Why Events Are A Bad Idea (for high-concurrency servers)

Rob von Behren, Jeremy Condit and Eric Brewer University of California at Berkeley {jrvb,jcondit,brewer}@cs.berkeley.edu http://capriccio.cs.berkeley.edu

A Talk HotOS 2003

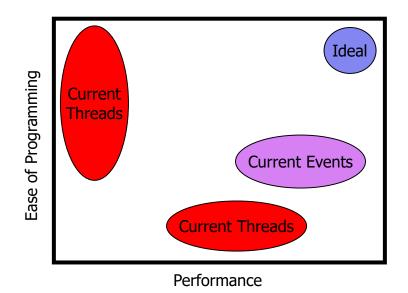

# The Stage

- Highly concurrent applications
  - Internet servers (Flash, Ninja, SEDA)
  - Transaction processing databases
- Workload
  - Operate "near the knee"
  - Avoid thrashing!
- What makes concurrency hard?
  - Race conditions
  - Scalability (no O(n) operations)
  - Scheduling & resource sensitivity
  - Inevitable overload
  - Code complexity

### The Debate

- Performance vs. Programmability
  - Current threads pick one
  - Events somewhat better
- Questions
  - Threads vs. Events?
  - How do we get performance and programmability?

## **Our Position**

- Thread-event duality still holds
- But threads are better anyway
  - More natural to program
  - Better fit with tools and hardware
- Compiler-runtime integration is key

## The Duality Argument

General assumption: follow "good practices"

### Observations

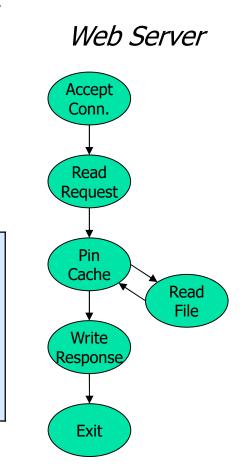

- Major concepts are analogous
- Program structure is similar
- Performance should be similar
  - Given good implementations!

### Threads

#### Events

#### Monitors

- Exported functions
- Call/return and fork/join
- Wait on condition variable
- Event handler & queue
- Events accepted
- Send message / await reply
- Wait for new messages

## The Duality Argument

General assumption: follow "good practices"

### Observations

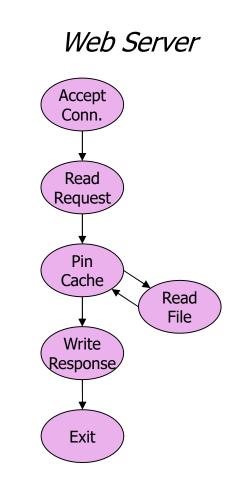

- Major concepts are analogous
- Program structure is similar
- Performance should be similar
  - Given good implementations!

### Threads

#### Events

#### Monitors

- Exported functions
- Call/return and fork/join
- Wait on condition variable
- Event handler & queue
- Events accepted
- Send message / await reply
- Wait for new messages

## The Duality Argument

General assumption: follow "good practices"

### Observations

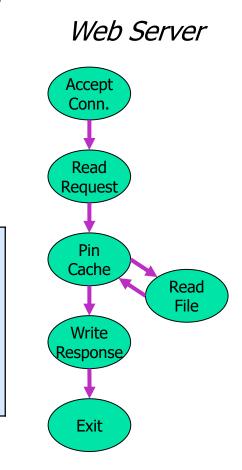

- Major concepts are analogous
- Program structure is similar
- Performance should be similar
  - Given good implementations!

### Threads

#### Events

#### Monitors

- Exported functions
- Call/return and fork/join
- Wait on condition variable
- Event handler & queue
- Events accepted
- Send message / await reply
- Wait for new messages

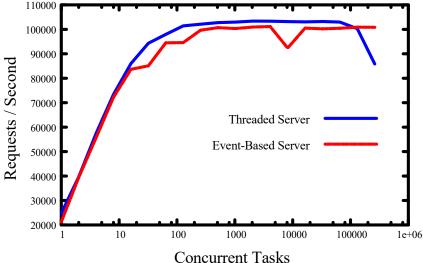

### "But Events Are Better!"

- Recent arguments for events
  - Lower runtime overhead
  - Better live state management
  - Inexpensive synchronization
  - More flexible control flow
  - Better scheduling and locality
- All true but...
  - No *inherent* problem with threads!
  - Thread implementations can be improved

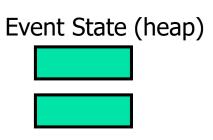

### **Runtime Overhead**

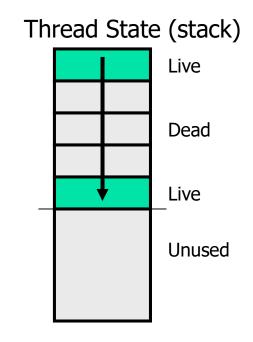

- Criticism: Threads don't perform well for high concurrency
- Response
  - Avoid O(n) operations
  - Minimize context switch overhead
- Simple scalability test
  - Slightly modified GNU Pth
  - Thread-per-task vs. single thread
  - Same performance!

### Live State Management

- Criticism: Stacks are bad for live state
- Response
  - Fix with compiler help
  - Stack overflow vs. wasted space
    - Dynamically link stack frames
  - Retain dead state
    - Static lifetime analysis
    - Plan arrangement of stack
    - Put some data on heap
    - Pop stack before tail calls
  - Encourage inefficiency
    - Warn about inefficiency

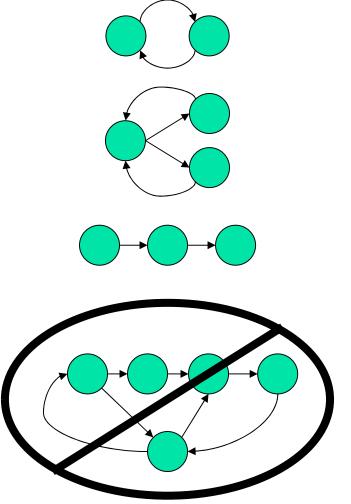

## Synchronization

- *Criticism: Thread synchronization is heavyweight*
- Response
  - Cooperative multitasking works for threads, too!
  - Also presents same problems
    - Starvation & fairness
    - Multiprocessors
    - Unexpected blocking (page faults, etc.)
  - Compiler support helps

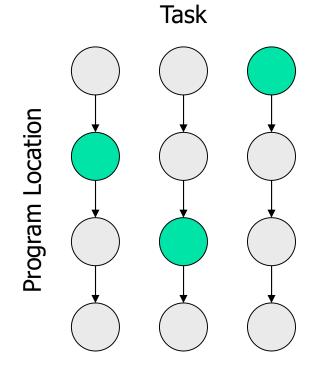

## **Control Flow**

- Criticism: Threads have restricted control flow
- Response
  - Programmers use simple patterns
    - Call / return
    - Parallel calls
    - Pipelines
  - Complicated patterns are unnatural
    - Hard to understand
    - Likely to cause bugs

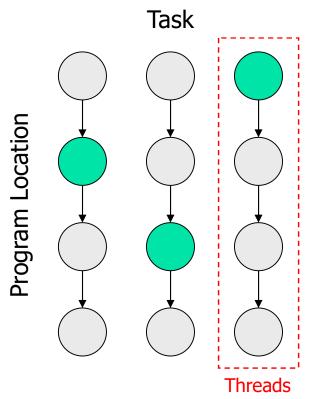

# Scheduling

- *Criticism: Thread schedulers are too generic* 
  - Can't use application-specific information
- Response
  - 2D scheduling: task & program location
    - Threads schedule based on task only
    - Events schedule by location (e.g. SEDA)
      - Allows batching
      - Allows prediction for SRCT
  - Threads can use 2D, too!
    - Runtime system tracks current location
    - Call graph allows prediction

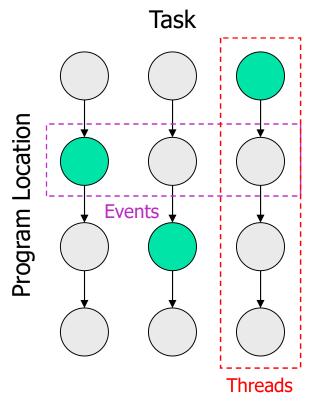

# Scheduling

- *Criticism: Thread schedulers are too generic* 
  - Can't use application-specific information
- Response
  - 2D scheduling: task & program location
    - Threads schedule based on task only
    - Events schedule by location (e.g. SEDA)
      - Allows batching
      - Allows prediction for SRCT
  - Threads can use 2D, too!
    - Runtime system tracks current location
    - Call graph allows prediction

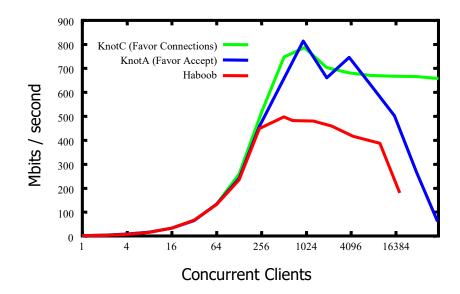

# Scheduling

- *Criticism: Thread schedulers are too generic* 
  - Can't use application-specific information
- Response
  - 2D scheduling: task & program location
    - Threads schedule based on task only
    - Events schedule by location (e.g. SEDA)
      - Allows batching
      - Allows prediction for SRCT
  - Threads can use 2D, too!
    - Runtime system tracks current location
    - Call graph allows prediction

## The Proof's in the Pudding

- User-level threads package
  - Subset of pthreads
  - Intercept blocking system calls
  - No *O(n)* operations
  - Support > 100K threads
  - 5000 lines of C code
- Simple web server: Knot
  - 700 lines of C code
- Similar performance
  - Linear increase, then steady
  - Drop-off due to poll() overhead

## Our Big But...

- More natural programming model
  - Control flow is more apparent
  - Exception handling is easier
  - State management is automatic
- Better fit with current tools & hardware
  - Better existing infrastructure
  - Allows better performance?

## **Control Flow**

- Events obscure control flow
  - For programmers *and* tools

#### Threads

thread_main(int sock) {
struct session s;
accept_conn(sock, &s);
read_request(&s);
pin_cache(&s);
write_response(&s);
unpin(&s);
}

```
pin_cache(struct session *s) {
    pin(&s);
    if( !in_cache(&s) )
```

```
read_file(&s);
```

}

```
AcceptHandler(event e) {
    struct session *s = new_session(e);
    RequestHandler.enqueue(s);
```

```
RequestHandler(struct session *s) {
    ...; CacheHandler.enqueue(s);
```

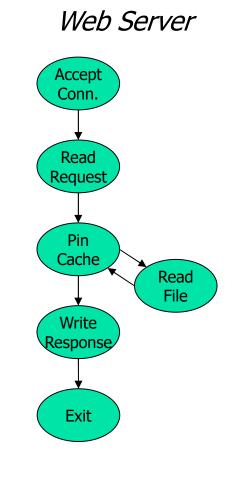

```
CacheHandler(struct session *s) {
pin(s);
```

**Events** 

#### }

}

ExitHandlerr(struct session \*s) {
 ...; unpin(&s); free\_session(s); }

## **Control Flow**

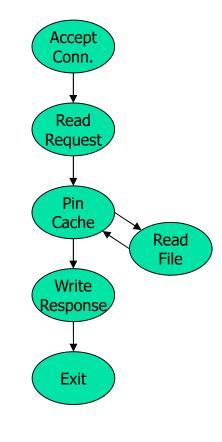

- Events obscure control flow
  - For programmers *and* tools

#### Threads

thread_main(int sock) {     struct session s;	CacheHandler(struct session *s) {     pin(s);
accept_conn(sock, &s);	if( !in_cache(s) ) ReadFileHandler.enqueue(s);
read_request(&s);	else ResponseHandler.enqueue(s);
pin_cache(&s);	}
write_response(&s);	RequestHandler(struct session *s) {
unpin(&s);	; CacheHandler.enqueue(s);
}	}
pin_cache(struct session *s) {	ExitHandlerr(struct session *s) {
pin(&s);	; unpin(&s); free_session(s);
if( !in_cache(&s) )	}
read_file(&s);	AcceptHandler(event e) {
}	struct session *s = new_session(e);
	RequestHandler.enqueue(s); }

*Events* 

### Web Server

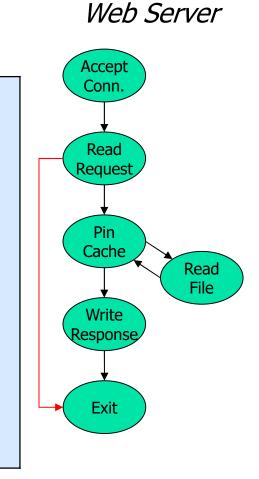

### Exceptions

- Exceptions complicate control flow
  - Harder to understand program flow
  - Cause bugs in cleanup code

#### Threads

1111 Caus	LVCIICS
thread_main(int sock) {     struct session s;	CacheHandler(struct session *s) {     pin(s);
accept_conn(sock, &s);	if(!in_cache(s)) ReadFileHandler.enqueue(s);
if( !read_request(&s) )	else ResponseHandler.enqueue(s);
return;	}
pin_cache(&s);	RequestHandler(struct session *s) {
write_response(&s);	; if( error ) return; CacheHandler.enqueue(s);
unpin(&s);	}
}	
	ExitHandlerr(struct session *s) {
pin_cache(struct session *s) {	; unpin(&s); free_session(s);
pin(&s);	}
if( !in_cache(&s) )	AcceptHandler(event e) {
read_file(&s);	struct session *s = new_session(e);
}	RequestHandler.enqueue(s); }

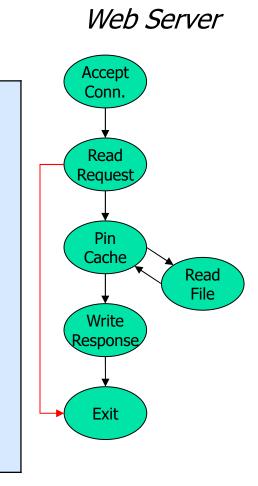

**Fvents** 

## State Management

- Évents require manual state management
- Hard to know when to free
  - Use GC or risk bugs

#### Threads **Events** thread main(int sock) { CacheHandler(struct session \*s) { struct session s; pin(s); if(!in\_cache(s)) ReadFileHandler.enqueue(s); accept\_conn(sock, &s); ResponseHandler.engueue(s); if( !read\_request(&s) ) else return; pin\_cache(&s); RequestHandler(struct session \*s) { write\_response(&s); ...; if( error ) return; CacheHandler.enqueue(s); unpin(&s); } } ExitHandlerr(struct session \*s) { pin\_cache(struct session \*s) { ...; unpin(&s); free\_session(s); pin(&s); } if( !in\_cache(&s) ) AcceptHandler(event e) { struct session \*s = new\_session(e); read\_file(&s); RequestHandler.engueue(s); }

## **Existing Infrastructure**

- Lots of infrastructure for threads
  - Debuggers
  - Languages & compilers
- Consequences
  - More amenable to analysis
  - Less effort to get working systems

### **Better Performance?**

- Function pointers & dynamic dispatch
  - Limit compiler optimizations
  - Hurt branch prediction & I-cache locality
- More context switches with events?
  - Example: Haboob does 6x more than Knot
  - Natural result of queues
- More investigation needed!

## The Future: Compiler-Runtime Integration

- Insight
  - Automate things event programmers do by hand
  - Additional analysis for other things
- Specific targets
  - Dynamic stack growth\*
  - Live state management
  - Synchronization
  - Scheduling\*
- Improve performance *and* decrease complexity

\* Working prototype in threads package

## Conclusion

- Threads  $\approx$  Events
  - Performance
  - Expressiveness
- Threads > Events
  - Complexity / Manageability
- Performance and Ease of use?
  - Compiler-runtime integration is key
