings in this description are named to match the encodings of BFM.
• The description of BFM gives the operational pseudocode for this instruction.

32-bit variant

Applies when \( sf = 0 \) \&\& \( N = 0 \).

\[
\text{BFXIL } <Wd>, <Wn>, #<lsb>, #<width>
\]

is equivalent to

\[
\text{BFM } <Wd>, <Wn>, #<lsb>, #(<lsb>+<width>-1)
\]

and is the preferred disassembly when \( \text{UInt}(\text{imms}) \geq \text{UInt}(\text{immr}) \).

64-bit variant

Applies when \( sf = 1 \) \&\& \( N = 1 \).

\[
\text{BFXIL } <Xd>, <Xn>, #<lsb>, #<width>
\]

is equivalent to

\[
\text{BFM } <Xd>, <Xn>, #<lsb>, #(<lsb>+<width>-1)
\]

and is the preferred disassembly when \( \text{UInt}(\text{imms}) \geq \text{UInt}(\text{immr}) \).

Assembler symbols

- \(<Wd>\) Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Wn>\) Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.
- \(<Xd>\) Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Xn>\) Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.

  For the 64-bit variant: is the bit number of the lsb of the source bitfield, in the range 0 to 63.
- \(<\text{width}>\) For the 32-bit variant: is the width of the bitfield, in the range 1 to 32-<\text{lsb}>.
  For the 64-bit variant: is the width of the bitfield, in the range 1 to 64-<\text{lsb}>.

Operation

The description of BFM gives the operational pseudocode for this instruction.
C6.2.29  BIC (shifted register)

Bitwise Bit Clear (shifted register) performs a bitwise AND of a register value and the complement of an optionally-shifted register value, and writes the result to the destination register.

32-bit variant

Applies when $sf = 0$.

$$\text{BIC}<W_d>,<W_n>,<W_m>,<\text{shift}>\ #\text{amount}$$

64-bit variant

Applies when $sf = 1$.

$$\text{BIC}<X_d>,<X_n>,<X_m>,<\text{shift}>\ #\text{amount}$$

Decode for all variants of this encoding

$$\text{integer } d = \text{UInt}(R_d);\$$
$$\text{integer } n = \text{UInt}(R_n);\$$
$$\text{integer } m = \text{UInt}(R_m);\$$
$$\text{integer } \text{datasize} = \text{if } sf = '1' \text{ then 64 else 32; }\$$
$$\text{if } sf = '0' \&\& \text{imm6} <5> = '1' \text{ then ReservedValue(); }\$$

$$\text{ShiftType } \text{shift}_\text{type} = \text{DecodeShift}(\text{shift});\$$
$$\text{integer } \text{shift}_\text{amount} = \text{UInt}(\text{imm6});\$$

Assembler symbols

$$<W_d>$$  Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

$$<W_n>$$  Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.

$$<W_m>$$  Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.

$$<X_d>$$  Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

$$<X_n>$$  Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.

$$<X_m>$$  Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.

$$<\text{shift}>$$  Is the optional shift to be applied to the final source, defaulting to LSL and encoded in the "shift" field. It can have the following values:

- LSL when shift = 00
- LSR when shift = 01
- ASR when shift = 10
- ROR when shift = 11

$$<\text{amount}>$$  For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.

For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field,
Operation

bits(datasize) operand1 = X[n];
bits(datasize) operand2 = ShiftReg(m, shift_type, shift_amount);

operand2 = NOT(operand2);

result = operand1 AND operand2;
X[d] = result;
C6.2.30   BICS (shifted register)

Bitwise Bit Clear (shifted register), setting flags, performs a bitwise AND of a register value and the complement of an optionally-shifted register value, and writes the result to the destination register. It updates the condition flags based on the result.

32-bit variant
Applies when $sf == 0$.

BICS <Wd>, <Wn>, <Wm>{, <shift> #<amount>}</Wd>

64-bit variant
Applies when $sf == 1$.

BICS <Xd>, <Xn>, <Xm>{, <shift> #<amount>}</Xd>

Decode for all variants of this encoding

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
if sf == '0' && imm6<5> == '1' then ReservedValue();
ShiftType shift_type = DecodeShift(shift);
integer shift_amount = UInt(imm6);

Assembler symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Wn> Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.
<Wm> Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.
<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Xn> Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.
<Xm> Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.
<shift> Is the optional shift to be applied to the final source, defaulting to LSL and encoded in the "shift" field. It can have the following values:
  LSL   when shift = 00
  LSR   when shift = 01
  ASR   when shift = 10
  ROR   when shift = 11
<amount> For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.
For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field,
**Operation**

bits(datasize) operand1 = X[n];  
bits(datasize) operand2 = ShiftReg(m, shift_type, shift_amount);  
operand2 = NOT(operand2);  
result = operand1 AND operand2;  
PSTATE.<N,Z,C,V> = result<datasize-1>:IsZeroBit(result):'00';  
X[d] = result;
C6.2.31   BL

Branch with Link branches to a PC-relative offset, setting the register X30 to PC+4. It provides a hint that this is a subroutine call.

26-bit signed PC-relative branch offset variant

BL <label>

Decode for this encoding

bits(64) offset = SignExtend(imm26:'00', 64);

Assembler symbols

[label]     Is the program label to be unconditionally branched to. Its offset from the address of this instruction, in the range +/-128MB, is encoded as "imm26" times 4.

Operation

X[30] = PC[] + 4;

BranchTo(PC[] + offset, BranchType_CALL);
C6.2.32 BLR

Branch with Link to Register calls a subroutine at an address in a register, setting register X30 to PC+4.

Integer variant

BLR <Xn>

Decode for this encoding

integer n = UInt(Rn);

Assembler symbols

<Xn> Is the 64-bit name of the general-purpose register holding the address to be branched to, encoded in the "Rn" field.

Operation

bits(64) target = X[n];
X[30] = PC[] + 4;
BranchTo(target, BranchType_CALL);
C6.2.33 **BLRAA, BLRAAZ, BLRAB, BLRABZ**

Branch with Link to Register, with pointer authentication. This instruction authenticates the address in the general-purpose register that is specified by `<Xn>`, using a modifier and the specified key, and calls a subroutine at the authenticated address, setting register X30 to PC+4.

The modifier is:

- In the general-purpose register or stack pointer that is specified by `<Xm|SP>` for BLRAA and BLRAB.
- The value zero, for BLRAAZ and BLRABZ.

Key A is used for BLRAA and BLRAAZ, and key B is used for BLRAB and BLRABZ.

If the authentication passes, the PE continues execution at the target of the branch. If the authentication fails, a Translation fault is generated.

The authenticated address is not written back to the general-purpose register.

ARMv8.3

</table>

Key A, zero modifier variant

Applies when Z == 0 && M == 0 && Rm == 11111.

BLRAAZ `<Xn>`

Key A, register modifier variant

Applies when Z == 1 && M == 0.

BLRAA `<Xn>` , `<Xm|SP>`

Key B, zero modifier variant

Applies when Z == 0 && M == 1 && Rm == 11111.

BLRABZ `<Xn>`

Key B, register modifier variant

Applies when Z == 1 && M == 1.

BLRAB `<Xn>` , `<Xm|SP>`

Decode for all variants of this encoding

```java
integer n = UInt(Rn);
integer m = UInt(Rm);
boolean use_key_a = (M == '0');
boolean source_is_sp = ((Z == '1') && (m == 31));
if !HavePACExt() then
  UnallocatedEncoding();
if Z == '0' && m != 31 then
  UnallocatedEncoding();
```
Assembler symbols

<Xn> Is the 64-bit name of the general-purpose register holding the address to be branched to, encoded in the "Rn" field.

<Xm|SP> Is the 64-bit name of the general-purpose source register or stack pointer holding the modifier, encoded in the "Rm" field.

Operation

bits(64) target = X[n];
bits(64) modifier = if source_is_sp then SP[] else X[m];

if use_key_a then
  target = AuthIA(target, modifier);
else
  target = AuthIB(target, modifier);

X[30] = PC[] + 4;
BranchTo(target, BranchType_CALL);
BR

Branch to Register branches unconditionally to an address in a register, with a hint that this is not a subroutine return.

**Integer variant**

\[
\text{BR } <Xn> 
\]

**Decode for this encoding**

integer \( n = \text{UInt}(Rn); \)

**Assembler symbols**

\(<Xn>\) Is the 64-bit name of the general-purpose register holding the address to be branched to, encoded in the "Rn" field.

**Operation**

bits(64) target = X[n];
\(\text{BranchTo}(\text{target}, \text{BranchType\_JMP});\)
C6.2.35 BRAA, BRAAZ, BRAB, BRABZ

Branch to Register, with pointer authentication. This instruction authenticates the address in the general-purpose register that is specified by <Xn>, using a modifier and the specified key, and branches to the authenticated address.

The modifier is:

• In the general-purpose register or stack pointer that is specified by <Xm|SP> for BRAA and BRAB.

• The value zero, for BRAAZ and BRABZ.

Key A is used for BRAA and BRAAZ, and key B is used for BRAB and BRABZ.

If the authentication passes, the PE continues execution at the target of the branch. If the authentication fails, a Translation fault is generated.

The authenticated address is not written back to the general-purpose register.

ARMv8.3

Key A, zero modifier variant
Applies when Z == 0 && M == 0 && Rm == 11111.

BRAA <Xn>

Key A, register modifier variant
Applies when Z == 1 && M == 0.

BRAA <Xn>, <Xm|SP>

Key B, zero modifier variant
Applies when Z == 0 && M == 1 && Rm == 11111.

BRABZ <Xn>

Key B, register modifier variant
Applies when Z == 1 && M == 1.

BRAB <Xn>, <Xm|SP>

Decode for all variants of this encoding

```c
integer n = UInt(Rn); integer m = UInt(Rm); boolean use_key_a = (M == '0'); boolean source_is_sp = ((Z == '1') && (m == 31)); if !HavePACExt() then UnallocatedEncoding(); if Z == '0' && m != 31 then UnallocatedEncoding();
```
**Assembler symbols**

<Xn>   Is the 64-bit name of the general-purpose register holding the address to be branched to, encoded in the "Rn" field.

<Xm|SP> Is the 64-bit name of the general-purpose source register or stack pointer holding the modifier, encoded in the "Rm" field.

**Operation**

```plaintext
bits(64) target = X[n];
bits(64) modifier = if source_is_sp then SP[] else X[m];

if use_key_a then
    target = AuthIA(target, modifier);
else
    target = AuthIB(target, modifier);

BranchTo(target, BranchType_JMP);
```
C6.2.36  BRK

Breakpoint instruction generates a Breakpoint Instruction exception. The PE records the exception in ESR_ELx, using the EC value 0x3c, and captures the value of the immediate argument in ESR_ELx.ISS.

```
[31 30 29 28][27 26 25 24][23 22 21 20]  |  |  |  5  4  3  2  1  0 |
  1 1 0 1 0 1 0 0 0 0 1               imm16  0 0 0 0 0
```

**System variant**

BRK #<imm>

**Decode for this encoding**

// Empty.

**Assembler symbols**

<imm> Is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm16" field.

**Operation**

AArch64.SoftwareBreakpoint(imm16);
C6.2.37 CASB, CASAB, CASALB, CASLB

Compare and Swap byte in memory reads an 8-bit byte from memory, and compares it against the value held in a first register. If the comparison is equal, the value in a second register is written to memory. If the write is performed, the read and write occur atomically such that no other modification of the memory location can take place between the read and write.

- CASAB and CASALB load from memory with acquire semantics.
- CASLB and CASALB store to memory with release semantics.
- CASB has no memory ordering requirements.

For information about memory accesses see Load/Store addressing modes on page C1-149.

The architecture permits that the data read clears any exclusive monitors associated with that location, even if the compare subsequently fails.

If the instruction generates a synchronous Data Abort, the register which is compared and loaded, that is \(<Ws>\), is restored to the values held in the register before the instruction was executed.

bits(datasize) \( \text{operand2} = X[m]; \)

if ConditionHolds(cond) then
  \( \text{operand2} = \text{NOT}(\text{operand2}); \)
  \( (\_, \text{flags}) = \text{AddWithCarry}(\text{operand1, operand2, '1'}); \)
  PSTATE.<N,Z,C,V> = flags;
C6.2.47  CINC

Conditional Increment returns, in the destination register, the value of the source register incremented by 1 if the condition is TRUE, and otherwise returns the value of the source register.

This instruction is an alias of the CSINC instruction. This means that:

- The encodings in this description are named to match the encodings of CSINC.
- The description of CSINC gives the operational pseudocode for this instruction.

32-bit variant

Applies when \( sf = 0 \).

\[
\text{CINC <Wd>, <Wn>, <cond>}
\]

is equivalent to

\[
\text{CSINC <Wd>, <Wn>, <Wn>, invert(<cond>)}
\]

and is the preferred disassembly when \( Rn = Rm \).

64-bit variant

Applies when \( sf = 1 \).

\[
\text{CINC <Xd>, <Xn>, <cond>}
\]

is equivalent to

\[
\text{CSINC <Xd>, <Xn>, <Xn>, invert(<cond>)}
\]

and is the preferred disassembly when \( Rn = Rm \).

Assembler symbols

- \(<Wd>\) Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Wn>\) Is the 32-bit name of the general-purpose source register, encoded in the "Rn" and "Rm" fields.
- \(<Xd>\) Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Xn>\) Is the 64-bit name of the general-purpose source register, encoded in the "Rn" and "Rm" fields.
- \(<\text{cond}>\) Is one of the standard conditions, excluding AL and NV, encoded in the "cond" field with its least significant bit inverted.

Operation

The description of CSINC gives the operational pseudocode for this instruction.
C6.2.48 CINV

Conditional Invert returns, in the destination register, the bitwise inversion of the value of the source register if the condition is TRUE, and otherwise returns the value of the source register.

This instruction is an alias of the CSINV instruction. This means that:

- The encodings in this description are named to match the encodings of CSINV.
- The description of CSINV gives the operational pseudocode for this instruction.

### 32-bit variant

Applies when $sf = 0$.

\[
\text{CINV } \langle Wd \rangle, \langle Wn \rangle, \langle \text{cond} \rangle
\]

is equivalent to

\[
\text{CSINV } \langle Wd \rangle, \langle Wn \rangle, \langle Wn \rangle, \text{invert}(\langle \text{cond} \rangle)
\]

and is the preferred disassembly when $Rn = Rm$.

### 64-bit variant

Applies when $sf = 1$.

\[
\text{CINV } \langle Xd \rangle, \langle Xm \rangle, \langle \text{cond} \rangle
\]

is equivalent to

\[
\text{CSINV } \langle Xd \rangle, \langle Xm \rangle, \langle Xm \rangle, \text{invert}(\langle \text{cond} \rangle)
\]

and is the preferred disassembly when $Rn = Rm$.

### Assembler symbols

- $\langle Wd \rangle$: Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- $\langle Wn \rangle$: Is the 32-bit name of the general-purpose source register, encoded in the "Rn" and "Rm" fields.
- $\langle Xd \rangle$: Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- $\langle Xm \rangle$: Is the 64-bit name of the general-purpose source register, encoded in the "Rn" and "Rm" fields.
- $\langle \text{cond} \rangle$: Is one of the standard conditions, excluding AL and NV, encoded in the "cond" field with its least significant bit inverted.

### Operation

The description of CSINV gives the operational pseudocode for this instruction.
C6.2.49 CLREX

Clear Exclusive clears the local monitor of the executing PE.

```
[31 30 29 28|27 26 25 24|23 22 21 20|19 18 17 16|15 14 13 12|11 8 | 7 6 5 4 | 3 2 1 0 ]
 1 1 0 1 0 1 0 0 | 0 0 1 1 0 0 1 1 | CRm 0 1 0 1 1 1 1 1
```

**System variant**

CLREX {#<imm>}

**Decode for this encoding**

// CRm field is ignored

**Assembler symbols**

<imm> Is an optional 4-bit unsigned immediate, in the range 0 to 15, defaulting to 15 and encoded in the "CRm" field.

**Operation**

ClearExclusiveLocal(ProcessorID());
C6.2.50  CLS

Count leading sign bits: \( R_d = \text{CLS}(R_n) \).

<table>
<thead>
<tr>
<th>32-bit variant</th>
</tr>
</thead>
<tbody>
<tr>
<td>Applies when ( sf = 0 ).</td>
</tr>
<tr>
<td>( \text{CLS \ &lt;W_d&gt;, &lt;W_n&gt;} )</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>64-bit variant</th>

</thead>
<tbody>
<tr>
<td>Applies when ( sf = 1 ).</td>
</tr>
<tr>
<td>( \text{CLS \ &lt;X_d&gt;, &lt;X_n&gt;} )</td>
</tr>
</tbody>
</table>

**Decode for all variants of this encoding**

\[
\text{integer } d = \text{UInt}(R_d); \\
\text{integer } n = \text{UInt}(R_n); \\
\text{integer } \text{datasize} = \text{if } sf = '1' \text{ then } 64 \text{ else } 32;
\]

**Assembler symbols**

- \(<W_d>\) Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<W_n>\) Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.
- \(<X_d>\) Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<X_n>\) Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.

**Operation**

\[
\text{integer result}; \\
\text{bits(datasize) operand1} = X[n]; \\
\text{result} = \text{CountLeadingSignBits(operand1)}; \\
X[d] = \text{result<datasize-1:0>};
\]
C6.2.51   CLZ

Count leading zero bits: \( \text{Rd} = \text{CLZ}(\text{Rn}) \).

\[
\begin{array}{ccccccccccccccccccccccc}
\hline
\text{sf} & 1 & 0 & 1 & 1 & 0 & 1 & 0 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
code\text{op}
\end{array}
\]

32-bit variant

Applies when \( sf = 0 \).

\[
\text{CLZ} \ <Wd>, \ <Wn>
\]

64-bit variant

Applies when \( sf = 1 \).

\[
\text{CLZ} \ <Xd>, \ <Xn>
\]

Decode for all variants of this encoding

\[
\begin{align*}
\text{integer } d &= \text{UInt}(\text{Rd}); \\
\text{integer } n &= \text{UInt}(\text{Rn}); \\
\text{integer } \text{datasize} &= \text{if } sf == '1' \text{ then } 64 \text{ else } 32;
\end{align*}
\]

Assembler symbols

\[
\begin{align*}
\text{<Wd>} & \quad \text{Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.} \\
\text{<Wn>} & \quad \text{Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.} \\
\text{<Xd>} & \quad \text{Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.} \\
\text{<Xn>} & \quad \text{Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.}
\end{align*}
\]

Operation

\[
\begin{align*}
\text{integer } \text{result}; \\
\text{bits(\text{datasize}) } \text{operand1} &= X[n]; \\
\text{result} &= \text{CountLeadingZeroBits}(\text{operand1}); \\
X[d] &= \text{result}<\text{datasize}-1:0>;
\end{align*}
\]
C6.2.52   CMN (extended register)

Compare Negative (extended register) adds a register value and a sign or zero-extended register value, followed by an optional left shift amount. The argument that is extended from the <Rm> register can be a byte, halfword, word, or doubleword. It updates the condition flags based on the result, and discards the result.

This instruction is an alias of the ADDS (extended register) instruction. This means that:

• The encodings in this description are named to match the encodings of ADDS (extended register).
• The description of ADDS (extended register) gives the operational pseudocode for this instruction.

32-bit variant
Applies when \( sf == 0 \).

\[
\text{CMN} \ <Wn|WSP>, \ <Wm>{, \ <extend> \ {#<amount>}}
\]

is equivalent to

\[
\text{ADDS} \ \text{WZR}, \ <Wn|WSP>, \ <Wm>{, \ <extend> \ {#<amount>}}
\]

and is always the preferred disassembly.

64-bit variant
Applies when \( sf == 1 \).

\[
\text{CMN} \ <Xn|SP>, \ <R><m>{, \ <extend> \ {#<amount>}}
\]

is equivalent to

\[
\text{ADDS} \ \text{XZR}, \ <Xn|SP>, \ <R><m>{, \ <extend> \ {#<amount>}}
\]

and is always the preferred disassembly.

Assembler symbols

\(<Wn|WSP>\) Is the 32-bit name of the first source general-purpose register or stack pointer, encoded in the "Rn" field.

\(<Wm>\) Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.

\(<Xn|SP>\) Is the 64-bit name of the first source general-purpose register or stack pointer, encoded in the "Rn" field.

\(<R>\) Is a width specifier, encoded in the "option" field. It can have the following values:

\(W\) when \(\text{option} = 00x\)

\(W\) when \(\text{option} = 010\)

\(X\) when \(\text{option} = x11\)

\(W\) when \(\text{option} = 10x\)

\(W\) when \(\text{option} = 110\)

\(<m>\) Is the number \([0-30]\) of the second general-purpose source register or the name \(\text{ZR} (31)\), encoded in the "Rm" field.
<extend> For the 32-bit variant: is the extension to be applied to the second source operand, encoded in the "option" field. It can have the following values:
- UXTB when option = 000
- UXTH when option = 001
- LSL|UXTW when option = 010
- UTXT when option = 011
- SXTB when option = 100
- SXTH when option = 101
- SXTW when option = 110
- SXTX when option = 111

If "Rn" is '11111' (WSP) and "option" is '010' then LSL is preferred, but may be omitted when "imm3" is '000'. In all other cases <extend> is required and must be UXTW when "option" is '010'.

For the 64-bit variant: is the extension to be applied to the second source operand, encoded in the "option" field. It can have the following values:
- UXTB when option = 000
- UXTH when option = 001
- UXTW when option = 010
- LSL|UXTX when option = 011
- SXTB when option = 100
- SXTH when option = 101
- SXTW when option = 110
- SXTX when option = 111

If "Rn" is '11111' (SP) and "option" is '011' then LSL is preferred, but may be omitted when "imm3" is '000'. In all other cases <extend> is required and must be UTXT when "option" is '011'.

<amount> Is the left shift amount to be applied after extension in the range 0 to 4, defaulting to 0, encoded in the "imm3" field. It must be absent when <extend> is absent, is required when <extend> is LSL, and is optional when <extend> is present but not LSL.

Operation

The description of ADDS (extended register) gives the operational pseudocode for this instruction.
C6.2.53   CMN (immediate)

Compare Negative (immediate) adds a register value and an optionally-shifted immediate value. It updates the condition flags based on the result, and discards the result.

This instruction is an alias of the ADDS (immediate) instruction. This means that:

• The encodings in this description are named to match the encodings of ADDS (immediate).
• The description of ADDS (immediate) gives the operational pseudocode for this instruction.

32-bit variant
Applies when sf == 0.

CMN <Wn|WSP>, #<imm>{, <shift>}

is equivalent to

ADDS WZR, <Wn|WSP>, #<imm> {, <shift>}

and is always the preferred disassembly.

64-bit variant
Applies when sf == 1.

CMN <Xn|SP>, #<imm>{, <shift>}

is equivalent to

ADDS XZR, <Xn|SP>, #<imm> {, <shift>}

and is always the preferred disassembly.

Assembler symbols

- <Wn|WSP>   Is the 32-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.
- <Xn|SP>    Is the 64-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.
- <imm>      Is an unsigned immediate, in the range 0 to 4095, encoded in the "imm12" field.
- <shift>    Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in the "shift" field. It can have the following values:

  - LSL #0   when shift = 00
  - LSL #12  when shift = 01
  - The encoding shift = 1x is reserved.

Operation
The description of ADDS (immediate) gives the operational pseudocode for this instruction.
C6.2.54 CMN (shifted register)

Compare Negative (shifted register) adds a register value and an optionally-shifted register value. It updates the condition flags based on the result, and discards the result.

This instruction is an alias of the ADDS (shifted register) instruction. This means that:

- The encodings in this description are named to match the encodings of ADDS (shifted register).
- The description of ADDS (shifted register) gives the operational pseudocode for this instruction.

32-bit variant

Applies when sf == 0.

CMN <Wn>, <Wm>{, <shift> #<amount>}

is equivalent to

ADDS WZR, <Wn>, <Wm> {, <shift> #<amount>}

and is always the preferred disassembly.

64-bit variant

Applies when sf == 1.

CMN <Xn>, <Xm>{, <shift> #<amount>}

is equivalent to

ADDS XZR, <Xn>, <Xm> {, <shift> #<amount>}

and is always the preferred disassembly.

Assembler symbols

<Wn> Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.

<Wm> Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.

<Xn> Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.

<Xm> Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the optional shift type to be applied to the second source operand, defaulting to LSL and encoded in the "shift" field. It can have the following values:

| LSL | when shift = 00 |
| LSR | when shift = 01 |
| ASR | when shift = 10 |

The encoding shift = 11 is reserved.

<amount> For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.

For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field.
Operation

The description of ADDS (shifted register) gives the operational pseudocode for this instruction.
C6.2.55 CMP (extended register)

Compare (extended register) subtracts a sign or zero-extended register value, followed by an optional left shift amount, from a register value. The argument that is extended from the <Rm> register can be a byte, halfword, word, or doubleword. It updates the condition flags based on the result, and discards the result.

This instruction is an alias of the SUBS (extended register) instruction. This means that:

- The encodings in this description are named to match the encodings of SUBS (extended register).
- The description of SUBS (extended register) gives the operational pseudocode for this instruction.

### 32-bit variant

Applies when \( sf = 0 \).

\[
\text{CMP } <\text{Wn}|\text{WSP}>, <\text{Wm}>\{, <\text{extend}>, \{#<\text{amount}>\}\}
\]

is equivalent to

\[
\text{SUBS } \text{WZR}, <\text{Wn}|\text{WSP}>, <\text{Wm}>\{, <\text{extend}>, \{#<\text{amount}>\}\}
\]

and is always the preferred disassembly.

### 64-bit variant

Applies when \( sf = 1 \).

\[
\text{CMP } <\text{Xn}|\text{SP}>, <\text{R}>\text{m}\{, <\text{extend}>, \{#<\text{amount}>\}\}
\]

is equivalent to

\[
\text{SUBS } \text{XZR}, <\text{Xn}|\text{SP}>, <\text{R}>\text{m}\{, <\text{extend}>, \{#<\text{amount}>\}\}
\]

and is always the preferred disassembly.

### Assembler symbols

- \(<\text{Wn}|\text{WSP}>\) is the 32-bit name of the first source general-purpose register or stack pointer, encoded in the "Rn" field.
- \(<\text{Wm}>\) is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.
- \(<\text{Xn}|\text{SP}>\) is the 64-bit name of the first source general-purpose register or stack pointer, encoded in the "Rn" field.
- \(<\text{R}>\) is a width specifier, encoded in the "option" field. It can have the following values:
  - \( W \) when \( \text{option} = 00x \)
  - \( W \) when \( \text{option} = 010 \)
  - \( X \) when \( \text{option} = x11 \)
  - \( W \) when \( \text{option} = 10x \)
  - \( W \) when \( \text{option} = 110 \)
- \(<\text{m}>\) is the number [0-30] of the second general-purpose source register or the name ZR (31), encoded in the "Rm" field.
<extend>

For the 32-bit variant: is the extension to be applied to the second source operand, encoded in the "option" field. It can have the following values:

- UXTB when option = 000
- UXTH when option = 001
- LSL\|UXTW when option = 010
- UTXT when option = 011
- SXTB when option = 100
- SXTH when option = 101
- SXTW when option = 110
- SXTX when option = 111

If "Rn" is '11111' (WSP) and "option" is '010' then LSL is preferred, but may be omitted when "imm3" is '000'. In all other cases <extend> is required and must be UXTW when "option" is '010'.

For the 64-bit variant: is the extension to be applied to the second source operand, encoded in the "option" field. It can have the following values:

- UXTB when option = 000
- UXTH when option = 001
- UXTW when option = 010
- LSL\|UXTX when option = 011
- SXTB when option = 100
- SXTH when option = 101
- SXTW when option = 110
- SXTX when option = 111

If "Rn" is '11111' (SP) and "option" is '011' then LSL is preferred, but may be omitted when "imm3" is '000'. In all other cases <extend> is required and must be UTXT when "option" is '011'.

<amount>

Is the left shift amount to be applied after extension in the range 0 to 4, defaulting to 0, encoded in the "imm3" field. It must be absent when <extend> is absent, is required when <extend> is LSL, and is optional when <extend> is present but not LSL.

**Operation**

The description of `SUBS (extended register)` gives the operational pseudocode for this instruction.
C6.2.56  CMP (immediate)

Compare (immediate) subtracts an optionally-shifted immediate value from a register value. It updates the condition flags based on the result, and discards the result.

This instruction is an alias of the SUBS (immediate) instruction. This means that:

- The encodings in this description are named to match the encodings of SUBS (immediate).
- The description of SUBS (immediate) gives the operational pseudocode for this instruction.

32-bit variant

Applies when \( sf = 0 \).

\[
\text{CMP } \langle Wn|WSP \rangle, \#<imm>{, <shift>} \]

is equivalent to

\[
\text{SUBS WZR, } \langle Wn|WSP \rangle, \#<imm> {, <shift>} \]

and is always the preferred disassembly.

64-bit variant

Applies when \( sf = 1 \).

\[
\text{CMP } \langle Xn|SP \rangle, \#<imm>{, <shift>} \]

is equivalent to

\[
\text{SUBS XZR, } \langle Xn|SP \rangle, \#<imm> {, <shift>} \]

and is always the preferred disassembly.

Assembler symbols

- \( \langle Wn|WSP \rangle \) is the 32-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.
- \( \langle Xn|SP \rangle \) is the 64-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.
- \( <imm> \) is an unsigned immediate, in the range 0 to 4095, encoded in the "imm12" field.
- \( <shift> \) is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in the "shift" field. It can have the following values:
  - LSL #0 when \( shift = 00 \)
  - LSL #12 when \( shift = 01 \)
  - The encoding \( shift = 1x \) is reserved.

Operation

The description of SUBS (immediate) gives the operational pseudocode for this instruction.
### C6.2.57 CMP (shifted register)

Compare (shifted register) subtracts an optionally-shifted register value from a register value. It updates the condition flags based on the result, and discards the result.

This instruction is an alias of the SUBS (shifted register) instruction. This means that:

- The encodings in this description are named to match the encodings of SUBS (shifted register).
- The description of SUBS (shifted register) gives the operational pseudocode for this instruction.

#### 32-bit variant

Applies when \( sf = 0 \).

\[
\text{CMP} \ <Wn>, <Wm>{, <shift> #<amount>} \\
\text{is equivalent to} \\
\text{SUBS} \ WZR, <Wn>, <Wm> {, <shift> #<amount>} \\
\text{and is always the preferred disassembly.}
\]

#### 64-bit variant

Applies when \( sf = 1 \).

\[
\text{CMP} \ <Xn>, <Xm>{, <shift> #<amount>} \\
\text{is equivalent to} \\
\text{SUBS} \ XZR, <Xn>, <Xm> {, <shift> #<amount>} \\
\text{and is always the preferred disassembly.}
\]

#### Assembler symbols

- \(<Wn>\) Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.
- \(<Wm>\) Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.
- \(<Xn>\) Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.
- \(<Xm>\) Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.
- \(<\text{shift}>\) Is the optional shift type to be applied to the second source operand, defaulting to LSL and encoded in the "shift" field. It can have the following values:
  - LSL when \( shift = 00 \)
  - LSR when \( shift = 01 \)
  - ASR when \( shift = 10 \)
- The encoding \( shift = 11 \) is reserved.
- \(<\text{amount}>\) For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.
  - For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field.
Operation

The description of SUBS (shifted register) gives the operational pseudocode for this instruction.
C6.2.58   CNEG

Conditional Negate returns, in the destination register, the negated value of the source register if the condition is TRUE, and otherwise returns the value of the source register.

This instruction is an alias of the CSNEG instruction. This means that:

- The encodings in this description are named to match the encodings of CSNEG.
- The description of CSNEG gives the operational pseudocode for this instruction.

### 32-bit variant

Applies when $sf == 0$.

CNEG <Wd>, <Wn>, <cond>

is equivalent to

CSNEG <Wd>, <Wn>, <Wn>, invert(<cond>)

and is the preferred disassembly when $Rn == Rm$.

### 64-bit variant

Applies when $sf == 1$.

CNEG <Xd>, <Xn>, <cond>

is equivalent to

CSNEG <Xd>, <Xn>, <Xn>, invert(<cond>)

and is the preferred disassembly when $Rn == Rm$.

### Assembler symbols

- `<Wd>` Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- `<Wn>` Is the 32-bit name of the general-purpose source register, encoded in the "Rn" and "Rm" fields.
- `<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- `<Xn>` Is the 64-bit name of the general-purpose source register, encoded in the "Rn" and "Rm" fields.
- `<cond>` Is one of the standard conditions, excluding AL and NV, encoded in the "cond" field with its least significant bit inverted.

### Operation

The description of CSNEG gives the operational pseudocode for this instruction.
C6.2.59 CRC32B, CRC32H, CRC32W, CRC32X

CRC32 checksum performs a cyclic redundancy check (CRC) calculation on a value held in a general-purpose register. It takes an input CRC value in the first source operand, performs a CRC on the input value in the second source operand, and returns the output CRC value. The second source operand can be 8, 16, 32, or 64 bits. To align with common usage, the bit order of the values is reversed as part of the operation, and the polynomial 0x04C11DB7 is used for the CRC calculation.

In ARMv8-A, this is an optional instruction, and in ARMv8.1 it is mandatory for all implementations to implement it.

Note
ID_AA64ISAR0_EL1.CRC32 indicates whether this instruction is supported.

Decoded instructions

\[
\begin{array}{cccccccccccc}
| sf | 0 | 1 | 1 | 0 | 1 | 1 | 0 | Rm & 0 & 1 & 0 & 0 & sz & Rn & Rd \\
\end{array}
\]

**CRC32B variant**

Applies when sf == 0 && sz == 00.

`CRC32B <Wd>, <Wn>, <Wm>`

**CRC32H variant**

Applies when sf == 0 && sz == 01.

`CRC32H <Wd>, <Wn>, <Wm>`

**CRC32W variant**

Applies when sf == 0 && sz == 10.

`CRC32W <Wd>, <Wn>, <Wm>`

**CRC32X variant**

Applies when sf == 1 && sz == 11.

`CRC32X <Wd>, <Wn>, <Xm>`

**Decode for all variants of this encoding**

```plaintext
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if sf == '1' && sz != '11' then UnallocatedEncoding();
if sf == '0' && sz == '11' then UnallocatedEncoding();
integer size = 8 << UInt(sz);
```

**Assembler symbols**

- `<Wd>` Is the 32-bit name of the general-purpose accumulator output register, encoded in the "Rd" field.
- `<Wn>` Is the 32-bit name of the general-purpose accumulator input register, encoded in the "Rn" field.
- `<Xm>` Is the 64-bit name of the general-purpose data source register, encoded in the "Rm" field.
- `<Wm>` Is the 32-bit name of the general-purpose data source register, encoded in the "Rm" field.
Operation

if !HaveCRCExt() then
    UnallocatedEncoding();

bits(32) acc = X[n];    // accumulator
bits(size) val = X[m];  // input value
bits(32) poly = 0x04C11DB7<31:0>;

bits(32+size) tempacc = BitReverse(acc):Zeros(size);
bits(size+32) tempval = BitReverse(val):Zeros(32);

// Poly32Mod2 on a bitstring does a polynomial Modulus over {0,1} operation
X[d] = BitReverse(Poly32Mod2(tempacc EOR tempval, poly));
C6.2.60 CRC32CB, CRC32CH, CRC32CW, CRC32CX

CRC32 checksum performs a cyclic redundancy check (CRC) calculation on a value held in a general-purpose register. It takes an input CRC value in the first source operand, performs a CRC on the input value in the second source operand, and returns the output CRC value. The second source operand can be 8, 16, 32, or 64 bits. To align with common usage, the bit order of the values is reversed as part of the operation, and the polynomial 0x1EDC6F41 is used for the CRC calculation.

In ARMv8-A, this is an optional instruction, and in ARMv8.1 it is mandatory for all implementations to implement it.

--- Note ---

ID_AA64ISAR0_EL1.CRC32 indicates whether this instruction is supported.

---

CRC32CB variant

Applies when sf == 0 && sz == 00.

CRC32CB <Wd>, <Wn>, <Wm>

CRC32CH variant

Applies when sf == 0 && sz == 01.

CRC32CH <Wd>, <Wn>, <Xm>

CRC32CW variant

Applies when sf == 0 && sz == 10.

CRC32CW <Wd>, <Xm>, <Wm>

CRC32CX variant

Applies when sf == 1 && sz == 11.

CRC32CX <Wd>, <Xm>, <Xm>

Decode for all variants of this encoding

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if sf == '1' && sz != '11' then UnallocatedEncoding();
if sf == '0' && sz == '11' then UnallocatedEncoding();
integer size = 8 << UInt(sz);

Assembler symbols

<Wd> Is the 32-bit name of the general-purpose accumulator output register, encoded in the "Rd" field.

<Wn> Is the 32-bit name of the general-purpose accumulator input register, encoded in the "Rn" field.

<Xm> Is the 64-bit name of the general-purpose data source register, encoded in the "Rm" field.

<Xm> Is the 32-bit name of the general-purpose data source register, encoded in the "Rm" field.
Operation

if !HaveCRCExt() then
    UnallocatedEncoding();

bits(32) acc = X[n];   // accumulator
bits(size) val = X[m]; // input value
bits(32) poly = 0x1EDC6F41<31:0>;

bits(32+size) tempacc = BitReverse(acc):Zeros(size);
bits(size+32) tempval = BitReverse(val):Zeros(32);

// Poly32Mod2 on a bitstring does a polynomial Modulus over {0,1} operation
X[d] = BitReverse(Poly32Mod2(tempacc EOR tempval, poly));
C6.2.61 CSEL

Conditional Select returns, in the destination register, the value of the first source register if the condition is TRUE, and otherwise returns the value of the second source register.

32-bit variant
Applies when \(sf == 0\).

CSEL \(<Wd>, <Wn>, <Wm>, <cond>\)

64-bit variant
Applies when \(sf == 1\).

CSEL \(<Xd>, <Xn>, <Xm>, <cond>\)

Decode for all variants of this encoding

\[
\text{integer } d = \text{UInt}(Rd); \\
\text{integer } n = \text{UInt}(Rn); \\
\text{integer } m = \text{UInt}(Rm); \\
\text{integer } \text{datasize} = \text{if } sf == '1' \text{ then 64 else 32};
\]

Assembler symbols

- \(\langle Wd \rangle\) Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(\langle Wn \rangle\) Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.
- \(\langle Wm \rangle\) Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.
- \(\langle Xd \rangle\) Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(\langle Xn \rangle\) Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.
- \(\langle Xm \rangle\) Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.
- \(\langle \text{cond} \rangle\) Is one of the standard conditions, encoded in the "cond" field in the standard way.

Operation

\[
\text{bits(datasize) result;} \\
\text{bits(datasize) operand1} = X[n]; \\
\text{bits(datasize) operand2} = X[m]; \\
\text{if } \text{ConditionHolds} (\text{cond}) \text{ then} \\
\text{result} = \text{operand1}; \\
\text{else} \\
\text{result} = \text{operand2}; \\
X[d] = \text{result};
\]
C6.2.62  CSET

Conditional Set sets the destination register to 1 if the condition is TRUE, and otherwise sets it to 0.

This instruction is an alias of the CSINC instruction. This means that:

- The encodings in this description are named to match the encodings of CSINC.
- The description of CSINC gives the operational pseudocode for this instruction.

### 32-bit variant

Applies when $sf = 0$.

CSET $<Wd>$, $<\text{cond}>$

is equivalent to

CSINC $<Wd>$, WZR, WZR, invert($<\text{cond}>$)

and is always the preferred disassembly.

### 64-bit variant

Applies when $sf = 1$.

CSET $<Xd>$, $<\text{cond}>$

is equivalent to

CSINC $<Xd>$, XZR, XZR, invert($<\text{cond}>$)

and is always the preferred disassembly.

### Assembler symbols

- $<Wd>$ Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- $<Xd>$ Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- $<\text{cond}>$ Is one of the standard conditions, excluding AL and NV, encoded in the "cond" field with its least significant bit inverted.

### Operation

The description of CSINC gives the operational pseudocode for this instruction.
### C6.2.63 CSETM

Conditional Set Mask sets all bits of the destination register to 1 if the condition is TRUE, and otherwise sets all bits to 0.

This instruction is an alias of the CSINV instruction. This means that:

- The encodings in this description are named to match the encodings of CSINV.
- The description of CSINV gives the operational pseudocode for this instruction.

**32-bit variant**

Applies when \( sf = 0 \).

\[
\text{CSETM} \ <\text{Wd}, \ <\text{cond}>
\]

is equivalent to

\[
\text{CSINV} \ <\text{Wd}, \ \text{WZR}, \ \text{WZR}, \ \text{invert}\langle\text{cond}\rangle
\]

and is always the preferred disassembly.

**64-bit variant**

Applies when \( sf = 1 \).

\[
\text{CSETM} \ <\text{Xd}, \ <\text{cond}>
\]

is equivalent to

\[
\text{CSINV} \ <\text{Xd}, \ \text{XZR}, \ \text{XZR}, \ \text{invert}\langle\text{cond}\rangle
\]

and is always the preferred disassembly.

**Assembler symbols**

- \(<\text{Wd}\>) Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<\text{Xd}\>) Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<\text{cond}\>) Is one of the standard conditions, excluding AL and NV, encoded in the "cond" field with its least significant bit inverted.

**Operation**

The description of CSINV gives the operational pseudocode for this instruction.
C6.2.64 CSINC

Conditional Select Increment returns, in the destination register, the value of the first source register if the condition is TRUE, and otherwise returns the value of the second source register incremented by 1.

This instruction is used by the aliases CINC and CSET. See Alias conditions for details of when each alias is preferred.

### 32-bit variant

Applies when \( sf = 0 \).

\[
\text{CSINC} \ <Wd>, \ <Wn>, \ <Wm>, \ <\text{cond}> 
\]

### 64-bit variant

Applies when \( sf = 1 \).

\[
\text{CSINC} \ <Xd>, \ <Xn>, \ <Xm>, \ <\text{cond}> 
\]

**Decode for all variants of this encoding**

\[
\text{integer } d = \text{UInt}(Rd); \\
\text{integer } n = \text{UInt}(Rn); \\
\text{integer } m = \text{UInt}(Rm); \\
\text{integer } \text{datasize} = \text{if } sf = '1' \text{ then } 64 \text{ else } 32; 
\]

**Alias conditions**

<table>
<thead>
<tr>
<th>Alias</th>
<th>is preferred when</th>

</tr>
<tr>
<td>CSET</td>
<td>( Rm == '11111' &amp;&amp; \text{cond} != '111x' &amp;&amp; Rn == '11111')</td>
</tr>
</tbody>
</table>

**Assembler symbols**

\(<Wd>\) Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

\(<Wn>\) Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.

\(<Wm>\) Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.

\(<Xd>\) Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

\(<Xn>\) Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.

\(<Xm>\) Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.

\(<\text{cond}>\) Is one of the standard conditions, encoded in the "cond" field in the standard way.
Operation

bits(datasize) result;
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = X[m];

if ConditionHolds(cond) then
    result = operand1;
else
    result = operand2 + 1;

X[d] = result;
C6.2.65   CSINV

Conditional Select Invert returns, in the destination register, the value of the first source register if the condition is TRUE, and otherwise returns the bitwise inversion value of the second source register.

This instruction is used by the aliases CINV and CSETM. See Alias conditions for details of when each alias is preferred.

32-bit variant
Applies when $sf == 0$.

CSINV <Wd>, <Wn>, <Wm>, <cond>

64-bit variant
Applies when $sf == 1$.

CSINV <Xd>, <Xn>, < Xm>, <cond>

Decode for all variants of this encoding

    result = NOT(operand2);
    result = result + 1;

X[d] = result;
C6.2.67   DC

Data Cache operation. For more information, see op0==0b01, cache maintenance, TLB maintenance, and address translation instructions on page C5-332.

This instruction is an alias of the SYS instruction. This means that:

- The encodings in this description are named to match the encodings of SYS.
- The description of SYS gives the operational pseudocode for this instruction.

System variant

DC <dc_op>, <Xt>

is equivalent to

SYS #<op1>, C7, <Cm>, #<op2>, <Xt>

and is the preferred disassembly when SysOp(op1,'0111',CRm,op2) == Sys_DC.

Assembler symbols

<dc_op>   Is a DC instruction name, as listed for the DC system instruction group, encoded in the "op1:CRm:op2" field. It can have the following values:

- IVAC when op1 = 000, CRm = 0110, op2 = 001
- ISW when op1 = 000, CRm = 0110, op2 = 010
- CSW when op1 = 000, CRm = 1010, op2 = 010
- CISW when op1 = 000, CRm = 1110, op2 = 010
- ZVA when op1 = 011, CRm = 0100, op2 = 001
- CVAC when op1 = 011, CRm = 1010, op2 = 001
- CVAU when op1 = 011, CRm = 1011, op2 = 001
- CIVAC when op1 = 011, CRm = 1110, op2 = 001

When ARMv8.2-DCPoP is implemented, the following value is also valid:
- CVAP when op1 = 011, CRm = 1100, op2 = 001

<op1>   Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op1" field.

<Cm>   Is a name 'Cm', with 'm' in the range 0 to 15, encoded in the "CRm" field.

<op2>   Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op2" field.

<Xt>   Is the 64-bit name of the general-purpose source register, encoded in the "Rt" field.

Operation

The description of SYS gives the operational pseudocode for this instruction.
DCPS1

Debug Change PE State to EL1, when executed in Debug state:

- If executed at EL0 changes the current Exception level and SP to EL1 using SP_EL1.
- Otherwise, if executed at ELx, selects SP_ELx.

The target exception level of a DCPS1 instruction is:

- EL1 if the instruction is executed at EL0.
- Otherwise, the Exception level at which the instruction is executed.

When the target Exception level of a DCPS1 instruction is ELx, on executing this instruction:

- ELR_ELx becomes UNKNOWN.
- SPSR_ELx becomes UNKNOWN.
- ESR_ELx becomes UNKNOWN.
- DLR_EL0 and DSPSR_EL0 become UNKNOWN.
- The endianness is set according to SCTLR_ELx.EE.

This instruction is UNDEFINED at EL0 in Non-secure state if EL2 is implemented and HCR_EL2.TGE == 1.

This instruction is always UNDEFINED in Non-debug state.

For more information on the operation of the DCPSn instructions, see DCPS<n> on page H2-5724.

| 31 30 29 28 27 26 25 24 23 22 21 20 | | | | 5 4 3 2 1 0 |

System variant

DCPS1 {#imm}

Decode for this encoding

if !Halted() then AArch64.UndefinedFault();

Assembler symbols

<imm> Is an optional 16-bit unsigned immediate, in the range 0 to 65535, defaulting to 0 and encoded in the "imm16" field.

Operation

DCPSInstruction(LL);
C6.2.69 DCPS2

Debug Change PE State to EL2, when executed in Debug state:

- If executed at EL0 or EL1 changes the current Exception level and SP to EL2 using SP_EL2.
- Otherwise, if executed at ELx, selects SP_ELx.

The target exception level of a DCPS2 instruction is:

- EL2 if the instruction is executed at an exception level that is not EL3.
- EL3 if the instruction is executed at EL3.

When the target Exception level of a DCPS2 instruction is ELx, on executing this instruction:

- ELR_ELx becomes UNKNOWN.
- SPSR_ELx becomes UNKNOWN.
- ESR_ELx becomes UNKNOWN.
- DLR_EL0 and DSPSR_EL0 become UNKNOWN.
- The endianness is set according to SCTLR_ELx.EE.

This instruction is UNDEFINED at the following exception levels:

- All exception levels if EL2 is not implemented.
- At EL0 and EL1 in Secure state if EL2 is implemented.

This instruction is always UNDEFINED in Non-debug state.

For more information on the operation of the DCPSn instructions, see DCPS<n> on page H2-5724.

[31 30 29 28][27 26 25 24][23 22 21 20] [5 4 3 2 1 0]
1 1 0 1 0 0 1 0 1 0 1
imm16 0 0 0 1 0

**System variant**

DCPS2 {#<imm>}

**Decode for this encoding**

if !Halted() then AArch64.UndefinedFault();

**Assembler symbols**

<imm> Is an optional 16-bit unsigned immediate, in the range 0 to 65535, defaulting to 0 and encoded in the "imm16" field.

**Operation**

DCPSInstruction(LL);
C6.2.70 DCPS3

Debug Change PE State to EL3, when executed in Debug state:

- If executed at EL3 selects SP_EL3.
- Otherwise, changes the current Exception level and SP to EL3 using SP_EL3.

The target exception level of a DCPS3 instruction is EL3.

On executing a DCPS3 instruction:

- ELR_EL3 becomes UNKNOWN.
- SPSR_EL3 becomes UNKNOWN.
- ESR_EL3 becomes UNKNOWN.
- DLR_EL0 and DSPSR_EL0 become UNKNOWN.
- The endianness is set according to SCTLR_EL3.EE.

This instruction is UNDEFINED at all exception levels if either:

- EDSRC.SDD == 1.
- EL3 is not implemented.

This instruction is always UNDEFINED in Non-debug state.

For more information on the operation of the DCPSn instructions, see DCPS<n> on page H2-5724.

```
[31 30 29 28|27 26 25 24|23 22 21 20|  5  4  3  2  1  0]
  1 1 0 1 0 1 0 0 1 0 1  imm16
     |          |        | 0 0 1 1
```

**System variant**

DCPS3 {#<imm>}

**Decode for this encoding**

if !Halted() then AArch64.UndefiledFault();

**Assemble symbols**

<imm> is an optional 16-bit unsigned immediate, in the range 0 to 65535, defaulting to 0 and encoded in the "imm16" field.

**Operation**

DCPSInstruction(LL);
C6.2.71 DMB

Data Memory Barrier is a memory barrier that ensures the ordering of observations of memory accesses, see Data Memory Barrier (DMB) on page B2-99.

  when '10' domain = MBReqDomain_InnerShareable;
  when '11' domain = MBReqDomain_FullSystem;

  case CRm<1:0> of
    when '01' types = MBReqTypes_Reads;
    when '10' types = MBReqTypes_Writes;
    when '11' types = MBReqTypes_All;
    otherwise
      types = MBReqTypes_All;
      domain = MBReqDomain_FullSystem;

Assembler symbols

<option> Specifies the limitation on the barrier operation. Values are:

SY Full system is the required shareability domain, reads and writes are the required access types, both before and after the barrier instruction. This option is referred to as the full system barrier. Encoded as CRm = 0b1111.

ST Full system is the required shareability domain, writes are the required access type, both before and after the barrier instruction. Encoded as CRm = 0b1110.

LD Full system is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as CRm = 0b1011.

ISH Inner Shareable is the required shareability domain, reads and writes are the required access types, both before and after the barrier instruction. Encoded as CRm = 0b1001.

ISHST Inner Shareable is the required shareability domain, writes are the required access type, both before and after the barrier instruction. Encoded as CRm = 0b1001.

TSHLD Inner Shareable is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as CRm = 0b1001.

NSH Non-shareable is the required shareability domain, reads and writes are the required access types, both before and after the barrier instruction. Encoded as CRm = 0b1011.

NSHST Non-shareable is the required shareability domain, writes are the required access type, both before and after the barrier instruction. Encoded as CRm = 0b1011.
NSHLD  Non-shareable is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as CRm = 0b0101.

OSH  Outer Shareable is the required shareability domain, reads and writes are the required access types, both before and after the barrier instruction. Encoded as CRm = 0b0011.

OSHST  Outer Shareable is the required shareability domain, writes are the required access type, both before and after the barrier instruction. Encoded as CRm = 0b0010.

OSHLD  Outer Shareable is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as CRm = 0b0001.

All other encodings of CRm that are not listed above are reserved, and can be encoded using the #<imm> syntax. It is IMPLEMENTATION DEFINED whether options other than SY are implemented. All unsupported and reserved options must execute as a full system barrier operation, but software must not rely on this behavior. For more information on whether an access is before or after a barrier instruction, see Data Memory Barrier (DMB) on page B2-99 or see Data Synchronization Barrier (DSB) on page B2-100.

<imm>  Is a 4-bit unsigned immediate, in the range 0 to 15, encoded in the "CRm" field.

**Operation**

\[
\text{DataMemoryBarrier(domain, types)};
\]
C6.2.72 DRPS

Debug restore process state.

### Assembler symbols

- \(<Wd>\) is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Wn>\) is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.
- \(<Wm>\) is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.
- \(<Xd>\) is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Xn>\) is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.
- \(<Xm>\) is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.
- \(<\text{shift}>\) is the optional shift to be applied to the final source, defaulting to LSL and encoded in the "shift" field. It can have the following values:
  - LSL when \( \text{shift} = 00 \)
  - LSR when \( \text{shift} = 01 \)
  - ASR when \( \text{shift} = 10 \)
  - ROR when \( \text{shift} = 11 \)
- \(<\text{amount}>\) For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.
  For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field.
Operation

bits(datasize) operand1 = X[n];
bits(datasize) operand2 = ShiftReg(m, shift_type, shift_amount);
result = operand1 EOR operand2;
X[d] = result;
C6.2.77   ERET

Exception Return using the ELR and SPSR for the current Exception level. When executed, the PE restores PSTATE from the SPSR, and branches to the address held in the ELR.

The PE checks the SPSR for the current Exception level for an illegal return event. See Illegal return events from AArch64 state on page D1-1884.

ERET is UNDEFINED at EL0.

```
... 1 1 0 1 0 1 1 | 1 0 0 1 1 1 1 0 0 0 0 0 0 1 1 1 1 0 0 0 0 0
A M Rn op4
```

System variant

ERET

Decode for this encoding

if PSTATE.EL == EL0 then UnallocatedEncoding();

Operation

AArch64.CheckForERetTrap(FALSE, TRUE);
bits(64) target = ELR[];
AArch64.ExceptionReturn(target, SPSR[]);
C6.2.78 ERETTA, ERETAB

Exception Return, with pointer authentication. This instruction authenticates the address in ELR, using SP as the modifier and the specified key, the PE restores PSTATE from the SPSR for the current Exception level, and branches to the authenticated address.

Key A is used for ERETTA, and key B is used for ERETAB.

If the authentication passes, the PE continues execution at the target of the branch. If the authentication fails, a Translation fault is generated.

The authenticated address is not written back to ELR.

The PE checks the SPSR for the current Exception level for an illegal return event. See Illegal return events from AArch64 state on page D1-1884.

ERETTA and ERETAB are UNDEFINED at EL0.

ARMv8.3

```
[31 30 29 28|27 26 25 24|23 22 21 20|19 18 17 16|15 14 13 12|11 10 9 | 5 4 | 0 ]
\| A Rn op4 \|
```

**ERE_TAA variant**

Applies when M == 0.

ERE_TAA

**ERE_TAB variant**

Applies when M == 1.

ERE_TAB

**Decode for all variants of this encoding**

if PSTATE.EL == EL0 then UnallocatedEncoding();
boolean use_key_a = (M == '0');
if !HavePACExt() then UnallocatedEncoding();

**Operation**

AArch64.CheckForERetTrap(TRUE, use_key_a);
bits(64) target;
if use_key_a then
target = AuthIA(ELR[], SP[]);
else
target = AuthIB(ELR[], SP[]);
AArch64.ExceptionReturn(target, SPSR[]);
C6.2.79 ESB

Error Synchronization Barrier is an error synchronization event that might also update DISR_EL1 and VDISR_EL2.

This instruction can be used at all Exception levels and in Debug state.

In Debug state, this instruction behaves as if SError interrupts are masked at all Exception levels. See Error Synchronization Barrier in the ARM(R) Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for ARMv8-A architecture profile.

If the RAS Extension is not implemented, this instruction executes as aNOP.

ARMv8.2

```
|31| 30| 29| 28|27|26|25|24|23|22|21|20|19|18|17|16|15|14|13|12|11|8| 7| 5| 4| 3| 2| 1| 0 |
|1| 1| 0| 1| 0| 1| 0| 0| 0| 0| 1| 1| 0| 0| 1| 0| 0| 0| 1| 0| 0| 0| 1| 1| 1| 1| 1|
```

**System variant**

ESB

**Decode for this encoding**

```c
if !HaveRASExt() then EndOfInstruction();
```

**Operation**

```c
SynchronizeErrors();
AArch64.ESB0peration();
if HaveEL(EL2) && !IsSecure() && PSTATE.EL IN {EL0, EL1} then AArch64.vESB0peration();
TakeUnmaskedSErrorInterrupts();
```
C6.2.80 EXTR

Extract register extracts a register from a pair of registers.

This instruction is used by the alias ROR (immediate). See Alias conditions for details of when each alias is preferred.

| 31 30 29 28 27 26 25 24 23 22 21 20 | 16 15 | 10 9 | 5 4 | 0 |
| sf | 0 0 | 1 0 0 1 1 | N | 0 | Rm | imms | Rn | Rd |

32-bit variant

Applies when $sf == 0 && N == 0 && imms == 0xxxxx$.

EXTR $<Wd>, <Wn>, <Wm>, #<lsb>$

64-bit variant

Applies when $sf == 1 && N == 1$.

EXTR $<Xd>, <Xn>, <Xm>, #<lsb>$

Decode for all variants of this encoding

```plaintext
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
integer lsb;
if N != sf then UnallocatedEncoding();
if sf == '0' && imms<5> == '1' then ReservedValue();
lsb = UInt(imms);
```

Alias conditions

<table>
<thead>
<tr>
<th>Alias</th>
<th>is preferred when</th>
</tr>
</thead>
<tbody>
<tr>
<td>ROR (immediate)</td>
<td>$Rn == Rm$</td>
</tr>
</tbody>
</table>

Assembler symbols

- $<Wd>$: Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- $<Wn>$: Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.
- $<Wm>$: Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.
- $<Xd>$: Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- $<Xn>$: Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.
- $<Xm>$: Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.
- $<lsb>$: For the 32-bit variant: is the least significant bit position from which to extract, in the range 0 to 31, encoded in the "imms" field.
  For the 64-bit variant: is the least significant bit position from which to extract, in the range 0 to 63, encoded in the "imms" field.
Operation

bits(datasize) result;
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = X[m];
bits(2*datasize) concat = operand1:operand2;

result = concat<lsb+datasize-1:lsb>;
X[d] = result;
C6.2.81  HINT

Hint instruction is for the instruction set space that is reserved for architectural hint instructions.

Some encodings described here are not allocated in this revision of the architecture, and behave as NOPs. These encodings might be allocated to other hint functionality in future revisions of the architecture and therefore must not be used by software.

Hints 6 and 7 variant
Applies when CRm == 0000 && op2 == 11x.
HINT #<imm>

Hints 8 to 15, and 24 to 127 variant
Applies when CRm != 00x0.
HINT #<imm>

Hints 18 to 23 variant
Applies when CRm == 0010 && op2 != 00x.
HINT #<imm>

Assembler symbols

<imm>  Is a 7-bit unsigned immediate, in the range 0 to 127, excluding the allocated encodings described below, encoded in "CRm:op2".

The following encodings of "CRm:op2" are allocated:

0000000  NOP
0000001  YIELD
0000010  WFE
0000011  WFI
0000100  SEV
0000101  SEVL
0010000  ESB
0010001  PSB  CSYNC

Note

For allocated encodings of "CRm:op2":

•  A disassembler will disassemble the allocated instruction, rather than the HINT instruction.
•  An assembler may support assembly of allocated encodings using HINT with the corresponding <imm> value, but it is not required to do so.
C6.2.82  HLT

Halt instruction generates a Halt Instruction debug event.

| 31 30 29 28|27 26 25 24|23 22 21 20|    |    | 5 4 3 2 1 0 |
| 1 1 0 1 0 1 0 0 0 1 0 | imm16 | 0 0 0 0 0 |

System variant

HLT #<imm>

Decode for this encoding

if EDSCR.HDE == '0' || !HaltingAllowed() then UndefinedFault();

Assembler symbols

<imm> Is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm16" field.

Operation

Halt(DebugHalt_HaltInstruction);
C6.2.83   HVC

Hypervisor Call causes an exception to EL2. Non-secure software executing at EL1 can use this instruction to call the hypervisor to request a service.

The HVC instruction is UNDEFINED:

• At EL0, and Secure EL1.
• When SCR_EL3.HCE is set to 0.

On executing an HVC instruction, the PE records the exception as a Hypervisor Call exception in ESR_ELx, using the EC value 0x16, and the value of the immediate argument.

```
<table>
<thead>

IC \(<ic\_op\>\{, <Xt>\}

is equivalent to

SYS \#<op1>, C7, \#<Cm>, \#<op2>\{, <Xt>\}

and is the preferred disassembly when \(\text{SysOp}(op1,'0111',CRm,op2) == \text{Sys\_IC}\).

\textbf{Assembler symbols}

\begin{itemize}
  \item \(<ic\_op>\) Is an IC instruction name, as listed for the IC system instruction pages, encoded in the "op1:CRm:op2" field. It can have the following values:
    \begin{itemize}
      \item IALLUI5 when \(op1 = 000\), \(CRm = 0001\), \(op2 = 000\)
      \item IALLU when \(op1 = 000\), \(CRm = 0101\), \(op2 = 000\)
      \item IVAU when \(op1 = 011\), \(CRm = 0101\), \(op2 = 000\)
    \end{itemize}
  \item \(<op1>\) Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op1" field.
  \item \(<Cm>\) Is a name 'Cm', with 'm' in the range 0 to 15, encoded in the "CRm" field.
  \item \(<op2>\) Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op2" field.
  \item \(<Xt>\) Is the 64-bit name of the optional general-purpose source register, defaulting to '11111', encoded in the "Rt" field.
\end{itemize}

\textbf{Operation}

The description of SYS gives the operational pseudocode for this instruction.
C6.2.85   ISB

Instruction Synchronization Barrier flushes the pipeline in the PE and is a context synchronization event. For more information, see Instruction Synchronization Barrier (ISB) on page B2-99.

\]

**System variant**

ISB {<option>|#<imm>}

**Decode for this encoding**

// Empty.

**Assembler symbols**

- <option> Specifies an optional limitation on the barrier operation. Values are:
  - SY Full system barrier operation, encoded as CRm = 0b1111. Can be omitted.
  - All other encodings of CRm are reserved. The corresponding instructions execute as full system barrier operations, but must not be relied upon by software.

- <imm> Is an optional 4-bit unsigned immediate, in the range 0 to 15, defaulting to 15 and encoded in the "CRm" field.

**Operation**

InstructionSynchronizationBarrier();
C6.2.86  **LDADDB, LDADDAB, LDADDALB, LDADDLB**

Atomic add on byte in memory atomically loads an 8-bit byte from memory, adds the value held in a register to it, and stores the result back to memory. The value initially loaded from memory is returned in the destination register.

- If the destination register is not WZR, LDADDAB and LDADDALB load from memory with acquire semantics.
- LDADDB and LDADDLB store to memory with release semantics.
- LDADD has no memory ordering requirements.

For information about memory accesses see *Load/Store addressing modes on page C1-149.*

This instruction is used by the alias STADDB, STADDLB. See *Alias conditions on page C6-649* for details of when each alias is preferred.

**ARMv8.1**

```
  31  30  29  28|27  26  25  24|23  22  21  20|  16| 15  14  12| 11  10  9  5  4  0 |  0  |
  0  0  1  1  1  0  0  0 A R 1 | Rs  0  0  0  0  0 | Rn | Rt |
  size   opc
```

**LDADDAB variant**

Applies when A == 1 && R == 0.

LDADDAB <Ws>, <Wt>, [<Xn|SP>]

**LDADDALB variant**

Applies when A == 1 && R == 1.

LDADDALB <Ws>, <Wt>, [<Xn|SP>]

**LDADDB variant**

Applies when A == 0 && R == 0.

LDADDB <Ws>, <Wt>, [<Xn|SP>]

**LDADDLB variant**

Applies when A == 0 && R == 1.

LDADDLB <Ws>, <Wt>, [<Xn|SP>]

**Decode for all variants of this encoding**

```cpp
if !HaveAtomicExt() then UnallocatedEncoding();
integer t = UInt(Rt);
integer n = UInt(Rn);
integer s = UInt(Rs);

AccType ldacctype = if A == '1' && Rt != '11111' then AccType.ORDEREDRW else AccType_ATOMICRW;
AccType stacctype = if R == '1' then AccType.ORDEREDRW else AccType_ATOMICRW;
```
Alias conditions

</tbody>
</table>

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Wt> Is the 32-bit name of the general-purpose register to be loaded, encoded in the "Rt" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```
bits(64) address;
bits(8) value;
bits(8) data;
bits(8) result;

value = X[s];
if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];

// All observers in the shareability domain observe the following load and store atomically.
data = Mem[address, 1, ldacctype];
result = data + value;
Mem[address, 1, stacctype] = result;
if t != 31 then
    X[t] = ZeroExtend(data, 32);
```
C6.2.87   LDADDH, LDADDAH, LDADDALH, LDADDLH

Atomic add on halfword in memory atomically loads a 16-bit halfword from memory, adds the value held in a
register to it, and stores the result back to memory. The value initially loaded from memory is returned in the
destination register.

- If the destination register is not WZR, LDADDAH and LDADDALH load from memory with acquire semantics.
- LDADDLH and LDADDALH store to memory with release semantics.
- LDADDH has no memory ordering requirements.

For more information about memory ordering semantics see Load-Acquire, Load-AcquirePC, and Store-Release on

For information about memory accesses see Load/Store addressing modes on page C1-149.

This instruction is used by the alias STADDH, STADDLH. See Alias conditions on page C6-651 for details of when
each alias is preferred.

C6.2.89 LDAPR

Load-Acquire RCpc Register derives an address from a base register value, loads a 32-bit word or 64-bit doubleword from the derived address in memory, and writes it to a register.

The instruction has memory ordering semantics as described in Load-Acquire, Load-AcquirePC, and Store-Release on page B2-101, except that:

- There is no ordering requirement, separate from the requirements of a Load-AcquirePC or a Store-Release, created by having a Store-Release followed by a Load-AcquirePC instruction.
- The reading of a value written by a Store-Release by a Load-AcquirePC instruction by the same observer does not make the write of the Store-Release globally observed.

This difference in memory ordering is not described in the pseudocode.

For information about memory accesses, see Load/Store addressing modes on page C1-149.

No offset variant

LDARH <Wt>, [<Xn|SP>{,#0}]

Decode for this encoding

integer n = UInt(Rn);
integer t = UInt(Rt);

Assembler symbols

<Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

bits(64) address;
bits(16) data;

if n == 31 then
   CheckSPAlignment();
   address = SP[];
else
   address = X[n];

data = Mem[address, 2, AccType_ORDERED];
X[t] = ZeroExtend(data, 32);
C6.2.95   LDAXP

Load-Acquire Exclusive Pair of Registers derives an address from a base register value, loads two 32-bit words or two 64-bit doublewords from memory, and writes them to two registers. A 32-bit pair requires the address to be doubleword aligned and is single-copy atomic at doubleword granularity. A 64-bit pair requires the address to be quadword aligned and is single-copy atomic for each doubleword at doubleword granularity. The PE marks the physical address being accessed as an exclusive access. This exclusive access mark is checked by Store Exclusive instructions. See Synchronization and semaphores on page B2-128. The instruction also has memory ordering semantics as described in Load-Acquire, Load-AcquirePC, and Store-Release on page B2-101. For information about memory accesses see Load/Store addressing modes on page C1-149.

32-bit variant

Applies when \( sz = 0 \).

LDAXP \(<Wt1>, <Wt2>, [Xn|SP>{,#0}>\)

64-bit variant

Applies when \( sz = 1 \).

LDAXP \(<Xt1>, <Xt2>, [Xn|SP>{,#0}>\)

Decode for all variants of this encoding

\[
\begin{align*}
\text{integer } n &= \text{UInt}(Rn); \\
\text{integer } t &= \text{UInt}(Rt); \\
\text{integer } t2 &= \text{UInt}(Rt2); \\
\text{integer } elsize &= 32 << \text{UInt}(sz); \\
\text{integer } datasize &= elsize \times 2;
\end{align*}
\]

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors, and particularly LDAXP on page K1-6418.

Assembler symbols

\(<Wt1>\quad \text{Is the 32-bit name of the first general-purpose register to be transferred, encoded in the "Rt" field.}\)

<tbody>
<tr>
<td>STEORH, STEORLH</td>
<td>A == '0' &amp;&amp; Rt == '11111'</td>
</tr>
</tbody>
</table>

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Wt> Is the 32-bit name of the general-purpose register to be loaded, encoded in the "Rt" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```plaintext
bits(64) address;
bits(16) value;
bits(16) data;
bits(16) result;

value = X[s];
if n == 31 then
    CheckSAPAlignment();
    address = SP[];
else
    address = X[n];

// All observers in the shareability domain observe the following load and store atomically.
data = Mem[address, 2, ldacctype];

result = data EOR value;
Mem[address, 2, stacctype] = result;

if t != 31 then
    X[t] = ZeroExtend(data, 32);
```
C6.2.104 LDEOR, LDEORA, LDEORAL, LDEORL

Atomic exclusive OR on word or doubleword in memory atomically loads a 32-bit word or 64-bit doubleword from memory, performs an exclusive OR with the value held in a register on it, and stores the result back to memory. The value initially loaded from memory is returned in the destination register.

- If the destination register is not one of WZR or XZR, LDEORA and LDEORAL load from memory with acquire semantics.
- LDEORL and LDEORAL store to memory with release semantics.
- LDEOR has no memory ordering requirements.

For information about memory accesses see Load/Store addressing modes on page C1-149.

This instruction is used by the alias STEOR, STEORL. See Alias conditions on page C6-680 for details of when each alias is preferred.

### LDLARB

Load LOAcquire Register Byte loads a byte from memory, zero-extends it and writes it to a register. The instruction also has memory ordering semantics as described in LoadLOAcquire, StoreLORelease on page B2-102. For information about memory accesses, see Load/Store addressing modes on page C1-149.

Note

For this instruction, if the destination is WZR/ZXR, it is impossible for software to observe the presence of the acquire semantic other than its effect on the arrival at endpoints.

#### ARMv8.1

```
[31 30 29 28|27 26 25 24|23 22 21 20] 16|15 14 | 10 9 |  5 4 |   0 |
0 0 0 0 1 0 0 0 | 1 1 0 | 1(1)(1)(1)(1)(1) | 0 | (1)(1)(1)(1)(1) |
size L Rs o0 Rt2
```

**No offset variant**

LDLARB `<Wt>, [<Xn|SP>{,#0}]`

**Decode for this encoding**

```plaintext```
integer n = UInt(Rn);
integer t = UInt(Rt);
```

**Assembler symbols**

- `<Wt>` Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
- `<Xn|SP>` Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

**Operation**

```plaintext```
bits(64) address;
bits(8) data;
if n == 31 then 
    CheckSPAlignment();
    address = SP[];
else 
    address = X[n];

data = Mem[address, 1, AccType_LIMITEDORDERED];
X[t] = ZeroExtend(data, 32);
```

```
C6.2.106 LDLARH

Load LOAcquire Register Halfword loads a halfword from memory, zero-extends it, and writes it to a register. The instruction also has memory ordering semantics as described in LoadLOAcquire, StoreLORelease on page B2-102. For information about memory accesses, see Load/Store addressing modes on page C1-149.

Note

For this instruction, if the destination is WZR/ZXR, it is impossible for software to observe the presence of the acquire semantic other than its effect on the arrival at endpoints.

ARMv8.1

No offset variant

LDLARH <Wt>, [<Xn|SP>{,#0}]

Decode for this encoding

integer n = UInt(Rn);
integer t = UInt(Rt);

Assembler symbols

<Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

bits(64) address;
bits(16) data;
if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];
data = Mem[address, 2, AccType_LIMITEDORDERED];
X[t] = ZeroExtend(data, 32);
C6.2.107 LDLAR

Load LOAcquire Register loads a 32-bit word or 64-bit doubleword from memory, and writes it to a register. The instruction also has memory ordering semantics as described in LoadLOAcquire, StoreLORelease on page B2-102. For information about memory accesses, see Load/Store addressing modes on page C1-149.

--- Note ---

For this instruction, if the destination is WZR/ZXR, it is impossible for software to observe the presence of the acquire semantic other than its effect on the arrival at endpoints.

ARMv8.1

C6.2.111   LDR (immediate)

Load Register (immediate) loads a word or doubleword from memory and writes it to a register. The address that is used for the load is calculated from a base register and an immediate offset. For information about memory accesses, see Load/Store addressing modes on page C1-149. The Unsigned offset variant scales the immediate offset value by the size of the value accessed before adding it to the base register value.

**Post-index**

32-bit variant

Applies when size == 10.

LDR <Wt>, [<Xn|SP>], #<simm>

64-bit variant

Applies when size == 11.

LDR <Xt>, [<Xn|SP>], #<simm>

**Decode for all variants of this encoding**

boolean wback = TRUE;
boolean postindex = TRUE;
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);

**Pre-index**

32-bit variant

Applies when size == 10.

LDR <Wt>, [<Xn|SP>, #<simm>]!

64-bit variant

Applies when size == 11.

LDR <Xt>, [<Xn|SP>, #<simm>]!

**Decode for all variants of this encoding**

boolean wback = TRUE;
boolean postindex = FALSE;
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
Unsigned offset

bits(64) address;
bits(datasize) data;

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];

address = address + offset;

data = Mem[address, datasize DIV 8, AccType_NORMAL];
X[t] = ZeroExtend(data, regsize);
```
C6.2.114   LDRAA, LDRAB

Load Register, with pointer authentication. This instruction authenticates an address from a base register using a modifier of zero and the specified key, adds an immediate offset to the authenticated address, and loads a 64-bit doubleword from memory at this resulting address into a register.

Key A is used for LDRAA, and key B is used for LDRAB.

If the authentication passes, the PE behaves the same as for an LDR instruction. If the authentication fails, a Translation fault is generated.

The authenticated address is not written back to the base register, unless the pre-indexed variant of the instruction is used. In this case, the address that is written back to the base register does not include the pointer authentication code.

For information about memory accesses, see Load/Store addressing modes on page C1-149.

C6.2.124 LDRSW (literal)

Load Register Signed Word (literal) calculates an address from the PC value and an immediate offset, loads a word from memory, and writes it to a register. For information about memory accesses, see Load/Store addressing modes on page C1-149.

```
<table>
<thead>
<tr>
<th>31 30 29 28</th>
<th>27 26 25 24</th>
<th>23</th>
<th></th>
<th></th>
<th>5 4</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 0 0 1 1</td>
<td>0 0 0</td>
<td>imm19</td>
<td></td>
<td></td>
<td>Rt</td>
<td></td>
</tr>
</tbody>
</table>
```

**Literal variant**

LDRSW `<Xt>, <label>

**Decode for this encoding**

```
integer t = UInt(Rt);
bits(64) offset;
offset = SignExtend(imm19:'00', 64);
```

**Assembler symbols**

- `<Xt>` Is the 64-bit name of the general-purpose register to be loaded, encoded in the "Rt" field.
- `<label>` Is the program label from which the data is to be loaded. Its offset from the address of this instruction, in the range +/-1MB, is encoded as "imm19" times 4.

**Operation**

```
bits(64) address = PC[] + offset;
bits(32) data;

data = Mem[address, 4, AccType_NORMAL];
X[t] = SignExtend(data, 64);
```
C6.2.125 LDRSW (register)

Load Register Signed Word (register) calculates an address from a base register value and an offset register value, loads a word from memory, sign-extends it to form a 64-bit value, and writes it to a register. The offset register value can be shifted left by 0 or 2 bits. For information about memory accesses, see Load/Store addressing modes on page C1-149.

64-bit variant

LDRSW <Xt>, [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}}]

Decode for this encoding

ExtendType extend_type = DecodeRegExtend(option);
integer shift = if S == '1' then 2 else 0;

Assembler symbols

<Xt> Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<Wm> When option<0> is set to 0, is the 32-bit name of the general-purpose index register, encoded in the "Rm" field.
<Xm> When option<0> is set to 1, is the 64-bit name of the general-purpose index register, encoded in the "Rm" field.
<extend> Is the index extend/shift specifier, defaulting to LSL, and which must be omitted for the LSL option when <amount> is omitted. encoded in the "option" field. It can have the following values:
   UXTW when option = 010
   LSL when option = 011
   SXTW when option = 110
   SXTX when option = 111

<amount> Is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in the "S" field. It can have the following values:
   #0 when S = 0
   #2 when S = 1

Shared decode for all encodings

integer n = UInt(Rn);
integer t = UInt(Rt);
integer m = UInt(Rm);

Operation

bits(64) offset = ExtendReg(m, extend_type, shift);
bits(64) address;
bits(32) data;
if n == 31 then
    CheckSPA[]):
    address = SP[];
else
    address = X[n];

address = address + offset;

data = Mem[address, 4, AccType_NORMAL];
X[t] = SignExtend(data, 64);
C6.2.126  LDSETB, LDSETAB, LDSETALB, LDSETLB

Atomic bit set on byte in memory atomically loads an 8-bit byte from memory, performs a bitwise OR with the value held in a register on it, and stores the result back to memory. The value initially loaded from memory is returned in the destination register.

- If the destination register is not WZR, LDSETAB and LDSETALB load from memory with acquire semantics.
- LDSETLB and LDSETALB store to memory with release semantics.
- LDSETB has no memory ordering requirements.

For information about memory accesses see Load/Store addressing modes on page C1-149.

This instruction is used by the alias STSETB, STSETLB. See Alias conditions on page C6-726 for details of when each alias is preferred.

ARMv8.1

LDSETAB variant

<Ws> Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Wt> Is the 32-bit name of the general-purpose register to be loaded, encoded in the "Rt" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```plaintext
bits(64) address;
bits(8) value;
bits(8) data;
bits(8) result;

value = X[s];
if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];

// All observers in the shareability domain observe the following load and store atomically.
data = Mem[address, 1, ldacctype];

result = if SInt(data) > SInt(value) then value else data;
Mem[address, 1, stacctype] = result;

if t != 31 then
    X[t] = ZeroExtend(data, 32);
```
C6.2.133 LDSMINH, LDSMINAH, LDSMINALH, LDSMINLH

Atomic signed minimum on halfword in memory atomically loads a 16-bit halfword from memory, compares it against the value held in a register, and stores the smaller value back to memory, treating the values as signed numbers. The value initially loaded from memory is returned in the destination register.

- If the destination register is not WZR, LDSMINAH and LDSMINALH load from memory with acquire semantics.
- LDSMINLH and LDSMINALH store to memory with release semantics.
- LDSMINH has no memory ordering requirements.

For information about memory accesses see Load/Store addressing modes on page C1-149.

This instruction is used by the alias STSMINH, STSMINLH. See Alias conditions on page C6-742 for details of when each alias is preferred.

ARMv8.1

LDSMINAH variant
Applies when $A == 1 \&\& R == 0$.
LDSMINAH <Ws>, <Wt>, [<Xn|SP>]

LDSMINALH variant
Applies when $A == 1 \&\& R == 1$.
LDSMINALH <Ws>, <Wt>, [<Xn|SP>]

LDSMINH variant
Applies when $A == 0 \&\& R == 0$.
LDSMINH <Ws>, <Wt>, [<Xn|SP>]

LDSMINLH variant
Applies when $A == 0 \&\& R == 1$.
LDSMINLH <Ws>, <Wt>, [<Xn|SP>]

Decode for all variants of this encoding

C6.2.141 LDUMAXB, LDUMAXAB, LDUMAXALB, LDUMAXLB

Atomic unsigned maximum on byte in memory atomically loads an 8-bit byte from memory, compares it against the value held in a register, and stores the larger value back to memory, treating the values as unsigned numbers. The value initially loaded from memory is returned in the destination register.

• If the destination register is not WZR, LDUMAXAB and LDUMAXALB load from memory with acquire semantics.
• LDUMAXLB and LDUMAXALB store to memory with release semantics.
• LDUMAXB has no memory ordering requirements.

For information about memory accesses see Load/Store addressing modes on page C1-149.

This instruction is used by the alias STUMAXB, STUMAXLB. See Alias conditions on page C6-756 for details of when each alias is preferred.

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Wt> Is the 32-bit name of the general-purpose register to be loaded, encoded in the "Rt" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```
bits(64) address;
bits(8) value;
bits(8) data;
bits(8) result;

value = X[s];
if n == 31 then
    CheckSPAignment();
    address = SP[];
else
    address = X[n];

// All observers in the shareability domain observe the following load and store atomically.
data = Mem[address, 1, ldacctype];

result = if UInt(data) > UInt(value) then data else value;
Mem[address, 1, stacctype] = result;

if t != 31 then
    X[t] = ZeroExtend(data, 32);
```
C6.2.142   LDUMAXH, LDUMAXAH, LDUMAXALH, LDUMAXLH

Atomic unsigned maximum on halfword in memory atomically loads a 16-bit halfword from memory, compares it
against the value held in a register, and stores the larger value back to memory, treating the values as unsigned
numbers. The value initially loaded from memory is returned in the destination register.

- If the destination register is not WZR, LDUMAXAH and LDUMAXALH load from memory with acquire semantics.
- LDUMAXALH and LDUMAXALH store to memory with release semantics.
- LDUMAXH has no memory ordering requirements.

For more information about memory ordering semantics see Load-Acquire, Load-AcquirePC, and Store-Release on

For information about memory accesses see Load/Store addressing modes on page C1-149.

This instruction is used by the alias STUMAXH, STUMAXLH. See Alias conditions on page C6-758 for details of
when each alias is preferred.

C6.2.153   LDXP

Load Exclusive Pair of Registers derives an address from a base register value, loads two 32-bit words or two 64-bit
doublewords from memory, and writes them to two registers. A 32-bit pair requires the address to be doubleword
aligned and is single-copy atomic at doubleword granularity. A 64-bit pair requires the address to be quadword
aligned and is single-copy atomic for each doubleword at doubleword granularity. The PE marks the physical
address being accessed as an exclusive access. This exclusive access mark is checked by Store Exclusive
instructions. See Synchronization and semaphores on page B2-128. For information about memory accesses see
Load/Store addressing modes on page C1-149.

32-bit variant

Applies when \( sz = 0 \).

LDXP \(<Wt1>, <Wt2>, [<Xn|SP>{,#0}]\)

64-bit variant

Applies when \( sz = 1 \).

```
C6.2.157   LSL (register)

Logical Shift Left (register) shifts a register value left by a variable number of bits, shifting in zeros, and writes the result to the destination register. The remainder obtained by dividing the second source register by the data size defines the number of bits by which the first source register is left-shifted.

This instruction is an alias of the LSLV instruction. This means that:

- The encodings in this description are named to match the encodings of LSLV.
- The description of LSLV gives the operational pseudocode for this instruction.

32-bit variant

Applies when sfr = 0.

LSL <Wd>, <Wn>, <Wm>

is equivalent to

LSLV <Wd>, <Wn>, <Wm>

and is always the preferred disassembly.

64-bit variant

Applies when sfr = 1.

LSL <Xd>, <Xn>, <Xm>

is equivalent to

LSLV <Xd>, <Xn>, <Xm>

and is always the preferred disassembly.

Assembler symbols

- <Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Wn> Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.
- <Wm> Is the 32-bit name of the second general-purpose source register holding a shift amount from 0 to 31 in its bottom 5 bits, encoded in the "Rm" field.
- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Xn> Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.
- <Xm> Is the 64-bit name of the second general-purpose source register holding a shift amount from 0 to 63 in its bottom 6 bits, encoded in the "Rm" field.

Operation

The description of LSLV gives the operational pseudocode for this instruction.
C6.2.158   LSL (immediate)

Logical Shift Left (immediate) shifts a register value left by an immediate number of bits, shifting in zeros, and writes the result to the destination register.

This instruction is an alias of the UBFM instruction. This means that:

- The encodings in this description are named to match the encodings of UBFM.
- The description of UBFM gives the operational pseudocode for this instruction.

### 32-bit variant
Applies when `sf == 0 && N == 0 && imms != 011111`.  
`LSL <Wd>, <Wn>, #<shift>`
is equivalent to
`UBFM <Wd>, <Wn>, #(-<shift> MOD 32), #(31-<shift>)`
and is the preferred disassembly when `imms + 1 == immr`.

### 64-bit variant
Applies when `sf == 1 && N == 1 && imms != 111111`.  
`LSL <Xd>, <Xn>, #<shift>`
is equivalent to
`UBFM <Xd>, <Xn>, #(-<shift> MOD 64), #(63-<shift>)`
and is the preferred disassembly when `imms + 1 == immr`.

### Assembler symbols
- `<Wd>`: Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- `<Wn>`: Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.
- `<Xd>`: Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- `<Xn>`: Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.
- `<shift>`: For the 32-bit variant: is the shift amount, in the range 0 to 31.  
  For the 64-bit variant: is the shift amount, in the range 0 to 63.

### Operation
The description of UBFM gives the operational pseudocode for this instruction.
C6.2.159   LSLV

Logical Shift Left Variable shifts a register value left by a variable number of bits, shifting in zeros, and writes the result to the destination register. The remainder obtained by dividing the second source register by the data size defines the number of bits by which the first source register is left-shifted.

This instruction is used by the alias LSL (register). The alias is always the preferred disassembly.

32-bit variant

Applies when \( sf = 0 \).

\[
\text{LSLV} \\langle W_d \rangle, \langle W_n \rangle, \langle W_m \rangle
\]

64-bit variant

Applies when \( sf = 1 \).

\[
\text{LSLV} \\langle X_d \rangle, \langle X_n \rangle, \langle X_m \rangle
\]

**Decode for all variants of this encoding**

\[
\begin{align*}
\text{integer } d &= \text{UInt}(Rd); \\
\text{integer } n &= \text{UInt}(Rn); \\
\text{integer } m &= \text{UInt}(Rm); \\
\text{integer } \text{datasize} &= \text{if } sf == '1' \text{ then } 64 \text{ else } 32; \\
\text{ShiftType } \text{shift_type} &= \text{DecodeShift}(\text{op2});
\end{align*}
\]

**Assembler symbols**

\[
\begin{align*}
\langle W_d \rangle & \quad \text{Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.} \\
\langle W_n \rangle & \quad \text{Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.} \\
\langle W_m \rangle & \quad \text{Is the 32-bit name of the second general-purpose source register holding a shift amount from 0 to 31 in its bottom 5 bits, encoded in the "Rm" field.} \\
\langle X_d \rangle & \quad \text{Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.} \\
\langle X_n \rangle & \quad \text{Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.} \\
\langle X_m \rangle & \quad \text{Is the 64-bit name of the second general-purpose source register holding a shift amount from 0 to 63 in its bottom 6 bits, encoded in the "Rm" field.}
\end{align*}
\]

**Operation**

\[
\begin{align*}
\text{bits(data-size)} \text{ result}; \\
\text{bits(data-size)} \text{ operand2} &= X[m]; \\
\text{result} &= \text{ShiftReg}(n, \text{shift_type}, \text{UInt}(\text{operand2}) \text{ MOD data-size}); \\
X[d] &= \text{result};
\end{align*}
\]
C6.2.160  LSR (register)

Logical Shift Right (register) shifts a register value right by a variable number of bits, shifting in zeros, and writes the result to the destination register. The remainder obtained by dividing the second source register by the data size defines the number of bits by which the first source register is right-shifted.

This instruction is an alias of the LSRV instruction. This means that:

- The encodings in this description are named to match the encodings of LSRV.
- The description of LSRV gives the operational pseudocode for this instruction.

32-bit variant

Applies when \( sf = 0 \).

\[
\text{LSR } <Wd>, <Wn>, <Wm>
\]

is equivalent to

\[
\text{LSRV } <Wd>, <Wn>, <Wm>
\]

and is always the preferred disassembly.

64-bit variant

Applies when \( sf = 1 \).

\[
\text{LSR } <Xd>, <Xn>, <Xm>
\]

is equivalent to

\[
\text{LSRV } <Xd>, <Xn>, <Xm>
\]

and is always the preferred disassembly.

Assembler symbols

- \( <Wd> \) is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \( <Wn> \) is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.
- \( <Wm> \) is the 32-bit name of the second general-purpose source register holding a shift amount from 0 to 31 in its bottom 5 bits, encoded in the "Rm" field.
- \( <Xd> \) is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \( <Xn> \) is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.
- \( <Xm> \) is the 64-bit name of the second general-purpose source register holding a shift amount from 0 to 63 in its bottom 6 bits, encoded in the "Rm" field.

Operation

The description of LSRV gives the operational pseudocode for this instruction.
C6.2.161   LSR (immediate)

Logical Shift Right (immediate) shifts a register value right by an immediate number of bits, shifting in zeros, and
writes the result to the destination register.

This instruction is an alias of the UBFM instruction. This means that:

- The encodings in this description are named to match the encodings of UBFM.
- The description of UBFM gives the operational pseudocode for this instruction.

32-bit variant

Applies when `sf == 0 && N == 0 && imms == 011111`.  
`LSR <Wd>, <Wn>, #<shift>`

is equivalent to

`UBFM <Wd>, <Wn>, #<shift>, #31`

and is always the preferred disassembly.

64-bit variant

Applies when `sf == 1 && N == 1 && imms == 111111`.  
`LSR <Xd>, <Xn>, #<shift>`

is equivalent to

`UBFM <Xd>, <Xn>, #<shift>, #63`

and is always the preferred disassembly.

Assembler symbols

- `<Wd>` Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- `<Wn>` Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.
- `<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- `<Xn>` Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.
- `<shift>` For the 32-bit variant: is the shift amount, in the range 0 to 31, encoded in the "immr" field.  
  For the 64-bit variant: is the shift amount, in the range 0 to 63, encoded in the "immr" field.

Operation

The description of UBFM gives the operational pseudocode for this instruction.
C6.2.162   LSRV

Logical Shift Right Variable shifts a register value right by a variable number of bits, shifting in zeros, and writes
the result to the destination register. The remainder obtained by dividing the second source register by the data size
defines the number of bits by which the first source register is right-shifted.

This instruction is used by the alias LSR (register). The alias is always the preferred disassembly.

32-bit variant
Applies when \( sf == 0 \).
LSRV <Wd>, <Wn>, <Wm>

64-bit variant
Applies when \( sf == 1 \).
LSRV <Xd>, <Xn>, <Xm>

Decode for all variants of this encoding

integer \( d = \text{UInt}(Rd); \)
integer \( n = \text{UInt}(Rn); \)
integer \( m = \text{UInt}(Rm); \)
integer datasize = if \( sf == '1' \) then 64 else 32;
ShiftType shift_type = DecodeShift(op2);

Assembler symbols

<Wd>   Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Xd>   Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

Operation

bits(datasize) result;
bits(datasize) operand2 = X[m];
result = ShiftReg(n, shift_type, UInt(operand2) MOD datasize);
X[d] = result;
C6.2.163  MADD

Multiply-Add multiplies two register values, adds a third register value, and writes the result to the destination register.

This instruction is used by the alias MUL. See Alias conditions for details of when each alias is preferred.

32-bit variant

Applies when sf == 0.

MADD <Wd>, <Wn>, <Wm>, <Wa>

64-bit variant

Applies when sf == 1.

MADD <Xd>, <Xn>, < Xm>, <Xa>

Decode for all variants of this encoding

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer a = UInt(Ra);
integer destsize = if sf == '1' then 64 else 32;

Alias conditions

Assembler symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xn> Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

<Xm> Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

<Xa> Is the 32-bit name of the third general-purpose source register holding the addend, encoded in the "Ra" field.

Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xn> Is the 64-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

<Xm> Is the 64-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.
<Xa> is the 64-bit name of the third general-purpose source register holding the addend, encoded in the "Ra" field.

**Operation**

```plaintext
bits(destsize) operand1 = X[n];
bits(destsize) operand2 = X[m];
bits(destsize) operand3 = X[a];

integer result;

result = UInt(operand3) + (UInt(operand1) * UInt(operand2));

X[d] = result<destsize-1:0>;
```
C6.2.164    MNEG

Multiply-Negate multiplies two register values, negates the product, and writes the result to the destination register.

This instruction is an alias of the MSUB instruction. This means that:

- The encodings in this description are named to match the encodings of MSUB.
- The description of MSUB gives the operational pseudocode for this instruction.

### 32-bit variant

Applies when $sf = 0$.

$MNEG <Wd>, <Wn>, <Wm>$

is equivalent to

$MSUB <Wd>, <Wn>, <Wm>, WZR$

and is always the preferred disassembly.

### 64-bit variant

Applies when $sf = 1$.

$MNEG <Xd>, <Xn>, <Xm>$

is equivalent to

$MSUB <Xd>, <Xn>, <Xm>, XZR$

and is always the preferred disassembly.

### Assembler symbols

- $<Wd>$: Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- $<Wn>$: Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
- $<Wm>$: Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.
- $<Xd>$: Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- $<Xn>$: Is the 64-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
- $<Xm>$: Is the 64-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

### Operation

The description of MSUB gives the operational pseudocode for this instruction.
C6.2.165   MOV (to/from SP)

Move between register and stack pointer : Rd = Rn.

This instruction is an alias of the ADD (immediate) instruction. This means that:

- The encodings in this description are named to match the encodings of ADD (immediate).
- The description of ADD (immediate) gives the operational pseudocode for this instruction.

### 32-bit variant

Applies when \( sf = 0 \).

\[
\text{MOV} \ <Wd|WSP>, <Wn|WSP> \\
\text{is equivalent to} \\
\text{ADD} \ <Wd|WSP>, <Wn|WSP>, 0
\]

and is the preferred disassembly when \( (Rd == '11111' \lor Rn == '11111') \).

### 64-bit variant

Applies when \( sf = 1 \).

\[
\text{MOV} \ <Xd|SP>, <Xn|SP> \\
\text{is equivalent to} \\
\text{ADD} \ <Xd|SP>, <Xn|SP>, 0
\]

and is the preferred disassembly when \( (Rd == '11111' \lor Rn == '11111') \).

### Assembler symbols

- \(<Wd|WSP>\)  Is the 32-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.
- \(<Wn|WSP>\)  Is the 32-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.
- \(<Xd|SP>\)  Is the 64-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.
- \(<Xn|SP>\)  Is the 64-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.

### Operation

The description of ADD (immediate) gives the operational pseudocode for this instruction.
C6.2.166 MOV (inverted wide immediate)

Move (inverted wide immediate) moves an inverted 16-bit immediate value to a register.

This instruction is an alias of the MOVN instruction. This means that:

- The encodings in this description are named to match the encodings of MOVN.
- The description of MOVN gives the operational pseudocode for this instruction.

### 32-bit variant

Applies when $sf = 0$.

MOV $<Wd>$, #<imm>

is equivalent to

MOVN $<Wd>$, #<imm16>, LSL #<shift>

and is the preferred disassembly when $! (IsZero(imm16) \&\& hw \neq '00') \&\& ! IsOnes(imm16)$.

### 64-bit variant

Applies when $sf = 1$.

MOV $<Xd>$, #<imm>

is equivalent to

MOVN $<Xd>$, #<imm16>, LSL #<shift>

and is the preferred disassembly when $! (IsZero(imm16) \&\& hw \neq '00')$.

### Assembler symbols

- $<Wd>$: Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- $<Xd>$: Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- $<imm>$: For the 32-bit variant: is a 32-bit immediate, the bitwise inverse of which can be encoded in "imm16:hw", but excluding 0xffff0000 and 0x0000ffff.
  For the 64-bit variant: is a 64-bit immediate, the bitwise inverse of which can be encoded in "imm16:hw".
- $<shift>$: For the 32-bit variant: is the amount by which to shift the immediate left, either 0 (the default) or 16, encoded in the "hw" field as $<shift>/16$.
  For the 64-bit variant: is the amount by which to shift the immediate left, either 0 (the default), 16, 32 or 48, encoded in the "hw" field as $<shift>/16$.

### Operation

The description of MOVN gives the operational pseudocode for this instruction.
C6.2.167   MOV (wide immediate)

Move (wide immediate) moves a 16-bit immediate value to a register.

This instruction is an alias of the MOVZ instruction. This means that:

- The encodings in this description are named to match the encodings of MOVZ.
- The description of MOVZ gives the operational pseudocode for this instruction.

### 32-bit variant

Applies when $sf = 0$.

MOV <Wd>, #<imm>

is equivalent to

MOVZ <Wd>, #<imm16>, LSL #<shift>

and is the preferred disassembly when $!(IsZero(imm16) && hw != '00')$.

### 64-bit variant

Applies when $sf = 1$.

MOV <Xd>, #<imm>

is equivalent to

MOVZ <Xd>, #<imm16>, LSL #<shift>

and is the preferred disassembly when $!(IsZero(imm16) && hw != '00')$.

### Assembler symbols

- **<Wd>**  Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- **<Xd>**  Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- **<imm>**  For the 32-bit variant: is a 32-bit immediate which can be encoded in "imm16:hw".
  - For the 64-bit variant: is a 64-bit immediate which can be encoded in "imm16:hw".
- **<shift>**  For the 32-bit variant: is the amount by which to shift the immediate left, either 0 (the default) or 16, encoded in the "hw" field as $<shift>/16$.
  - For the 64-bit variant: is the amount by which to shift the immediate left, either 0 (the default), 16, 32 or 48, encoded in the "hw" field as $<shift>/16$.

### Operation

The description of MOVZ gives the operational pseudocode for this instruction.
C6.2.168 MOV (bitmask immediate)

Move (bitmask immediate) writes a bitmask immediate value to a register.

This instruction is an alias of the ORR (immediate) instruction. This means that:

- The encodings in this description are named to match the encodings of ORR (immediate).
- The description of ORR (immediate) gives the operational pseudocode for this instruction.

32-bit variant

Applies when $sf == 0 \&\& N == 0$.

MOV $<Wd|WSP>$, #<imm>

is equivalent to

ORR $<Wd|WSP>$, WZR, #<imm>

and is the preferred disassembly when $! MoveWidePreferred(sf, N, imms, immr)$.

64-bit variant

Applies when $sf == 1$.

MOV $<Xd|SP>$, #<imm>

is equivalent to

ORR $<Xd|SP>$, XZR, #<imm>

and is the preferred disassembly when $! MoveWidePreferred(sf, N, imms, immr)$.

Assembler symbols

$<Wd|WSP>$ Is the 32-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.

$<Xd|SP>$ Is the 64-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.

<imm> For the 32-bit variant: is the bitmask immediate, encoded in "imms:immr", but excluding values which could be encoded by MOVZ or MOVN.

For the 64-bit variant: is the bitmask immediate, encoded in "N:imms:immr", but excluding values which could be encoded by MOVZ or MOVN.

Operation

The description of ORR (immediate) gives the operational pseudocode for this instruction.
C6.2.169   MOV (register)

Move (register) copies the value in a source register to the destination register.

This instruction is an alias of the ORR (shifted register) instruction. This means that:

- The encodings in this description are named to match the encodings of ORR (shifted register).
- The description of ORR (shifted register) gives the operational pseudocode for this instruction.

**32-bit variant**

Applies when $sf == 0$.

MOV $<Wd>$, $<Wm>$

is equivalent to

ORR $<Wd>$, WZR, $<Wm>$

and is always the preferred disassembly.

**64-bit variant**

Applies when $sf == 1$.

MOV $<Xd>$, $<Xm>$

is equivalent to

ORR $<Xd>$, XZR, $<Xm>$

and is always the preferred disassembly.

**Assembler symbols**

$<Wd>$ Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

$<Wm>$ Is the 32-bit name of the general-purpose source register, encoded in the "Rm" field.

$<Xd>$ Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

$<Xm>$ Is the 64-bit name of the general-purpose source register, encoded in the "Rm" field.

**Operation**

The description of ORR (shifted register) gives the operational pseudocode for this instruction.
C6.2.170 MOVK

Move wide with keep moves an optionally-shifted 16-bit immediate value into a register, keeping other bits unchanged.

<table>
<thead>
<tr>
<th>31 30 29 28</th>
<th>27 26 25 24</th>
<th>23 22 21 20</th>
<th>5 4 0</th>

<tbody>
<tr>
<td>sf</td>
<td>1</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>opc</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### 32-bit variant

Applies when sf == 0.

MOVK <Wd>, #<imm>{, LSL #<shift>}

### 64-bit variant

Applies when sf == 1.

MOVK <Xd>, #<imm>{, LSL #<shift>}

### Decode for all variants of this encoding

```plaintext
d = UInt(Rd);
datasize = if sf == '1' then 64 else 32;
pos = UInt(hw:'0000');
if sf == '0' & hw<1> == '1' then UnallocatedEncoding();
pos = UInt(hw:'0000');
```

### Assembler symbols

- `<Wd>` Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- `<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- `<imm>` Is the 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm16" field.
- `<shift>` For the 32-bit variant: is the amount by which to shift the immediate left, either 0 (the default) or 16, encoded in the "hw" field as `<shift>/16`.
  
  For the 64-bit variant: is the amount by which to shift the immediate left, either 0 (the default), 16, 32 or 48, encoded in the "hw" field as `<shift>/16`.

### Operation

```plaintext
bits(datasize) result;
result = X[d];
result<pos:imm16> = imm16;
X[d] = result;
```
C6.2.171 MOVN

Move wide with NOT moves the inverse of an optionally-shifted 16-bit immediate value to a register.

This instruction is used by the alias MOV (inverted wide immediate). See Alias conditions for details of when each alias is preferred.

32-bit variant

Applies when \( sf = 0 \).

\[
\text{MOVN} \ <Wd>, \ #<imm>\{, \ LSL \ #<shift>\}
\]

64-bit variant

Applies when \( sf = 1 \).

\[
\text{MOVN} \ <Xd>, \ #<imm>\{, \ LSL \ #<shift>\}
\]

Decode for all variants of this encoding

\[
\text{integer } d = \text{UInt}(Rd);
\text{integer } datasize = \text{if } sf = '1' \text{ then } 64 \text{ else } 32;
\text{integer } pos;
\text{if } sf = '0' \&\& hw<1> = '1' \text{ then UnallocatedEncoding();}
\text{pos} = \text{UInt}(hw:'0000');
\]

Assembler symbols

\(<Wd>\) Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

\(<Xd>\) Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

\(<imm>\) Is the 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm16" field.

\(<shift>\) For the 32-bit variant: is the amount by which to shift the immediate left, either 0 (the default) or 16, encoded in the "hw" field as \(<shift>/16\).

For the 64-bit variant: is the amount by which to shift the immediate left, either 0 (the default), 16, 32 or 48, encoded in the "hw" field as \(<shift>/16\).

Operation

\[
\text{bits(datasize) result;}
\text{result} = \text{Zeros();}
\]
result<pos+15:pos> = imm16;
result = NOT(result);
X[d] = result;
C6.2.172   MOVZ

Move wide with zero moves an optionally-shifted 16-bit immediate value to a register.

This instruction is used by the alias MOV (wide immediate). See Alias conditions for details of when each alias is preferred.

```
| 31 30 29 28|27 26 25 24|23 22 21 20|             | 5 4 | 0 |
| sf 1 0 1 0 0 1 0 1 | hw | imm16 | Rd |
```

32-bit variant

Applies when \( sf = 0 \).

`MOVZ <Wd>, #<imm>{, LSL #<shift>}}`

64-bit variant

Applies when \( sf = 1 \).

`MOVZ <Xd>, #<imm>{, LSL #<shift>}}`

**Decode for all variants of this encoding**

```
integer d = UInt(Rd);
integer datasize = if sf == '1' then 64 else 32;
integer pos;
if sf == '0' && hw<1> == '1' then UnallocatedEncoding();
pos = UInt(hw:'0000');
```

**Alias conditions**

<table>
<thead>
<tr>
<th>Alias</th>
<th>is preferred when</th>
</tr>
</thead>
<tbody>
<tr>
<td>MOV (wide immediate)</td>
<td>! (IsZero(imm16) &amp;&amp; hw != '00')</td>
</tr>
</tbody>
</table>

**Assembler symbols**

- `<Wd>`   Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- `<Xd>`   Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- `<imm>`  Is the 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm16" field.
- `<shift>` For the 32-bit variant: is the amount by which to shift the immediate left, either 0 (the default) or 16, encoded in the "hw" field as <shift>/16.
  For the 64-bit variant: is the amount by which to shift the immediate left, either 0 (the default), 16, 32 or 48, encoded in the "hw" field as <shift>/16.

**Operation**

```
bites(datasize) result;
result = Zeros();
```
result<pos+15:pos> = imm16;
X[d] = result;
C6.2.173  MRS

Move System Register allows the PE to read an AArch64 System register into a general-purpose register.

System variant
MRS <Xt>, (<systemreg>|S<op0>_<op1>_<Cn>_<Cm>_<op2>)

Decode for this encoding
AArch64.CheckSystemAccess('1':o0, op1, CRn, CRm, op2, Rt, L);
integer t = UInt(Rt);
integer sys_op0 = 2 + UInt(o0);
integer sys_op1 = UInt(op1);
integer sys_op2 = UInt(op2);
integer sys_crn = UInt(CRn);
integer sys_crm = UInt(CRm);

Assembler symbols
<Xt> Is the 64-bit name of the general-purpose destination register, encoded in the "Rt" field.
<systemreg> Is a System register name, encoded in the "o0:op1:CRn:CRm:op2".
The System register names are defined in Chapter D10 AArch64 System Register Descriptions.
<op0> Is an unsigned immediate, encoded in the "o0" field. It can have the following values:
2 when o0 = 0
3 when o0 = 1
<op1> Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op1" field.
<Cn> Is a name 'Cn', with 'n' in the range 0 to 15, encoded in the "CRn" field.
<Cm> Is a name 'Cm', with 'm' in the range 0 to 15, encoded in the "CRm" field.
<op2> Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op2" field.

Operation
X[t] = AArch64.SysRegRead(sys_op0, sys_op1, sys_crn, sys_crm, sys_op2);
C6.2.174 MSR (Immediate)

Move immediate value to Special Register moves an immediate value to selected bits of the PSTATE. For more information, see PSTATE.

The bits that can be written are D, A, I, F, and SP. This set of bits is expanded in extensions to the architecture as follows:

- ARMv8.1-PAN adds the PAN bit.
- ARMv8.2-UAO adds the UAO bit.

System variant

MSR <pstatefield>, #<imm>

Decode for this encoding

AArch64.CheckSystemAccess('00', op1, '0100', CRm, op2, '11111', '0');

PSTATEField field;
case op1:op2 of
  when '000 011'
    if !HaveUAOExt() then
      UnallocatedEncoding();
    field = PSTATEField_UAO;
  when '000 100'
    if !HavePANExt() then
      UnallocatedEncoding();
    field = PSTATEField_PAN;
  when '000 101' field = PSTATEField_SP;
  when '011 110' field = PSTATEField_DAIFSet;
  when '011 111' field = PSTATEField_DAIFClr;
  otherwise UnallocatedEncoding();

  // Check that an AArch64 MSR/MRS access to the DAIF flags is permitted
  if op1 == '011' && PSTATE.EL == EL0 && (IsInHost() || SCTLR_EL1.UMA == '0') then
    AArch64.SystemRegisterTrap(EL1, '00', op2, op1, '0100', '11111', CRm, '0');

Assembler symbols

<pstatefield> Is a PSTATE field name, encoded in the "op1:op2" field. It can have the following values:

- SPsel when op1 = 000, op2 = 101
- DAIFSet when op1 = 011, op2 = 110
- DAIFClr when op1 = 011, op2 = 111

When ARMv8.2-UAO is implemented, the following value is also valid:

- UAO when op1 = 000, op2 = 011

When ARMv8.1-PAN is implemented, the following value is also valid:

- PAN when op1 = 000, op2 = 100

The following encodings are reserved:

- op1 = 000, op2 = 00x.
- op1 = 000, op2 = 010.
• op1 = 000, op2 = 1x.
• op1 = 001, op2 = xxx.
• op1 = 010, op2 = xxx.
• op1 = 011, op2 = 0xx.
• op1 = 011, op2 = 10x.
• op1 = 1xx, op2 = xxx.

<imm> Is a 4-bit unsigned immediate, in the range 0 to 15, encoded in the "CRm" field.

**Operation**

case field of
  when PSTATEField_SP
    PSTATE.SP = CRm<0>;
  when PSTATEField_DAIFSet
    PSTATE.D = PSTATE.D OR CRm<3>;
    PSTATE.A = PSTATE.A OR CRm<2>;
    PSTATE.I = PSTATE.I OR CRm<1>;
    PSTATE.F = PSTATE.F OR CRm<0>;
  when PSTATEField_DAIFClr
    PSTATE.D = PSTATE.D AND NOT(CRm<3>);
    PSTATE.A = PSTATE.A AND NOT(CRm<2>);
    PSTATE.I = PSTATE.I AND NOT(CRm<1>);
    PSTATE.F = PSTATE.F AND NOT(CRm<0>);
  when PSTATEField_PAN
    PSTATE.PAN = CRm<0>;
  when PSTATEField_UAO
    PSTATE.UAO = CRm<0>;

C6.2.175  MSR (register)

Move general-purpose register to System Register allows the PE to write an AArch64 System register from a
general-purpose register.

**System variant**

MSR (<systemreg>|<op0>|<op1>|<Cn>|<Cm>|<op2>|<Xt>), <Xt>

**Decode for this encoding**

AArch64.CheckSystemAccess('1':o0, op1, CRn, CRm, op2, Rt, L);

integer t = UInt(Rt);

integer sys_op0 = 2 + UInt(o0);
integer sys_op1 = UInt(op1);
integer sys_op2 = UInt(op2);
integer sys_crn = UInt(CRn);
integer sys_crm = UInt(CRm);

**Assembler symbols**

- `<systemreg>` Is a System register name, encoded in the "o0:op1:CRn:CRm:op2".
  The System register names are defined in Chapter D10 AArch64 System Register Descriptions.

- `<op0>` Is an unsigned immediate, encoded in the "o0" field. It can have the following values:
  2 when o0 = 0
  3 when o0 = 1

- `<op1>` Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op1" field.

- `<Cn>` Is a name 'Cn', with 'n' in the range 0 to 15, encoded in the "CRn" field.

- `<Cm>` Is a name 'Cm', with 'm' in the range 0 to 15, encoded in the "CRm" field.

- `<op2>` Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op2" field.

- `<Xt>` Is the 64-bit name of the general-purpose source register, encoded in the "Rt" field.

**Operation**

AArch64.SysRegWrite(sys_op0, sys_op1, sys_crn, sys_crm, sys_op2, X[t]);
C6.2.176   MSUB

Multiply-Subtract multiplies two register values, subtracts the product from a third register value, and writes the result to the destination register.

This instruction is used by the alias MNEG. See Alias conditions for details of when each alias is preferred.

32-bit variant
Applies when sf == 0.
MSUB <Wd>, <Wn>, <Wm>, <Wa>

64-bit variant
Applies when sf == 1.
MSUB <Xd>, <Xn>, <Xm>, <Xa>

Decode for all variants of this encoding

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer a = UInt(Ra);
integer destsize = if sf == '1' then 64 else 32;

Alias conditions

<table>
<thead>
<tr>
<th>Alias</th>
<th>is preferred when</th>

Assembler symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Xn> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Xa> Is the 64-bit name of the third general-purpose source register holding the minuend, encoded in the "Ra" field.

**Operation**

```c
bits(destsize) operand1 = X[n];
bits(destsize) operand2 = X[m];
bits(destsize) operand3 = X[a];

integer result;

result = UInt(operand3) - (UInt(operand1) * UInt(operand2));
X[d] = result<destsize-1:0>;
```
C6.2.177   MUL

Multiply: Rd = Rn * Rm.

This instruction is an alias of the MADD instruction. This means that:

- The encodings in this description are named to match the encodings of MADD.
- The description of MADD gives the operational pseudocode for this instruction.

### 32-bit variant

Applies when \( sf = 0 \).

MUL \(<Wd>, <Wn>, <Wm>\)

is equivalent to

MADD \(<Wd>, <Wn>, <Wm>, WZR\)

and is always the preferred disassembly.

### 64-bit variant

Applies when \( sf = 1 \).

MUL \(<Xd>, <Xn>, <Xm>\)

is equivalent to

MADD \(<Xd>, <Xn>, <Xm>, XZR\)

and is always the preferred disassembly.

### Assembler symbols

- \(<Wd>\) Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Wn>\) Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
- \(<Wm>\) Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.
- \(<Xd>\) Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Xn>\) Is the 64-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
- \(<Xm>\) Is the 64-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

### Operation

The description of MADD gives the operational pseudocode for this instruction.

C6.2.178   MVN

Bitwise NOT writes the bitwise inverse of a register value to the destination register.

This instruction is an alias of the ORN (shifted register) instruction. This means that:

- The encodings in this description are named to match the encodings of ORN (shifted register).
- The description of ORN (shifted register) gives the operational pseudocode for this instruction.

32-bit variant

Applies when \( sf = 0 \).

MVN <Wd>, <Wm>{, <shift> #<amount>}

is equivalent to

ORN <Wd>, WZR, <Wm>{, <shift> #<amount>}

and is always the preferred disassembly.

64-bit variant

Applies when \( sf = 1 \).

MVN <Xd>, <Xm>{, <shift> #<amount>}

is equivalent to

ORN <Xd>, XZR, <Xm>{, <shift> #<amount>}

and is always the preferred disassembly.

Assembler symbols

|<Wd>| Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
|<Wm>| Is the 32-bit name of the general-purpose source register, encoded in the "Rm" field.
|<Xd>| Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
|<Xm>| Is the 64-bit name of the general-purpose source register, encoded in the "Rm" field.
|<shift>| Is the optional shift to be applied to the final source, defaulting to LSL and encoded in the "shift" field. It can have the following values:
|LSL| when shift = 00
|LSR| when shift = 01
|ASR| when shift = 10
|ROR| when shift = 11
|<amount>| For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.

For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field,
Operation

The description of ORN (shifted register) gives the operational pseudocode for this instruction.
C6.2.179   NEG (shifted register)

Negate (shifted register) negates an optionally-shifted register value, and writes the result to the destination register.

This instruction is an alias of the SUB (shifted register) instruction. This means that:

- The encodings in this description are named to match the encodings of SUB (shifted register).
- The description of SUB (shifted register) gives the operational pseudocode for this instruction.

### 32-bit variant

Applies when \( sf = 0 \).

\[
\text{NEG } <Wd>, <Wm>{, <shift> #<amount>} \\
\text{is equivalent to} \\
\text{SUB } <Wd>, WZR, <Wm> {, <shift> #<amount>} \\
\text{and is always the preferred disassembly.}
\]

### 64-bit variant

Applies when \( sf = 1 \).

\[
\text{NEG } <Xd>, <Xm>{, <shift> #<amount>} \\
\text{is equivalent to} \\
\text{SUB } <Xd>, XZR, <Xm> {, <shift> #<amount>} \\
\text{and is always the preferred disassembly.}
\]

### Assembler symbols

- \(<Wd>\) Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Wm>\) Is the 32-bit name of the general-purpose source register, encoded in the "Rm" field.
- \(<Xd>\) Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Xm>\) Is the 64-bit name of the general-purpose source register, encoded in the "Rm" field.
- \(<\text{shift}>\) Is the optional shift type to be applied to the second source operand, defaulting to LSL and encoded in the "shift" field. It can have the following values:
  - LSL when \( shift = 00 \)
  - LSR when \( shift = 01 \)
  - ASR when \( shift = 10 \)

The encoding \( shift = 11 \) is reserved.

- \(<\text{amount}>\) For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.

For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field.
Operation

The description of **SUB (shifted register)** gives the operational pseudocode for this instruction.
**C6.2.180 NEGS**

Negate, setting flags, negates an optionally-shifted register value, and writes the result to the destination register. It updates the condition flags based on the result.

This instruction is an alias of the SUBS (shifted register) instruction. This means that:

- The encodings in this description are named to match the encodings of SUBS (shifted register).
- The description of SUBS (shifted register) gives the operational pseudocode for this instruction.

### 32-bit variant

Applies when \(sf == 0\).

\[
\text{NEGS} \ <Wd>, \ <Wm>\{, \ <shift> \ #<amount>\}
\]

is equivalent to

\[
\text{SUBS} \ <Wd>, \ WZR, \ <Wm>\{, \ <shift> \ #<amount>\}
\]

and is always the preferred disassembly.

### 64-bit variant

Applies when \(sf == 1\).

\[
\text{NEGS} \ <Xd>, \ <Xm>\{, \ <shift> \ #<amount>\}
\]

is equivalent to

\[
\text{SUBS} \ <Xd>, \ XZR, \ <Xm>\{, \ <shift> \ #<amount>\}
\]

and is always the preferred disassembly.

### Assembler symbols

- `<Wd>` Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- `<Wm>` Is the 32-bit name of the general-purpose source register, encoded in the "Rm" field.
- `<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- `<Xm>` Is the 64-bit name of the general-purpose source register, encoded in the "Rm" field.
- `<shift>` Is the optional shift type to be applied to the second source operand, defaulting to LSL and encoded in the "shift" field. It can have the following values:
  - LSL when \(shift = 00\)
  - LSR when \(shift = 01\)
  - ASR when \(shift = 10\)
  - The encoding \(shift = 11\) is reserved.
- `<amount>` For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.
  - For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field.
Operation

The description of `SUBS (shifted register)` gives the operational pseudocode for this instruction.
C6.2.181 NGC

Negate with Carry negates the sum of a register value and the value of NOT (Carry flag), and writes the result to the destination register.

This instruction is an alias of the SBC instruction. This means that:

- The encodings in this description are named to match the encodings of SBC.
- The description of SBC gives the operational pseudocode for this instruction.

32-bit variant

Applies when sf == 0.

NGC <Wd>, <Wm>

is equivalent to

SBC <Wd>, WZR, <Wm>

and is always the preferred disassembly.

64-bit variant

Applies when sf == 1.

NGC <Xd>, <Xm>

is equivalent to

SBC <Xd>, XZR, <Xm>

and is always the preferred disassembly.

Assembler symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wm> Is the 32-bit name of the general-purpose source register, encoded in the "Rm" field.

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xm> Is the 64-bit name of the general-purpose source register, encoded in the "Rm" field.

Operation

The description of SBC gives the operational pseudocode for this instruction.
C6.2.182   NGCS

Negate with Carry, setting flags, negates the sum of a register value and the value of NOT (Carry flag), and writes the result to the destination register. It updates the condition flags based on the result.

This instruction is an alias of the SBCS instruction. This means that:

- The encodings in this description are named to match the encodings of SBCS.
- The description of SBCS gives the operational pseudocode for this instruction.

### 32-bit variant

Applies when \( sf = 0 \).

\[
\text{NGCS } \langle Wd \rangle, \langle Wm \rangle
\]
is equivalent to

\[
\text{SBCS } \langle Wd \rangle, \text{WZR, } \langle Wm \rangle
\]
and is always the preferred disassembly.

### 64-bit variant

Applies when \( sf = 1 \).

\[
\text{NGCS } \langle Xd \rangle, \langle Xm \rangle
\]
is equivalent to

\[
\text{SBCS } \langle Xd \rangle, \text{XZR, } \langle Xm \rangle
\]
and is always the preferred disassembly.

### Assembler symbols

- \( \langle Wd \rangle \) is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \( \langle Wm \rangle \) is the 32-bit name of the general-purpose source register, encoded in the "Rm" field.
- \( \langle Xd \rangle \) is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \( \langle Xm \rangle \) is the 64-bit name of the general-purpose source register, encoded in the "Rm" field.

### Operation

The description of SBCS gives the operational pseudocode for this instruction.
C6.2.183  NOP

No Operation does nothing, other than advance the value of the program counter by 4. This instruction can be used for instruction alignment purposes.

--- Note ---

The timing effects of including a NOP instruction in a program are not guaranteed. It can increase execution time, leave it unchanged, or even reduce it. Therefore, NOP instructions are not suitable for timing loops.

---

**System variant**

NOP

**Decode for this encoding**

// Empty.

**Operation**

// do nothing
C6.2.184 ORN (shifted register)

Bitwise OR NOT (shifted register) performs a bitwise (inclusive) OR of a register value and the complement of an optionally-shifted register value, and writes the result to the destination register.

This instruction is used by the alias MVN. See Alias conditions for details of when each alias is preferred.

32-bit variant

Applies when $sf == 0$.

ORN $<Wd>$, $<Wn>$, $<Wm>$ {, $<shift>$ #$<amount>$}

64-bit variant

Applies when $sf == 1$.

ORN $<Xd>$, $<Xn>$, $<Xm>$ {, $<shift>$ #$<amount>$}

Decode for all variants of this encoding

integer $d = $UInt$(Rd)$;
integer $n = $UInt$(Rn)$;
integer $m = $UInt$(Rm)$;
integer $datasize = if sf == '1' then 64 else 32$;
if $sf == '0' \\&\& imm6<5> == '1' then $ReservedValue()$;

$ShiftType$ $shift\_type = $DecodeShift$(shift)$;
integer $shift\_amount = $UInt$(imm6)$;

Alias conditions

<table>
<thead>
<tr>
<th>Alias</th>
<th>is preferred when</th>

</thead>
<tbody>
<tr>
<td>MVN</td>
<td>$Rn == '11111'$</td>
</tr>
</tbody>
</table>

Assembler symbols

$<Wd>$ Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

$<Wn>$ Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.

$<Wm>$ Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.

$<Xd>$ Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

$<Xn>$ Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.

$<Xm>$ Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.

$<shift>$ Is the optional shift to be applied to the final source, defaulting to LSL and encoded in the "shift" field. It can have the following values:

<table>
<thead>
<tr>
<th>ShiftType</th>
<th>when shift = 00</th>
</tr>
</thead>
<tbody>
<tr>
<td>LSL</td>
<td></td>
</tr>
<tr>
<td>LSR</td>
<td>when shift = 01</td>
</tr>
</tbody>
</table>
ASR  when shift = 10
ROR  when shift = 11

<amount>  For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.
For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field,

**Operation**

```plaintext
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = ShiftReg(m, shift_type, shift_amount);

operand2 = NOT(operand2);
result = operand1 OR operand2;
X[d] = result;
```
C6.2.185    ORR (immediate)

Bitwise OR (immediate) performs a bitwise (inclusive) OR of a register value and an immediate register value, and writes the result to the destination register.

This instruction is used by the alias MOV (bitmask immediate). See Alias conditions for details of when each alias is preferred.

32-bit variant

Applies when \( sf == 0 \land N == 0 \).

\[
\text{ORR}<Wd|WSP>, <Wn>, #<imm>
\]

64-bit variant

Applies when \( sf == 1 \).

\[
\text{ORR}<Xd|SP>, <Xn>, #<imm>
\]

**Decode for all variants of this encoding**

\[
\begin{align*}
\text{integer } d &= \text{UInt}(Rd); \\
\text{integer } n &= \text{UInt}(Rn); \\
\text{integer } \text{datasize} &= \text{if } sf == '1' \text{ then 64 else 32}; \\
\text{bits}(\text{datasize}) \text{ imm}; \\
\text{if } sf == '0' \land N != '0' \text{ then ReservedValue();} \\
(imm, -) &= \text{DecodeBitMasks}(N, \text{imms}, \text{immr}, \text{TRUE});
\end{align*}
\]

Assembler symbols

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Xn|SP> Is the 64-bit name of the general-purpose source register or stack pointer, encoded in the "Rn" field.

Operation for all encodings

if HavePACExt() then
  if source_is_sp then
    X[d] = AddPACIA(X[d], SP[]);
  else
    X[d] = AddPACIA(X[d], X[n]);
C6.2.191 PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZB

Pointer Authentication Code for Instruction address, using key B. This instruction computes and inserts a pointer authentication code for an instruction address, using a modifier and key B.

The address is:

- In the general-purpose register that is specified by \(<Xd>\) for PACIB and PACIZB.
- In X17, for PACIB1716.
- In X30, for PACIBSP and PACIBZ.

The modifier is:

- In the general-purpose register or stack pointer that is specified by \(<Xn|SP>\) for PACIB.
- The value zero, for PACIZB and PACIBZ.
- In X16, for PACIB1716.
- In SP, for PACIBSP.

**Integer**

ARMv8.3

\[
\begin{array}{ccccccccccccccccc}
\end{array}
\]

\[
\begin{array}{cccccccccccc}
1 & 1 & 0 & 1 & 1 & 0 & 1 & 1 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & Z & 0 & 0 & 1 & & & & & & Rn & Rd
\end{array}
\]

**PACIB variant**

Applies when \(Z = 0\).

PACIB \(<Xd>, <Xn|SP>\)

**PACIZB variant**

Applies when \(Z = 1 \&\& \text{Rn} = 11111\).

PACIZB \(<Xd>\)

**Decode for all variants of this encoding**

```java
boolean source_is_sp = FALSE;
integer d = UInt(Rd);
integer n = UInt(Rn);
if !HavePACExt() then
    UnallocatedEncoding();
if Z == '0' then // PACIB
    if n == 31 then source_is_sp = TRUE;
else // PACIZB
    if n != 31 then UnallocatedEncoding();
```

**System**

ARMv8.3
PACIB1716 variant

Applies when CRm == 0001 && op2 == 010.

PACIB1716

PACIBSP variant

Applies when CRm == 0011 && op2 == 011.

PACIBSP

PACIBZ variant

Applies when CRm == 0011 && op2 == 010.

PACIBZ

Decode for all variants of this encoding

```
integer d;
integer n;
boolean source_is_sp = FALSE;

case CRm:op2 of
  when '0011 010'    // PACIBZ
    d = 30;
    n = 31;

```

Assembler symbols

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xn|SP> Is the 64-bit name of the general-purpose source register or stack pointer, encoded in the "Rn" field.

Operation for all encodings

```
if HavePACExt() then
  if source_is_sp then
    X[d] = AddPACIB(X[d], SP[]);
  else
    X[d] = AddPACIB(X[d], X[n]);
```

```
### C6.2.192 PRFM (immediate)

Prefetch Memory (immediate) signals the memory system that data memory accesses from a specified address are likely to occur in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as preloading the cache line containing the specified address into one or more caches.

The effect of an PRFM instruction is IMPLEMENTATION DEFINED. For more information, see *Prefetch memory* on page C3-180.

For information about memory accesses, see *Load/Store addressing modes* on page C1-149.

</table>

**Unsigned offset variant**

PRFM (<prfop>|#<imm5>), [<Xn|SP>{, #<pimm>}]

**Decode for this encoding**

bits(64) offset = LSL(ZeroExtend(imm12, 64), 3);

**Assembler symbols**

- `<prfop>` is the prefetch operation, defined as `<type><target><policy>.

  - `<type>` is one of:
    - PLD: Prefetch for load, encoded in the "Rt<4:3>" field as 0b00.
    - PLI: Preload instructions, encoded in the "Rt<4:3>" field as 0b01.
    - PST: Prefetch for store, encoded in the "Rt<4:3>" field as 0b10.

  - `<target>` is one of:
    - L1: Level 1 cache, encoded in the "Rt<2:1>" field as 0b00.
    - L2: Level 2 cache, encoded in the "Rt<2:1>" field as 0b01.
    - L3: Level 3 cache, encoded in the "Rt<2:1>" field as 0b10.

  - `<policy>` is one of:
    - KEEP: Retained or temporal prefetch, allocated in the cache normally. Encoded in the "Rt<0>" field as 0.
    - STRM: Streaming or non-temporal prefetch, for data that is used only once. Encoded in the "Rt<0>" field as 1.

For more information on these prefetch operations, see *Prefetch memory* on page C3-180.

For other encodings of the "Rt" field, use `<imm5>`.

- `<imm5>` is the prefetch operation encoding as an immediate, in the range 0 to 31, encoded in the "Rt" field. This syntax is only for encodings that are not accessible using `<prfop>`.

- `<Xn|SP>` is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

- `<pimm>` is the optional positive immediate byte offset, a multiple of 8 in the range 0 to 32760, defaulting to 0 and encoded in the "imm12" field as `<pimm>/8`. 
Shared decode for all encodings

integer n = UInt(Rn);
integer t = UInt(Rt);

Operation

bits(64) address;

if n == 31 then
    address = SP[];
else
    address = X[n];

address = address + offset;
Prefetch(address, t<4:0>);
C6.2.193 PRFM (literal)

Prefetch Memory (literal) signals the memory system that data memory accesses from a specified address are likely to occur in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as preloading the cache line containing the specified address into one or more caches.

The effect of an PRFM instruction is IMPLEMENTATION DEFINED. For more information, see Prefetch memory on page C3-180.

For information about memory accesses, see Load/Store addressing modes on page C1-149.

```
[31 30 29 28|27 26 25 24|23 | | | 5 4 | 0 | 11 1 0 1 1 0 0 imm19 0000 Rt]  
opc
```

**Literal variant**

PRFM (<prfop>|#<imm5>), <label>

**Decode for this encoding**

integer t = UInt(Rt);  
bits(64) offset;  
offset = SignExtend(imm19:'00', 64);

**Assembler symbols**

- `<prfop>` Is the prefetch operation, defined as <type><target><policy>.  
  <type> is one of:  
  - PLD  Prefetch for load, encoded in the "Rt<4:3>" field as 0b00.  
  - PLI  Preload instructions, encoded in the "Rt<4:3>" field as 0b01.  
  - PST  Prefetch for store, encoded in the "Rt<4:3>" field as 0b10.  
  <target> is one of:  
  - L1  Level 1 cache, encoded in the "Rt<2:1>" field as 0b00.  
  - L2  Level 2 cache, encoded in the "Rt<2:1>" field as 0b01.  
  - L3  Level 3 cache, encoded in the "Rt<2:1>" field as 0b10.  
  <policy> is one of:  
  - KEEP  Retained or temporal prefetch, allocated in the cache normally. Encoded in the "Rt<0>" field as 0.  
  - STRM  Streaming or non-temporal prefetch, for data that is used only once. Encoded in the "Rt<0>" field as 1.

For more information on these prefetch operations, see Prefetch memory on page C3-180.

For other encodings of the "Rt" field, use `<imm5>`.

- `<imm5>` Is the prefetch operation encoding as an immediate, in the range 0 to 31, encoded in the "Rt" field. This syntax is only for encodings that are not accessible using `<prfop>`.

- `<label>` Is the program label from which the data is to be loaded. Its offset from the address of this instruction, in the range +/-1MB, is encoded as "imm19" times 4.
Operation

\[
\text{bits}(64) \text{ address } = \text{PC}[] + \text{offset};
\]

\textit{Prefetch}(\text{address, t<4:0>});
C6.2.194  PRFM (register)

Prefetch Memory (register) signals the memory system that data memory accesses from a specified address are likely to occur in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as preloading the cache line containing the specified address into one or more caches.

The effect of an PRFM instruction is IMPLEMENTATION DEFINED. For more information, see Prefetch memory on page C3-180.

ExtendType extend_type = DecodeRegExtend(option);
integer shift = if S == '1' then 3 else 0;

**Assembler symbols**

<prfop>  Is the prefetch operation, defined as <type><target><policy>.
<type> is one of:
PLD    Prefetch for load, encoded in the "Rt<4:3>" field as 0b00.
PLI    Preload instructions, encoded in the "Rt<4:3>" field as 0b01.
PST    Prefetch for store, encoded in the "Rt<4:3>" field as 0b10.
<target> is one of:
L1     Level 1 cache, encoded in the "Rt<2:1>" field as 0b00.
L2     Level 2 cache, encoded in the "Rt<2:1>" field as 0b01.
L3     Level 3 cache, encoded in the "Rt<2:1>" field as 0b10.
<policy> is one of:
KEEP   Retained or temporal prefetch, allocated in the cache normally. Encoded in the "Rt<0>" field as 0.
STRM   Streaming or non-temporal prefetch, for data that is used only once. Encoded in the "Rt<0>" field as 1.

For more information on these prefetch operations, see Prefetch memory on page C3-180.

For other encodings of the "Rt" field, use <imm5>.

<imm5>  Is the prefetch operation encoding as an immediate, in the range 0 to 31, encoded in the "Rt" field. This syntax is only for encodings that are not accessible using <prfop>.

<Xn|SP>  Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<Wm>    When option<0> is set to 0, is the 32-bit name of the general-purpose index register, encoded in the "Rm" field.
When option<0> is set to 1, is the 64-bit name of the general-purpose index register, encoded in the "Rm" field.

Is the index extend/shift specifier, defaulting to LSL, and which must be omitted for the LSL option when <amount> is omitted. encoded in the "option" field. It can have the following values:

- UXTW when option = 010
- LSL when option = 011
- SXTW when option = 110
- SXTX when option = 111

Is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in the "S" field. It can have the following values:

- #0 when S = 0
- #3 when S = 1

Shared decode for all encodings

```c
integer n = UInt(Rn);
integer t = UInt(Rt);
integer m = UInt(Rm);
```

Operation

```c
bits(64) offset = ExtendReg(m, extend_type, shift);
bm(64) address;
if n == 31 then
    address = SP[];
else
    address = X[n];
address = address + offset;
Prefetch(address, t<4:0>);
```
C6.2.195   PRFM (unscaled offset)

Prefetch Memory (unscaled offset) signals the memory system that data memory accesses from a specified address are likely to occur in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as preloading the cache line containing the specified address into one or more caches.

The effect of an PRFM instruction is IMPLEMENTATION DEFINED. For more information, see Prefetch memory on page C3-180.

For information about memory accesses, see Load/Store addressing modes on page C1-149.

- **<simm>** Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field.
Shared decode for all encodings

integer n = UInt(Rn);
integer t = UInt(Rt);

Operation

bits(64) address;

if n == 31 then
    address = SP[];
else
    address = X[n];

address = address + offset;

Prefetch(address, t<4:0>);
C6.2.196 PSB CSYNC

Profiling Synchronization Barrier. This instruction is a barrier that ensures that all existing profiling data for the current PE has been formatted, and profiling buffer addresses have been translated such that all writes to the profiling buffer have been initiated. A following DSB instruction completes when the writes to the profiling buffer have completed.

If the Statistical Profiling Extension is not implemented, this instruction executes as a NOP.

ARMv8.2

```
|31 30 29 28|27 26 25 24|23 22 21 20|19 18 17 16|15 14 13 12|11 8 7 5 4 3 2 1 0 |

CRm   op2
```

**System variant**

PSB CSYNC

**Decode for this encoding**

```
if !HaveStatisticalProfiling() then EndOfInstruction();
```

**Operation**

```
ProfilingSynchronizationBarrier();
```
C6.2.197 RBIT

Reverse Bits reverses the bit order in a register.

32-bit variant
Applies when \(sf == 0\).

RBIT <Wd>, <Wn>

64-bit variant
Applies when \(sf == 1\).

RBIT <Xd>, <Xn>

Decode for all variants of this encoding

\[
\begin{align*}
\text{integer } d &= \text{UInt}(Rd); \\
\text{integer } n &= \text{UInt}(Rn); \\
\text{integer } datasize &= \text{if } sf == '1' \text{ then } 64 \text{ else } 32;
\end{align*}
\]

Assembler symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wn> Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xn> Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.

Operation

\[
\begin{align*}
\text{bits(datasize) operand} &= X[n]; \\
\text{bits(datasize) result}; \\
\text{for } i = 0 \text{ to } \text{datasize}-1 \\
&\quad \text{result(datasize-1-i} > = \text{operand<i>}; \\
\text{X[d]} &= \text{result};
\end{align*}
\]
C6.2.198 RET

Return from subroutine branches unconditionally to an address in a register, with a hint that this is a subroutine return.

```
<table>
<thead>
<tr>
<th>31 30 29 28</th>
<th>27 26 25 24</th>
<th>23 22 21 20</th>

<td>M</td>
<td>Rn</td>
<td>Rm</td>
<td></td>
</tr>
</tbody>
</table>
```

**Integer variant**

RET {<Xn>}

**Decode for this encoding**

```c
int n = UInt(Rn);
```

**Assembler symbols**

<Xn> Is the 64-bit name of the general-purpose register holding the address to be branched to, encoded in the "Rn" field. Defaults to X30 if absent.

**Operation**

```c
bits(64) target = X[n];
BranchTo(target, BranchType_RET);
```
C6.2.199   RETAA, RETAB

Return from subroutine, with pointer authentication. This instruction authenticates the address that is held in LR, using SP as the modifier and the specified key, branches to the authenticated address, with a hint that this instruction is a subroutine return.

Key A is used for RETAA, and key B is used for RETAB.

If the authentication passes, the PE continues execution at the target of the branch. If the authentication fails, a Translation fault is generated.

The authenticated address is not written back to LR.

ARMv8.3

```
  [31 30 29 28] | [27 26 25 24] | [23 22 21 20] | [19 18 17 16] | [15 14 13 12] | [11 10 9 ] | 5 4 | 0 |

\(<Wn>\) Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.
\(<Xd>\) Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
\(<Xn>\) Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.

Operation

```plaintext
bits(datasize) operand = X[n];
bits(datasize) result;

integer containers = datasize DIV container_size;
integer elements_per_container = container_size DIV 8;
integer index = 0;
integer rev_index;
for c = 0 to containers-1
  rev_index = index + ((elements_per_container - 1) * 8);
  for e = 0 to elements_per_container-1
```
result<rev_index7:rev_index> = operand<index7:index>;
index = index + 8;
rev_index = rev_index - 8;

X[d] = result;
C6.2.202 REV32

Reverse bytes in 32-bit words reverses the byte order in each 32-bit word of a register.

C6.2.203   REV64

Reverse Bytes reverses the byte order in a 64-bit general-purpose register.

When assembling for ARMv8.2, an assembler must support this pseudo-instruction. It is OPTIONAL whether an assembler supports this pseudo-instruction when assembling for an architecture earlier than ARMv8.2.

This instruction is a pseudo-instruction of the REV instruction. This means that:

- The encodings in this description are named to match the encodings of REV.
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of REV gives the operational pseudocode for this instruction.

### 64-bit variant

REV64 <Xd>, <Xn>

is equivalent to

REV <Xd>, <Xn>

and is never the preferred disassembly.

### Assembler symbols

- `<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- `<Xn>` Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.

### Operation

The description of REV gives the operational pseudocode for this instruction.
C6.2.204  ROR (immediate)

Rotate right (immediate) provides the value of the contents of a register rotated by a variable number of bits. The bits that are rotated off the right end are inserted into the vacated bit positions on the left.

This instruction is an alias of the EXTR instruction. This means that:

- The encodings in this description are named to match the encodings of EXTR.
- The description of EXTR gives the operational pseudocode for this instruction.

32-bit variant

Applies when \( sf == 0 \&\& N == 0 \&\& imms == 0xxxxx \).

ROR \(<Wd>, <Ws>, #<shift>\)

is equivalent to

EXTR \(<Wd>, <Ws>, <Ws>, #<shift>\)

and is the preferred disassembly when \( Rn == Rm \).

64-bit variant

Applies when \( sf == 1 \&\& N == 1 \).

ROR \(<Xd>, <Xs>, #<shift>\)

is equivalent to

EXTR \(<Xd>, <Xs>, <Xs>, #<shift>\)

and is the preferred disassembly when \( Rn == Rm \).

Assembler symbols

\(<Wd>\) Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

\(<Ws>\) Is the 32-bit name of the general-purpose source register, encoded in the "Rn" and "Rm" fields.

\(<Xd>\) Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

\(<Xs>\) Is the 64-bit name of the general-purpose source register, encoded in the "Rn" and "Rm" fields.

\(<shift>\) For the 32-bit variant: is the amount by which to rotate, in the range 0 to 31, encoded in the "imms" field.

For the 64-bit variant: is the amount by which to rotate, in the range 0 to 63, encoded in the "imms" field.

Operation

The description of EXTR gives the operational pseudocode for this instruction.
C6.2.205   ROR (register)

Rotate Right (register) provides the value of the contents of a register rotated by a variable number of bits. The bits that are rotated off the right end are inserted into the vacated bit positions on the left. The remainder obtained by dividing the second source register by the data size defines the number of bits by which the first source register is right-shifted.

This instruction is an alias of the RORV instruction. This means that:

- The encodings in this description are named to match the encodings of RORV.
- The description of RORV gives the operational pseudocode for this instruction.

### 32-bit variant

Applies when \( sf = 0 \).

\[
\text{ROR} <Wd>, <Wn>, <Wm>
\]

is equivalent to

\[
\text{RORV} <Wd>, <Wn>, <Wm>
\]

and is always the preferred disassembly.

### 64-bit variant

Applies when \( sf = 1 \).

\[
\text{ROR} <Xd>, <Xn>, <Xm>
\]

is equivalent to

\[
\text{RORV} <Xd>, <Xn>, <Xm>
\]

and is always the preferred disassembly.

### Assembler symbols

- \(<Wd>\) Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Wn>\) Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.
- \(<Wm>\) Is the 32-bit name of the second general-purpose source register holding a shift amount from 0 to 31 in its bottom 5 bits, encoded in the "Rm" field.
- \(<Xd>\) Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Xn>\) Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.
- \(< Xm>\) Is the 64-bit name of the second general-purpose source register holding a shift amount from 0 to 63 in its bottom 6 bits, encoded in the "Rm" field.

### Operation

The description of RORV gives the operational pseudocode for this instruction.
C6.2.206  **RORV**

Rotate Right Variable provides the value of the contents of a register rotated by a variable number of bits. The bits that are rotated off the right end are inserted into the vacated bit positions on the left. The remainder obtained by dividing the second source register by the data size defines the number of bits by which the first source register is right-shifted.

This instruction is used by the alias **ROR** (register). The alias is always the preferred disassembly.

**32-bit variant**

Applies when \(sf = 0\).

\[
\text{RORV} \ <Wd>, \ <Wn>, \ <Wm>
\]

**64-bit variant**

Applies when \(sf = 1\).

\[
\text{RORV} \ <Xd>, \ <Xn>, \ < Xm>
\]

### Decode for all variants of this encoding

\[
\begin{align*}
\text{integer } & d = \text{UInt}(Rd); \\
\text{integer } & n = \text{UInt}(Rn); \\
\text{integer } & m = \text{UInt}(Rm); \\
\text{integer } & \text{datasize} = \text{if } sf = '1' \text{ then 64 else 32}; \\
\text{ShiftType } & \text{shift\_type} = \text{DecodeShift}(\text{op2});
\end{align*}
\]

### Assembler symbols

- \(<Wd>\) Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Wn>\) Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.
- \(<Wm>\) Is the 32-bit name of the second general-purpose source register holding a shift amount from 0 to 31 in its bottom 5 bits, encoded in the "Rm" field.
- \(<Xd>\) Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Xn>\) Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.
- \(<Xm>\) Is the 64-bit name of the second general-purpose source register holding a shift amount from 0 to 63 in its bottom 6 bits, encoded in the "Rm" field.

### Operation

\[
\begin{align*}
\text{bits}(\text{datasize}) & \text{ result}; \\
\text{bits}(\text{datasize}) & \text{ operand2} = X[m]; \\
\text{result} &= \text{ShiftReg}(n, \text{shift\_type}, \text{UInt(operand2)} \ MOD \ \text{datasize}); \\
X[d] &= \text{result};
\end{align*}
\]
C6.2.207  SBC

Subtract with Carry subtracts a register value and the value of NOT (Carry flag) from a register value, and writes the result to the destination register.

This instruction is used by the alias NGC. See Alias conditions for details of when each alias is preferred.

32-bit variant
Applies when \( sf = 0 \).

\[ \text{SBC} <Wd>, <Wn>, <Wm> \]

64-bit variant
Applies when \( sf = 1 \).

\[ \text{SBC} <Xd>, <Xn>, <Xm> \]

**Decode for all variants of this encoding**

\[
\begin{align*}
\text{integer } d &= \text{UInt}(Rd); \\
\text{integer } n &= \text{UInt}(Rn); \\
\text{integer } m &= \text{UInt}(Rm); \\
\text{integer } \text{datasize} &= \text{if } sf == \text{'}1\text{'} \text{ then } 64 \text{ else } 32;
\end{align*}
\]

Alias conditions

<table>
<thead>
<tr>
<th>Alias</th>
<th>is preferred when</th>

**Assembler symbols**

- \(<Wd>\) Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Wn>\) Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.
- \(<Wm>\) Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.
- \(<Xd>\) Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Xn>\) Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.
- \(<Xm>\) Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.

**Operation**

\[
\begin{align*}
\text{bits(datasize) result;} \\
\text{bits(datasize) operand1} &= X[n]; \\
\text{bits(datasize) operand2} &= X[m]; \\
\text{operand2} &= \text{NOT(operand2)};
\end{align*}
\]
(result, -) = AddWithCarry(operand1, operand2, PSTATE.C);
X[d] = result;
C6.2.208 SBCS

Subtract with Carry, setting flags, subtracts a register value and the value of NOT (Carry flag) from a register value, and writes the result to the destination register. It updates the condition flags based on the result.

This instruction is used by the alias NGCS. See Alias conditions for details of when each alias is preferred.

32-bit variant
Applies when $sf == 0$.
SBCS $<Wd>, <Wm>$

64-bit variant
Applies when $sf == 1$.
SBCS $<Xd>, <Xm>$

Decode for all variants of this encoding
integer $d = UInt(Rd)$;
integer $n = UInt(Rn)$;
integer $m = UInt(Rm)$;
integer data_size = if $sf == '1'$ then 64 else 32;

Alias conditions

Assembler symbols

$<Wd>$ Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
$<Wn>$ Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.
$<Wm>$ Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.
$<Xd>$ Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
$<Xn>$ Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.
$<Xm>$ Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.

Operation

bits(data_size) result;
bits(data_size) operand1 = X[n];
bits(data_size) operand2 = X[m];
bits(4) nzcv;
operand2 = NOT(operand2);
(result, nzcv) = AddWithCarry(operand1, operand2, PSTATE.C);

PSTATE.<N,Z,C,V> = nzcv;

X[d] = result;
C6.2.209   SBFIZ

Signed Bitfield Insert in Zero zeroes the destination register and copies any number of contiguous bits from a source register into any position in the destination register, sign-extending the most significant bit of the transferred value.

This instruction is an alias of the SBFM instruction. This means that:

- The encodings in this description are named to match the encodings of SBFM.
- The description of SBFM gives the operational pseudocode for this instruction.

### 32-bit variant

Applies when \( sf = 0 \) \&\& \( N = 0 \).

\[
\text{SBFIZ} \ <Wd>, \ <Wn>, \ #<lsb>, \ #<width>
\]

is equivalent to

\[
\text{SBFM} \ <Wd>, \ <Wn>, \ #(-<lsb> \text{ MOD } 32), \ #(<width>-1)
\]

and is the preferred disassembly when \( \text{UInt}(\text{imms}) < \text{UInt}(\text{immr}) \).

### 64-bit variant

Applies when \( sf = 1 \) \&\& \( N = 1 \).

\[
\text{SBFIZ} \ <Xd>, \ <Xn>, \ #<lsb>, \ #<width>
\]

is equivalent to

\[
\text{SBFM} \ <Xd>, \ <Xn>, \ #(-<lsb> \text{ MOD } 64), \ #(<width>-1)
\]

and is the preferred disassembly when \( \text{UInt}(\text{imms}) < \text{UInt}(\text{immr}) \).

### Assembler symbols

- \( <Wd> \) is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \( <Wn> \) is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.
- \( <Xd> \) is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \( <Xn> \) is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.
- \( <lsb> \) is the bit number of the lsb of the destination bitfield, in the range 0 to 31. For the 64-bit variant: is the bit number of the lsb of the destination bitfield, in the range 0 to 63.
- \( <width> \) is the width of the bitfield, in the range 1 to 32-\( <lsb> \). For the 64-bit variant: is the width of the bitfield, in the range 1 to 64-\( <lsb> \).

### Operation

The description of SBFM gives the operational pseudocode for this instruction.
C6.2.210 SBFM

Signed Bitfield Move copies any number of low-order bits from a source register into the same number of adjacent bits at any position in the destination register, shifting in copies of the sign bit in the upper bits and zeros in the lower bits.

This instruction is used by the aliases ASR (immediate), SBFIZ, SBFX, SXTB, SXTH, and SXTW. See Alias conditions on page C6-858 for details of when each alias is preferred.

32-bit variant

Applies when sf == 0 && N == 0.

SBFM <Wd>, <Wn>, #<immr>, #<imms>

64-bit variant

Applies when sf == 1 && N == 1.

SBFM <Xd>, <Xn>, #<immr>, #<imms>

Decode for all variants of this encoding

```c
integer d = UInt(Rd);
integer n = UInt(Rn);
integer datasize = if sf == '1' then 64 else 32;

integer R;
integer S;
bis(datasize) wmask;
bis(datasize) tmask;

if sf == '1' && N != '1' then ReservedValue();
if sf == '0' && (N != '0' || immr<5> != '0' || imms<5> != '0') then ReservedValue();

R = UInt(immr);
S = UInt(imms);
(wmask, tmask) = DecodeBitMasks(N, imms, immr, FALSE);
```

### Assembler symbols

- `<Wd>`: Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- `<Wn>`: Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.
- `<Xd>`: Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- `<Xn>`: Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.
- `<immr>`: For the 32-bit variant: is the right rotate amount, in the range 0 to 31, encoded in the "immr" field. For the 64-bit variant: is the right rotate amount, in the range 0 to 63, encoded in the "immr" field.
- `<imms>`: For the 32-bit variant: is the leftmost bit number to be moved from the source, in the range 0 to 31, encoded in the "imms" field. For the 64-bit variant: is the leftmost bit number to be moved from the source, in the range 0 to 63, encoded in the "imms" field.

### Operation

```
bits(datasize) src = X[n];

// perform bitfield move on low bits
bits(datasize) bot = ROR(src, R) AND wmask;

// determine extension bits (sign, zero or dest register)
bits(datasize) top = Replicate(src<<S);

// combine extension bits and result bits
X[d] = (top AND NOT(tmask)) OR (bot AND tmask);
```
C6.2.211  SBFX

Signed Bitfield Extract extracts any number of adjacent bits at any position from a register, sign-extends them to the size of the register, and writes the result to the destination register.

This instruction is an alias of the SBFM instruction. This means that:

- The encodings in this description are named to match the encodings of SBFM.
- The description of SBFM gives the operational pseudocode for this instruction.

### 32-bit variant

Applies when \( sf = 0 \) && \( N = 0 \).

\[ \text{SBFX} <Wd>, <Wn>, #<lsb>, #<width> \]

is equivalent to

\[ \text{SBFM} <Wd>, <Wn>, #<lsb>, #(<lsb>+<width>-1) \]

and is the preferred disassembly when \( \text{BFXPreferred}(sf, opc<1>, imms, immr) \).

### 64-bit variant

Applies when \( sf = 1 \) && \( N = 1 \).

\[ \text{SBFX} <Xd>, <Xn>, #<lsb>, #<width> \]

is equivalent to

\[ \text{SBFM} <Xd>, <Xn>, #<lsb>, #(<lsb>+<width>-1) \]

and is the preferred disassembly when \( \text{BFXPreferred}(sf, opc<1>, imms, immr) \).

### Assembler symbols

- \( <Wd> \): Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \( <Wn> \): Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.
- \( <Xd> \): Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \( <Xn> \): Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.
- \( <lsb> \): For the 32-bit variant: is the bit number of the lsb of the source bitfield, in the range 0 to 31.
  For the 64-bit variant: is the bit number of the lsb of the source bitfield, in the range 0 to 63.
- \( <width> \): For the 32-bit variant: is the width of the bitfield, in the range 1 to 32-<lsb>.
  For the 64-bit variant: is the width of the bitfield, in the range 1 to 64-<lsb>.

### Operation

The description of SBFM gives the operational pseudocode for this instruction.
Signed Divide divides a signed integer register value by another signed integer register value, and writes the result to the destination register. The condition flags are not affected.

SDIV <Wd>, <Wn>, <Wm>

32-bit variant
Applies when \( \text{sf} = 0 \).
SDIV <Wd>, <Wn>, <Wm>

64-bit variant
Applies when \( \text{sf} = 1 \).
SDIV <Xd>, <Xn>, <Xm>

\end{verbatim}

\texttt{CRm op2}
C6.2.215   SMADDL

Signed Multiply-Add Long multiplies two 32-bit register values, adds a 64-bit register value, and writes the result to the 64-bit destination register.

This instruction is used by the alias SMULL. See Alias conditions for details of when each alias is preferred.

64-bit variant

SMADDL <Xd>, <Wn>, <Wm>, <Xa>

Decode for this encoding

integer d = UInt(Rd);
icenter integer n = UInt(Rn);
icenter integer m = UInt(Rm);
icenter integer a = UInt(Ra);

Alias conditions

<table>
<thead>
<tr>
<th>Alias</th>
<th>is preferred when</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMULL</td>
<td>Ra == '11111'</td>
</tr>
</tbody>
</table>

Assembler symbols

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wn> Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

<Wm> Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

<Xa> Is the 64-bit name of the third general-purpose source register holding the addend, encoded in the "Ra" field.

Operation

bits(32) operand1 = X[n];
bits(32) operand2 = X[m];
bits(64) operand3 = X[a];

integer result;

result = Int(operand3, FALSE) + (Int(operand1, FALSE) * Int(operand2, FALSE));

X[d] = result<63:0>;
C6.2.216  SMC

Secure Monitor Call causes an exception to EL3.

SMC is available only for software executing at EL1 or higher. It is UNDEFINED in EL0.

If the values of HCR_EL2.TSC and SCR_EL3.SMD are both 0, execution of an SMC instruction at EL1 or higher generates a Secure Monitor Call exception, recording it in ESR_ELx, using the EC value 0x17, that is taken to EL3.

If the value of HCR_EL2.TSC is 1, execution of an SMC instruction in a Non-secure EL1 state generates an exception that is taken to EL2, regardless of the value of SCR_EL3.SMD. For more information, see Traps to EL2 of Non-secure EL1 execution of SMC instructions on page D1-1927.

If the value of HCR_EL2.TSC is 0 and the value of SCR_EL3.SMD is 1, the SMC instruction is UNDEFINED.

<tbody>
<tr>
<td>1 1 0 1 0 1 0 0 0 0</td>
<td>imm16</td>
<td>0 0 0 1 1</td>
<td></td>
</tr>
</tbody>
</table>

System variant
SMC #<imm>

Decode for this encoding
// Empty.

Assembler symbols
<imm> Is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm16" field.

Operation
AArch64.CheckForSMCUndefOrTrap(imm16);

if SCR_EL3.SMD == '1' then
  // SMC disabled
  AArch64.UndefinedFault();
else
  AArch64.CallSecureMonitor(imm16);
C6.2.217  SMNEGL

Signed Multiply-Negate Long multiplies two 32-bit register values, negates the product, and writes the result to the 64-bit destination register.

This instruction is an alias of the SMSUBL instruction. This means that:

- The encodings in this description are named to match the encodings of SMSUBL.
- The description of SMSUBL gives the operational pseudocode for this instruction.

### 64-bit variant

SMNEGL <Xd>, <Wn>, <Wm>

is equivalent to

SMSUBL <Xd>, <Wn>, <Wm>, XZR

and is always the preferred disassembly.

### Assembler symbols

- `<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- `<Wn>` Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
- `<Wm>` Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

### Operation

The description of SMSUBL gives the operational pseudocode for this instruction.
C6.2.218 SMSUBL

Signed Multiply-Subtract Long multiplies two 32-bit register values, subtracts the product from a 64-bit register value, and writes the result to the 64-bit destination register.

This instruction is used by the alias SMNEGL. See Alias conditions for details of when each alias is preferred.

**64-bit variant**

SMSUBL <Xd>, <Wn>, <Wm>, <Xa>

**Decode for this encoding**

```plaintext
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer a = UInt(Ra);

Alias conditions

<table>
<thead>
<tr>
<th>Alias</th>
<th>is preferred when</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMNEGL</td>
<td>Ra == '11111'</td>
</tr>
</tbody>
</table>

**Assembler symbols**

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wn> Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

<Wm> Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

<Xa> Is the 64-bit name of the third general-purpose source register holding the minuend, encoded in the "Ra" field.

**Operation**

```plaintext
bits(32) operand1 = X[n];
bits(32) operand2 = X[m];
bits(64) operand3 = X[a];

integer result;

result = Int(operand3, FALSE) - (Int(operand1, FALSE) * Int(operand2, FALSE));
X[d] = result<63:0>;
```
C6.2.219  SMULH

Signed Multiply High multiplies two 64-bit register values, and writes bits[127:64] of the 128-bit result to the 64-bit destination register.

```
<table>
<thead>
<tr>
<th>31 30 29 28</th>

```

**64-bit variant**

$\text{SMULH } <X_d>, <X_n>, <X_m>$

**Decode for this encoding**

- integer $d = \text{UInt}(Rd)$;
- integer $n = \text{UInt}(Rn)$;
- integer $m = \text{UInt}(Rm)$;

**Assembler symbols**

- $<X_d>$ Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- $<X_n>$ Is the 64-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
- $<X_m>$ Is the 64-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

**Operation**

```
bits(64) operand1 = X[n];
bits(64) operand2 = X[m];

integer result;

result = Int(operand1, FALSE) * Int(operand2, FALSE);

X[d] = result[127:64];
```
SMULL

Signed Multiply Long multiplies two 32-bit register values, and writes the result to the 64-bit destination register.

This instruction is an alias of the SMADDL instruction. This means that:

- The encodings in this description are named to match the encodings of SMADDL.
- The description of SMADDL gives the operational pseudocode for this instruction.

<table>

64-bit variant

SMULL <Xd>, <Wn>, <Wm>

is equivalent to

SMADDL <Xd>, <Wn>, <Wm>, XZR

and is always the preferred disassembly.

Assembler symbols

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wn> Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

<Wm> Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

Operation

The description of SMADDL gives the operational pseudocode for this instruction.
C6.2.221 STADDB, STADDLB

Atomic add on byte in memory, without return, atomically loads an 8-bit byte from memory, adds the value held in a register to it, and stores the result back to memory.

- STADDB has no memory ordering semantics.

For information about memory accesses see Load/Store addressing modes on page C1-149.

This instruction is an alias of the LDADDB, LDADDAB, LDADDBL, LDADDLL instruction. This means that:

- The encodings in this description are named to match the encodings of LDADDB, LDADDAB, LDADDBL, LDADDLL.
- The description of LDADDB, LDADDAB, LDADDBL, LDADDLL gives the operational pseudocode for this instruction.

No memory ordering variant

Applies when \( R = 0 \).

STADDB <Ws>, [<Xn|SP>]

is equivalent to

LDADDB <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

Release variant

Applies when \( R = 1 \).

STADDLB <Ws>, [<Xn|SP>]

is equivalent to

LDADDLB <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

The description of LDADDB, LDADDAB, LDADDBL, LDADDLL gives the operational pseudocode for this instruction.
C6.2.222 STADDH, STADDLH

Atomic add on halfword in memory, without return, atomically loads a 16-bit halfword from memory, adds the value held in a register to it, and stores the result back to memory.

- STADDH has no memory ordering semantics.

For information about memory accesses see *Load/Store addressing modes* on page C1-149.

This instruction is an alias of the LDADDH, LDADDAH, LDADDALH, LDADDLH instruction. This means that:

- The encodings in this description are named to match the encodings of LDADDH, LDADDAH, LDADDALH, LDADDLH.
- The description of LDADDH, LDADDAH, LDADDALH, LDADDLH gives the operational pseudocode for this instruction.

ARMv8.1

No memory ordering variant

Applies when \(R == 0\).

STADDH \(<\text{Ws}>, [<\text{Xn}|\text{SP}>]\)

is equivalent to

LDADDH \(<\text{Ws}>, \text{WZR}, [<\text{Xn}|\text{SP}>]\)

and is always the preferred disassembly.

Release variant

Applies when \(R == 1\).

STADDLH \(<\text{Ws}>, [<\text{Xn}|\text{SP}>]\)

is equivalent to

LDADDLH \(<\text{Ws}>, \text{WZR}, [<\text{Xn}|\text{SP}>]\)

and is always the preferred disassembly.

Assembler symbols

\(<\text{Ws}>\) Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

\(<\text{Xn}|\text{SP}>\) Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

The description of LDADDH, LDADDAH, LDADDALH, LDADDLH gives the operational pseudocode for this instruction.
C6.2.223  STADD, STADDL

Atomic add on word or doubleword in memory, without return, atomically loads a 32-bit word or 64-bit doubleword from memory, adds the value held in a register to it, and stores the result back to memory.

- STADD has no memory ordering semantics.

For information about memory accesses see Load/Store addressing modes on page C1-149.

This instruction is an alias of the LDADD, LDADDA, LDADDL, LDADDL instruction. This means that:

- The encodings in this description are named to match the encodings of LDADD, LDADDA, LDADDL, LDADDL.
- The description of LDADD, LDADDA, LDADDL, LDADDL gives the operational pseudocode for this instruction.

<Ws> Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

**Operation**

The description of LDCLRB, LDCLRAB, LDCLRALB, LDCLRLB gives the operational pseudocode for this instruction.
C6.2.225  STCLRH, STCLRLH

Atomic bit clear on halfword in memory, without return, atomically loads a 16-bit halfword from memory, performs a bitwise AND with the complement of the value held in a register on it, and stores the result back to memory.

• STCLRH has no memory ordering semantics.
• STCLRLH stores to memory with release semantics, as described in Load-Acquire, Load-AcquirePC, and Store-Release on page B2-101.

For information about memory accesses see Load/Store addressing modes on page C1-149.

This instruction is an alias of the LDCLRH, LDCLRAH, LDCLRALH, LDCLRLH instruction. This means that:

• The encodings in this description are named to match the encodings of LDCLRH, LDCLRAH, LDCLRALH, LDCLRLH.
• The description of LDCLRH, LDCLRAH, LDCLRALH, LDCLRLH gives the operational pseudocode for this instruction.

ARMv8.1

No memory ordering variant

Applies when R == 0.

STCLRH <Ws>, [<Xn|SP>]
is equivalent to

LDCLRH <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

Release variant

Applies when R == 1.

STCLRLH <Ws>, [<Xn|SP>]
is equivalent to

LDCLRLH <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

Assembler symbols

<Ws>  Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xn|SP>  Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

The description of LDCLRH, LDCLRAH, LDCLRALH, LDCLRLH gives the operational pseudocode for this instruction.
C6.2.226 STCLR, STCLRL

Atomic bit clear on word or doubleword in memory, without return, atomically loads a 32-bit word or 64-bit doubleword from memory, performs a bitwise AND with the complement of the value held in a register on it, and stores the result back to memory.

- STCLR has no memory ordering semantics.

For information about memory accesses see Load/Store addressing modes on page C1-149.

This instruction is an alias of the LDCLR, LDCLRA, LDCLRAL, LDCLRL instruction. This means that:

- The encodings in this description are named to match the encodings of LDCLR, LDCLRA, LDCLRAL, LDCLRL.
- The description of LDCLR, LDCLRA, LDCLRAL, LDCLRL gives the operational pseudocode for this instruction.

**Assembler symbols**

- \(<Ws>\) Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

- \(<Xs>\) Is the 64-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

- \(<Xn|SP>\) Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

**Operation**

The description of LDCLR, LDCLRA, LDCLRAL, LDCLRL gives the operational pseudocode for this instruction.
C6.2.227   STEORB, STEORLB

Atomic exclusive OR on byte in memory, without return, atomically loads an 8-bit byte from memory, performs an exclusive OR with the value held in a register on it, and stores the result back to memory.

- STEORB has no memory ordering semantics.

For information about memory accesses see Load/Store addressing modes on page C1-149.

This instruction is an alias of the LDEORB, LDEORAB, LDEORALB, LDEORLB instruction. This means that:

- The encodings in this description are named to match the encodings of LDEORB, LDEORAB, LDEORALB, LDEORLB.
- The description of LDEORB, LDEORAB, LDEORALB, LDEORLB gives the operational pseudocode for this instruction.

ARMv8.1

No memory ordering variant
Applies when \( R = 0 \).
STEORB \(<Ws>, [<Xn|SP>]\)
is equivalent to
LDEORB \(<Ws>, WZR, [<Xn|SP>]\)
and is always the preferred disassembly.

Release variant
Applies when \( R = 1 \).
STEORLB \(<Ws>, [<Xn|SP>]\)
is equivalent to
LDEORLB \(<Ws>, WZR, [<Xn|SP>]\)
and is always the preferred disassembly.

Assembler symbols

\(<Ws>\)   Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

\(<Xn|SP>\) Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation
The description of LDEORB, LDEORAB, LDEORALB, LDEORLB gives the operational pseudocode for this instruction.
C6.2.228   STEORH, STEORLH

Atomic exclusive OR on halfword in memory, without return, atomically loads a 16-bit halfword from memory, performs an exclusive OR with the value held in a register on it, and stores the result back to memory.

• STEORH has no memory ordering semantics.
• STEORLH stores to memory with release semantics, as described in Load-Acquire, Load-AcquirePC, and Store-Release on page B2-101.

For information about memory accesses see Load/Store addressing modes on page C1-149.

This instruction is an alias of the LDEORH, LDEORAH, LDEORALH, LDEORLH instruction. This means that:

• The encodings in this description are named to match the encodings of LDEORH, LDEORAH, LDEORALH, LDEORLH.
• The description of LDEORH, LDEORAH, LDEORALH, LDEORLH gives the operational pseudocode for this instruction.

ARMv8.1

No memory ordering variant

Applies when \( R = 0 \).

STEORH \(<Ws>\), \ [<Xn|SP>]\n
is equivalent to

LDEORH \(<Ws>\), WZR, \ [<Xn|SP>]\n
and is always the preferred disassembly.

Release variant

Applies when \( R = 1 \).

STEORLH \(<Ws>\), \ [<Xn|SP>]\n
is equivalent to

LDEORLH \(<Ws>\), WZR, \ [<Xn|SP>]\n
and is always the preferred disassembly.

Assembler symbols

\(<Ws>\) Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

\(<Xn|SP>\) Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

The description of LDEORH, LDEORAH, LDEORALH, LDEORLH gives the operational pseudocode for this instruction.
C6.2.229 STEOR, STEORL

Atomic exclusive OR on word or doubleword in memory, without return, atomically loads a 32-bit word or 64-bit
doubleword from memory, performs an exclusive OR with the value held in a register on it, and stores the result
back to memory.

• STEOR has no memory ordering semantics.

• STEORL stores to memory with release semantics, as described in Load-Acquire, Load-AcquirePC, and

For information about memory accesses see Load/Store addressing modes on page C1-149.

This instruction is an alias of the LDEOR, LDEORA, LDEORAL, LDEORL instruction. This means that:

• The encodings in this description are named to match the encodings of LDEOR, LDEORA, LDEORAL,
  LDEORL.

• The description of LDEOR, LDEORA, LDEORAL, LDEORL gives the operational pseudocode for this
  instruction.

32-bit LDEOR alias variant

Applies when size == 10 && R == 0.

STEOR <Ws>, [<Xn|SP>]

is equivalent to

LDEOR <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

32-bit LDEORL alias variant

Applies when size == 10 && R == 1.

STEORL <Ws>, [<Xn|SP>]

is equivalent to

LDEORL <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

64-bit LDEOR alias variant

Applies when size == 11 && R == 0.

STEOR <Xs>, [<Xn|SP>]

is equivalent to

LDEOR <Xs>, XZR, [<Xn|SP>]

and is always the preferred disassembly.
64-bit LDEORL alias variant

Applies when size == 11 && R == 1.

STEORL <Xs>, [<Xn|SP>]

is equivalent to

LDEORL <Xs>, XZR, [<Xn|SP>]

and is always the preferred disassembly.

Assembler symbols

<Xs> Is the 64-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

The description of LDEOR, LDEORA, LDEORAL, LDEORL gives the operational pseudocode for this instruction.
C6.2.230    STLLRB

Store LORelease Register Byte stores a byte from a 32-bit register to a memory location. The instruction also has memory ordering semantics as described in LoadLOAcquire, StoreLORelease on page B2-102. For information about memory accesses, see Load/Store addressing modes on page C1-149.

    address = X[n];
data = X[t];
Mem[address, 2, AccType_ORDERED] = data;
C6.2.236  STLXP

Store-Release Exclusive Pair of registers stores two 32-bit words or two 64-bit doublewords to a memory location if the PE has exclusive access to the memory address, from two registers, and returns a status value of 0 if the store was successful, or of 1 if no store was performed. See Synchronization and semaphores on page B2-128. A 32-bit pair requires the address to be doubleword aligned and is single-copy atomic at doubleword granularity. A 64-bit pair requires the address to be quadword aligned and, if the Store-Exclusive succeeds, it causes a single-copy atomic update of the 128-bit memory location being updated. The instruction also has memory ordering semantics as described in Load-Acquire, Load-AcquirePC, and Store-Release on page B2-101. For information about memory accesses see Load/Store addressing modes on page C1-149.

32-bit variant

Applies when sz == 0.

STLXP <Ws>, <Wt1>, <Wt2>, [Xn|SP]

64-bit variant

Applies when sz == 1.

STLXP <Ws>, <Xt1>, <Xt2>, [Xn|SP]

Decode for all variants of this encoding

integer n = UInt(Rn);
integer t = UInt(Rt);
integer t2 = UInt(Rt2);    // ignored by load/store single register
integer s = UInt(Rs);    // ignored by all loads and store-release
integer elsize = 32 << UInt(sz);
integer datasize = elsize * 2;

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors, and particularly STLXP on page K1-6423.

Assembler symbols

<Ws>  Is the 32-bit name of the general-purpose register into which the status result of the store exclusive is written, encoded in the "Rs" field. The value returned is:
0     If the operation updates memory.
1     If the operation fails to update memory.

<Xt1>  Is the 64-bit name of the first general-purpose register to be transferred, encoded in the "Rt" field.

<Xt2>  Is the 64-bit name of the second general-purpose register to be transferred, encoded in the "Rt2" field.

<Wt1>  Is the 32-bit name of the first general-purpose register to be transferred, encoded in the "Rt" field.

<Wt2>  Is the 32-bit name of the second general-purpose register to be transferred, encoded in the "Rt2" field.
<Xn|SP>       Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

**Aborts and alignment**

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Ws> is not updated.

Accessing an address that is not aligned to the size of the data being accessed causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If AArch64.ExclusiveMonitorsPass() returns TRUE, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If AArch64.ExclusiveMonitorsPass() returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

**Operation**

```plaintext
bits(64) address;
bits(datasize) data;
constant integer dbytes = datasize DIV 8;
boolean rt_unknown = FALSE;
boolean rn_unknown = FALSE;

if s == t || (s == t2) then
  Constraint c = ConstrainUnpredictable();
  assert c IN {Constraint_UNKNOWN, Constraint_NONE, Constraint_UNDEF, Constraint_NOP};
  case c of
    when Constraint_UNKNOWN rt_unknown = TRUE;    // store UNKNOWN value
    when Constraint_NONE    rt_unknown = FALSE;    // store original value
    when Constraint_UNDEF   UnallocatedEncoding();
    when Constraint_NOP     EndOfInstruction();
  end;

if s == n && n != 31 then
  Constraint c = ConstrainUnpredictable();
  assert c IN {Constraint_UNKNOWN, Constraint_NONE, Constraint_UNDEF, Constraint_NOP};
  case c of
    when Constraint_UNKNOWN rn_unknown = TRUE;    // address is UNKNOWN
    when Constraint_NONE    rn_unknown = FALSE;    // address is original base
    when Constraint_UNDEF   UnallocatedEncoding();
    when Constraint_NOP     EndOfInstruction();
  end;

if n == 31 then
  CheckSPAlignment();
  address = SP[];
elsif rn_unknown then
  address = bits(64) UNKNOWN;
else
  address = X[n];

if rt_unknown then
  data = bits(datasize) UNKNOWN;
else
  bits(datasize DIV 2) el1 = X[t];
  bits(datasize DIV 2) el2 = X[t2];
  data = if BigEndian() then el1:el2 else el2:el1;
  bit status = '1';
  // Check whether the Exclusives monitors are set to include the
  // physical memory locations corresponding to virtual address
  // range [address, address+dbytes-1].
  if AArch64.ExclusiveMonitorsPass(address, dbytes) then
    // This atomic write will be rejected if it does not refer
    // to the same physical locations after address translation.
```
Mem[address, dbytes, AccType_ORDERED] = data;
status = ExclusiveMonitorsStatus();
X[s] = ZeroExtend(status, 32);
C6.2.237   STLXR

Store-Release Exclusive Register stores a 32-bit word or a 64-bit doubleword to memory if the PE has exclusive
access to the memory address, from two registers, and returns a status value of 0 if the store was successful, or of 1
if no store was performed. See Synchronization and semaphores on page B2-128. The memory access is atomic.
The instruction also has memory ordering semantics as described in Load-Acquire, Load-AcquirePC, and
Store-Release on page B2-101. For information about memory accesses see Load/Store addressing modes on
page C1-149.

32-bit variant

Applies when size == 10.
STLXR <Ws>, <Wt>, [<Xn|SP>{,#0}]

64-bit variant

Applies when size == 11.
STLXR <Ws>, <Xt>, [<Xn|SP>{,#0}]

Decode for all variants of this encoding

integer n = UInt(Rn);
integer t = UInt(Rt);
integer s = UInt(Rs);    // ignored by all loads and store-release
integer elsize = 8 << UInt(size);

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1
Architectural Constraints on UNPREDICTABLE behaviors, and particularly STLXR on page K1-6423.

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register into which the status result of the store exclusive
is written, encoded in the "Rs" field. The value returned is:
0     If the operation updates memory.
1     If the operation fails to update memory.

<Xt> Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

<Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

• Memory is not updated.
• <Ws> is not updated.
Accessing an address that is not aligned to the size of the data being accessed causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If `AArch64.ExclusiveMonitorsPass()` returns `TRUE`, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If `AArch64.ExclusiveMonitorsPass()` returns `FALSE` and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

**Operation**

```plaintext
bits(64) address;
bits(elsize) data;

C6.2.243  STR (register)

Store Register (register) calculates an address from a base register value and an offset register value, and stores a 32-bit word or a 64-bit doubleword to the calculated address, from a register. For information about memory accesses, see Load/Store addressing modes on page C1-149.

The instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an offset register value. The offset can be optionally shifted and extended.

```
32-bit variant
Applies when \text{size} == 10.

\text{STR} \ <Wt>, [\langle Xn|SP\rangle, (\langle Wm\rangle|\langle Xm\rangle)\{, \langle extend\rangle \{\langle amount\rangle\}\}]
```

```
64-bit variant
Applies when \text{size} == 11.

\text{STR} \ <Xt>, [\langle Xn|SP\rangle, (\langle Wm\rangle|\langle Xm\rangle)\{, \langle extend\rangle \{\langle amount\rangle\}\}]
```

**Decode for all variants of this encoding**

```
\text{integer scale} = \text{UInt}(\text{size});
\text{if} \ \text{option<0>} = '0' \ \text{then UnallocatedEncoding();} \quad \text{// sub-word index}
\text{ExtendType extend_type} = \text{DecodeRegExtend(option)};
\text{integer shift} = \text{if} \ S == '1' \ \text{then} \ \text{scale} \ \text{else} \ 0;
```

**Assembler symbols**

- \text{<Wt>}  
  Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

- \text{<Xt>}  
  Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

- \text{<Xn|SP>}  
  Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

- \text{<Wm>}  
  When \text{option<0>} is set to 0, is the 32-bit name of the general-purpose index register, encoded in the "Rm" field.

- \text{<Xm>}  
  When \text{option<0>} is set to 1, is the 64-bit name of the general-purpose index register, encoded in the "Rm" field.

- \text{<extend>}  
  Is the index extend/shift specifier, defaulting to LSL, and which must be omitted for the LSL option when \text{<amount>} is omitted, encoded in the "option" field. It can have the following values:
    - \text{UXTW} when \text{option} = 010
    - \text{LSL} when \text{option} = 011
    - \text{SXTW} when \text{option} = 110
    - \text{SXTX} when \text{option} = 111

- \text{<amount>}  
  For the 32-bit variant: is the index shift amount, optional only when \text{<extend>} is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in the "S" field. It can have the following values:
    - #0 when \text{S} = 0
    - #2 when \text{S} = 1

For the 64-bit variant: is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in the "S" field. It can have the following values:

<table>
<thead>
<tr>
<th>Value</th>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>#0</td>
<td>S = 0</td>
</tr>
<tr>
<td>#3</td>
<td>S = 1</td>
</tr>
</tbody>
</table>

**Shared decode for all encodings**

```plaintext
integer n = UInt(Rn);
integer t = UInt(Rt);
integer m = UInt(Rm);

integer datasize = 8 << scale;
```

**Operation**

```plaintext
bits(64) offset = ExtendReg(m, extend_type, shift);
bits(64) address;
bits(datasize) data;

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];

address = address + offset;

data = X[t];
Mem[address, datasize DIV 8, AccType_NORMAL] = data;
```
C6.2.244   STRB (immediate)

Store Register Byte (immediate) stores the least significant byte of a 32-bit register to memory. The address that is used for the store is calculated from a base register and an immediate offset. For information about memory accesses, see Load/Store addressing modes on page C1-149.

**Unsigned offset variant**

\[
\text{STRH } <Wt>, [<Xn|SP>{, \#<pimm}>]
\]

**Decode for this encoding**

boolean wback = FALSE;
boolean postindex = FALSE;
bits(64) offset = \text{LSL}(\text{ZeroExtend}(\text{imm12}, 64), 1);
Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors, and particularly STRH (immediate) on page K1-6425.

Assembler symbols

<\Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<\simm> Is the signed immediate byte offset, in the range -256 to 255, encoded in the "imm9" field.

<\pimm> Is the optional positive immediate byte offset, a multiple of 2 in the range 0 to 8190, defaulting to 0 and encoded in the "imm12" field as \pimm/2.

Shared decode for all encodings

integer n = UInt(Rn);
integer t = UInt(Rt);

Operation for all encodings

bits(64) address;
bits(16) data;
boolean rt_unknown = FALSE;

if wback && n == t && n != 31 then
    c = ConstrainUnpredictable();
    assert c IN {Constraint_NONE, Constraint_UNKNOWN, Constraint_UNDEF, Constraint_NOP};
    case c of
        when Constraint_NONE    rt_unknown = FALSE;    // value stored is original value
        when Constraint_UNKNOWN rt_unknown = TRUE;    // value stored is UNKNOWN
        when Constraint_UNDEF   UnallocatedEncoding();
        when Constraint_NOP     EndOfInstruction();
    end_case

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];

if !postindex then
    address = address + offset;

if rt_unknown then
    data = bits(16) UNKNOWN;
else
    data = X[t];
Mem[address, 2, AccType_NORMAL] = data;

if wback then
    if postindex then
        address = address + offset;
    if n == 31 then
        SP[] = address;
    else
        X[n] = address;
C6.2.247 STRH (register)

Store Register Halfword (register) calculates an address from a base register value and an offset register value, and stores a halfword from a 32-bit register to the calculated address. For information about memory accesses, see Load/Store addressing modes on page C1-149.

The instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an offset register value. The offset can be optionally shifted and extended.

32-bit variant

STRH <Wt>, [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}}]

Decode for this encoding

if option<1> == '0' then UnallocatedEncoding(); // sub-word index
ExtendType extend_type = DecodeRegExtend(option);
integer shift = if S == '1' then 1 else 0;

Assembler symbols

<Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<Wm> When option<0> is set to 0, is the 32-bit name of the general-purpose index register, encoded in the "Rm" field.
<Xm> When option<0> is set to 1, is the 64-bit name of the general-purpose index register, encoded in the "Rm" field.
<extend> Is the index extend/shift specifier, defaulting to LSL, and which must be omitted for the LSL option when <amount> is omitted. encoded in the "option" field. It can have the following values:
  UXTW when option = 010
  LSL when option = 011
  SXTW when option = 110
  SXTX when option = 111
<amount> Is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in the "S" field. It can have the following values:
  #0 when S = 0
  #1 when S = 1

Shared decode for all encodings

integer n = UInt(Rn);
integer t = UInt(Rt);
integer m = UInt(Rm);
Operation

bits(64) offset = ExtendReg(m, extend_type, shift);
bits(64) address;
bits(16) data;

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];

address = address + offset;

data = X[t];
Mem[address, 2, AccType_NORMAL] = data;
C6.2.248  STSETB, STSETLB

Atomic bit set on byte in memory, without return, atomically loads an 8-bit byte from memory, performs a bitwise
OR with the value held in a register on it, and stores the result back to memory.

- STSETB has no memory ordering semantics.
- STSETLB stores to memory with release semantics, as described in Load-Acquire, Load-AcquirePC, and

For information about memory accesses see Load/Store addressing modes on page C1-149.

This instruction is an alias of the LDSETB, LDSETAB, LDSETALB, LDSETLB instruction. This means that:

- The encodings in this description are named to match the encodings of LDSETB, LDSETAB, LDSETALB,
  LDSETLB.
- The description of LDSETB, LDSETAB, LDSETALB, LDSETLB gives the operational pseudocode for this
  instruction.

ARMv8.1

```
size A opc Rt
[31 30 29 28|27 26 25 24|23 22 21 20]  16|15 14 12|11 10 9 | 5 4 | 0 |
0 0 1 1 1 | 0 0 0 0 | Rs 0 0 1 1 0 0 | Rn 1 1 1 1 1 1
```

No memory ordering variant

Applies when R == 0.

STSETB <Ws>, [<Xn|SP>]

is equivalent to

LDSETB <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

Release variant

Applies when R == 1.

STSETLB <Ws>, [<Xn|SP>]

is equivalent to

LDSETLB <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

Assembler symbols

- <Ws> Is the 32-bit name of the general-purpose register holding the data value to be operated on with the
  contents of the memory location, encoded in the "Rs" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

The description of LDSETB, LDSETAB, LDSETALB, LDSETLB gives the operational pseudocode for this
instruction.
C6.2.249  STSETH, STSETLH

Atomic bit set on halfword in memory, without return, atomically loads a 16-bit halfword from memory, performs a bitwise OR with the value held in a register on it, and stores the result back to memory.

- STSETH has no memory ordering semantics.

For information about memory accesses see Load/Store addressing modes on page C1-149.

This instruction is an alias of the LDSETH, LDSETAH, LDSETALH, LDSETLH instruction. This means that:

- The encodings in this description are named to match the encodings of LDSETH, LDSETAH, LDSETALH, LDSETLH.
- The description of LDSETH, LDSETAH, LDSETALH, LDSETLH gives the operational pseudocode for this instruction.

ARMv8.1

No memory ordering variant

Applies when R == 0.

STSETH <Ws>, [<Xn|SP>]

is equivalent to

LDSETH <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

Release variant

Applies when R == 1.

STSETLH <Ws>, [<Xn|SP>]

is equivalent to

LDSETLH <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

The description of LDSETH, LDSETAH, LDSETALH, LDSETLH gives the operational pseudocode for this instruction.
C6.2.250  STSET, STSETL

Atomic bit set on word or doubleword in memory, without return, atomically loads a 32-bit word or 64-bit doubleword from memory, performs a bitwise OR with the value held in a register on it, and stores the result back to memory.

- STSET has no memory ordering semantics.

For information about memory accesses see Load/Store addressing modes on page C1-149.

This instruction is an alias of the LDSET, LDSETA, LDSETAL, LDSETL instruction. This means that:

- The encodings in this description are named to match the encodings of LDSET, LDSETA, LDSETAL, LDSETL.
- The description of LDSET, LDSETA, LDSETAL, LDSETL gives the operational pseudocode for this instruction.

ARMv8.1

32-bit LDSET alias variant

Applies when size == 10 && R == 0.
STSET <Ws>, [<Xn|SP>]
is equivalent to
LDSET <Ws>, WZR, [<Xn|SP>]
and is always the preferred disassembly.

32-bit LDSETL alias variant

Applies when size == 10 && R == 1.
STSETL <Ws>, [<Xn|SP>]
is equivalent to
LDSETL <Ws>, WZR, [<Xn|SP>]
and is always the preferred disassembly.

64-bit LDSET alias variant

Applies when size == 11 && R == 0.
STSET <Xs>, [<Xn|SP>]
is equivalent to
LDSET <Xs>, XZR, [<Xn|SP>]
and is always the preferred disassembly.
**64-bit LDSETL alias variant**

Applies when \( \text{size} == 11 \) \&\& \( R == 1 \).

\[
\text{STSETL} \ <\!\!Xs\!\!> , \ [\ <\!\!Xn\!\!>|SP\!\!>]
\]

is equivalent to

\[
\text{LDSETL} \ <\!\!Xs\!\!> , \ XZR , \ [\ <\!\!Xn\!\!>|SP\!\!>]
\]

and is always the preferred disassembly.

**Assembler symbols**

- \(<\!\!Ws\!\!>\) Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.
- \(<\!\!Xs\!\!>\) Is the 64-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.
- \(<\!\!Xn\!\!>|SP\!\!>\) Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

**Operation**

The description of \( \text{LDSET, LDSETA, LDSETAL, LDSETL} \) gives the operational pseudocode for this instruction.
C6.2.251 STSMAXB, STSMAXLB

Atomic signed maximum on byte in memory, without return, atomically loads an 8-bit byte from memory, compares it against the value held in a register, and stores the larger value back to memory, treating the values as signed numbers.

- STSMAXB has no memory ordering semantics.

For information about memory accesses see Load/Store addressing modes on page C1-149.

This instruction is an alias of the LDSMAXB, LDSMAXAB, LDSMAXALB, LDSMAXLB instruction. This means that:

- The encodings in this description are named to match the encodings of LDSMAXB, LDSMAXAB, LDSMAXALB, LDSMAXLB.
- The description of LDSMAXB, LDSMAXAB, LDSMAXALB, LDSMAXLB gives the operational pseudocode for this instruction.

32-bit LDSMAX alias variant

Applies when size == 10 && R == 0.
STSMAX <Ws>, [<Xn|SP>]
is equivalent to
LDSMAX <Ws>, WZR, [<Xn|SP>]
and is always the preferred disassembly.

32-bit LDSMAXL alias variant

Applies when size == 10 && R == 1.
STSMAXL <Ws>, [<Xn|SP>]
is equivalent to
LDSMAXL <Ws>, WZR, [<Xn|SP>]
and is always the preferred disassembly.

64-bit LDSMAX alias variant

Applies when size == 11 && R == 0.
STSMAX <Xs>, [<Xn|SP>]
is equivalent to
LDSMAX <Xs>, XZR, [<Xn|SP>]
and is always the preferred disassembly.
**64-bit LDSMAXL alias variant**

Applies when `size == 11 && R == 1`.

`STSMAXL <Xs>, [<Xn|SP>]`

is equivalent to

`LDSMAXL <Xs>, XZR, [<Xn|SP>]`

and is always the preferred disassembly.

**Assembler symbols**

- `<Ws>`: Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.
- `<Xs>`: Is the 64-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.
- `<Xn|SP>`: Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

**Operation**

The description of `LDSMAX, LDSMAXA, LDSMAXAL, LDSMAXL` gives the operational pseudocode for this instruction.
C6.2.254   STSMINB, STSMINLB

Atomic signed minimum on byte in memory, without return, atomically loads an 8-bit byte from memory, compares it against the value held in a register, and stores the smaller value back to memory, treating the values as signed numbers.

- STSMINB has no memory ordering semantics.

For information about memory accesses see Load/Store addressing modes on page C1-149.

This instruction is an alias of the LDSMINB, LDSMINAB, LDSMINALB, LDSMINLB instruction. This means that:

- The encodings in this description are named to match the encodings of LDSMINB, LDSMINAB, LDSMINALB, LDSMINLB.
- The description of LDSMINB, LDSMINAB, LDSMINALB, LDSMINLB gives the operational pseudocode for this instruction.

ARMv8.1

No memory ordering variant

Applies when \( R = 0 \).

STSMINB \(<Ws>\), \([<Xn|SP>]\)

is equivalent to

LDSMINB \(<Ws>\), WZR, \([<Xn|SP>]\)

and is always the preferred disassembly.

Release variant

Applies when \( R = 1 \).

STSMINLB \(<Ws>\), \([<Xn|SP>]\)

is equivalent to

LDSMINLB \(<Ws>\), WZR, \([<Xn|SP>]\)

and is always the preferred disassembly.

Assembler symbols

\(<Ws>\)  is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

\(<Xn|SP>\)  is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
Operation

The description of LDSMINB, LDSMINAB, LDSMINALB, LDSMINLB gives the operational pseudocode for this instruction.
Atomic signed minimum on halfword in memory, without return, atomically loads a 16-bit halfword from memory, compares it against the value held in a register, and stores the smaller value back to memory, treating the values as signed numbers.

- STSMINH has no memory ordering semantics.

For information about memory accesses see Load/Store addressing modes on page C1-149.

This instruction is an alias of the LDSMINH, LDSMINAH, LDSMINALH, LDSMINLH instruction. This means that:

- The encodings in this description are named to match the encodings of LDSMINH, LDSMINAH, LDSMINALH, LDSMINLH.

Release variant

Applies when R == 1.

STSMINLH <Ws>, [<Xn|SP>]

is equivalent to

LDSMINLH <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
Operation

The description of LDSMINH, LDSMINAH, LDSMINALH, LDSMINLH gives the operational pseudocode for this instruction.
C6.2.256   STSMIN, STSMINL

Atomic signed minimum on word or doubleword in memory, without return, atomically loads a 32-bit word or 64-bit doubleword from memory, compares it against the value held in a register, and stores the smaller value back to memory, treating the values as signed numbers.

- STSMIN has no memory ordering semantics.

For information about memory accesses see Load/Store addressing modes on page C1-149.

This instruction is an alias of the LDSMIN, LDSMINA, LDSMINAL, LDSMINL instruction. This means that:

- The encodings in this description are named to match the encodings of LDSMIN, LDSMINA, LDSMINAL, LDSMINL.
- The description of LDSMIN, LDSMINA, LDSMINAL, LDSMINL gives the operational pseudocode for this instruction.

ARMv8.1

32-bit LDSMIN alias variant
Applies when size == 10 && R == 0.
STSMIN <Ws>, [<Xn|SP>]
is equivalent to
LDSMIN <Ws>, WZR, [<Xn|SP>]
and is always the preferred disassembly.

32-bit LDSMINL alias variant
Applies when size == 10 && R == 1.
STSMINL <Ws>, [<Xn|SP>]
is equivalent to
LDSMINL <Ws>, WZR, [<Xn|SP>]
and is always the preferred disassembly.

64-bit LDSMIN alias variant
Applies when size == 11 && R == 0.
STSMIN <Xs>, [<Xn|SP>]
is equivalent to
LDSMIN <Xs>, XZR, [<Xn|SP>]
and is always the preferred disassembly.
64-bit LDSMINL alias variant

Applies when size == 11 && R == 1.

STSMINL <Xs>, [<Xn|SP>]

is equivalent to

LDSMINL <Xs>, XZR, [<Xn|SP>]

and is always the preferred disassembly.

Assembler symbols

<Xs>  Is the 64-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xn>  Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

The description of LDSMIN, LDSMINA, LDSMINAL, LDSMINL gives the operational pseudocode for this instruction.
C6.2.257  STTR

Store Register (unprivileged) stores a word or doubleword from a register to memory. The address that is used for the store is calculated from a base register and an immediate offset.

Memory accesses made by the instruction behave as if the instruction was executed at EL0 if the Effective value of PSTATE.UAO is 0 and either:

- The instruction is executed at EL1.
- The instruction is executed at EL2 when the Effective value of HCR_EL2.{E2H, TGE} is \{1, 1\}.

Otherwise, the memory access operates with the restrictions determined by the Exception level at which the instruction is executed. For information about memory accesses, see Load/Store addressing modes on page C1-149.

32-bit variant

Applies when size == 10.

STTR <Wt>, [<Xn|SP>{, #<simm>}]

64-bit variant

Applies when size == 11.

STTR <Xt>, [<Xn|SP>{, #<simm>}]

Decode for all variants of this encoding

integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);

Assembler symbols

<Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
<Xt> Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<simm> Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field.

Shared decode for all encodings

integer n = UInt(Rn);
integer t = UInt(Rt);
AccType acctype = AccType_UNPRIV;
if (HaveNVExt() && HaveEL(EL2) && HCR_EL2.NV == 1 && HCR_EL2.NV1 == 1) then
    acctype = AccType_NORMAL;
integer datasize = 8 << scale;
Operation

bits(64) address;
bits(datasize) data;

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];

address = address + offset;

data = X[t];
Mem[address, datasize DIV 8, acctype] = data;
C6.2.258  **STTRB**

Store Register Byte (unprivileged) stores a byte from a 32-bit register to memory. The address that is used for the store is calculated from a base register and an immediate offset.

Memory accesses made by the instruction behave as if the instruction was executed at EL0 if the Effective value of PSTATE.UAO is 0 and either:

- The instruction is executed at EL1.
- The instruction is executed at EL2 when the Effective value of HCR_EL2.{E2H, TGE} is \{1, 1\}.

Otherwise, the memory access operates with the restrictions determined by the Exception level at which the instruction is executed. For information about memory accesses, see *Load/Store addressing modes on page C1-149*.

### Unscaled offset variant

STTRB <Wt>, [<Xn|SP>{, #<simm}>]

### Decode for this encoding

bits(64) offset = SignExtend(imm9, 64);

### Assembler symbols

- `<Wt>` Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
- `<Xn|SP>` Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- `<simm>` Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field.

### Shared decode for all encodings

integer n = UInt(Rn);
integer t = UInt(Rt);
AccType acctype = AccType_UNPRIV;
if (HaveNVExt() && HaveEL(EL2) && HCR_EL2.NV == 1 && HCR_EL2.NV1 == 1) then
  acctype = AccType_NORMAL;

### Operation

bits(64) address;
bits(8) data;
if n == 31 then
  CheckSPAlignment();
else
  address = X[n];
address = address + offset;
data = X[t];
Mem[address, 1, acctype] = data;
STTRH

Store Register Halfword (unprivileged) stores a halfword from a 32-bit register to memory. The address that is used for the store is calculated from a base register and an immediate offset.

Memory accesses made by the instruction behave as if the instruction was executed at EL0 if the Effective value of PSTATE.UAO is 0 and either:

• The instruction is executed at EL1.
• The instruction is executed at EL2 when the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.

Otherwise, the memory access operates with the restrictions determined by the Exception level at which the instruction is executed. For information about memory accesses, see Load/Store addressing modes on page C1-149.

Unscaled offset variant

STTRH \(<Wt>, [<Xn]|SP\{, #<simm>}\)\]

Decode for this encoding

bits(64) offset = SignExtend(imm9, 64);

Assembler symbols

\(<Wt>\) Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

\(<Xn>|SP>\) Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

\(<simm>\) Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field.

Shared decode for all encodings

integer n = UInt(Rn);
integer t = UInt(Rt);
AccType accctype = AccType_UNPRIV;
if (HaveNVExt() && HaveEl2(E2H) && HCR_EL2.NV == 1 && HCR_EL2.NV1 == 1) then
    accctype = AccType_NORMAL;

Operation

bits(64) address;
bits(16) data;
if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];
address = address + offset;
data = X[t];
Mem[address, 2, acctype] = data;

STUMAXB, STUMAXLB

Atomic unsigned maximum on byte in memory, without return, atomically loads an 8-bit byte from memory, compares it against the value held in a register, and stores the larger value back to memory, treating the values as unsigned numbers.

- STUMAXB has no memory ordering semantics.

For information about memory accesses see Load/Store addressing modes on page C1-149.

This instruction is an alias of the LDUMAXB, LDUMAXAB, LDUMAXALB, LDUMAXLB instruction. This means that:

- The encodings in this description are named to match the encodings of LDUMAXB, LDUMAXAB, LDUMAXALB, LDUMAXLB.
- The description of LDUMAXB, LDUMAXAB, LDUMAXALB, LDUMAXLB gives the operational pseudocode for this instruction.

ARMv8.1

No memory ordering variant

Applies when R == 0.

STUMAXB <Ws>, [<Xn|SP>]

is equivalent to

LDUMAXB <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

Release variant

Applies when R == 1.

STUMAXLB <Ws>, [<Xn|SP>]

is equivalent to

LDUMAXLB <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

Assembler symbols

<Ws> is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xn|SP> is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
Operation

The description of LDUMAXB, LDUMAXAB, LDUMAXALB, LDUMAXLB gives the operational pseudocode for this instruction.
C6.2.261 STUMAXH, STUMAXLH

Atomic unsigned maximum on halfword in memory, without return, atomically loads a 16-bit halfword from memory, compares it against the value held in a register, and stores the larger value back to memory, treating the values as unsigned numbers.

- **STUMAXH** has no memory ordering semantics.
- **STUMAXLH** stores to memory with release semantics, as described in Load-Acquire, Load-AcquirePC, and Store-Release on page B2-101.

For information about memory accesses see Load/Store addressing modes on page C1-149.

This instruction is an alias of the LDUMAXH, LDUMAXAH, LDUMAXALH, LDUMAXLH instruction. This means that:

- The encodings in this description are named to match the encodings of LDUMAXH, LDUMAXAH, LDUMAXALH, LDUMAXLH.
- The description of LDUMAXH, LDUMAXAH, LDUMAXALH, LDUMAXLH gives the operational pseudocode for this instruction.

**ARMv8.1**

No memory ordering variant

Applies when \( R = 0 \).

\( \text{STUMAXH} \ <\text{ws}> \), [\(<Xn|SP>\)]

is equivalent to

\( \text{LDUMAXH} \ <\text{ws}> \), WZR, [\(<Xn|SP>\)]

and is always the preferred disassembly.

Release variant

Applies when \( R = 1 \).

\( \text{STUMAXLH} \ <\text{ws}> \), [\(<Xn|SP>\)]

is equivalent to

\( \text{LDUMAXLH} \ <\text{ws}> \), WZR, [\(<Xn|SP>\)]

and is always the preferred disassembly.

**Assembler symbols**

\(<\text{ws}>\) Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

\(<Xn|SP>\) Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
Operation

The description of LDUMAXH, LDUMAXAH, LDUMAXALH, LDUMAXLH gives the operational pseudocode for this instruction.
C6.2.262 STUMAX, STUMAXL

Atomic unsigned maximum on word or doubleword in memory, without return, atomically loads a 32-bit word or 64-bit doubleword from memory, compares it against the value held in a register, and stores the larger value back to memory, treating the values as unsigned numbers.

- **STUMAX** has no memory ordering semantics.
- **STUMAXL** stores to memory with release semantics, as described in *Load-Acquire, Load-AcquirePC, and Store-Release* on page B2-101.

For information about memory accesses see *Load/Store addressing modes* on page C1-149.

This instruction is an alias of the LDUMAX, LDUMAXA, LDUMAXAL, LDUMAXL instruction. This means that:

- The encodings in this description are named to match the encodings of LDUMAX, LDUMAXA, LDUMAXAL, LDUMAXL.
- The description of LDUMAX, LDUMAXA, LDUMAXAL, LDUMAXL gives the operational pseudocode for this instruction.

**32-bit LDUMAX alias variant**

Applies when `size == 10 && R == 0`.

STUMAX `<Ws>` , `[<Xn|SP>]`

is equivalent to

LDUMAX `<Ws>` , WZR , `[<Xn|SP>]`

and is always the preferred disassembly.

**32-bit LDUMAXL alias variant**

Applies when `size == 10 && R == 1`.

STUMAXL `<Ws>` , `[<Xn|SP>]`

is equivalent to

LDUMAXL `<Ws>` , WZR , `[<Xn|SP>]`

and is always the preferred disassembly.

**64-bit LDUMAX alias variant**

Applies when `size == 11 && R == 0`.

STUMAX `<Xs>` , `[<Xn|SP>]`

is equivalent to

LDUMAX `<Xs>` , XZR , `[<Xn|SP>]`

and is always the preferred disassembly.
64-bit LDUMAXL alias variant

Applies when size == 11 && R == 1.

STUMAXL <Xs>, [<Xn|SP>]

is equivalent to

LDUMAXL <Xs>, XZR, [<Xn|SP>]

and is always the preferred disassembly.

Assembler symbols

<Xs> Is the 64-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

The description of LDUMAX, LDUMAXA, LDUMAXAL, LDUMAXL gives the operational pseudocode for this instruction.
C6.2.263  STUMINB, STUMINLB

Atomic unsigned minimum on byte in memory, without return, atomically loads an 8-bit byte from memory, compares it against the value held in a register, and stores the smaller value back to memory, treating the values as unsigned numbers.

- **STUMINB** has no memory ordering semantics.
- **STUMINLB** stores to memory with release semantics, as described in *Load-Acquire, Load-AcquirePC, and Store-Release* on page B2-101.

For information about memory accesses see *Load/Store addressing modes* on page C1-149.

This instruction is an alias of the LDUMINB, LDUMINAB, LDUMINALB, LDUMINLB instruction. This means that:

- The encodings in this description are named to match the encodings of LDUMINB, LDUMINAB, LDUMINALB, LDUMINLB.
- The description of LDUMINB, LDUMINAB, LDUMINALB, LDUMINLB gives the operational pseudocode for this instruction.

### 32-bit LDUMIN alias variant

Applies when size == 10 & R == 0.

STUMIN <Ws>, [<Xn|SP>]

is equivalent to

LDUMIN <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

### 32-bit LDUMINL alias variant

Applies when size == 10 & R == 1.

STUMINL <Ws>, [<Xn|SP>]

is equivalent to

LDUMINL <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

### 64-bit LDUMIN alias variant

Applies when size == 11 & R == 0.

STUMIN <Xs>, [<Xn|SP>]

is equivalent to

LDUMIN <Xs>, XZR, [<Xn|SP>]

and is always the preferred disassembly.
**64-bit LDUMINL alias variant**

Applies when size == 11 && R == 1.

STUMINL <Xs>, [<Xn|SP>]

is equivalent to

LDUMINL <Xs>, XZR, [<Xn|SP>]

and is always the preferred disassembly.

**Assembler symbols**

- `<Ws>` Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

- `<Xs>` Is the 64-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

- `<Xn|SP>` Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

**Operation**

The description of LDUMIN, LDUMINA, LDUMINAL, LDUMINL gives the operational pseudocode for this instruction.
C6.2.266   STUR

Store Register (unscaled) calculates an address from a base register value and an immediate offset, and stores a 32-bit word or a 64-bit doubleword to the calculated address, from a register. For information about memory accesses, see Load/Store addressing modes on page C1-149.

32-bit variant

Applies when size == 10.

STUR <Wt>, [<Xn|SP>{, #<simm}>]

64-bit variant

Applies when size == 11.

STUR <Xt>, [<Xn|SP>{, #<simm}>]

Decode for all variants of this encoding

integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);

Assembler symbols

<Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
<Xt> Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<simm> Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field.

Shared decode for all encodings

integer n = UInt(Rn);
integer t = UInt(Rt);
integer datasize = 8 << scale;

Operation

bits(64) address;
bits(datasize) data;

if n == 31 then
    CheckSAlignment();
    address = SP[];
else
    address = X[n];

address = address + offset;

data = X[t];
Mem[address, datasize DIV 8, AccType_NORMAL] = data;
C6.2.267  STURB

Store Register Byte (unscaled) calculates an address from a base register value and an immediate offset, and stores a byte to the calculated address, from a 32-bit register. For information about memory accesses, see Load/Store addressing modes on page C1-149.

Unscaled offset variant

STURB <Wt>, [<Xn|SP>{, #<simm>}]

Decode for this encoding

bits(64) offset = SignExtend(imm9, 64);

Assembler symbols

<Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<simm> Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field.

Shared decode for all encodings

integer n = UInt(Rn);
integer t = UInt(Rt);

Operation

bits(64) address;
bits(8) data;

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];
address = address + offset;
data = X[t];
Mem[address, 1, AccType_NORMAL] = data;
C6.2.268  STURH

Store Register Halfword (unscaled) calculates an address from a base register value and an immediate offset, and stores a halfword to the calculated address, from a 32-bit register. For information about memory accesses, see Load/Store addressing modes on page C1-149.

Unscaled offset variant

STURH <Wt>, [<Xn|SP>{, #<simm>}]

Decode for this encoding

bits(64) offset = SignExtend(imm9, 64);

Assembler symbols

<Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<simm> Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field.

Shared decode for all encodings

integer n = UInt(Rn);
integer t = UInt(Rt);

Operation

bits(64) address;
bits(16) data;

if n == 31 then
  CheckSPAlignment();
  address = SP[];
else
  address = X[n];

address = address + offset;

data = X[t];
Mem[address, 2, AccType_NORMAL] = data;
C6.2.269  STXP

Store Exclusive Pair of registers stores two 32-bit words or two 64-bit doublewords from two registers to a memory location if the PE has exclusive access to the memory address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed. See Synchronization and semaphores on page B2-128. A 32-bit pair requires the address to be doubleword aligned and is single-copy atomic at doubleword granularity. A 64-bit pair requires the address to be quadword aligned and, if the Store-Exclusive succeeds, it causes a single-copy atomic update of the 128-bit memory location being updated. For information about memory accesses see Load/Store addressing modes on page C1-149.

32-bit variant
Applies when $sz == 0$.

\[
\text{STXP } \langle Ws \rangle, \langle Wt1 \rangle, \langle Wt2 \rangle, [\langle Xn|SP \rangle^{\{,#0\}}]
\]

64-bit variant
Applies when $sz == 1$.

\[
\text{STXP } \langle Ws \rangle, \langle Xt1 \rangle, \langle Xt2 \rangle, [\langle Xn|SP \rangle^{\{,#0\}}]
\]

Decode for all variants of this encoding

\[
\begin{align*}
\text{integer } n &= \text{UInt}(Rn); \\
\text{integer } t &= \text{UInt}(Rt); \\
\text{integer } t2 &= \text{UInt}(Rt2); \quad // \text{ignored by load/store single register} \\
\text{integer } s &= \text{UInt}(Rs); \quad // \text{ignored by all loads and store-release} \\
\text{integer } elsize &= 32 \ll \text{UInt}(sz); \\
\text{integer } datasize &= elsize \times 2;
\end{align*}
\]

Notes for all encodings
For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors, and particularly STXP on page K1-6425.

Assembler symbols

\[
\begin{align*}
\langle Ws \rangle & \quad \text{Is the 32-bit name of the general-purpose register into which the status result of the store exclusive is written, encoded in the "Rs" field. The value returned is:} \\
& \quad 0 \quad \text{If the operation updates memory.} \\
& \quad 1 \quad \text{If the operation fails to update memory.} \\
\langle Xt1 \rangle & \quad \text{Is the 64-bit name of the first general-purpose register to be transferred, encoded in the "Rt" field.} \\
\langle Xt2 \rangle & \quad \text{Is the 64-bit name of the second general-purpose register to be transferred, encoded in the "Rt2" field.} \\
\langle Wt1 \rangle & \quad \text{Is the 32-bit name of the first general-purpose register to be transferred, encoded in the "Rt" field.} \\
\langle Wt2 \rangle & \quad \text{Is the 32-bit name of the second general-purpose register to be transferred, encoded in the "Rt2" field.} \\
\langle Xn|SP \rangle & \quad \text{Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.}
\end{align*}
\]
Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <ws> is not updated.

Accessing an address that is not aligned to the size of the data being accessed causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

If AArch64.ExclusiveMonitorsPass() returns TRUE, the exception is generated.

- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If AArch64.ExclusiveMonitorsPass() returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation

```plaintext
bits(64) address;
bits(datasize) data;
constant integer dbytes = datasize DIV 8;
boolean rt_unknown = FALSE;
boolean rn_unknown = FALSE;
if s == t || (s == t2) then
    Constraint c = ConstrainUnpredictable();
    assert c IN {Constraint_UNKNOWN, Constraint_NONE, Constraint_UNDEF, Constraint_NOP};
    case c of
        when Constraint_UNKNOWN rt_unknown = TRUE; // store UNKNOWN value
        when Constraint_NONE rt_unknown = FALSE; // store original value
        when Constraint_UNDEF UnallocatedEncoding();
        when Constraint_NOP EndOfInstruction();
    if s == n && n != 31 then
        Constraint c = ConstrainUnpredictable();
        assert c IN {Constraint_UNKNOWN, Constraint_NONE, Constraint_UNDEF, Constraint_NOP};
        case c of
            when Constraint_UNKNOWN rn_unknown = TRUE; // address is UNKNOWN
            when Constraint_NONE rn_unknown = FALSE; // address is original base
            when Constraint_UNDEF UnallocatedEncoding();
            when Constraint_NOP EndOfInstruction();
    if n == 31 then
        CheckSPAlignment();
        address = SP[];
    elsif rn_unknown then
        address = bits(64) UNKNOWN;
    else
        address = X[n];
    if rt_unknown then
        data = bits(datasize) UNKNOWN;
    else
        bits(datasize DIV 2) el1 = X[t];
        bits(datasize DIV 2) el2 = X[t2];
        data = if BigEndian() then el1:el2 else el2:el1;
    bit status = '1';
    // Check whether the Exclusives monitors are set to include the
    // physical memory locations corresponding to virtual address
    // range [address, address+dbytes-1].
    if AArch64.ExclusiveMonitorsPass(address, dbytes) then
        // This atomic write will be rejected if it does not refer
        // to the same physical locations after address translation.
        Mem[address, dbytes, AccType_ATOMIC] = data;
        status = ExclusiveMonitorsStatus();
        X[s] = ZeroExtend(status, 32);
```

C6.2.270   STXR

Store Exclusive Register stores a 32-bit word or a 64-bit doubleword from a register to memory if the PE has exclusive access to the memory address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed. See *Synchronization and semaphores* on page B2-128. For information about memory accesses see *Load/Store addressing modes* on page C1-149.

32-bit variant

Applies when size == 10.

STXR <Ws>, <Wt>, [<Xn|SP>{,#0}]

64-bit variant

Applies when size == 11.

STXR <Ws>, <Xt>, [<Xn|SP>{,#0}]

**Decode for all variants of this encoding**

integer n = UInt(Rn);
integer t = UInt(Rt);
integer s = UInt(Rs); // ignored by all loads and store-release

integer elsize = 8 << UInt(size);

**Notes for all encodings**

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *STXR* on page K1-6426.

**Assembler symbols**

<Ws> Is the 32-bit name of the general-purpose register into which the status result of the store exclusive is written, encoded in the "Rs" field. The value returned is:

0 If the operation updates memory.
1 If the operation fails to update memory.

<Xt> Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

<Wr> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

**Aborts and alignment**

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Ws> is not updated.
Accessing an address that is not aligned to the size of the data being accessed causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If AArch64.ExclusiveMonitorsPass() returns TRUE, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If AArch64.ExclusiveMonitorsPass() returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

**Operation**

```
bits(64) address;
bits(elsize) data;
constant integer dbytes = elsize DIV 8;
boolean rt_unknown = FALSE;
boolean rn_unknown = FALSE;

if s == t then
  Constraint c = ConstrainUnpredictable();
  assert c IN {Constraint_UNKNOWN, Constraint_NONE, Constraint_UNDEF, Constraint_NOP};
  case c of
    when Constraint_UNKNOWN rt_unknown = TRUE;    // store UNKNOWN value
    when Constraint_NONE rt_unknown = FALSE;    // store original value
    when Constraint_UNDEF UnallocatedEncoding();
    when Constraint_NOP EndOfInstruction();

if s == n && n != 31 then
  Constraint c = ConstrainUnpredictable();
  assert c IN {Constraint_UNKNOWN, Constraint_NONE, Constraint_UNDEF, Constraint_NOP};
  case c of
    when Constraint_UNKNOWN rn_unknown = TRUE;    // address is UNKNOWN
    when Constraint_NONE    rn_unknown = FALSE;    // address is original base
    when Constraint_UNDEF   UnallocatedEncoding();
    when Constraint_NOP     EndOfInstruction();

  CheckSPAlignment();
  address = SP[];
elsif rn_unknown then
  address = bits(64) UNKNOWN;
else
  address = X[n];

if rt_unknown then
  data = bits(elsize) UNKNOWN;
else
  data = X[t];

bit status = '1';
// Check whether the Exclusives monitors are set to include the
// physical memory locations corresponding to virtual address
// range [address, address+dbytes-1].
if AArch64.ExclusiveMonitorsPass(address, dbytes) then
  // This atomic write will be rejected if it does not refer
  // to the same physical locations after address translation.
  Mem[address, dbytes, AccType_ATOMIC] = data;
  status = ExclusiveMonitorsStatus();
  X[s] = ZeroExtend(status, 32);
```
C6.2.271 STXRB

Store Exclusive Register Byte stores a byte from a register to memory if the PE has exclusive access to the memory address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed. See Synchronization and semaphores on page B2-128. The memory access is atomic.

For information about memory accesses see Load/Store addressing modes on page C1-149.

No offset variant

STXRB <Ws>, <Wt>, [<Xn|SP>{,#0}]

Decode for this encoding

integer n = UInt(Rn);
integer t = UInt(Rt);
integer s = UInt(Rs);  // ignored by all loads and store-release

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors, and particularly STXRB on page K1-6426.

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register into which the status result of the store exclusive is written, encoded in the "Rs" field. The value returned is:

0  If the operation updates memory.
1  If the operation fails to update memory.

<Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Aborts

If a synchronous Data Abort exception is generated by the execution of this instruction:

• Memory is not updated.
• <Ws> is not updated.

If AArch64.ExclusiveMonitorsPass() returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation

bits(64) address;
bits(8) data;
boolean rt_unknown = FALSE;
boolean rn_unknown = FALSE;

if s == t then
    Constraint c = ConstrainUnpredictable();
assert c IN {Constraint_UNKNOWN, Constraint_NONE, Constraint_UNDEF, Constraint_NOP};
case c of
  when Constraint_UNKNOWN rt_unknown = TRUE; // store UNKNOWN value
  when Constraint_NONE rt_unknown = FALSE; // store original value
  when Constraint_UNDEF UnallocatedEncoding();
  when Constraint_NOP EndOfInstruction();
if s == n && n != 31 then
  Constraint c = ConstrainUnpredictable();
  assert c IN {Constraint_UNKNOWN, Constraint_NONE, Constraint_UNDEF, Constraint_NOP};
case c of
  when Constraint_UNKNOWN rt_unknown = TRUE; // address is UNKNOWN
  when Constraint_NONE rt_unknown = FALSE; // address is original base
  when Constraint_UNDEF UnallocatedEncoding();
  when Constraint_NOP EndOfInstruction();
if n == 31 then
  CheckSPAlignment();
  address = SP[];
elseif rt_unknown then
  address = bits(64) UNKNOWN;
else
  address = X[n];
if rt_unknown then
  data = bits(8) UNKNOWN;
else
  data = X[t];
bit status = '1';
// Check whether the Exclusives monitors are set to include the
// physical memory locations corresponding to virtual address
// range [address, address+dbytes-1].
if AArch64.ExclusiveMonitorsPass(address, 1) then
  // This atomic write will be rejected if it does not refer
  // to the same physical locations after address translation.
  Mem[address, 1, AccType_ATOMIC] = data;
  status = ExclusiveMonitorsStatus();
X[s] = ZeroExtend(status, 32);
C6.2.272  STXRH

Store Exclusive Register Halfword stores a halfword from a register to memory if the PE has exclusive access to the memory address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed. See Synchronization and semaphores on page B2-128. The memory access is atomic.

For information about memory accesses see Load/Store addressing modes on page C1-149.

No offset variant

STXRH <Ws>, <Wt>, [<Xn|SP>{,#0}]

Decode for this encoding

integer n = UInt(Rn);
integer t = UInt(Rt);
integer s = UInt(Rs);    // ignored by all loads and store-release

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register into which the status result of the store exclusive is written, encoded in the "Rs" field. The value returned is:
0 If the operation updates memory.
1 If the operation fails to update memory.

<Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

• Memory is not updated.
• <Ws> is not updated.

A non halfword-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

• If AArch64.ExclusiveMonitorsPass() returns TRUE, the exception is generated.
• Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If AArch64.ExclusiveMonitorsPass() returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation

bits(64) address;
bits(16) data;

  // This atomic write will be rejected if it does not refer
  // to the same physical locations after address translation.
  Mem[address, 2, AccType_ATOMIC] = data;
  status = ExclusiveMonitorsStatus();
X[s] = ZeroExtend(status, 32);
C6.2.273  SUB (extended register)

Subtract (extended register) subtracts a sign or zero-extended register value, followed by an optional left shift amount, from a register value, and writes the result to the destination register. The argument that is extended from the \(<Rm>\) register can be a byte, halfword, word, or doubleword.

\[
\begin{array}{cccccc}
\hline
\sf & 1 & 0 & 1 & 0 & 1 & 0 & 0 & 1 & \hline
Rn & option & imm3 & Rn & Rd & \\
\end{array}
\]

32-bit variant

Applies when \(sf == 0\).

\[
\text{SUB <Wd\|WSP>, <Wn\|WSP>, <Wm>{, <extend> {#<amount>}}}
\]

64-bit variant

Applies when \(sf == 1\).

\[
\text{SUB <Xd\|SP>, <Xn\|SP>, <R><m>{, <extend> {#<amount>}}}
\]

*Decode for all variants of this encoding*

\[
\text{integer } d = \text{UInt}(Rd); \\
\text{integer } n = \text{UInt}(Rn); \\
\text{integer } m = \text{UInt}(Rm); \\
\text{integer } \text{datasize} = \text{if } sf == '1' \text{ then 64 else 32}; \\
\text{ExtendType } \text{extend}_\text{type} = \text{DecodeRegExtend}(\text{option}); \\
\text{integer } \text{shift} = \text{UInt}(\text{imm3}); \\
\text{if } \text{shift} > 4 \text{ then ReservedValue();}
\]

*Assembler symbols*

- \(<Wd\|WSP>\): Is the 32-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.
- \(<Wn\|WSP>\): Is the 32-bit name of the first source general-purpose register or stack pointer, encoded in the "Rn" field.
- \(<Wm>\): Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.
- \(<Xd\|SP>\): Is the 64-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.
- \(<Xn\|SP>\): Is the 64-bit name of the first source general-purpose register or stack pointer, encoded in the "Rn" field.
- \(<R>\): Is a width specifier, encoded in the "option" field. It can have the following values:
  - 'W' when \(\text{option} = 00x\)
  - 'W' when \(\text{option} = 010\)
  - 'X' when \(\text{option} = x11\)
  - 'W' when \(\text{option} = 10x\)
  - 'W' when \(\text{option} = 110\)
- \(<m>\): Is the number [0-30] of the second general-purpose source register or the name ZR (31), encoded in the "Rm" field.
<extend>
For the 32-bit variant: is the extension to be applied to the second source operand, encoded in the "option" field. It can have the following values:

- **UXTB** when option = 000
- **UXTH** when option = 001
- **LSL|UXTW** when option = 010
- **UXTX** when option = 011
- **SXTB** when option = 100
- **SXTH** when option = 101
- **SXTW** when option = 110
- **SXTX** when option = 111

If "Rd" or "Rn" is '11111' (WSP) and "option" is '010' then LSL is preferred, but may be omitted when "imm3" is '000'. In all other cases <extend> is required and must be UXTW when "option" is '010'.

For the 64-bit variant: is the extension to be applied to the second source operand, encoded in the "option" field. It can have the following values:

- **UXTB** when option = 000
- **UXTH** when option = 001
- **UXTW** when option = 010
- **LSL|UXTX** when option = 011
- **SXTB** when option = 100
- **SXTH** when option = 101
- **SXTW** when option = 110
- **SXTX** when option = 111

If "Rd" or "Rn" is '11111' (SP) and "option" is '011' then LSL is preferred, but may be omitted when "imm3" is '000'. In all other cases <extend> is required and must be UXTX when "option" is '011'.

<amount>
Is the left shift amount to be applied after extension in the range 0 to 4, defaulting to 0, encoded in the "imm3" field. It must be absent when <extend> is absent, is required when <extend> is LSL, and is optional when <extend> is present but not LSL.

### Operation

```
bits(datasize) result;
bits(datasize) operand1 = if n == 31 then SP[] else X[n];
bits(datasize) operand2 = ExtendReg(m, extend_type, shift);
operand2 = NOT(operand2);
(result, -) = AddWithCarry(operand1, operand2, '1');
if d == 31 then
    SP[] = result;
else
    X[d] = result;
```
C6.2.274   SUB (immediate)

Subtract (immediate) subtracts an optionally-shifted immediate value from a register value, and writes the result to the destination register.

32-bit variant

Applies when \( sf = 0 \).

\[
\text{SUB} <Wd|WSP>, <Wn|WSP>, #<imm>{, <shift>}
\]

64-bit variant

Applies when \( sf = 1 \).

\[
\text{SUB} <Xd|SP>, <Xn|SP>, #<imm>{, <shift>}
\]

Decode for all variants of this encoding

\[
\begin{align*}
\text{integer } d &= \text{UInt}(Rd); \\
\text{integer } n &= \text{UInt}(Rn); \\
\text{integer } \text{datasize} &= \text{if } sf == '1' \text{ then } 64 \text{ else } 32; \\
\text{bits(}\text{datasize}) \text{ imm}; \\
\text{case } \text{shift} \text{ of} \\
\text{when } '00' \text{ imm} &= \text{ZeroExtend}(\text{imm12}, \text{datasize}); \\
\text{when } '01' \text{ imm} &= \text{ZeroExtend}(\text{imm12:Zeros(12)}, \text{datasize}); \\
\text{when } '1x' \text{ ReservedValue();}
\end{align*}
\]

Assembler symbols

- \(<Wd|WSP>\) Is the 32-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.
- \(<Wn|WSP>\) Is the 32-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.
- \(<Xd|SP>\) Is the 64-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.
- \(<Xn|SP>\) Is the 64-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.
- \(<imm>\) Is an unsigned immediate, in the range 0 to 4095, encoded in the "imm12" field.
- \(<shift>\) Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in the "shift" field. It can have the following values:
  - LSL #0 when shift = 00
  - LSL #12 when shift = 01

The encoding \( \text{shift} = 1x \) is reserved.

Operation

\[
\begin{align*}
\text{bits(}\text{datasize}) \text{ result}; \\
\text{bits(}\text{datasize}) \text{ operand1} &= \text{if } n == 31 \text{ then } SP[] \text{ else } X[n]; \\
\text{bits(}\text{datasize}) \text{ operand2};
\end{align*}
\]
operand2 = NOT(imm);
(result, -) = AddWithCarry(operand1, operand2, '1');

if d == 31 then
    SP[] = result;
else
    X[d] = result;
C6.2.275  SUB (shifted register)

Subtract (shifted register) subtracts an optionally-shifted register value from a register value, and writes the result to the destination register.

This instruction is used by the alias NEG (shifted register). See Alias conditions for details of when each alias is preferred.

32-bit variant
Applies when \( sf = 0 \).

\[
\text{SUB } <Wd>, <Wn>, <Wm>\{, <shift> #<amount>\}
\]

64-bit variant
Applies when \( sf = 1 \).

\[
\text{SUB } <Xd>, <Xn>, <Xm>\{, <shift> #<amount>\}
\]

Decode for all variants of this encoding

\[
\begin{align*}
\text{integer } d &= \text{UInt}(Rd); \\
\text{integer } n &= \text{UInt}(Rn); \\
\text{integer } m &= \text{UInt}(Rm); \\
\text{integer } \text{datasize} &= \text{if } sf = '1' \text{ then } 64 \text{ else } 32; \\
\text{if } \text{shift} = '11' \text{ then } &\text{ReservedValue();} \\
\text{if } \text{shift} = '0' \text{ } \&\& \text{imm6<5> } = '1' \text{ then } &\text{ReservedValue();}
\end{align*}
\]

\[
\text{ShiftType } \text{shift_type} = \text{DecodeShift(shift)}; \\
\text{integer } \text{shift_amount} = \text{UInt}(\text{imm6});
\]

Alias conditions

<table>
<thead>
<tr>
<th>Alias is preferred when</th>
</tr>
</thead>
<tbody>
<tr>
<td>NEG (shifted register) ( Rn = '11111' )</td>
</tr>
</tbody>
</table>

Assembler symbols

\(<Wd>\) Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

\(<Wn>\) Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.

\(<Wm>\) Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.

\(<Xd>\) Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

\(<Xn>\) Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.

\(<Xm>\) Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.
<shift> Is the optional shift type to be applied to the second source operand, defaulting to LSL and encoded in the "shift" field. It can have the following values:

- LSL when shift = 00
- LSR when shift = 01
- ASR when shift = 10

The encoding shift = 11 is reserved.

<amount> For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.

For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field.

**Operation**

```c
bits(datasize) result;
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = ShiftReg(m, shift_type, shift_amount);

operand2 = NOT(operand2);
(result, -) = AddWithCarry(operand1, operand2, '1');

X[d] = result;
```
C6.2.276 SUBS (extended register)

Subtract (extended register), setting flags, subtracts a sign or zero-extended register value, followed by an optional left shift amount, from a register value, and writes the result to the destination register. The argument that is extended from the <Rm> register can be a byte, halfword, word, or doubleword. It updates the condition flags based on the result.

This instruction is used by the alias CMP (extended register). See Alias conditions for details of when each alias is preferred.

32-bit variant

Applies when \( sf = 0 \).

\[
\text{SUBS} \ <Wd>, <Wn|WSP>, <Wm>{, <extend> {#<amount>}}
\]

64-bit variant

Assembler symbols

- \(<Wd>\) Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Wn|WSP>\) Is the 32-bit name of the first source general-purpose register or stack pointer, encoded in the "Rn" field.
- \(<Wm>\) Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.
- \(<Xd>\) Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Xn|SP>\) Is the 64-bit name of the first source general-purpose register or stack pointer, encoded in the "Rn" field.
- \(<W>\) Is a width specifier, encoded in the "option" field. It can have the following values:
  - \( W \) when \( \text{option} = 00x \)
W when option = 010
X when option = x11
W when option = 10x
W when option = 110

<index> Is the number [0-30] of the second general-purpose source register or the name ZR (31), encoded in the "Rm" field.

<extend> For the 32-bit variant: is the extension to be applied to the second source operand, encoded in the "option" field. It can have the following values:
- UXTB when option = 000
- UXTH when option = 001
- LSL|UXTW when option = 010
- UXTX when option = 011
- SXTB when option = 100
- SXTH when option = 101
- SXTW when option = 110
- SXTX when option = 111

For the 64-bit variant: is the extension to be applied to the second source operand, encoded in the "option" field. It can have the following values:
- UXTB when option = 000
- UXTH when option = 001
- UXTW when option = 010
- LSL|UXTX when option = 011
- SXTB when option = 100
- SXTH when option = 101
- SXTW when option = 110
- SXTX when option = 111

If "Rn" is '11111' (WSP) and "option" is '010' then LSL is preferred, but may be omitted when "imm3" is '000'. In all other cases <extend> is required and must be UXTW when "option" is '010'.

For the 64-bit variant: is the extension to be applied to the second source operand, encoded in the "option" field. It can have the following values:
- UXTB when option = 000
- UXTH when option = 001
- UXTW when option = 010
- LSL|UXTX when option = 011
- SXTB when option = 100
- SXTH when option = 101
- SXTW when option = 110
- SXTX when option = 111

If "Rn" is '11111' (SP) and "option" is '011' then LSL is preferred, but may be omitted when "imm3" is '000'. In all other cases <extend> is required and must be UXTX when "option" is '011'.

<amount> Is the left shift amount to be applied after extension in the range 0 to 4, defaulting to 0, encoded in the "im3" field. It must be absent when <extend> is absent, is required when <extend> is LSL, and is optional when <extend> is present but not LSL.

**Operation**

```plaintext
bits(data-size) result;
bits(data-size) operand1 = if n == 31 then SP[] else X[n];
bits(data-size) operand2 = ExtendReg(m, extend_type, shift);
bits(4) nzcv;

operand2 = NOT(operand2);
(result, nzcv) = AddWithCarry(operand1, operand2, '1');

PSTATE.<N,Z,C,V> = nzcv;
X[d] = result;
```
C6.2.277 SUBS (immediate)

Subtract (immediate), setting flags, subtracts an optionally-shifted immediate value from a register value, and writes the result to the destination register. It updates the condition flags based on the result.

This instruction is used by the alias CMP (immediate). See Alias conditions for details of when each alias is preferred.

### 32-bit variant

#### Assembler symbols

- `<Wd>` Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- `<Wn|WSP>` Is the 32-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.
- `<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- `<Xn|SP>` Is the 64-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.
- `<imm>` Is an unsigned immediate, in the range 0 to 4095, encoded in the "imm12" field.
- `<shift>` Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in the "shift" field. It can have the following values:
  - LSL #0 when shift = 00
  - LSL #12 when shift = 01
The encoding shift = 1x is reserved.

**Operation**

```
bits(datasize) result;
bits(datasize) operand1 = if n == 31 then SP[] else X[n];
bits(datasize) operand2;
bits(4) nzcv;
operand2 = NOT(imm);
(result, nzcv) = AddWithCarry(operand1, operand2, '1');
PSTATE.<N,Z,C,V> = nzcv;
X[d] = result;
```
C6.2.278 SUBS (shifted register)

Subtract (shifted register), setting flags, subtracts an optionally-shifted register value from a register value, and writes the result to the destination register. It updates the condition flags based on the result.

This instruction is used by the aliases CMP (shifted register) and NEGS. See *Alias conditions* for details of when each alias is preferred.

### 32-bit variant
Applies when \( sf = 0 \).

\[
\text{SUBS } <Wd>, <Wn>, <Wm>\{, <shift> \#<amount>\}
\]

### 64-bit variant
Applies when \( sf = 1 \).

\[
\text{SUBS } <Xd>, <Xn>, <Xm>\{, <shift> \#<amount>\}
\]

**Decode for all variants of this encoding**

\[
\begin{align*}
\text{integer } d & = \text{UInt}(Rd); \\
\text{integer } n & = \text{UInt}(Rn); \\
\text{integer } m & = \text{UInt}(Rm); \\
\text{integer } \text{datasize} & = \text{if } sf = 1 \text{ then 64 else 32}; \\
\text{if } \text{shift} & = 11 \text{ then ReservedValue(); } \\
\text{if } sf & = 0 \text{ then ReservedValue(); } \\
\text{int } \text{shift}_{-}\text{type} & = \text{DecodeShift(shift)}; \\
\text{integer } \text{shift}_{-}\text{amount} & = \text{UInt}(\text{imm6});
\end{align*}
\]

**Alias conditions**

<table>
<thead>
<tr>
<th>Alias</th>
<th>is preferred when</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMP (shifted register)</td>
<td>Rd == '111111'</td>
</tr>
<tr>
<td>NEGS</td>
<td>Rn == '111111'</td>
</tr>
</tbody>
</table>

**Assembler symbols**

- \(<Wd>\) Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Wn>\) Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.
- \(<Wm>\) Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.
- \(<Xd>\) Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Xn>\) Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.
- \(<Xm>\) Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.
<shift> Is the optional shift type to be applied to the second source operand, defaulting to LSL and encoded in the "shift" field. It can have the following values:

- LSL when shift = 00
- LSR when shift = 01
- ASR when shift = 10

The encoding shift = 11 is reserved.

<amount> For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.

For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field.

**Operation**

```c
bits(datasize) result;
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = ShiftReg(m, shift_type, shift_amount);
bits(4) nzcv;

operand2 = NOT(operand2);
(result, nzcv) = AddWithCarry(operand1, operand2, '1');

PSTATE.<N,Z,C,V> = nzcv;

X[d] = result;
```
C6.2.279   SVC

    Supervisor Call causes an exception to be taken to EL1.

    On executing an SVC instruction, the PE records the exception as a Supervisor Call exception in ESR_ELx, using the EC value 0x15, and the value of the immediate argument.

    \[
    \begin{array}{ccccccccccc}
    \text{31} & \text{30} & \text{29} & \text{28} & \text{27} & \text{26} & \text{25} & \text{24} & \text{23} & \text{22} & \text{21} & \text{20} & \text{5} & \text{4} & \text{3} & \text{2} & \text{1} & \text{0} \\
    1 & 1 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & \text{imm16} & 0 & 0 & 0 & 0 & 1 \\
    \end{array}
    \]

    **System variant**

    SVC #<imm>

    **Decode for this encoding**

    // Empty.

    **Assembler symbols**

    <imm>   Is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm16" field.

    **Operation**

    AArch64.CallSupervisor(imm16);
C6.2.280  SWPB, SWPAB, SWPALB, SWPLB

Swap byte in memory atomically loads an 8-bit byte from a memory location, and stores the value held in a register back to the same memory location. The value initially loaded from memory is returned in the destination register.

- If the destination register is not WZR, SWPAB and SWPALB load from memory with acquire semantics.
- SWPLB and SWPALB store to memory with release semantics.
- SWPB has no memory ordering requirements.

For information about memory accesses see *Load/Store addressing modes on page C1-149.*

SWPAB <Ws>, <Wt>, [<Xn|SP>]

**SWPALB variant**

Applies when A == 1 && R == 1.

SWPALB <Ws>, <Wt>, [<Xn|SP>]

**SWPB variant**

Applies when A == 0 && R == 0.

SWPB <Ws>, <Wt>, [<Xn|SP>]

**SWPLB variant**

Applies when A == 0 && R == 1.

SWPLB <Ws>, <Wt>, [<Xn|SP>]

**Decode for all variants of this encoding**

if !HaveAtomicExt() then UnallocatedEncoding();

integer t = UInt(Rt);
integer n = UInt(Rn);
integer s = UInt(Rs);

AccType ldacctype = if A == '1' && Rt != '11111' then AccType_ORDEREDRW else AccType_ATOMICRW;
AccType stacctype = if R == '1' then AccType_ORDEREDRW else AccType_ATOMICRW;

**Assembler symbols**

<Ws>  Is the 32-bit name of the general-purpose register to be stored, encoded in the "Rs" field.

<Wt>  Is the 32-bit name of the general-purpose register to be loaded, encoded in the "Rt" field.
<Xn|SP>  Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

**Operation**

```
bits(64) address;
bits(8) data;

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];

// All observers in the shareability domain observe the
// following load and store atomically.
data = Mem[address, 1, ldacctype];
Mem[address, 1, stacctype] = X[s];
X[t] = ZeroExtend(data, 32);
```
C6.2.281 SWPH, SWPAH, SWPALH, SWPLH

Swap halfword in memory atomically loads a 16-bit halfword from a memory location, and stores the value held in a register back to the same memory location. The value initially loaded from memory is returned in the destination register.

- If the destination register is not WZR, SWPAH and SWPALH load from memory with acquire semantics.
- SWPLH and SWPALH store to memory with release semantics.
- SWPH has no memory ordering requirements.

For information about memory accesses see Load/Store addressing modes on page C1-149.

#### Assembler symbols

- \(<W_s>\) Is the 32-bit name of the general-purpose register to be stored, encoded in the "Rs" field.
- \(<W_t>\) Is the 32-bit name of the general-purpose register to be loaded, encoded in the "Rt" field.
- \(<X_s>\) Is the 64-bit name of the general-purpose register to be stored, encoded in the "Rs" field.
- \(<X_t>\) Is the 64-bit name of the general-purpose register to be loaded, encoded in the "Rt" field.
- \(<X_n|SP>\) Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

#### Operation

bits(64) address;
bits(datasize) data;

if \( n == 31 \) then
    CheckSPAignment();
    address = SP[];
else
    address = X[n];

// All observers in the shareability domain observe the
// following load and store atomically.
data = Mem[address, datasize DIV 8, ldacctype];
Mem[address, datasize DIV 8, stacctype] = X[s];
X[t] = ZeroExtend(data, regsize);
C6.2.283  SXTB

Signed Extend Byte extracts an 8-bit value from a register, sign-extends it to the size of the register, and writes the result to the destination register.

This instruction is an alias of the SBFM instruction. This means that:

- The encodings in this description are named to match the encodings of SBFM.
- The description of SBFM gives the operational pseudocode for this instruction.

### 32-bit variant

Applies when \( sf = 0 \) && \( N = 0 \).

SXTB \(<Wd>, <Wn>\)

is equivalent to

SBFM \(<Wd>, <Wn>, #0, #7\)

and is always the preferred disassembly.

### 64-bit variant

Applies when \( sf = 1 \) && \( N = 1 \).

SXTB \(<Xd>, <Xn>\)

is equivalent to

SBFM \(<Xd>, <Xn>, #0, #7\)

and is always the preferred disassembly.

### Assembler symbols

- \(<Wd>\)  Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Xd>\)  Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Xn>\)  Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.
- \(<ilm>\)  Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.

### Operation

The description of SBFM gives the operational pseudocode for this instruction.
### C6.2.284 SXTH

Sign Extend Halfword extracts a 16-bit value, sign-extends it to the size of the register, and writes the result to the destination register.

This instruction is an alias of the SBFM instruction. This means that:

- The encodings in this description are named to match the encodings of SBFM.
- The description of SBFM gives the operational pseudocode for this instruction.

#### 32-bit variant

Applies when $sf == 0$ && $N == 0$.

SXTH <Wd>, <Wn>
is equivalent to
SBFM <Wd>, <Wn>, #0, #15
and is always the preferred disassembly.

#### 64-bit variant

Applies when $sf == 1$ && $N == 1$.

SXTH <Xd>, <Wn>
is equivalent to
SBFM <Xd>, <Xn>, #0, #15
and is always the preferred disassembly.

#### Assembler symbols

- `<Wd>` Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- `<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- `<Xn>` Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.
- `<imm>` Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.

#### Operation

The description of SBFM gives the operational pseudocode for this instruction.
C6.2.285   SXTW

Sign Extend Word sign-extends a word to the size of the register, and writes the result to the destination register.

This instruction is an alias of the SBFM instruction. This means that:

- The encodings in this description are named to match the encodings of SBFM.
- The description of SBFM gives the operational pseudocode for this instruction.

### 64-bit variant

SXTW <Xd>, <Wn>

is equivalent to

SBFM <Xd>, <Xn>, #0, #31

and is always the preferred disassembly.

#### Assembler symbols

- `<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- `<Xn>` Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.
- `<Wn>` Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.

#### Operation

The description of SBFM gives the operational pseudocode for this instruction.
C6.2.286   SYS

System instruction. For more information, see op0==0b01, cache maintenance, TLB maintenance, and address translation instructions on page C5-332 for the encodings of System instructions.

This instruction is used by the aliases AT, DC, IC, and TLBI. See Alias conditions for details of when each alias is preferred.

Assembler symbols
<op1> Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op1" field.
<Cn> Is a name 'Cn', with 'n' in the range 0 to 15, encoded in the "CRn" field.
<Cm> Is a name 'Cm', with 'm' in the range 0 to 15, encoded in the "CRm" field.
<op2> Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op2" field.
<Xt> Is the 64-bit name of the optional general-purpose source register, defaulting to '11111', encoded in the "Rt" field.

Operation
AArch64.SysInstr(1, sys_op1, sys_crn, sys_crm, sys_op2, X[t]);
C6.2.287   SYSL

System instruction with result. For more information, see op0==0b01, cache maintenance, TLB maintenance, and address translation instructions on page C5-332 for the encodings of System instructions.

System variant
SYSL <Xt>, #<op1>, <Cn>, <Cm>, #<op2>

Decode for this encoding

AArch64.CheckSystemAccess('01', op1, CRn, CRm, op2, Rt, L);

integer t = UInt(Rt);

integer sys_op1 = UInt(op1);
integer sys_op2 = UInt(op2);
integer sys_crn = UInt(CRn);
integer sys_crm = UInt(CRm);

Assembler symbols

<Xt> Is the 64-bit name of the general-purpose destination register, encoded in the "Rt" field.
<op1> Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op1" field.
<Cn> Is a name 'Cn', with 'n' in the range 0 to 15, encoded in the "CRn" field.
<Cm> Is a name 'Cm', with 'm' in the range 0 to 15, encoded in the "CRm" field.
<op2> Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op2" field.

Operation

X[t] = AArch64.SysInstrWithResult(1, sys_op1, sys_crn, sys_crm, sys_op2);
C6.2.288   TBNZ

Test bit and Branch if Nonzero compares the value of a bit in a general-purpose register with zero, and conditionally branches to a label at a PC-relative offset if the comparison is not equal. It provides a hint that this is not a subroutine call or return. This instruction does not affect condition flags.

14-bit signed PC-relative branch offset variant

TBNZ <R><t>, #<imm>, <label>

Decode for this encoding

```
integer t = UInt(Rt);
integer datasize = if b5 == '1' then 64 else 32;
integer bit_pos = UInt(b5:b40);
bits(64) offset = SignExtend(imm14:'00', 64);
```

Assembler symbols

- `<R>`: Is a width specifier, encoded in the "b5" field. It can have the following values:
  - W when b5 = 0
  - X when b5 = 1
  In assembler source code an 'X' specifier is always permitted, but a 'W' specifier is only permitted when the bit number is less than 32.

- `<t>`: Is the number [0-30] of the general-purpose register to be tested or the name ZR (31), encoded in the "Rt" field.

- `<imm>`: Is the bit number to be tested, in the range 0 to 63, encoded in "b5:b40".

- `<label>`: Is the program label to be conditionally branched to. Its offset from the address of this instruction, in the range +/-32KB, is encoded as "imm14" times 4.

Operation

```
bits(datasize) operand = X[t];
if operand<bit_pos> == op then
    BranchTo(PC[] + offset, BranchType_JMP);
```
C6.2.289 TBZ

Test bit and Branch if Zero compares the value of a test bit with zero, and conditionally branches to a label at a PC-relative offset if the comparison is equal. It provides a hint that this is not a subroutine call or return. This instruction does not affect condition flags.

14-bit signed PC-relative branch offset variant

TBZ <R><t>, #<imm>, <label>

Decode for this encoding

integer t = UInt(Rt);

integer datasize = if b5 == '1' then 64 else 32;
integer bit_pos = UInt(b5:b40);
bits(64) offset = SignExtend(imm14:'00', 64);

Assembler symbols

<R> Is a width specifier, encoded in the "b5" field. It can have the following values:
  W when b5 = 0
  X when b5 = 1
In assembler source code an 'X' specifier is always permitted, but a 'W' specifier is only permitted when the bit number is less than 32.

<t> Is the number [0-30] of the general-purpose register to be tested or the name ZR (31), encoded in the "Rt" field.

<imm> Is the bit number to be tested, in the range 0 to 63, encoded in "b5:b40".

<label> Is the program label to be conditionally branched to. Its offset from the address of this instruction, in the range +/-32KB, is encoded as "imm14" times 4.

Operation

bits(datasize) operand = X[t];

if operand<bit_pos> == op then
  BranchTo(PC[] + offset, BranchType_JMP);
C6.2.290 TLBI

TLB Invalidate operation. For more information, see op0==0b01, cache maintenance, TLB maintenance, and address translation instructions on page C5-332.

This instruction is an alias of the SYS instruction. This means that:

- The encodings in this description are named to match the encodings of SYS.
- The description of SYS gives the operational pseudocode for this instruction.

System variant

TLBI <tlbi_op>{, <Xt>}

is equivalent to

SYS #<op1>, C8, <Cm>, #<op2>{, <Xt>}

and is the preferred disassembly when SysOp(op1,'1000',CRm,op2) == Sys_TLBI.

Assembler symbols

- <op1> Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op1" field.
- <Cm> Is a name 'Cm', with 'm' in the range 0 to 15, encoded in the "CRm" field.
- <op2> Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op2" field.
- <tlbi_op> Is a TLBI instruction name, as listed for the TLBI system instruction group, encoded in the "op1:CRm:op2" field. It can have the following values:
  - VMALLE1IS when op1 = 000, CRm = 0011, op2 = 000
  - VAEIIS when op1 = 000, CRm = 0011, op2 = 001
  - ASIDE1IS when op1 = 000, CRm = 0011, op2 = 010
  - VAAE1IS when op1 = 000, CRm = 0011, op2 = 011
  - VALE1IS when op1 = 000, CRm = 0011, op2 = 101
  - VAALE1IS when op1 = 000, CRm = 0011, op2 = 111

<Xt> Is the 64-bit name of the optional general-purpose source register, defaulting to '11111', encoded in the "Rt" field.

Operation

The description of SYS gives the operational pseudocode for this instruction.
C6.2.291 TST (immediate)

Test bits (immediate), setting the condition flags and discarding the result: \( Rn \ AND \ imm \).

This instruction is an alias of the ANDS (immediate) instruction. This means that:

- The encodings in this description are named to match the encodings of ANDS (immediate).
- The description of ANDS (immediate) gives the operational pseudocode for this instruction.

### 32-bit variant

Applies when \( sf == 0 && N == 0 \).

TST <Wn>, #<imm>

is equivalent to

ANDS WZR, <Wn>, #<imm>

and is always the preferred disassembly.

### 64-bit variant

Applies when \( sf == 1 \).

TST <Xn>, #<imm>

is equivalent to

ANDS XZR, <Xn>, #<imm>

and is always the preferred disassembly.

### Assembler symbols

- \(<Wn>\) Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.
- \(<Xn>\) Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.
- \(<imm>\) For the 32-bit variant: is the bitmask immediate, encoded in "imms:immr".
  
  For the 64-bit variant: is the bitmask immediate, encoded in "N:imms:immr".

### Operation

The description of ANDS (immediate) gives the operational pseudocode for this instruction.
C6.2.292   TST (shifted register)

Test (shifted register) performs a bitwise AND operation on a register value and an optionally-shifted register value. It updates the condition flags based on the result, and discards the result.

This instruction is an alias of the ANDS (shifted register) instruction. This means that:

- The encodings in this description are named to match the encodings of ANDS (shifted register).
- The description of ANDS (shifted register) gives the operational pseudocode for this instruction.

32-bit variant

Applies when \( sf = 0 \).

\[
\text{TST} \ <Wn>, \ <Wm>{, <shift> #<amount>}
\]

is equivalent to

\[
\text{ANDS} \ WZR, \ <Wn>, \ <Wm>{, <shift> #<amount>}
\]

and is always the preferred disassembly.

64-bit variant

Applies when \( sf = 1 \).

\[
\text{TST} \ <Xn>, \ <Xm>{, <shift> #<amount>}
\]

is equivalent to

\[
\text{ANDS} \ XZR, \ <Xn>, \ <Xm>{, <shift> #<amount>}
\]

and is always the preferred disassembly.

Assembler symbols

- \(<Wn>\) Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.
- \(<Wm>\) Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.
- \(<Xn>\) Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.
- \(<Xm>\) Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.
- \(<\text{shift}>\) Is the optional shift to be applied to the final source, defaulting to LSL and encoded in the "shift" field. It can have the following values:
  - LSL when \( \text{shift} = 00 \)
  - LSR when \( \text{shift} = 01 \)
  - ASR when \( \text{shift} = 10 \)
  - ROR when \( \text{shift} = 11 \)
- \(<\text{amount}>\) For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.
  For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field.
Operation

The description of **ANDS (shifted register)** gives the operational pseudocode for this instruction.
C6.2.293  UBFIZ

Unsigned Bitfield Insert in Zero zeroes the destination register and copies any number of contiguous bits from a
source register into any position in the destination register.

This instruction is an alias of the UBFM instruction. This means that:

- The encodings in this description are named to match the encodings of UBFM.
- The description of UBFM gives the operational pseudocode for this instruction.

32-bit variant

Applies when \( sf == 0 && N == 0 \).

\[
\text{UBFIZ} \ <Wd>, <Wn>, #<lsb>, #<width>
\]
is equivalent to

\[
\text{UBFM} \ <Wd>, <Wn>, #(-<lsb> MOD 32), #(<width>-1)
\]
and is the preferred disassembly when \( \text{UInt}(\text{imms}) < \text{UInt}(\text{immr}) \).

64-bit variant

Applies when \( sf == 1 && N == 1 \).

\[
\text{UBFIZ} \ <Xd>, <Xn>, #<lsb>, #<width>
\]
is equivalent to

\[
\text{UBFM} \ <Xd>, <Xn>, #(-<lsb> MOD 64), #(<width>-1)
\]
and is the preferred disassembly when \( \text{UInt}(\text{imms}) < \text{UInt}(\text{immr}) \).

Assembler symbols

- \(<Wd>\) Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Wn>\) Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.
- \(<Xd>\) Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- \(<Xn>\) Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.
- \(<\text{lsb}>\) For the 32-bit variant: is the bit number of the lsb of the destination bitfield, in the range 0 to 31.
  For the 64-bit variant: is the bit number of the lsb of the destination bitfield, in the range 0 to 63.
- \(<\text{width}>\) For the 32-bit variant: is the width of the bitfield, in the range 1 to 32-<\text{lsb}>.
  For the 64-bit variant: is the width of the bitfield, in the range 1 to 64-<\text{lsb}>.

Operation

The description of UBFM gives the operational pseudocode for this instruction.
C6.2.294  UBFM

Unsigned Bitfield Move copies any number of low-order bits from a source register into the same number of
adjacent bits at any position in the destination register, with zeros in the upper and lower bits.

This instruction is used by the aliases LSL (immediate), LSR (immediate), UBFIZ, UBFX, UXTB, and UXTH. See
Alias conditions on page C6-990 for details of when each alias is preferred.

Assembler symbols

- `<Wd>` Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- `<Wn>` Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.
- `<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- `<Xn>` Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.
- `<immr>` For the 32-bit variant: is the right rotate amount, in the range 0 to 31, encoded in the "immr" field. For the 64-bit variant: is the right rotate amount, in the range 0 to 63, encoded in the "immr" field.
- `<imms>` For the 32-bit variant: is the leftmost bit number to be moved from the source, in the range 0 to 31, encoded in the "imms" field. For the 64-bit variant: is the leftmost bit number to be moved from the source, in the range 0 to 63, encoded in the "imms" field.

Operation

bits(datasize) src = X[n];

// perform bitfield move on low bits
bits(datasize) bot = ROR(src, R) AND wmask;

// combine extension bits and result bits
X[d] = bot AND tmask;
C6.2.295  UBFX

Unsigned Bitfield Extract extracts any number of adjacent bits at any position from a register, zero-extends them to the size of the register, and writes the result to the destination register.

This instruction is an alias of the UBFM instruction. This means that:

- The encodings in this description are named to match the encodings of UBFM.
- The description of UBFM gives the operational pseudocode for this instruction.

32-bit variant
Applies when $sf == 0 \&\& N == 0$.

$UBFX <Wd>, <Wn>, # <+lsb>, #<width>$

is equivalent to

$UBFM <Wd>, <Wn>, # <+lsb>, #(<lsb>+<width>-1)$

and is the preferred disassembly when $BFXPreferred(sf, opc<1>, imms, immr)$.

64-bit variant
Applies when $sf == 1 \&\& N == 1$.

$UBFX <Xd>, <Xn>, # <+lsb>, #<width>$

is equivalent to

$UBFM <Xd>, <Xn>, # <+lsb>, #(<lsb>+<width>-1)$

and is the preferred disassembly when $BFXPreferred(sf, opc<1>, imms, immr)$.

Assembler symbols

- $<Wd>$ Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- $<Wn>$ Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.
- $<Xd>$ Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- $<Xn>$ Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.
- $<lsb>$ For the 32-bit variant: is the bit number of the lsb of the source bitfield, in the range 0 to 31.
  For the 64-bit variant: is the bit number of the lsb of the source bitfield, in the range 0 to 63.
- $<width>$ For the 32-bit variant: is the width of the bitfield, in the range 1 to 32-$<lsb>$.
  For the 64-bit variant: is the width of the bitfield, in the range 1 to 64-$<lsb>$.

Operation
The description of UBFM gives the operational pseudocode for this instruction.
C6.2.296   UDIV

Unsigned Divide divides an unsigned integer register value by another unsigned integer register value, and writes
the result to the destination register. The condition flags are not affected.

```
| 31 30 29 28|27 26 25 24|23 22 21 20|   16|15 14 13 12|11 10  9 |  5  4 |  0 |

```

32-bit variant
Applies when sf == 0.
UDIV <Wd>, <Wn>, <Wm>

64-bit variant
Applies when sf == 1.
UDIV <Xd>, <Xn>, <Xm>

Decoding for all variants of this encoding

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;

Assembler symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wn> Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.

<Wm> Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xn> Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.

<Xm> Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.

Operation

bits(datasize) operand1 = X[n];
bits(datasize) operand2 = X[m];
integer result;

if IsZero(operand2) then
    result = 0;
else
    result = RoundTowardsZero(Real(Int(operand1, TRUE)) / Real(Int(operand2, TRUE)));

X[d] = result<datasize-1:0>;
C6.2.297   UMADDL

Unsigned Multiply-Add Long multiplies two 32-bit register values, adds a 64-bit register value, and writes the result to the 64-bit destination register.

This instruction is used by the alias UMULL. See Alias conditions for details of when each alias is preferred.

```
[31 30 29 28|27 26 25 24|23 22 21 20| 16|15 14 | 10 9 | 5 4 | 0 ]

<tbody>
<tr>
<td>UMULL</td>
<td>Ra == '11111'</td>
</tr>
</tbody>
</table>

**Assembler symbols**

- `<Xd>` Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- `<Wn>` Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
- `<Wm>` Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.
- `<Xa>` Is the 64-bit name of the third general-purpose source register holding the addend, encoded in the "Ra" field.

**Operation**

```java
bits(32) operand1 = X[n];
bits(32) operand2 = X[m];
bits(64) operand3 = X[a];

integer result;
result = Int(operand3, TRUE) + (Int(operand1, TRUE) * Int(operand2, TRUE));
X[d] = result<63:0>;
```
C6.2.298 UMNEGL

Unsigned Multiply-Negate Long multiplies two 32-bit register values, negates the product, and writes the result to the 64-bit destination register.

This instruction is an alias of the UMSUBL instruction. This means that:

- The encodings in this description are named to match the encodings of UMSUBL.
- The description of UMSUBL gives the operational pseudocode for this instruction.

64-bit variant

UMNEGL <Xd>, <Wn>, <Wm>

is equivalent to

UMSUBL <Xd>, <Wn>, <Wm>, XZR

and is always the preferred disassembly.

Assembler symbols

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wn> Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

<Wm> Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

Operation

The description of UMSUBL gives the operational pseudocode for this instruction.
C6.2.299  UMSUBL

Unsigned Multiply-Subtract Long multiplies two 32-bit register values, subtracts the product from a 64-bit register value, and writes the result to the 64-bit destination register.

This instruction is used by the alias UMNEGL. See *Alias conditions* for details of when each alias is preferred.

64-bit variant

UMSUBL <Xd>, <Wn>, <Wm>, <Xa>

**Decode for this encoding**

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer a = UInt(Ra);

**Alias conditions**

**Assembler symbols**

Xd  Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

Wn  Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

Wm  Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

Xa  Is the 64-bit name of the third general-purpose source register holding the minuend, encoded in the "Ra" field.

**Operation**

bits(32) operand1 = X[n];
bits(32) operand2 = X[m];
bits(64) operand3 = X[a];

integer result;

result = Int(operand3, TRUE) - (Int(operand1, TRUE) * Int(operand2, TRUE));
X[d] = result<63:0>;;
C6.2.300  UMULH

Unsigned Multiply High multiplies two 64-bit register values, and writes bits[127:64] of the 128-bit result to the 64-bit destination register.

64-bit variant

\[ \text{UMULH } <Xd>, <Xn>, <Xm> \]

**Decode for this encoding**

\[
\begin{align*}
\text{integer } d &= \text{UInt}(Rd); \\
\text{integer } n &= \text{UInt}(Rn); \\
\text{integer } m &= \text{UInt}(Rm);
\end{align*}
\]

**Assembler symbols**

\[<Xd>\] Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

\[<Xn>\] Is the 64-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

\[<Xm>\] Is the 64-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

**Operation**

\[
\begin{align*}
\text{bits}(64) \text{ operand1} &= X[n]; \\
\text{bits}(64) \text{ operand2} &= X[m]; \\
\text{integer } \text{result}; \\
\text{result} &= \text{Int}(\text{operand1}, \text{TRUE}) \times \text{Int}(\text{operand2}, \text{TRUE}); \\
X[d] &= \text{result}[127:64];
\end{align*}
\]
C6.2.301 UMULL

Unsigned Multiply Long multiplies two 32-bit register values, and writes the result to the 64-bit destination register.

This instruction is an alias of the UMADDL instruction. This means that:

- The encodings in this description are named to match the encodings of UMADDL.
- The description of UMADDL gives the operational pseudocode for this instruction.

### 64-bit variant

UMULL <Xd>, <Wn>, <Wm>

is equivalent to

UMADDL <Xd>, <Wn>, <Wm>, XZR

and is always the preferred disassembly.

### Assembler symbols

- **<Xd>** Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- **<Wn>** Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
- **<Wm>** Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

### Operation

The description of UMADDL gives the operational pseudocode for this instruction.
C6.2.302  UXTB

Unsigned Extend Byte extracts an 8-bit value from a register, zero-extends it to the size of the register, and writes the result to the destination register.

This instruction is an alias of the UBFM instruction. This means that:

• The encodings in this description are named to match the encodings of UBFM.
• The description of UBFM gives the operational pseudocode for this instruction.

### 32-bit variant

UXTB <wd>, <rn>

is equivalent to

UBFM <wd>, <rn>, #0, #7

and is always the preferred disassembly.

### Assembler symbols

- `<wd>` is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- `<rn>` is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.

### Operation

The description of UBFM gives the operational pseudocode for this instruction.
C6.2.303  UXTH

Unsigned Extend Halfword extracts a 16-bit value from a register, zero-extends it to the size of the register, and writes the result to the destination register.

This instruction is an alias of the UBFM instruction. This means that:

• The encodings in this description are named to match the encodings of UBFM.
• The description of UBFM gives the operational pseudocode for this instruction.

32-bit variant

UXTH <Wd>, <Wn>

is equivalent to

UBFM <Wd>, <Wn>, #0, #15

and is always the preferred disassembly.

Assembler symbols

<Wd>  Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Wn>  Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.

Operation

The description of UBFM gives the operational pseudocode for this instruction.
C6.2.304  WFE

Wait For Event is a hint instruction that indicates that the PE can enter a low-power state and remain there until a wakeup event occurs. Wakeup events include the event signaled as a result of executing the SEV instruction on any PE in the multiprocessor system. For more information, see *Wait for Event mechanism and Send event on page D1-1954*.

As described in *Wait for Event mechanism and Send event on page D1-1954*, the execution of a WFE instruction that would otherwise cause entry to a low-power state can be trapped to a higher Exception level. See:

- *Traps to EL1 of EL0 execution of WFE and WFI instructions on page D1-1913*.
- *Traps to EL2 of Non-secure EL0 and EL1 execution of WFE and WFI instructions on page D1-1931*.
- *Traps to EL3 of EL2, EL1, and EL0 execution of WFE and WFI instructions on page D1-1944*.

```
[31 30 29 28][27 26 25 24][23 22 21 20][19 18 17 16][15 14 13 12][11  8  7  5  4  3  2  1  0]

System variant
WFE

Decode for this encoding
// Empty.

Operation
if IsEventRegisterSet() then
  ClearEventRegister();
else
  if PSTATE.EL == EL0 then
    // Check for traps described by the OS which may be EL1 or EL2.
    AArch64.CheckForWFxTrap(EL1, TRUE);
  if HaveEL(EL2) && !IsSecure() && PSTATE.EL IN {EL0, EL1} && !IsInHost() then
    // Check for traps described by the Hypervisor.
    AArch64.CheckForWFxTrap(EL2, TRUE);
  if HaveEL(EL3) && PSTATE.EL != EL3 then
    // Check for traps described by the Secure Monitor.
    AArch64.CheckForWFxTrap(EL3, TRUE);
  WaitForEvent();
```
C6.2.305 WFI

Wait For Interrupt is a hint instruction that indicates that the PE can enter a low-power state and remain there until a wakeup event occurs. For more information, see Wait For Interrupt on page D1-1957.

As described in Wait For Interrupt on page D1-1957, the execution of a WFI instruction that would otherwise cause entry to a low-power state can be trapped to a higher Exception level. See:

- Traps to EL1 of EL0 execution of WFE and WFI instructions on page D1-1913.
- Traps to EL2 of Non-secure EL0 and EL1 execution of WFE and WFI instructions on page D1-1931.
- Traps to EL3 of EL2, EL1, and EL0 execution of WFE and WFI instructions on page D1-1944.

```
C6.2.307   YIELD

YIELD is a hint instruction. Software with a multithreading capability can use a YIELD instruction to indicate to the PE that it is performing a task, for example a spin-lock, that could be swapped out to improve overall system performance. The PE can use this hint to suspend and resume multiple software threads if it supports the capability.

For more information about the recommended use of this instruction, see The YIELD instruction on page B1-82.

Chapter C7
A64 Advanced SIMD and Floating-point Instruction Descriptions

This chapter describes the A64 Advanced SIMD and floating-point instructions. It contains the following sections:

- *About the A64 SIMD and floating-point instructions* on page C7-1006.
- *Alphabetical list of A64 Advanced SIMD and floating-point instructions* on page C7-1008.
C7.1 About the A64 SIMD and floating-point instructions

Alphabetical list of A64 Advanced SIMD and floating-point instructions on page C7-1008 gives full descriptions of the A64 instructions that are in the following instruction groups:

• Loads and store instructions associated with the SIMD and floating-point registers.
• Data processing instructions with SIMD and floating-point registers.

A64 instruction set encoding on page C4-224 in the A64 Instruction Encodings chapter provides an overview of the instruction encodings as part of an instruction class within a functional group.

The rest of this section is a general description of the SIMD and floating-point instructions. It contains the following subsections:

• Register size.
• Data types.
• Condition flags and related instructions on page C7-1007.
• General capabilities on page C7-1007.

C7.1.1 Register size

A64 provides a comprehensive set of packed Single Instruction Multiple Data (SIMD) and scalar operations using data held in the 32 entry 128-bit wide SIMD and floating-point register file.

Each SIMD and floating-point register can be used to hold:

• A single scalar value of the floating-point or integer type.
• A 64-bit wide vector containing one or more elements.
• A 128-bit wide vector containing two or more elements.

Where the entire 128-bit wide register is not fully utilized, the vector or scalar quantity is held in the least significant bits of the register, with the most significant bits being cleared to zero on a write, see Vector formats on page A1-41.

The following instructions can insert data into individual elements within a SIMD and floating-pointer register without clearing the remaining bits to zero:

• Insert vector element from another vector element or general-purpose register, INS.
• Load structure into a single lane, for example LD3.
• All second-part narrowing operations, for example SHRN2.

C7.1.2 Data types

The A64 instruction set provides support for arithmetic, conversion, and bitwise operations on:

• Half-precision, single-precision, and double-precision floating-points.
• Signed and unsigned integers.
• Polynomials over \{0, 1\}.
• When ARMv8.3-CompNum is implemented, complex numbers.

For all AArch64 floating-point operations, including SIMD operations, the rounding mode and exception trap handling are controlled by the FPCR.

--- Note ---

• AArch32 Advanced SIMD operations always use ARM standard floating-point arithmetic, regardless of the rounding mode specified by the AArch64 FPCR or the AArch32 FPSCR.

• In AArch64 state, floating-point multiply-add operations are always performed as fused operations, but AArch32 state provides both fused and chained multiply-add instructions.
In addition to operations that consume and produce values of the same width and type, the A64 instruction set supports SIMD and scalar operations that produce a wider or narrower vector result:

- Where a SIMD operation narrows a 128-bit vector to a 64-bit vector, the A64 instruction set provides a second-part operation, for example `SHRN2`, that can pack the result of a second operation into the upper part of the same destination register.

- Where a SIMD operation widens a 64-bit vector to a 128-bit vector, the A64 instruction set provides a second-part operation, for example `SMUL2`, that can extract the source from the upper 64 bits of the source registers.

All SIMD operations that could produce side-effects that are not limited to the destination SIMD and floating-point register, for example a potential update of `FPSR.Q` or `FPSR.IDC`, have a dedicated scalar variant to support the use of SIMD with loops requiring specialised head or tail handling, or both.

### C7.1.3 Condition flags and related instructions

The A64 instruction set provides support for flag setting and conditional operations on the SIMD and floating-point register file:

- Floating-point `FCSEL` and `FCCMP` instructions are equivalent to the integer `CSEL` and `CCMP` instructions.

- Floating-point `FCMP`, `FOPF`, `FCMPF`, and `FCMPN` instructions set the PSTATE.\{N, Z, C, V\} flags based on the result of the floating-point comparison.

- Floating-point `FJCVTZS` instruction sets the PSTATE.Z flag if the result of the conversion, when converted back to a double-precision floating-point number, gives precisely the same value as the original. Other PSTATE flags are cleared by this instruction.

- Floating-point and integer instructions provide a means of producing either a scalar or a vector mask based on a comparison in a SIMD and floating-point register, for example `FCMEQ`.

---

**Note**

FCMP and FOPF differ from the A32/T32 VCMP and VCMPF instructions, which use the dedicated FPSCR.NZCV field for the result. A64 instructions store the result of an FCMP or FOPF operation in the PSTATE.\{N, Z, C, V\} field.

---

### C7.1.4 General capabilities

A64 SIMD and floating-point instructions provide the following capabilities:

- General arithmetic on vector and scalar floating-point and integer values.

- Dedicated polynomial multiply over \{0, 1\}.

- Vector and scalar fused multiply-addition of single-precision and double-precision floating-points, and for half-precision floating-points when ARMv8.2-FP16 is implemented.

- Load and store of single and pairs of SIMD and floating-point registers.

- Load and store of structures and individual lanes of between one and four SIMD and floating-point registers.

- Direct conversion between 64-bit integers and floating-point values, with explicit rounding.

- When ARMv8.3-JSConv is implemented, conversion from double precision floating-point values to 32-bit integers, with rounding to zero.

- Double-rounding free conversion between double-precision and half-precision floating-point values.

- Comprehensive SIMD with widening and narrowing support.

- Vector to scalar reduction returning the minimum or maximum value, or the sum.

- Floating-point to nearest integer in floating-point format.

- When ARMv8.3-CompNum is implemented, complex number arithmetic.
C7.2 Alphabetical list of A64 Advanced SIMD and floating-point instructions

This section lists every section in the Advanced SIMD and floating-point categories of the A64 instruction set. For details of the format used, see *Structure of the A64 assembler language* on page C1-143.
C7.2.1 ABS

Absolute value (vector). This instruction calculates the absolute value of each vector element in the source SIMD&FP register, puts the result into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

```
0 1 0 1 1 1 0 | size 1 0 0 0 0 1 0 1 1 1 0 | Rn  | Rd |
```

Scalar variant

ABS <V><d>, <V><n>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size != '11' then ReservedValue();
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;
boolean neg = (U == '1');
```

Vector

```
0 0 0 1 1 1 0 | size 1 0 0 0 0 1 0 1 1 1 0 | Rn  | Rd |
```

Vector variant

ABS <Vd>.<T>, <Vn>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size:Q == '110' then ReservedValue();
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean neg = (U == '1');
```

Assembler symbols

```
<V> Is a width specifier, encoded in the "size" field. It can have the following values:

- D when size = 11

The following encodings are reserved:
- size = 0x.
- size = 10.
```
Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<n>
Is the number of the SIMD&FP source register, encoded in the "Rn" field.

</d>
Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T>
Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

- 8B  when size = 00, Q = 0
- 16B when size = 00, Q = 1
- 4H  when size = 01, Q = 0
- 8H  when size = 01, Q = 1
- 2S  when size = 10, Q = 0
- 4S  when size = 10, Q = 1
- 2D  when size = 11, Q = 1

The encoding size = 11, Q = 0 is reserved.

</n>
Is the name of the SIMD&FP source register, encoded in the "Rn" field.

**Operation for all encodings**

```c
CheckFPAdvSIMDEnabled64();
bias(datasize) operand = V[n];
bias(datasize) result;
integer element;

for e = 0 to elements-1
    element = SInt(Elem[operand, e, esize]);
    if neg then
        element = -element;
    else
        element = Abs(element);
    Elem[result, e, esize] = element<esize-1:0>;

V[d] = result;
```
C7.2.2   ADD (vector)

Add (vector). This instruction adds corresponding elements in the two source SIMD&FP registers, places the results into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Add (vector). This instruction adds corresponding elements in the two source SIMD&FP registers, places the results into a vector, and writes the vector to the destination SIMD&FP register.

Scalar variant

ADD <V><d>, <V><n>, <V><m>

Decode for this encoding

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size != '11' then ReservedValue();
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;
boolean sub_op = (U == '1');

Vector

ADD <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size:Q == '110' then ReservedValue();
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean sub_op = (U == '1');

Assembler symbols

<V> Is a width specifier, encoded in the "size" field. It can have the following values:

- D when size = 11

The following encodings are reserved:

- size = 0x.
- size = 10.
<d> Is the number of the SIMD&FP destination register, in the "Rd" field.

<n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

<m> Is the number of the second SIMD&FP source register, encoded in the "Rm" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "size-Q" field. It can have the following values:

- **8B** when \( \text{size} = 00 \), \( Q = 0 \)
- **16B** when \( \text{size} = 00 \), \( Q = 1 \)
- **4H** when \( \text{size} = 01 \), \( Q = 0 \)
- **8H** when \( \text{size} = 01 \), \( Q = 1 \)
- **2S** when \( \text{size} = 10 \), \( Q = 0 \)
- **4S** when \( \text{size} = 10 \), \( Q = 1 \)
- **2D** when \( \text{size} = 11 \), \( Q = 1 \)

The encoding \( \text{size} = 11 \), \( Q = 0 \) is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

### Operation for all encodings

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
bits(esize) element1;
bits(esize) element2;

for e = 0 to elements-1
    element1 = Elem[operand1, e, esize];
    element2 = Elem[operand2, e, esize];
    if sub_op then
        Elem[result, e, esize] = element1 - element2;
    else
        Elem[result, e, esize] = element1 + element2;

V[d] = result;
```
C7.2.3 ADDHN, ADDHN2

Add returning High Narrow. This instruction adds each vector element in the first source SIMD&FP register to the corresponding vector element in the second source SIMD&FP register, places the most significant half of the result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register.

The results are truncated. For rounded results, see RADDHN, RADDHN2.

The ADDHN instruction writes the vector to the lower half of the destination register and clears the upper half, while the ADDHN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

\[
\begin{array}{|c|c|c|}
\hline
\text{ADDHN} & \text{ADDHN2} \\
\hline
\end{array}
\]

Three registers, not all the same type variant

ADDHN(2) <Vd>.<Tb>, <Vn>.<Ta>, <Vm>.<Ta>

Decode for this encoding

\[
\begin{align*}
\text{integer } d &= \text{UInt}(Rd); \\
\text{integer } n &= \text{UInt}(Rn); \\
\text{integer } m &= \text{UInt}(Rm); \\
\text{if size} &= \text{'}11\text{'} \text{ then ReservedValue();} \\
\text{integer } \text{esize} &= 8 \times \text{UInt(size)}; \\
\text{integer } \text{datasize} &= 64; \\
\text{integer } \text{part} &= \text{UInt}(Q); \\
\text{integer } \text{elements} &= \text{datasize} \text{DIV esize}; \\
\text{boolean } \text{sub_op} &= (o1 = \text{'}1\text{'}); \\
\text{boolean } \text{round} &= (U = \text{'}1\text{'});
\end{align*}
\]

Assembler symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

- [absent] when Q = 0
- [present] when Q = 1

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

- 8 when size = 00, Q = 0
- 16 when size = 00, Q = 1
- 4 when size = 01, Q = 0
- 8 when size = 01, Q = 1
- 2 when size = 10, Q = 0
- 4 when size = 10, Q = 1

The encoding size = 11, Q = x is reserved.
<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:
- 8H when size = 00
- 4S when size = 01
- 2D when size = 10

The encoding size = 11 is reserved.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(2*datasize) operand1 = V[n];
bits(2*datasize) operand2 = V[m];
bits(datasize) result;
integer round_const = if round then 1 << (esize - 1) else 0;
bits(2*esize) element1;
bits(2*esize) element2;
bits(2*esize) sum;
for e = 0 to elements-1
    element1 = Elem[operand1, e, 2*esize];
    element2 = Elem[operand2, e, 2*esize];
    if sub_op then
        sum = element1 - element2;
    else
        sum = element1 + element2;
    sum = sum + round_const;
    Elem[result, e, esize] = sum<2*esize-1:esize>;
Vpart[d, part] = result;
```
C7.2.4 ADDP (scalar)

Add Pair of elements (scalar). This instruction adds two vector elements in the source SIMD&FP register and writes the scalar result into the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Advanced SIMD variant

ADDP <V><d>, <Vn>.<T>

Decode for this encoding

integer d = UInt(Rd);
integer n = UInt(Rn);
if size != '11' then ReservedValue();
integer esize = 8 << UInt(size);
integer datasize = esize * 2;

Assembler symbols

<V> Is the destination width specifier, encoded in the "size" field. It can have the following values:
  0 when size = 11
The following encodings are reserved:
  • size = 0x.
  • size = 10.
<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.
<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
<T> Is the source arrangement specifier, encoded in the "size" field. It can have the following values:
  2D when size = 11
The following encodings are reserved:
  • size = 0x.
  • size = 10.

Operation

CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
V[d] = Reduce(ReduceOp_ADD, operand, esize);

<table>
<thead>
<tr>
<th>31 30 29 28</th>
<th>27 26 25 24</th>
<th>23 22 21 20</th>

<td>1 1 0 1 1 0</td>
<td>Rd</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
C7.2.5 ADDP (vector)

Add Pairwise (vector). This instruction creates a vector by concatenating the vector elements of the first source SIMD&FP register after the vector elements of the second source SIMD&FP register, reads each pair of adjacent vector elements from the concatenated vector, adds each pair of values together, places the result into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

```
[31 30 29 28|27 26 25 24|23 22 21 20] 16|15 14 13 12|11 10 9 | 5 4 | 0 |
 0 | Q | 0 | 1 | 1 | 1 | 0 | size | 1 | Rm | 1 | 0 | 1 | 1 | 1 | Rd
```

**Three registers of the same type variant**

ADD <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

**Decode for this encoding**

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size:Q == '110' then ReservedValue();
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
```

**Assembler symbols**

- `<Vd>` Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- `<T>` Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
  - 8B when size = 00, Q = 0
  - 16B when size = 00, Q = 1
  - 4H when size = 01, Q = 0
  - 8H when size = 01, Q = 1
  - 2S when size = 10, Q = 0
  - 4S when size = 10, Q = 1
  - 2D when size = 11, Q = 1
  The encoding size = 11, Q = 0 is reserved.
- `<Vn>` Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- `<Vm>` Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

**Operation**

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
b bits(datasize) result;
b bits(2*datasize) concat = operand2:operand1;
b bits(esize) element1;
b bits(esize) element2;
```
for \( e = 0 \) to \( \text{elements-1} \)

\[ \text{element1} = \text{Elem[concat, } 2\times e, \text{ esize}]; \]
\[ \text{element2} = \text{Elem[concat, } (2\times e)+1, \text{ esize}]; \]
\[ \text{Elem[result, } e, \text{ esize}] = \text{element1 + element2}; \]

\[ \text{V[d]} = \text{result}; \]
C7.2.6   ADDV

Add across Vector. This instruction adds every vector element in the source SIMD&FP register together, and writes the scalar result to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

```
| 31 30 29 28|27 26 25 24|23 22 21 20|19 18 17 16|15 14 13 12|11 10  9 |  5 4 | 0 |
| 0 | Q | 0 | 1 | 1 | 1 | 0 | size | 1 | 1 | 0 | 0 | 1 | 1 | 0 | 1 | 1 | 1 | 0 | Rd |
```

Advanced SIMD variant
ADDV <V><d>, <Vn>.<T>

**Decode for this encoding**

```plaintext
code:integer d = UInt(Rd);
code:integer n = UInt(Rn);
if size:Q == '100' then ReservedValue();
if size == '11' then ReservedValue();

code:integer esize = 8 << UInt(size);
code:integer datasize = if Q == '1' then 128 else 64;
```

**Assembler symbols**

```
<V> Is the destination width specifier, encoded in the "size" field. It can have the following values:
  B  when size = 00
  H  when size = 01
  S  when size = 10
The encoding size = 11 is reserved.

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
  8B when size = 00, Q = 0
  16B when size = 00, Q = 1
  4H when size = 01, Q = 0
  8H when size = 01, Q = 1
  4S when size = 10, Q = 1
The following encodings are reserved:
  * size = 10, Q = 0.
  * size = 11, Q = x.
```

**Operation**

```plaintext
CheckFPAvSIMDEnabled64();
bits(datasize) operand = V[n];
V[d] = Reduce(ReduceOp_ADD, operand, esize);
```
C7.2.7 AESD

AES single round decryption

Advanced SIMD variant

AESD <Vd>.16B, <Vn>.16B

Decode for this encoding

integer d = UInt(Rd);
integer n = UInt(Rn);
if !HaveCryptoExt() then UnallocatedEncoding();

Assembler symbols

<Vd> Is the name of the SIMD&FP source and destination register, encoded in the "Rd" field.
<Vn> Is the name of the second SIMD&FP source register, encoded in the "Rn" field.

Operation

CheckCryptoEnabled64();

bits(128) operand1 = V[d];
bits(128) operand2 = V[n];
bits(128) result;
result = operand1 EOR operand2;
result = AESInvSubBytes(AESInvShiftRows(result));
V[d] = result;
C7.2.8   AESE

AES single round encryption

<table>
<thead>
<tr>

Advanced SIMD variant

AESE <Vd>.16B, <Vn>.16B

Decode for this encoding

integer d = UInt(Rd);
integer n = UInt(Rn);
if !HaveCryptoExt() then UnallocatedEncoding();

Assembler symbols

<Vd>      Is the name of the SIMD&FP source and destination register, encoded in the "Rd" field.
<Vn>      Is the name of the second SIMD&FP source register, encoded in the "Rn" field.

Operation

CheckCryptoEnabled64();

bits(128) operand1 = V[d];
bites(128) operand2 = V[n];
bites(128) result;
result = operand1 EOR operand2;
result = AESubBytes(AEShiftRows(result));
V[d] = result;
C7.2.9 AESIMC

AES inverse mix columns

Advanced SIMD variant

AESIMC <Vd>.16B, <Vn>.16B

Decode for this encoding

integer d = Uint(Rd);
integer n = Uint(Rn);
if !HaveCryptoExt() then UnallocatedEncoding();

Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

CheckCryptoEnabled64();

bits(128) operand = V[n];
bits(128) result;
result = AESInvMixColumns(operand);
V[d] = result;
C7.2.10 AESMC

AES mix columns

```
[31 30 29 28|27 26 25 24|23 22 21 20|19 18 17 16|15 14 13 12|11 10 9 |  5  4 |  0 ]
[ 0  1  0  0 | 1  1  0 | 0  0 | 1  0  1  0 0  0  1  1 0 1 0 | Rn | Rd ]
```

**Advanced SIMD variant**

AESMC <Vd>.16B, <Vn>.16B

**Decode for this encoding**

```
integer d = UInt(Rd);
integer n = UInt(Rn);
if !HaveCryptoExt() then UnallocatedEncoding();
```

**Assembler symbols**

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

**Operation**

```
CheckCryptoEnabled64();

bits(128) operand = V[n];
bits(128) result;
result = AESMixColumns(operand);
V[d] = result;
```
C7.2.11   AND (vector)

Bitwise AND (vector). This instruction performs a bitwise AND between the two source SIMD&FP registers, and writes the result to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

AND <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Three registers of the same type variant

Decode for this encoding

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if Q == '1' then 128 else 64;

Assembler symbols

<Vd>   Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
<T>   Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
  8B   when Q = 0
  16B   when Q = 1
<Vn>   Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
<Vm>   Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
result = operand1 AND operand2;
V[d] = result;
C7.2.12   BCAX

Bit Clear and Exclusive OR performs a bitwise AND of the 128-bit vector in a source SIMD&FP register and the complement of the vector in another source SIMD&FP register, then performs a bitwise exclusive OR of the resulting vector and the vector in a third source SIMD&FP register, and writes the result to the destination SIMD&FP register.

This instruction is implemented only when ARMv8.2-SHA is implemented.

ARMv8.2

\[
\begin{array}{cccccccccccccccc}
1 & 1 & 0 & 0 & 1 & 1 & 0 & 0 & 0 & 1 & 0 & 1 & 16 & 15 & 14 & 10 & 9 & 5 & 4 & 0 \\
\end{array}
\]

Advanced SIMD variant

BCAX \(<Vd>.16B, <Vn>.16B, <Vm>.16B, <Va>.16B>

Decode for this encoding

if !HaveCryptoExt2() then UnallocatedEncoding();
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer a = UInt(Ra);

Assembler symbols

\(<Vd>\) Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
\(<Vn>\) Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
\(<Vm>\) Is the name of the second SIMD&FP source register, encoded in the "Rm" field.
\(<Va>\) Is the name of the third SIMD&FP source register, encoded in the "Ra" field.

Operation

\[
\begin{align*}
\text{bits}(128) & \ V_m = V[m]; \\
\text{bits}(128) & \ V_n = V[n]; \\
\text{bits}(128) & \ V_a = V[a]; \\
\text{V}[d] & \ = V_n \text{ EOR} \ (V_m \text{ AND} \text{ NOT}(V_a));
\end{align*}
\]
C7.2.13 **BIC (vector, immediate)**

Bitwise bit Clear (vector, immediate). This instruction reads each vector element from the destination SIMD&FP register, performs a bitwise AND between each result and the complement of an immediate constant, places the result into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

**16-bit variant**

Applies when `cmode == 10x1`.

BIC `<Vd>.<T>, #<imm8>{, LSL #<amount>}`

**32-bit variant**

Applies when `cmode == 0xx1`.

BIC `<Vd>.<T>, #<imm8>{, LSL #<amount>}`

**Decode for all variants of this encoding**

integer `rd = UInt(Rd)`;

integer `datasize = if Q == '1' then 128 else 64;`

bits(`datasize`) `imm`;

bits(`64`) `imm64`;

`ImmediateOp operation;`

case `cmode:op` of
  when '0xx01' operation = `ImmediateOp_MVNI`;
  when '0xx11' operation = `ImmediateOp_BIC`;
  when '10x01' operation = `ImmediateOp_MVNI`;
  when '10x11' operation = `ImmediateOp_BIC`;
  when '110x1' operation = `ImmediateOp_MVNI`;
  when '1110x' operation = `ImmediateOp_MOVI`;
  when '11111' // FMOV Dn,#imm is in main FP instruction set
    if Q == '0' then UnallocatedEncoding();
    operation = `ImmediateOp_MOVI`;

`imm64 = AdvSIMDExpandImm(op, cmode, a:b:c:d:e:f:g:h)`;

`imm = Replicate(imm64, datasize DIV 64)`;

**Assembler symbols**

`<Vd>` Is the name of the SIMD&FP register, encoded in the "Rd" field.

`<T>` For the 16-bit variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:

- **4H** when `Q == 0`
- **8H** when `Q == 1`
For the 32-bit variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:

2S when Q = 0
4S when Q = 1

<imm8> Is an 8-bit immediate encoded in "a:b:c:d:e:f:g:h".

<amount> For the 16-bit variant: is the shift amount encoded in the "cmode<1>" field. It can have the following values:

0 when cmode<1> = 0
8 when cmode<1> = 1
defaulting to 0 if LSL is omitted.

For the 32-bit variant: is the shift amount encoded in the "cmode<2:1>" field. It can have the following values:

0 when cmode<2:1> = 00
8 when cmode<2:1> = 01
16 when cmode<2:1> = 10
24 when cmode<2:1> = 11
defaulting to 0 if LSL is omitted.

Operation

CheckFPAdvSIMDEnabled64();
bits(datasize) operand;
bits(datasize) result;

case operation of
  when ImmediateOp_MOVI
    result = imm;
  when ImmediateOp_MVNI
    result = NOT(imm);
  when ImmediateOp_ORR
    operand = V[rd];
    result = operand OR imm;
  when ImmediateOp_BIC
    operand = V[rd];
    result = operand AND NOT(imm);
  V[rd] = result;
C7.2.14  **BIC (vector, register)**  

Bitwise bit Clear (vector, register). This instruction performs a bitwise AND between the first source SIMD&FP register and the complement of the second source SIMD&FP register, and writes the result to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

```
BIC <Vd>.<T>, <Vn>.<T>, <Vm>.<T>
```

**Operation**

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
operand2 = NOT(operand2);
result = operand1 AND operand2;
V[d] = result;
```
C7.2.15   BIF

Bitwise Insert if False. This instruction inserts each bit from the first source SIMD&FP register into the destination SIMD&FP register if the corresponding bit of the second source SIMD&FP register is 0, otherwise leaves the bit in the destination register unchanged.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

| 31 30 29 28|27 26 25 24|23 22 21 20|  16| 15 14 13 12|11 10  9|  5  4|  0 |

|  0   |   Q |  1  |  1  |  1  |  0  |  1  |  1  | Rd  |
| Rm   | 0   | 0   | 0   | 1   | 1   | 0   | 0   | 0   |

### Three registers of the same type variant

BIF <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

### Decode for this encoding

```c
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if Q == '1' then 128 else 64;
```

### Assembler symbols

- `<Vd>` Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- `<T>` Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
  - 8B when Q = 0
  - 16B when Q = 1
- `<Vn>` Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- `<Vm>` Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

### Operation

```c
CheckFPAdvSIMDEnabled64();
bias(datasize) operand1;
bias(datasize) operand3;
bias(datasize) operand4 = V[n];
operand1 = V[d];
operand3 = NOT(V[m]);
V[d] = operand1 EOR ((operand1 EOR operand4) AND operand3);
```
**C7.2.16 BIT**

Bitwise Insert if True. This instruction inserts each bit from the first source SIMD&FP register into the SIMD&FP destination register if the corresponding bit of the second source SIMD&FP register is 1, otherwise leaves the bit in the destination register unchanged.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

**Three registers of the same type variant**

BIT <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

**Decode for this encoding**

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if Q == '1' then 128 else 64;

**Assembler symbols**

- `<Vd>` Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- `<T>` Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
  - 8B when Q = 0
  - 16B when Q = 1
- `<Vn>` Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- `<Vm>` Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

**Operation**

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1;
bits(datasize) operand3;
bits(datasize) operand4 = V[n];
operand1 = V[d];
operand3 = V[m];
V[d] = operand1 EOR ((operand1 EOR operand4) AND operand3);
C7.2.17   BSL

Bitwise Select. This instruction sets each bit in the destination SIMD&FP register to the corresponding bit from the first source SIMD&FP register when the original destination bit was 1, otherwise from the second source SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Three registers of the same type variant

BSL <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if Q == '1' then 128 else 64;

Assembler symbols

<Vd> is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> is an arrangement specifier, encoded in the "Q" field. It can have the following values:

Q 8B 16B
0 8B
1 16B

<Vn> is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1;
bits(datasize) operand3;
bits(datasize) operand4 = V[n];

operand1 = V[m];
operand3 = V[d];
V[d] = operand1 EOR ((operand1 EOR operand4) AND operand3);
C7.2.18   CLS (vector)

Count Leading Sign bits (vector). This instruction counts the number of consecutive bits following the most significant bit that are the same as the most significant bit in each vector element in the source SIMD&FP register, places the result into a vector, and writes the vector to the destination SIMD&FP register. The count does not include the most significant bit itself.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

---

**Operation**

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;

integer count;
for e = 0 to elements-1
  if countop == CountOp_CLS then
    count = CountLeadingSignBits(Elem[operand, e, esize]);
  else
```

---

**Assembler symbols**

- `<Vd>` Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- `<T>` Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
  - `8B` when `size = 00, Q = 0`
  - `16B` when `size = 00, Q = 1`
  - `4H` when `size = 01, Q = 0`
  - `8H` when `size = 01, Q = 1`
  - `2S` when `size = 10, Q = 0`
  - `4S` when `size = 10, Q = 1`

The encoding `size = 11, Q = x` is reserved.

- `<Vn>` Is the name of the SIMD&FP source register, encoded in the "Rn" field.
count = CountLeadingZeroBits(Elem[operand, e, esize]);
Elem[result, e, esize] = count<esize-1:0>;
V[d] = result;
C7.2.19  CLZ (vector)

Count Leading Zero bits (vector). This instruction counts the number of consecutive zeros, starting from the most significant bit, in each vector element in the source SIMD&FP register, places the result into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Vector variant

CLZ <Vd>.<T>, <Vn>.<T>

Decode for this encoding

integer d = UInt(Rd);
integer n = UInt(Rn);
if size == '11' then ReservedValue();
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
CountOp countop = if U == '1' then CountOp_CLZ else CountOp_CLS;

Assembler symbols

<Vd>  Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
<T>  Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |

The encoding size = 11, Q = x is reserved.

<Vn>  Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;
integer count;
for e = 0 to elements-1
  if countop == CountOp_CLS then
    count = CountLeadingSignBits(Elem[operand, e, esize]);
  else

count = CountLeadingZeroBits(Elem[operand, e, esize]);
Elem[result, e, esize] = count<esize-1:0>;
V[d] = result;
C7.2.20 CMEQ (register)

Compare bitwise Equal (vector). This instruction compares each vector element from the first source SIMD&FP register with the corresponding vector element from the second source SIMD&FP register, and if the comparison is equal sets every bit of the corresponding vector element in the destination SIMD&FP register to one, otherwise sets every bit of the corresponding vector element in the destination SIMD&FP register to zero.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

- boolean and_test = (U == '0');

**Assembler symbols**

<V> is a width specifier, encoded in the "size" field. It can have the following values:

- D when size = 11

The following encodings are reserved:

- size = 0x
• size = 10.

<d>
Is the number of the SIMD&FP destination register, in the "Rd" field.

<n>
Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

<m>
Is the number of the second SIMD&FP source register, encoded in the "Rm" field.

<Vd>
Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T>
Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

- 8B when size = 00, Q = 0
- 16B when size = 00, Q = 1
- 4H when size = 01, Q = 0
- 8H when size = 01, Q = 1
- 2S when size = 10, Q = 0
- 4S when size = 10, Q = 1
- 2D when size = 11, Q = 1

The encoding size = 11, Q = 0 is reserved.

<Vn>
Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm>
Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

**Operation for all encodings**

    Elem[result, e, esize] = if test_passed then Ones() else Zeros();
V[d] = result;
```

### C7.2.21 CMEQ (zero)

Compare bitwise Equal to zero (vector). This instruction reads each vector element in the source SIMD&FP register and if the value is equal to zero sets every bit of the corresponding vector element in the destination SIMD&FP register to one, otherwise sets every bit of the corresponding vector element in the destination SIMD&FP register to zero.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

    test_passed = if cmp_eq then element1 >= element2 else element1 > element2;
    Elem[result, e, esize] = if test_passed then Ones() else Zeros();
V[d] = result;
```
C7.2.27   CMHS (register)

Compare unsigned Higher or Same (vector). This instruction compares each vector element in the first source SIMD&FP register with the corresponding vector element in the second source SIMD&FP register and if the first unsigned integer value is greater than or equal to the second unsigned integer value sets every bit of the corresponding vector element in the destination SIMD&FP register to one, otherwise sets every bit of the corresponding vector element in the destination SIMD&FP register to zero.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Bits(datasize) operand = V[n];

Bits(datasize) result;

Integer count;

For e = 0 to elements-1

Count = BitCount(Elem[operand, e, esize]);

Elem[result, e, esize] = count<esize-1:0>;

V[d] = result;
### C7.2.32 DUP (element)

Duplicate vector element to vector or scalar. This instruction duplicates the vector element at the specified element index in the source SIMD&FP register into a scalar or each element in a vector, and writes the result to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is used by the alias MOV (scalar). The alias is always the preferred disassembly.

**Scalar**

<index> Is the element index encoded in the "imm5" field. It can have the following values:
- imm5<4:1> when imm5 = xxxx1
- imm5<4:2> when imm5 = xxx10
- imm5<4:3> when imm5 = xx100
- imm5<4> when imm5 = x1000

The encoding imm5 = x0000 is reserved.

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(idxsize) operand = V[n];
bits(datasize) result;
bits(esize) element;

element = Elem[operand, index, esize];
for e = 0 to elements-1
    Elem[result, e, esize] = element;
V[d] = result;
```
C7.2.33   DUP (general)

Duplicate general-purpose register to vector. This instruction duplicates the contents of the source general-purpose register into a scalar or each element in a vector, and writes the result to the SIMD&FP destination register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Advanced SIMD variant

DUP <Vd>.<T>, <R><n>

Decode for this encoding

integer d = UInt(Rd);
integer n = UInt(Rn);

integer size = LowestSetBit(imm5);
if size > 3 then UnallocatedEncoding();

// imm5<4:size+1> is IGNORED
if size == 3 && Q == '0' then ReservedValue();
integer esize = 8 << size;
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
<T> Is an arrangement specifier, encoded in the "imm5:Q" field. It can have the following values:

| 8B  | when imm5 = xxxx1, Q = 0 |
| 16B | when imm5 = xxxx1, Q = 1 |
| 4H  | when imm5 = xxx10, Q = 0 |
| 8H  | when imm5 = xxx10, Q = 1 |
| 2S  | when imm5 = xx100, Q = 0 |
| 4S  | when imm5 = xx100, Q = 1 |
| 2D  | when imm5 = x1000, Q = 1 |

The following encodings are reserved:

- imm5 = x0000, Q = x.
- imm5 = x1000, Q = 0.

<W> Is the width specifier for the general-purpose source register, encoded in the "imm5" field. It can have the following values:

| W   | when imm5 = xxxx1 |
| W   | when imm5 = xx10 |
| W   | when imm5 = xx100 |
| X   | when imm5 = x1000 |
The encoding imm5 = x0000 is reserved.
Unspecified bits in "imm5" are ignored but should be set to zero by an assembler.

<n> Is the number [0-30] of the general-purpose source register or ZR (31), encoded in the "Rn" field.

**Operation**

```c
CheckFPAdvSIMDEnabled64();
bias(esize) element = X[n];
bias(datasize) result;

for e = 0 to elements-1
    Elem[result, e, esize] = element;
    V[d] = result;
```
C7.2.34   EOR (vector)

Bitwise Exclusive OR (vector). This instruction performs a bitwise Exclusive OR operation between the two source SIMD&FP registers, and places the result in the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

```
<table>
<thead>

</table>

Rm: 0 0 0 1 1 1
Rn: Rn
Rd: Rd
```

**Three registers of the same type variant**

EOR <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

**Decode for this encoding**

- integer d = UInt(Rd);
- integer n = UInt(Rn);
- integer m = UInt(Rm);
- integer datasize = if Q == '1' then 128 else 64;

**Assembler symbols**

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
  - 8B when Q = 0
  - 16B when Q = 1
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

**Operation**

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1;
bits(datasize) operand2;
bits(datasize) operand3;
bits(datasize) operand4 = V[n];
operand1 = V[m];
operand2 = Zeros();
operand3 = Ones();
V[d] = operand1 EOR ((operand2 EOR operand4) AND operand3);
C7.2.35  EOR3

Three-way Exclusive OR performs a three-way exclusive OR of the values in the three source SIMD&FP registers, and writes the result to the destination SIMD&FP register.

This instruction is implemented only when ARMv8.2-SHA is implemented.

ARMv8.2

<table>

Advanced SIMD variant

EOR3 <Vd>.16B, <Vn>.16B, <Vm>.16B, <Va>.16B

Decode for this encoding

if !HaveCryptoExt2() then UnallocatedEncoding();
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer a = UInt(Ra);

Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.
<Va> Is the name of the third SIMD&FP source register, encoded in the "Ra" field.

Operation

bits(128) Vm = V[m];
bits(128) Vn = V[n];
bits(128) Va = V[a];
V[d] = Vn EOR Vm EOR Va;
C7.2.36 EXT

Extract vector from pair of vectors. This instruction extracts the lowest vector elements from the second source SIMD&FP register and the highest vector elements from the first source SIMD&FP register, concatenates the results into a vector, and writes the vector to the destination SIMD&FP register vector. The index value specifies the lowest vector element to extract from the first source register, and consecutive elements are extracted from the first, then second, source registers until the destination vector is filled.

The following figure shows the operation of EXT doubleword operation for Q = 0 and imm4<2:0> = 3.

![Diagram of EXT operation]

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Advanced SIMD variant

EXT <Vd>.<T>, <Vn>.<T>, <Vm>.<T>, #<index>

Decode for this encoding

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if Q == '0' && imm4<3> == '1' then UnallocatedEncoding();

integer datasize = if Q == '1' then 128 else 64;
integer position = UInt(imm4) << 3;

Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
<T> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
    8B when Q = 0
    16B when Q = 1
<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.
<index> Is the lowest numbered byte element to be extracted, encoded in the "Q:imm4" field. It can have the following values:
    imm4<2:0> when Q = 0, imm4<3> = 0
    imm4 when Q = 1, imm4<3> = x
The encoding $Q = 0$, $\text{imm4} < 3 > = 1$ is reserved.

**Operation**

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) hi = V[m];
bits(datasize) lo = V[n];
bits(datasize*2) concat = hi:lo;
V[d] = concat<position+datasize-1:position>;
```
C7.2.37 FABD

Floating-point Absolute Difference (vector). This instruction subtracts the floating-point values in the elements of the second source SIMD&FP register, from the corresponding floating-point values in the elements of the first source SIMD&FP register, places the absolute value of each result in a vector, and writes the vector to the destination SIMD&FP register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page D1-1899.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

V[d] = result;
C7.2.41 FACGT

Floating-point Absolute Compare Greater than (vector). This instruction compares the absolute value of each vector element in the first source SIMD&FP register with the absolute value of the corresponding vector element in the second source SIMD&FP register and if the first value is greater than the second value sets every bit of the corresponding vector element in the destination SIMD&FP register to one, otherwise sets every bit of the corresponding vector element in the destination SIMD&FP register to zero.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps* on page D1-1899.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

C7.2.46   FCADD

Floating-point Complex Add.

This instruction operates on complex numbers that are represented in SIMD&FP registers as pairs of elements, with
the more significant element holding the imaginary part of the number and the less significant element holding the
real part of the number. Each element holds a floating-point value. It performs the following computation on the
corresponding complex number element pairs from the two source registers:

• Considering the complex number from the second source register on an Argand diagram, the number is
  rotated counterclockwise by 90 or 270 degrees.

• The rotated complex number is added to the complex number from the first source register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results
in either a flag being set in FPSR or a synchronous exception being generated. For more information, see
Floating-point exceptions and exception traps on page D1-1899.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state
and Exception level, an attempt to execute the instruction might be trapped.

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size == '00' then ReservedValue();
if Q == '0' && size == '11' then ReservedValue();
integer esize = 8 << UInt(size);
if !HaveFP16Ext() && esize == 16 then ReservedValue();
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
<T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

- 4H when size = 01, Q = 0
- 8H when size = 01, Q = 1
- 2S when size = 10, Q = 0
- 4S when size = 10, Q = 1
- 2D when size = 11, Q = 1

The following encodings are reserved:

- size = 00, Q = x.
- size = 11, Q = 0.
<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

<rotate> Is the rotation, encoded in the "rot" field. It can have the following values:

<table>
<thead>
<tr>
<th>rotate</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>90</td>
<td>when rot = 0</td>
</tr>
<tr>
<td>270</td>
<td>when rot = 1</td>
</tr>
</tbody>
</table>

**Operation**

```c
CheckFPAdvSIMDEnabled64();

bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) operand3 = V[d];
bits(datasize) result;
bits(esize) element1;
bits(esize) element3;

for e = 0 to (elements DIV 2)-1
    case rot of
        when '0'
            element1 = FPNeg(Elem[operand2, e*2+1, esize]);
            element3 = Elem[operand2, e*2, esize];
        when '1'
            element1 = Elem[operand2, e*2+1, esize];
            element3 = FPNeg(Elem[operand2, e*2, esize]);
    Elem[result, e*2, esize] = FPAdd(Elem[operand1, e*2, esize], element1, FPCR);
    Elem[result, e*2+1, esize] = FPAdd(Elem[operand1, e*2+1, esize], element3, FPCR);

V[d] = result;
```
C7.2.47   FCCMP

Floating-point Conditional quiet Compare (scalar). This instruction compares the two SIMD&FP source register values and writes the result to the PSTATE.\{N, Z, C, V\} flags. If the condition does not pass then the PSTATE.\{N, Z, C, V\} flags are set to the flag bit specifier.

It raises an Invalid Operation exception only if either operand is a signaling NaN.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page D1-1899.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

integer m = UInt(Rm);

integer datasize;
case type of
  when '00' datasize = 32;
  when '01' datasize = 64;
  when '10' UnallocatedEncoding();
  when '11'
    if HaveFP16Ext() then
data size = 16;
else
  UnallocatedEncoding();

bits(4) flags = nzcv;

Assembler symbols

<Dn>   Is the 64-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
<Dm>   Is the 64-bit name of the second SIMD&FP source register, encoded in the "Rm" field.
<Hn>   Is the 16-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
<hm> Is the 16-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

<sn> Is the 32-bit name of the first SIMD&FP source register, encoded in the "Rn" field.

<sm> Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

<nzcv> Is the flag bit specifier, an immediate in the range 0 to 15, giving the alternative state for the 4-bit NZCV condition flags, encoded in the "nzcv" field.

<cond> Is one of the standard conditions, encoded in the "cond" field in the standard way.

NaNs

The IEEE 754 standard specifies that the result of a comparison is precisely one of <, ==, > or unordered. If either or both of the operands are NaNs, they are unordered, and all three of (Operand1 < Operand2), (Operand1 == Operand2) and (Operand1 > Operand2) are false. This case results in the FPSCR flags being set to N=0, Z=0, C=1, and V=1.

Operation

CheckFPAdvSIMDEnabled64();

bits(datasize) operand1 = V[n];
bits(datasize) operand2;
operand2 = V[m];

if ConditionHolds(cond) then
    flags = FPCompare(operand1, operand2, FALSE, FPCR);
PSTATE.<N,Z,C,V> = flags;
C7.2.48 FCCMPE

Floating-point Conditional signaling Compare (scalar). This instruction compares the two SIMD&FP source register values and writes the result to the PSTATE.{N, Z, C, V} flags. If the condition does not pass then the PSTATE.{N, Z, C, V} flags are set to the flag bit specifier.

If either operand is any type of NaN, or if either operand is a signaling NaN, the instruction raises an Invalid Operation exception.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page D1-1899.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision variant

Applies when type == 11.

FCCMPE <Hn>, <Hm>, #<nzcv>, <cond>

FCCMPE <Sn>, <Sm>, #<nzcv>, <cond>

Double-precision variant

Applies when type == 01.

FCCMPE <Dn>, <Dm>, #<nzcv>, <cond>

Decode for all variants of this encoding

```plaintext
integer n = UInt(Rn);
integer m = UInt(Rm);

integer datasize;
case type of
  when '00' datasize = 32;
  when '01' datasize = 64;
  when '10' UnallocatedEncoding();
  when '11'
    if HaveFP16Ext() then
data size = 16;
    else
      UnallocatedEncoding();
    end

bits(4) flags = nzcv;
```

Assembler symbols

- `<Dn>` Is the 64-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
- `<Dm>` Is the 64-bit name of the second SIMD&FP source register, encoded in the "Rm" field.
<hn> Is the 16-bit name of the first SIMD&FP source register, encoded in the "Rn" field.

<hm> Is the 16-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

<sn> Is the 32-bit name of the first SIMD&FP source register, encoded in the "Rn" field.

<sm> Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

<nzcv> Is the flag bit specifier, an immediate in the range 0 to 15, giving the alternative state for the 4-bit NZCV condition flags, encoded in the "nzcv" field.

<cond> Is one of the standard conditions, encoded in the "cond" field in the standard way.

NaNs

The IEEE 754 standard specifies that the result of a comparison is precisely one of <, ==, > or unordered. If either or both of the operands are NaNs, they are unordered, and all three of (Operand1 < Operand2), (Operand1 == Operand2) and (Operand1 > Operand2) are false. This case results in the FPSCR flags being set to N=0, Z=0, C=1, and V=1.

FCOMPE raises an Invalid Operation exception if either operand is any type of NaN, and is suitable for testing for <, <=, >, >=, and other predicates that raise an exception when the operands are unordered.

**Operation**

```c
CheckFPAdvSIMDEnabled64();

bits(datasize) operand1 = V[n];
bits(datasize) operand2;
operand2 = V[m];

if ConditionHolds(cond) then
    flags = FPCompare(operand1, operand2, TRUE, FPCR);
PSTATE.<N,Z,C,V> = flags;
```
C7.2.49      FCMEQ (register)

Floating-point Compare Equal (vector). This instruction compares each floating-point value from the first source
SIMD&FP register, with the corresponding floating-point value from the second source SIMD&FP register, and if
the comparison is equal sets every bit of the corresponding vector element in the destination SIMD&FP register to
one, otherwise sets every bit of the corresponding vector element in the destination SIMD&FP register to zero.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results
in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see
Floating-point exceptions and exception traps on page D1-1899.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state
and Exception level, an attempt to execute the instruction might be trapped.

C7.2.52  FCMGE (zero)

Floating-point Compare Greater than or Equal to zero (vector). This instruction reads each floating-point value in the source SIMD&FP register and if the value is greater than or equal to zero sets every bit of the corresponding vector element in the destination SIMD&FP register to one, otherwise sets every bit of the corresponding vector element in the destination SIMD&FP register to zero.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page D1-1899.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

C7.2.55  FCMLA (by element)

Floating-point Complex Multiply Accumulate (by element).

This instruction operates on complex numbers that are represented in SIMD&FP registers as pairs of elements, with the more significant element holding the imaginary part of the number and the less significant element holding the real part of the number. Each element holds a floating-point value. It performs the following computation on complex numbers from the first source register and the destination register with the specified complex number from the second source register:

- Considering the complex number from the second source register on an Argand diagram, the number is rotated counterclockwise by 0, 90, 180, or 270 degrees.
- The two elements of the transformed complex number are multiplied by:
  - The real element of the complex number from the first source register, if the transformation was a rotation by 0 or 180 degrees.
  - The imaginary element of the complex number from the first source register, if the transformation was a rotation by 90 or 270 degrees.
- The complex number resulting from that multiplication is added to the complex number from the destination register.

The multiplication and addition operations are performed as a fused multiply-add, without any intermediate rounding.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page D1-1899.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

```

```
C7.2.57  FCMLE (zero)

Floating-point Compare Less than or Equal to zero (vector). This instruction reads each floating-point value in the source SIMD&FP register and if the value is less than or equal to zero sets every bit of the corresponding vector element in the destination SIMD&FP register to one, otherwise sets every bit of the corresponding vector element in the destination SIMD&FP register to zero.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page D1-1899.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Vector single-precision and double-precision variant

FCMLT <Vd>.<T>, <Vn>.<T>, #0.0

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if sz:Q == '10' then ReservedValue();
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

CompareOp comparison = CompareOp_LT;
```

Assembler symbols

- `<Hd>` Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- `<Hn>` Is the 16-bit name of the SIMD&FP source register, encoded in the "Rn" field.
- `<V>` Is a width specifier, encoded in the "sz" field. It can have the following values:
  - `S` when `sz = 0`
  - `D` when `sz = 1`
- `<d>` Is the number of the SIMD&FP destination register, encoded in the "Rd" field.
- `<n>` Is the number of the SIMD&FP source register, encoded in the "Rn" field.
<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> For the vector half precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:

4H when Q = 0
8H when Q = 1

For the vector single-precision and double-precision variant: is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

2S when sz = 0, Q = 0
4S when sz = 0, Q = 1
2D when sz = 1, Q = 1

The encoding sz = 1, Q = 0 is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

**Operation for all encodings**

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;
bits(esize) zero = FPZero('0');
bias(esize) element;
boolean test_passed;

for e = 0 to elements-1
    element = Elem[operand, e, esize];
    case comparison of
        when CompareOp_GT test_passed = FPCompareGT(element, zero, FPCR);
        when CompareOp_GE test_passed = FPCompareGE(element, zero, FPCR);
        when CompareOp_EQ test_passed = FPCompareEQ(element, zero, FPCR);
        when CompareOp_LE test_passed = FPCompareGE(zero, element, FPCR);
        when CompareOp_LT test_passed = FPCompareGT(zero, element, FPCR);
        Elem[result, e, esize] = if test_passed then Ones() else Zeros();

V[d] = result;
```

C7.2.59 FCMP

Floating-point quiet Compare (scalar). This instruction compares the two SIMD&FP source register values, or the first SIMD&FP source register value and zero. It writes the result to the PSTATE.\{N, Z, C, V\} flags.

It raises an Invalid Operation exception only if either operand is a signaling NaN.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page D1-1899.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision variant

Applies when type == 11 \&\& opc == 00.
FCMP <Hn>, <Hm>

Half-precision, zero variant

        UnallocatedEncoding();

boolean signal_all_nans = (opc<1> == '1');
boolean cmp_with_zero = (opc<0> == '1');

Assembler symbols

<Dn> For the double-precision variant: is the 64-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
For the double-precision, zero variant: is the 64-bit name of the SIMD&FP source register, encoded in the "Rn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

<Hn> For the half-precision variant: is the 16-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
For the half-precision, zero variant: is the 16-bit name of the SIMD&FP source register, encoded in the "Rn" field.

<Hm> Is the 16-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

<Sn> For the single-precision variant: is the 32-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
For the single-precision, zero variant: is the 32-bit name of the SIMD&FP source register, encoded in the "Rn" field.

<Sm> Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

NaNs
The IEEE 754 standard specifies that the result of a comparison is precisely one of <, ==, > or unordered. If either or both of the operands are NaNs, they are unordered, and all three of (Operand1 < Operand2), (Operand1 == Operand2) and (Operand1 > Operand2) are false. This case results in the FPSCR flags being set to N=0, Z=0, C=1, and V=1.

Operation
CheckFPAdvSIMDEnabled64();

bits(datasize) operand1 = V[n];
bites(datasize) operand2;

operand2 = if cmp_with_zero then FPZero('0') else V[m];

PSTATE.<N,Z,C,V> = FPCompare(operand1, operand2, signal_all_nans, FPCR);
C7.2.60  FCMPE

Floating-point signaling Compare (scalar). This instruction compares the two SIMD&FP source register values, or the first SIMD&FP source register value and zero. It writes the result to the PSTATE. {N, Z, C, V} flags.

If either operand is any type of NaN, or if either operand is a signaling NaN, the instruction raises an Invalid Operation exception.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page D1-1899.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision variant
Applies when type $= 11$ $\&\&$ opc $= 10$.
FCMPE <Hn>, <Hm>

boolean signal_all_nans = (opc<1> == '1');
boolean cmp_with_zero = (opc<0> == '1');

Assembler symbols

<Dn>
For the double-precision variant: is the 64-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
For the double-precision, zero variant: is the 64-bit name of the SIMD&FP source register, encoded in the "Rn" field.

<Dm>
Is the 64-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

<Hn>
For the half-precision variant: is the 16-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
For the half-precision, zero variant: is the 16-bit name of the SIMD&FP source register, encoded in the "Rn" field.

<Hm>
Is the 16-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

<Sn>
For the single-precision variant: is the 32-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
For the single-precision, zero variant: is the 32-bit name of the SIMD&FP source register, encoded in the "Rn" field.

<Sm>
Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

NaNs

The IEEE 754 standard specifies that the result of a comparison is precisely one of <, ==, > or unordered. If either or both of the operands are NaNs, they are unordered, and all three of (Operand1 < Operand2), (Operand1 == Operand2) and (Operand1 > Operand2) are false. This case results in the FPSCR flags being set to N=0, Z=0, C=1, and V=1.

FCMPE raises an Invalid Operation exception if either operand is any type of NaN, and is suitable for testing for <, <=, >, >=, and other predicates that raise an exception when the operands are unordered.

Operation

CheckFPAdvSIMDEnabled64();

bits(datasize) operand1 = V[n];
bits(datasize) operand2;
operand2 = if cmp_with_zero then FPZero('0') else V[m];
PSTATE.<N,Z,C,V> = FPCmpare(operand1, operand2, signal_all_nans, FPCR);
C7.2.61 FCSEL

Floating-point Conditional Select (scalar). This instruction allows the SIMD&FP destination register to take the value from either one or the other of two SIMD&FP source registers. If the condition passes, the first SIMD&FP source register value is taken, otherwise the second SIMD&FP source register value is taken.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

<Hn> Is the 16-bit name of the SIMD&FP source register, encoded in the "Rn" field.
<Dn> Is the 64-bit name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

CheckFPAdvSIMDEnabled64();

bits(fltsize) fltval;
bis(intsize) intval;

fltval = V[n];
intval = FPToFixed(fltval, 0, FALSE, FPCR, FPRounding_TIEAWAY);
X[d] = intval;
C7.2.65 FCVTAU (vector)

Floating-point Convert to Unsigned integer, rounding to nearest with ties to Away (vector). This instruction converts each element in a vector from a floating-point value to an unsigned integer value using the Round to Nearest with Ties to Away rounding mode and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page D1-1899.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Operation

CheckFPAdvSIMDEncabled64();

bits(fltsize) fltval;
bits(intsize) intval;
fltval = V[n];
intval = FPToFixed(fltval, 0, TRUE, FPCR, FPRounding_TIEAWAY);
X[d] = intval;
C7.2.67  FCVTL, FCVTL2

Floating-point Convert to higher precision Long (vector). This instruction reads each element in a vector in the SIMD&FP source register, converts each value to double the precision of the source element using the rounding mode that is determined by the FPCR, and writes each result to the equivalent element of the vector in the SIMD&FP destination register.

Where the operation lengthens a 64-bit vector to a 128-bit vector, the FCVTL2 variant operates on the elements in the top 64 bits of the source register.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page D1-1899.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

<db> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.
<Rn> Is the number of the SIMD&FP source register, encoded in the "Rn" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> For the vector half precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
- 4H when Q = 0
- 8H when Q = 1

For the vector single-precision and double-precision variant: is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:
- 2S when sz = 0, Q = 0
- 4S when sz = 0, Q = 1
- 2D when sz = 1, Q = 1

The encoding sz = 1, Q = 0 is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

**Operation for all encodings**

```plaintext
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;
bits(esize) element;

for e = 0 to elements-1
  element = Elem[operand, e, esize];
  Elem[result, e, esize] = FPToFixed(element, 0, unsigned, FPCR, rounding);
V[d] = result;
```

```
C7.2.71 FCVTMU (scalar)

Floating-point Convert to Unsigned integer, rounding toward Minus infinity (scalar). This instruction converts the floating-point value in the SIMD&FP source register to a 32-bit or 64-bit unsigned integer using the Round towards Minus Infinity rounding mode, and writes the result to the general-purpose destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page D1-1899.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

**Half-precision to 32-bit variant**

Applies when \( sf == 0 \) \&\& \( type == 11 \).

\[ \text{FCVTMU} \ <Wd>, <Hn> \]

**Half-precision to 64-bit variant**

bits(intsize) intval;
fltval = V[n];
intval = FPToFixed(fltval, 0, TRUE, FPCR, rounding);
X[d] = intval;
C7.2.72 FCVTN, FCVTN2

Floating-point Convert to lower precision Narrow (vector). This instruction reads each vector element in the SIMD&FP source register, converts each result to half the precision of the source element, writes the final result to a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. The destination vector elements are half as long as the source vector elements. The rounding mode is determined by the FPCR.

The FCVTN instruction writes the vector to the lower half of the destination register and clears the upper half, while the FCVTN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see `Floating-point exceptions and exception traps` on page D1-1899.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the Security state and Exception level in which the instruction is executed, an attempt to execute the instruction might be trapped.

C7.2.77   FCVTPS (vector)

Floating-point Convert to Signed integer, rounding toward Plus infinity (vector). This instruction converts a scalar or each element in a vector from a floating-point value to a signed integer value using the Round towards Plus Infinity rounding mode, and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page D1-1899.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the Security state and Exception level in which the instruction is executed, an attempt to execute the instruction might be trapped.

fltval = V[n];
intval = FPFixed(fltval, 0, TRUE, FPCR, rounding);
X[d] = intval;
C7.2.81 FCVTXN, FCVTXN2

Floating-point Convert to lower precision Narrow, rounding to odd (vector). This instruction reads each vector element in the source SIMD&FP register, narrows each value to half the precision of the source element using the Round to Odd rounding mode, writes the result to a vector, and writes the vector to the destination SIMD&FP register.

______ Note ________

This instruction uses the Round to Odd rounding mode which is not defined by the IEEE 754-2008 standard. This rounding mode ensures that if the result of the conversion is inexact the least significant bit of the mantissa is forced to 1. This rounding mode enables a floating-point value to be converted to a lower precision format via an intermediate precision format while avoiding double rounding errors. For example, a 64-bit floating-point value can be converted to a correctly rounded 16-bit floating-point value by first using this instruction to produce a 32-bit value and then using another instruction with the wanted rounding mode to convert the 32-bit value to the final 16-bit floating-point value.

The FCVTXN instruction writes the vector to the lower half of the destination register and clears the upper half, while the FCVTXN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page D1-1899.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Assembler symbols

<V>  Is a width specifier, encoded in the "immh" field. It can have the following values:
H     when immh = 001x
S     when immh = 01xx
D     when immh = 1xxx
The encoding immh = 000x is reserved.

<d>  Is the number of the SIMD&FP destination register, in the "Rd" field.
<n>  Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
<T>  Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:
4H    when immh = 001x, Q = 0
8H    when immh = 001x, Q = 1
2S    when immh = 01xx, Q = 0
4S    when immh = 01xx, Q = 1
2D    when immh = 1xxx, Q = 1
See Advanced SIMD modified immediate on page C4-306 when immh = 0000, Q = x.
The following encodings are reserved:
• immh = 0001, Q = x.
• immh = 1xxx, Q = 0.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<fbits> For the scalar variant: is the number of fractional bits, in the range 1 to the operand width, encoded in the "immh:immb" field. It can have the following values:
(32-UInt(immh:immb)) when immh = 001x
(64-UInt(immh:immb)) when immh = 01xx
(128-UInt(immh:immb)) when immh = 1xxx
The encoding immh = 000x is reserved.
For the vector variant: is the number of fractional bits, in the range 1 to the element width, encoded in the "immh:immb" field. It can have the following values:
(32-UInt(immh:immb)) when immh = 001x
(64-UInt(immh:immb)) when immh = 01xx
(128-UInt(immh:immb)) when immh = 1xxx
See Advanced SIMD modified immediate on page C4-306 when immh = 0000.
The encoding immh = 0001 is reserved.

Operation for all encodings

V[d] = result;
C7.2.83 FCVTZS (vector, integer)

Floating-point Convert to Signed integer, rounding toward Zero (vector). This instruction converts a scalar or each element in a vector from a floating-point value to a signed integer value using the Round towards Zero rounding mode, and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page D1-1899.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the Security state and Exception level in which the instruction is executed, an attempt to execute the instruction might be trapped.

if sz:Q == '10' then ReservedValue();
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

FPRounding rounding = FPDecodeRounding(o1:o2);
boolean unsigned = (U == '1');
```

**Assembler symbols**

- `<Hd>`: Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- `<Hn>`: Is the 16-bit name of the SIMD&FP source register, encoded in the "Rn" field.
- `<V>`: Is a width specifier, encoded in the "sz" field. It can have the following values:
  - `S` when `sz = 0`
  - `D` when `sz = 1`
- `<d>`: Is the number of the SIMD&FP destination register, encoded in the "Rd" field.
<n>
Is the number of the SIMD&FP source register, encoded in the "Rn" field.
</n>

<Vd>
Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
</Vd>

<T>
For the vector half precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:

4H    when Q = 0
8H    when Q = 1

For the vector single-precision and double-precision variant: is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

2S    when sz = 0, Q = 0
4S    when sz = 0, Q = 1
2D    when sz = 1, Q = 1

The encoding sz = 1, Q = 0 is reserved.
</T>

<Vn>
Is the name of the SIMD&FP source register, encoded in the "Rn" field.
</Vn>

**Operation for all encodings**

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;
bits(esize) element;

for e = 0 to elements-1
    element = Elem[operand, e, esize];
    Elem[result, e, esize] = FPToFixed(element, 0, unsigned, FPCR, rounding);
V[d] = result;
```

C7.2.88 FCVTZU (scalar, fixed-point)

Floating-point Convert to Unsigned fixed-point, rounding toward Zero (scalar). This instruction converts the floating-point value in the SIMD&FP source register to a 32-bit or 64-bit fixed-point unsigned integer using the Round towards Zero rounding mode, and writes the result to the general-purpose destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page D1-1899.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the Security state and Exception level in which the instruction is executed, an attempt to execute the instruction might be trapped.

if sz:Q == '10' then ReservedValue();
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

#### Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
<T>
For the half-precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
4H when Q = 0
8H when Q = 1

For the single-precision and double-precision variant: is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:
2S when sz = 0, Q = 0
4S when sz = 0, Q = 1
2D when sz = 1, Q = 1

The encoding sz = 1, Q = 0 is reserved.

<Vn>
Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm>
Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation for all encodings

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
bits(esize) element1;
bits(esize) element2;

for e = 0 to elements-1
    element1 = Elem[operand1, e, esize];
    element2 = Elem[operand2, e, esize];
    Elem[result, e, esize] = FPDiv(element1, element2, FPCR);

V[d] = result;
```
C7.2.91   FDIV (scalar)

Floating-point Divide (scalar). This instruction divides the floating-point value of the first source SIMD&FP register by the floating-point value of the second source SIMD&FP register, and writes the result to the destination SIMD&FP register.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page D1-1899.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision variant

<Sm> Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

**Operation**

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) result;
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];

result = FPDiv(operand1, operand2, FPCR);
V[d] = result;
```
C7.2.92   FJCVTZS

Floating-point Javascript Convert to Signed fixed-point, rounding toward Zero. This instruction converts the double-precision floating-point value in the SIMD&FP source register to a 32-bit signed integer using the Round towards Zero rounding mode, and writes the result to the general-purpose destination register. If the result is too large to be accommodated as a signed 32-bit integer, then the result is the integer modulo 2^{32}, as held in a 32-bit signed integer.

This instruction can generate a floating-point exception. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page D1-1899.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.
